Cheyenne Autumn is a flawed but fascinating film. Self-conscious of its civil rights message, the narrative is plodding if not depressing. Even the climax that sees the Indians achieve their goal of a new reservation in the north winds up a pyrrhic victory. By then, many of the Indians have died and their heroic leaders go their separate ways after Little Wolf (played by Ricardo Montalban) kills Dull Knife's son for stealing his wife. Evidently sensing the futility of the tale, Ford tries to lighten it up with the addition of subplots. The result is an episodic film that does not hold together very well. For example, the Dodge City sequence (which features James Stewart as Wyatt Earp living in a veritable Sodom and Gomorrah of a town replete with ineffectual politicians, killer cowboys, and happy hookers) does not even seem like it belongs in the picture.

Ford's western does have its moments, though. It remains true to the basic outline of the Cheyenne's flight, although the director does embellish the tragedy with fictional characters and some contrived Indian customs. The film also features some spectacular visual shots, as well as the types of intriguing details that only Ford would think of including, such as smoke coming out of tepees, or the ubiquitous dust in the air and on soldiers' faces and uniforms.

Significance

More than just a story about the early frontier, *Cheyenne Autumn* provides fascinating glimpses of racial attitudes in 1960s America. It shows that the roots of racism run deep in America's past. One scene, for instance, depicts a racist cowboy who coldly guns down and scalps a starving Indian. Other scenes offer evidence of institutional racism, portraying callous politicians who ignore Indian rights and military officers who blindly obey orders to the detriment of helpless victims.

John Ford directed the epic film Cheyenne Autumn in 1964. Ford considered Cheyenne Autumn an elegy for Native Americans abused by the U.S. government and misrepresented in many of the 140 films Ford himself made over a 50-year career.

At the same time, *Cheyenne Autumn* captures the optimism of the era's civil rights movement as it underscores the notion that eventually "We Shall Overcome" racial problems. The main characters clearly are in step with the changing times. Widmark's humane military officer is determined to cut through red tape in order to protect Indian rights. The compassionate Quaker missionary (played by Carroll Baker) evokes the era's resolute civil rights workers and Peace Corps volunteers who worked side-by-side with those in need. And Robinson's reform-minded secretary of the interior could have stepped out of President Lyndon Johnson's Great Society administration.

Cheyenne Autumn likewise picks up on changing attitudes toward ethnicity and gender. It offers sympathetic portrayals of white ethnics,

spotlighting principled Irish American and Polish American soldiers who are determined to respect Indian rights. It likewise depicts women in positive ways, reflecting the emergence of women in American society of the 1960s. Baker's missionary character, for example, is determined to advance the cause of Indian rights even if it means choosing career over marriage and personal well-being.

Cheyenne Autumn offers other insights about American life and thought of the 1960s. It reveals ambivalent attitudes toward social and cultural change. The Dodge City vignette, for instance, underscores concerns about the nation's growing consumer culture. Stewart's Wyatt Earp and other Dodge City residents are far more interested in money, gambling, drinking, and life's hedonistic pleasures than they are in American principles or enemy threats. The national media are likewise portrayed in a bad light. Greedy and unethical newspaper editors repeatedly lie about causes and results of the Cheyenne uprising merely to sell more papers.

Cheyenne Autumn was John Ford's last western. The famed director's flawed finale is hardly a great movie, yet even a mediocre Ford western reveals much about American history. The movie offers evidence of continuity and change in American society and culture. While the American West portrayed in *Cheyenne Autumn* was more inclusive of minorities, women, and white ethnics, it remained a land of hope, redemption, and opportunity.

Chicano Moratorium

The National Chicano Moratorium in East Los Angeles, California, on August 29, 1970, was one of the largest anti-Vietnam War protests in the United States and the largest held by Chicanos. By the late 1960s, ethnic and working-class groups questioned their participation rates in the war, resisted the draft, and protested. One of the most significant legacies of the demonstration that day was the riot and the subsequent death of *Los Angeles Times* reporter and KMEX-TV news director Ruben Salazar. The Chicano Moratorium was part of the broader Chicano Movement challenging inequality and promoting civil rights, ethnic nationalism, economic and political self-determination, and artistic revolution.

Student and community activists Rosalio Munoz, Ernesto Vigil, Manuel Gomez, Lorenzo Campbell, and David Sanchez planned a series of actions against the war in Vietnam. Organizations such as the Crusade for Justice and the Brown Berets played central roles in August 29 and the execution of two earlier protests on December 20, 1969, and February 28, 1970, in Los Angeles.

Between 20,000 and 30,000 people of all ages and ethnic backgrounds marched and gathered in Laguna Park to enjoy performances and lunch on August 29. A theft at a local liquor store caused police to rush into the park in pursuit of the accused, using tear gas, clubs, and arrests to disperse the thousands in attendance. Marchers fled and sought refuge in local homes and businesses, while some tried to defend themselves or threw things at the police who charged into the park. The resulting stampede and panic hurt 61 people, destroyed and damaged 162 buildings worth over \$1 million, and caused the arrest of over 400 people. Most tragic was the death and martyring of two: Ruben Salazar and 15-year-old Brown Berets member Mark Ward.

After covering the day's events, Salazar relaxed at the nearby Silver Dollar Bar with two colleagues from KMEX-TV. Police who claimed a suspect was hiding in the bar fired a 10-inch tear gas projectile inside through the head of Salazar, killing him. Chicanos found the death of Salazar suspicious given his positive coverage of the February 1970 protest and his work on a series titled "What Progress in Thirty Years of Police

Community Relations?” This series followed his stories on the suspicious deaths of two Mexican nationals by Los Angeles and San Leandro police. The police had previously threatened Salazar for inciting the community with his coverage and he believed he was under their surveillance.

Salazar’s death and the acquittal of those responsible for it outraged the community. While some viewed this as the “death of the Chicano Movement,” others saw it as a call to action and memorialized Salazar in art and film. Moctesuma Esparza and David Garcia produced and directed *Requiem 29* about the event and won a bronze medal at the Atlanta International Film Festival in 1971. He was honored by the renaming of Laguna Park to Ruben F. Salazar Park. The U.S. Postal Service later recognized his contributions with a stamp in a series devoted to journalists in 2008. On August 29, 2010, a 40th Anniversary Chicano Moratorium event was held in Belvedere Park in East Los Angeles. It featured popular Chicana/o bands, a photo exhibit, and a nearby performance of a play about Salazar’s death.

Also 40 years after the death of Salazar, the Los Angeles County Sheriff’s Department released eight boxes of documents and photographs of its investigation to its Office of Independent Review, in part to determine if they could be released under a California Records or Freedom of Information Act request by a local journalist. In February 2011 the Office of Independent Review issued the first outside review of the incident in 40 years, which found a series of tactical errors led to the death of the journalist, not a conspiracy by local law enforcement. Witnesses and colleagues of Salazar were disappointed but not surprised by the outcome given it was a review of police documents generated by what they believed was a shoddy investigation at the time. The Sheriff’s Office subsequently decided to make a limited number of documents available to viewing by a select group of journalists and academics under direct surveillance of sheriff’s employees. Because many documents are still considered confidential and remain out of reach to historians and journalists, skepticism persists.

The struggle to access the records of the events of August 29, 1970, reflects a broader challenge to the surveillance of many individuals in the Chicano and Black Power movements by the Los

Angeles police and sheriff’s departments and the Federal Bureau of Investigation’s Counter-Intelligence Program (COINTELPRO). August 29 also represents the ongoing challenge academics face in recovering and analyzing the history of marginalized groups in a broader historical narrative about the American experience and what value those stories have to ethnic communities.

Chicano Movement

The Chicano civil rights movement, also referred to as El Movimiento, had its roots in the evolution of organizing and challenges to inequality dating from the Treaty of Guadalupe Hidalgo in 1848. El Movimiento ran roughly from the post–World War II period through the mid-1970s. Although some scholars find its origins in earlier or later dates or dispute whether it ever ended, the 1960s and 1970s provide a generally accepted time frame. The Chicano movement involved not only organizations and events, but also the ideology of nationalism and aesthetics of the Chicana/o Renaissance.

Background

While young people agitating for civil rights in the late 1960s thought they were unique, in fact struggles for over a century demonstrated that Chicana/o movement activists inherited a long tradition of social activism and political engagement. The 1960s were unique, however, in creating and emphasizing a unique Chicana/o national identity as separate from that of other ethnic groups in the United States. A number of events coalesced to make this the moment for change: the black civil rights and Black Power movements; the election of President John F. Kennedy and the succession of President Lyndon B. Johnson, protests against the war in Vietnam; the Great Society and War on Poverty programs of the 1960s, the lapse of the Bracero Program, a Chicano Renaissance among artists of various media; and increased numbers of Mexican American graduates from high schools and colleges.

Fundamental to El Movimiento was the notion of *Chicanismo*, or a unique national identity. Some movement activists were overtly separatists and rejected the tactics of previous generations of Mexican Americans who attempted to gain equality through assimilation, acculturation, or hybridization. Chicanas/os began referring to the southwestern United States as Aztlán, or the Chicano nation. Aztlán was the mythic homeland of the Mexican Aztecs and came to represent the land that was taken by the United States from Mexico at the end of the Mexican-American War (1846–48) under the Treaty of Guadalupe Hidalgo (1848). Leaders created a new sense of the American normative in which “brown was beautiful.”

Organizations

Major organizations of the Chicano movement ranged from labor and education to religious and professional, such as the United Farm Workers of America, founded by César Chávez and Dolores Huerta in Delano, California, in 1962; the Alianza Federal de Mercedes, the Federal Alliance of Land Grant, founded in New Mexico under Reies Lopez Tijerina in 1963; the Denver, Colorado, Crusade for Justice founded by Rodolfo “Corky” Gonzales; and Partido de la Raza Unida, created from the Mexican American Youth Organization by José Ángel Gutiérrez in Crystal City, Texas, in 1970. The movement also included the

Mexican American Legal Defense and Education Fund (MALDEF), established in San Antonio in 1967, and a Chicana/o-liberation-theology-based organization out of Los Angeles called *Catolicos por la Raza* (CPLR), or Catholics for the Community. There were many other organizations across the country, but these are the most canonized within Chicano/a studies.

Key Events

A number of events highlighted the activism of the era and provided key documents to understanding the ideology and logic of the Chicano movement. In 1968, students in East Los Angeles, California, across south Texas, and throughout the southwest staged walkouts of educational institutions they found discriminatory and unequal, demanding greater voice in the content of the curriculum, the daily running of their schools, and the leadership they would follow. They converged at the Denver Youth Conference in March 1969, where they adopted El Plan Espiritual de Aztlán, a manifesto about the new emerging identity of Chicanas/os.

Student, teacher, and community activists also met at the University of California, Santa Barbara, in April 1969, adopting a second plan, El Plan de Santa Barbara, a blueprint for educational and political access creating Chicana/o studies, the student organization *Movimiento Estudiantil Chicano de Aztlán* (MEChA), and the Educational Opportunity Program (EOP) to facilitate college attendance. Some historians consider the apex of the Chicano movement to be the 1970 Chicano Moratorium anti-Vietnam War protest in Los Angeles, which resulted in the death of *Los Angeles Times* journalist Ruben Salazar. The moratorium drove home that the demand for equality in the United States sparked violent and even fatal responses.

Artistic Responses

The movement also incorporated a comprehensive artistic revolution supporting its ideology, organizations, leaders, and events. Two Chicana/o aesthetics that emerged were *rascuachismo* and *domesticana*, emphasizing the working-class roots and importance of family in the movement. Art moved from the street in the form of murals depicting epic Chicana/o narratives and poster art promoting events like United Farm Worker (UFW) marches, to the galleries,

which were targeted for inclusion by groups such as ASCO (a Chicano/a performance and conceptual art group). In music, Chicana/o performers crossed over into more mainstream genres like folk, rock, and country, and drew mainstream audiences back with them to their roots. Performers such as Joan Baez and Los Lobos played early shows for the United Farm Workers or Teatro Campesino, the theater troupe attached to the UFW. Literature flourished in all forms, with newspapers, publishing houses, and literary awards emerging to support writers. Finally, the more expensive media of television, documentary films, and mainstream Hollywood cinema began to reflect opposition to long-standing stereotypes of Latinas/os as bandits or lovers.

New Generation

A resurgence of Chicana/o nationalist organizing emerged in the 1990s after waning in the 1980s. The death of César Chávez; the Zapatista uprising in Chiapas, Mexico; anti-immigrant legislation; and rollbacks to the gains of the 1960s and 1970s ignited a new generation of leaders and rededicated veterans of the movement to its original goals.

Chicanos

The topic of ethnic identity is complex. The term *Chicano*, applied to individuals of Mexican origin, is no exception. One of the origins of the term *Chicano* is said to date back to the turbulent 1960s. College and high school students of that era looked for a positive reinforcement of their ethnic identity. The prior generation of the 1950s used the term *Mexican American* to identify with an assimilation approach.

Rejecting the prior form of identity on the grounds that it reinforced negative stereotypes, Chicanos embraced their Mexican indigenous cultural background. The term *Chicano* began to grow in popularity. Soon other members of the community, such as community organizers, used it as means to reinforce a positive view of being Mexican.

A small number of Chicano university professors used the term in the 1960s to identify with the growing student movement. Social activism during the 1960s was the norm, and it evolved into what Chicano historians would label the Chicano movement.

History of the Term

The most agreed-upon definition of the term *Chicano* refers largely to individuals who trace their origins to the southwest. The term *Chicano* also comes with some negative references, applied in the early 20th century to immigrant laborers from Mexico; the label implied a low or inferior form of worker. Despite this negative label, Mexican immigrant workers were desired by agricultural interests in the United States during that era, and were recruited to fill labor shortages in the southwest and midwest.

As recruiters in the United States were paid for each laborer they could secure, the recruitment effort became so intense that recruiters would literally snatch potential workers as they were crossing the border. Further recruitment took place in Mexico's interior. Not until the Great Depression did Mexican immigrant workers stop coming into the United States. By the 1930s, Mexicans and Mexican Americans were repatriated to Mexico.

The term also is said to have a reference to illegal forms of behavior known as chicanery, which

refers to individuals who engage in unlawful behavior. As a result, the term *Chicano* implied deviant behavior. In the 1940s, Chicanos were considered deviant by way of their anti-American behavior during World War II, with their wearing of zoot suits and open display of their flamboyant lifestyle while others were rationing food and other material goods. Chicanos became targeted for their chicanery behavior and were assaulted by G.I.s, resulting in the Zoot Suit Riots.

By the 1970s, the term *Hispanic*, employed by the U.S. government, attempted to hijack the popularity of the term *Chicano*. Under the Nixon administration, the term *Hispanic* began as a label for the growing Spanish-speaking population. In short, the term *Chicano* was being replaced in order to lump all Hispanics into one category.

Chicanos can be found throughout the United States, with political leanings toward progressive and liberal agendas. Chicano historian Rodolfo Acuña, in his book *Occupied America: A History of Chicanos in the United States* (used in most Chicano Studies courses) suggests that Chicanos are an occupied people, as Chicanos have been denied their rights through a prolonged struggle. Chicanos, once landowners, succumbed to violence or illegal methods of having their land stolen from them and found themselves as laborers. According to Acuña, the history of Chicanos is one of a people who have been denied their rights and opportunities in the United States.

By 1848, Chicanos were a part of the newly acquired southwest. Although still considered Mexicans after the war, it soon became evident that Mexicans would not be full U.S. citizens. As a result, Chicanos have used the southwest as a link to the origins of what was once their former land. One such method they employ is to use the name *Aztlán* for their former southwest. *Aztlán* refers to the place where the migrants began their journey south to Mexico City or Tenochtitlan. The term *Aztlán* has been perceived in some circles as a radical or revolutionary call for the return of the southwest to the Mexico.

However, Chicanos do not advocate the return of this former territory to Mexico; rather, Chicanos point out that the land has an ancestral heritage and a legacy of occupiers before it was seized by the United States. In short, Chicanos argue that

rather than being treated as second-class citizens, they should have full access to the same rights as other groups.

Social Change and Chicanos

Chicanos are an urban minority, which has added to their unique experience. Beginning in the 1940s, urban Chicanos began to take advantage of their working- and middle-class position. With the G.I. Bill, Chicanos were able to buy homes or attend college, and many ex-G.I.s returning from Europe and Asia after military service did attend college. However, their experience abroad as military combatants also raised their consciousness regarding the fight against fascism abroad, only to return to their segregated communities. Chicano historian Mario T. Garcia argued that their war experience was a changing point for Chicanos. A new sense of Americanism or pride led Chicanos to create organizations that challenged the status quo, setting the stage for the next generation that would forge the Chicano movement.

Most Chicano activism grew out of the turbulent 1960s social protests of that era. Social issues that Chicanos felt determined to challenge included the high dropout rate of Chicano high school students and the larger percentage of Chicanos who were sacrificing their lives in the Vietnam War. The War on Poverty also found a home among Chicanos, whose family histories traced a level of poverty throughout the southwest that politicians appeared to ignore. Chicanos also began to identify with the growing civil rights movement. By 1968, the high school protest called the Blowouts led to thousands of Chicano students walking out of their schools to protest their inferior education. The Blowouts in East Los Angeles would affect Chicanos from other southwest cities who used the walkout method at their schools. For Chicano activists, the Blowouts would be a signal of things to come.

By the 1960s, social protest and counterculture among American youth was ramped up, especially among college students. Protesting against the Vietnam War and civil rights, Chicanos were soon joining the student movement. Chicanos were dying at an alarming rate in the Vietnam War. The Chicano Moratorium, a Chicano anti-Vietnam War movement, would ultimately lead to the death of well-known Los Angeles reporter

The definition of Chicano is ambiguous and uncertain. The term was originally used as a label for the sons and daughters of Mexican migrants. For a Mexican child born in the United States, identifying as Chicano may represent the struggle of being accepted into the Anglo-dominated society of the United States, while maintaining a cultural sense developed as a Latino. Being Chicano has often been associated with negative ethnic stereotypes in mass media and the mainstream American consciousness.

and Chicano leader Ruben Salazar, who reported on various issues such as the killing of innocent Chicanos at the hands of local law officials. Salazar had been warned by the Los Angeles Police Department to tone down his reporting.

On August 29, 1970, Chicano activists gathered at a rally in East Los Angeles that attracted 20,000 to 30,000 anti-Vietnam War protesters. The peaceful gathering turned chaotic with the arrival of sheriff's deputies; the media later called the melee a Chicano riot. Despite the presence of women and children at the park, deputies began to physically disperse the crowd, and numerous Chicanos were beaten or tear-gassed. At the end of the rally, Salazar was killed when he was hit in the head by a tear-gas projectile that was shot into the Silver Dollar Bar. Salazar is remembered for his promotion of Chicano issues that were not covered by local media.

Chicanos were not just vying for the need to end the war; they were also asserting their rights to attend college and have more college classes that spoke to their interests, such as Chicano studies. Alongside the student protest was the work of César Chávez and Dolores Huerta, who fought for the rights of farm workers. Chicanos also identified with farm worker labor issues, as many of their ancestors had worked in the fields. The United Farm Workers movement, the struggle of laborers in the fields, also became part of the Chicano movement. Chicanas also saw their position within the Chicano movement relevant to their civil rights as women. Chicanas no longer wanted to see themselves as secondary players within the movement; they also wanted to be active leaders.

Chicanos also led the way to create the student organization called *Movimiento Educacional Chicano de Aztlán (MEChA)*. Established during the

1968 Plan de Santa Barbara, MEChA continues to have an impact on Chicano students in high schools and universities. As its philosophical mantra, MEChA expresses its desire to promote positive social change and ensure that Chicanos continue their education beyond high school. MEChA attracts Chicanos from around the country to its annual conference.

The La Raza Unida Party (LRUP), a third political party, was led by Chicanos in the 1970s. Although the group had a short history, it was responsible for the election of 15 seats in the Crystal City, Texas, council and school board races in 1970, including seven seats on the Board of Education.

Conclusion

Although not all people of Mexican origin called themselves Chicanos, it is important to their sense of ethnic identity, which can be partially attributed to their region of settlement. By the 1980s, scholars were documenting the initial migration of Chicanos to nontraditional areas of settlement, such as Alabama, Mississippi, Arkansas, and North Carolina. While the Chicano experience was first seen within the southwest, midwest, and northwest, today Chicanos can be found throughout the rest of the United States.

Today, the term *Chicano* implies social activism within the Mexican community. Chicano organizations such as the National Association of Chicana and Chicano Studies (NACCS) still meets annually to promote research on the Chicano experience in the United States. Both Chicanas and Chicanos have a research space to investigate issues such as identity, labor market inequality, history, and other areas of research. As 60 percent of the Latino population, Chicanos will continue to have a major impact on the future of the United States.

Chickasaw

An important Muskogean tribe, the Chickasaw migrated eastward to what is now Mississippi, Kentucky, Alabama, and Tennessee before the first Europeans arrived in the area. Their lifestyle was largely agrarian, but they were also fierce fighters. Because of the latter trait, they were known as the “Spartans of the Lower Mississippi Valley.” They supported the British in the French and Indian War, an alliance that some historians believe proved significant in the British victory. Their ability to adapt to European culture made them one of the Five Civilized Tribes, a quality that did not spare them from forced relocation in the 19th century. Only their tenacity maintained their separate tribal identity in the Indian Territory. In 2012, the Chickasaw Nation is the 13th-largest federally recognized tribe in the United States. According to the 2010 U.S. census, there are 52,278 people who self-identify as wholly or partially Chickasaw. Among these is a distinguished array of citizens.

The Chickasaw chiefdom that Hernando de Soto found in 1540 was a complex social system with clearly defined social strata and a highly developed set of laws, religious practices, and military structure. He also found that the law of hospitality was part of Chickasaw culture, but when he attempted to force tribal chiefs into providing him 200 supply bearers and had his men execute two Chickasaw for stealing pigs, he discovered the chiefdom’s warlike nature as well. The Chickasaw retaliated with an attack from three directions, inflicting considerable damage before disappearing into the wilderness.

Later in the colonial period, the Chickasaw were among the few tribes of the lower Mississippi to ally themselves with the British rather than with the French. Some scholars attribute their choice to their animosity toward the Choctaw, who were French allies. The Choctaw and Chickasaw were closely tied by language and custom but they shared a mutual antipathy. Others think traders from the Carolinas tipped the balance in favor of the British. The Chickasaw attacked French travelers on the Mississippi and ignored French demands that they expel British traders and Natchez refugees whom the Chickasaw had urged to resist French encroachments on their territory. They defeated the French at Amalahta in 1736, at the Long House and other points. Nor was their ferocity limited to the French. The Choctaw were just first in a long list of neighboring tribes with whom they fought, including their former allies the Cherokee, whom they soundly defeated in 1769 at Chickasaw Old Fields.

As non-Indian settlement increased during the 1820s, some Chickasaw chose to migrate west of the Mississippi, but most remained on their tribal lands in the southeast. In 1829, Andrew Jackson, who from 1814 to 1824 had been a key figure in negotiating nine treaties that pushed the southern tribes off their ancestral lands and onto lands in the west farther removed from white settlements, was inaugurated president of the United States. Most of Alabama and parts of Georgia, Tennessee, Mississippi, Kentucky, and North Carolina were under government control.

One year after taking office, Jackson signed the Indian Removal Act giving him power to negotiate removal treaties with Indian tribes living east of the Mississippi. Although some tribes tried to resist, their efforts were futile. The Chickasaw signed a treaty in 1832 that obligated the United States to provide them with suitable land in the west. It was one more promise on which the federal government failed to deliver. The Chickasaw migrated to Indian Territory, what is now Oklahoma, in the winter of 1837–38. Although their “Trail of Tears” journey was less devastating than the journeys of the other “civilized tribes,” many died of cholera and food poisoning after they reached their new home. The Chickasaw signed the Treaty of Doaksville in 1837, in which they agreed to a lease of land

from the Choctaw for \$530,000 and representation on the Choctaw Council.

The transition took 15 years. The Chickasaw were outvoted on the Choctaw Council and fearful of losing their identity as a separate people. They were relentless in their campaign to be recognized as a separate tribe. Finally, a formal separation treaty was approved in Washington in 1855 and was ratified by both tribal councils and the U.S. Senate a year later.

The victory was temporary. The Curtis Act, adopted by Congress in 1898, ended tribal sovereignty, abolished tribal courts and the enforcement of tribal laws, and moved Chickasaw children from tribal schools to the public schools. It scheduled all tribal governments to terminate on March 4, 1906. For the next 75 years, the Chickasaw Nation ceased to exist. Although shifts in federal Indian policy restored self-determination earlier, it was not until 1983 that Chickasaw tribe members ratified a new constitution that had received approval from the U.S. government.

Language

Although the Chickasaw have struggled to preserve their culture since relocation, over time the Chickasaw language has reached the verge of extinction. The language that once served as a medium of commercial and tribal intercourse for all the tribes along the lower Mississippi in the 21st century has fewer than 120 speakers, all older than 55. The Chickasaw Language Revitalization Program was begun in 2007. Participation in community language classes, language camps and clubs, and self-study programs are all being utilized to preserve the language.

Contemporary Tribe

The Chickasaw Nation ranks as the fourth-largest tribe in Oklahoma, according to 2010 census data. Its political ties with other relocated southeast tribes have endured. In August 2011, the Choctaw and Chickasaw Nations cooperated in a lawsuit filed in U.S. District Court that claims tribal rights and regulatory authority over water in the historic territories of the Choctaw and Chickasaw Nations predate and supersede any water rights claimed by Oklahoma.

Meanwhile, the descendants of the Chickasaw who first maintained a delicate balance between

tribal identity and assimilation are adding luster to an illustrious history. Among the most celebrated are famed Chickasaw storyteller Te Ata Thompson Fisher (1895–1995), whose career as an actor and storyteller spanned over eight decades during which she performed for a president and a king; Commander John Herrington, who became the first Native American astronaut in the U.S. space program in 1996 and the first in space in 2002; Tessie “Lushanya” Mobley (1906–90), world renowned operatic soprano; and Kevin Washburn, approved assistant secretary for Indian Affairs by unanimous consent of the Senate in September 2012.

Chief Diversity Officers

A chief diversity officer is an executive-level position responsible for overseeing the diversity and inclusivity strategy of an organization. The prevalence of the diversity officer has grown considerably in the 21st century. As recently as 2005, only 20 percent of Fortune 500 companies employed diversity officers; in 2012, about half did. The role differs slightly according to the sector of the organization. In the field of higher education, where diversity officers have been somewhat more common among elite schools, diversity officers generally possess a Ph.D. or the equivalent and may

have transitioned into the administrative role after a professorial career. In the business sector, the diversity officer is part of the organization’s human resources management team and usually rises through the ranks from that department. Because the role is relatively new, few people filling it have formal training in cultural diversity and have instead been successful in some other capacity in the organization.

Diversity and Inclusion Defined

Diversity is the coexistence of, and relationship between, multiple cultures, subcultures, and cultural backgrounds in a given place, as well as the coexistence of multiple ethnicities, religions, genders, sexual orientations, and other traits. While diversity was once seen as a temporary condition in U.S. society, a rough edge that would be smoothed out by the erosive action of assimilation and homogenization—the proverbial “melting pot”—today diversity is valued by contemporary culture. Rather than ignoring it or attempting to eradicate it, the choice is to celebrate and honor it. Inclusion is the conscious choice to involve members of an organization who are part of these diverse multiple cultures and backgrounds in order to create a working environment in which all members experience a sense of belonging, of being respected and valued, and of mutual commitment, which leads to everyone doing their best work.

Modern Chief Diversity Officers

A chief diversity officer’s work is accomplished through collaboration, especially with multiple sectors of the organization. Consensus- and relationship-building are key to the performance of the work, and collaboration must transpire across departments and roles responsible for hiring, leadership development and training, recruitment and retention, and strategic planning for diversity. This applies to areas that are specific to the nature of the organization; for example, the higher education sector would include student admissions, student government, the design of rules governing student behavior and conflict resolution, curriculum design, and the design of degree programs. Ideally, those who are responsible for these areas are actively engaged with the chief diversity officer rather than simply relegating him or her to the role of an adviser or consultant.

Larger organizations that are sufficiently committed to diversity will include chief diversity officers who provide leadership to the organization's diversity strategy but do not do all the work themselves. Instead, they may make the final decision or formulate a strategy that encompasses many departments and roles and set priorities while considering the input of those under them. There are many cases, however, in which a chief diversity officer has little access to an organization's senior leadership and is unable to create an organization-wide strategy.

In the higher education sector, the chief diversity officer often has other duties as well, and "chief diversity officer" may be one of their roles rather than their job title. For example, it is common for a dean, vice chancellor, vice president, or vice provost to take on the role of chief diversity officer in addition to their other administrative functions. In this case, they are the designated "face" of the university's diversity strategy, leading and coordinating meetings pertaining to diversity, overseeing elements related to the diversity strategy across multiple departments, and being responsible for public statements on the topic.

An increasing number of universities are creating a dedicated chief diversity role; for example, Harvard, Xavier, Miami, Marquette, the University of Virginia, and Washington State University have done so in the 21st century. A select few—Indiana University, the University of Washington, the University of Denver, Brown University, and Rensselaer Polytechnic Institute—have had the role filled for some time. In some cases, the chief diversity officer has replaced the role of "vice president for minority affairs" created in the 1970s, during the push on many campuses to encourage the enrollment of nonwhites or address the concerns of nonwhite student groups.

The diversity officer differs from the minority affairs officer (or affirmative action officer) in a key, defining respect: his or her work is viewed as benefiting the entire student body and university, not just the special needs of a small group. Diversity is treated not as a special interest but as a resource contributing to organizational excellence. The diversity officer may be involved in developing new diversity-minded programs, writing grants for existing programs such as Asian American Studies or study abroad programs,

assisting in the efforts to establish overseas sister campuses or develop a diversity component for the university's general education requirement. A true chief diversity officer position considers diversity as the primary, not secondary or tertiary, concern, and is responsible for guiding enterprise-wide efforts at the conceptual level as well as the implementation level. While these duties may include affirmative action and equal opportunity concerns, they should not be defined by or limited to them, nor should they consider diversity only in terms of racial minority status or gender.

Chilean Americans

Chile is a South American country, a narrow strip of land along the coast, bound by the Andes in the

east and the Pacific Ocean to the west. Once controlled by both the Inca Empire (in the north) and the Mapuche people (in the south), it was conquered by Spain in the colonial era before declaring its independence in 1818. Its northern territory was acquired in 19th-century wars with Bolivia and Peru. Chilean Americans are one of the smallest Hispanic groups in the country, though more Chilean expatriates live in the United States than in any other country except Argentina (which is home to more than half of them).

As of the 2010 U.S. census, there are 126,810 Chilean Americans. About half live in California (24,006), Florida (23,549), and the greater New York area (15,050 in New York, 8,100 in New Jersey); in addition, there are 6,282 Chilean Americans in Texas, 4,195 in Virginia, 4,146 in Maryland, 3,364 in Utah, 3,045 in Massachusetts, and 2,753 in Illinois. The largest metropolitan areas are the New York area; Miami–Fort Lauderdale, Florida; Los Angeles, Washington, D.C.; San Francisco, Boston, Houston, Chicago, Riverside, California; Orlando, Florida; Atlanta, Seattle, San Diego, Dallas–Fort Worth, Philadelphia, Salt Lake City, Utah; San Jose, California; Las Vegas, Tampa, Florida; and Phoenix.

Early Immigration

Prior to the late 20th century, there was no large sustained movement of Chilean immigration to the United States. Along with other South Americans, some Chileans came to California in 1849, drawn by the Gold Rush. Those who remained settled in San Francisco, Stockton, and Sacramento, pursuing craftsman trades or importing goods from Chile. Several San Francisco streets today are named for Chilean settlers, including Larkin, Ellis, Atherton, and Lick. A number of towns in northern California are named for Chilean places as well, including Santiago, Calera, and Valparaiso. Chilean communities were often called “Chilecito”—little Chile. South Americans working the gold fields tended to maintain separate camps, but as the Gold Rush subsided, Chileans assimilated quickly into the California culture, which was largely Spanish-fluent, Catholic, and easier for Chileans to integrate into than northeast Anglo-Protestant culture. Chilean Americans in the late 19th century, during the War of the Pacific, raised money through cultural

organizations to send back home to support the families of soldiers and other needy Chileans.

California bandit Joaquin Murrieta (1829–53), who was active in the Gold Rush years, may have been born in Chile or to a mother who had emigrated to Chile. Dime novels portrayed him as a Robin Hood–like figure who was subject to racism and violence by the Anglos of California, and Chilean poet Pablo Neruda focused on Murrieta’s possible Chilean heritage in his 1972 play *The Splendor and Death of Joaquin Murieta*. In the 1998 film *The Mask of Zorro*, Murrieta is portrayed as the brother of the lead character played by Antonio Banderas, and he is featured as a supporting character in Isabel Allende’s 1999 novel *Daughter of Fortune*. Allende, first cousin once removed to Salvador Allende (president of Chile from 1970 to 1973), was born in Peru where her father served as Chile’s ambassador, and later immigrated to the United States during the Pinochet regime, which succeeded her cousin’s presidency. Allende’s work, which at least overlaps with, if it cannot be placed entirely within, the genre of magical realism, often deals with themes of exile and liberty.

Post–World War II Immigration

After World War II, there was some movement of immigrants to the United States as Chile’s economy suffered and the American economy prospered in the 1950s. Though Chile today is one of the most stable nations in the Southern Hemisphere and leads Latin America in income and human development, from 1973 to 1990 it suffered under the dictatorship of General Augusto Pinochet. The first major wave of Chilean immigrants came to the United States during that regime and differed demographically from the larger, later wave of immigration. They were overwhelmingly well-educated or highly skilled at their professions, largely upper middle class, and usually fluent in English before their arrival in the United States.

A strong sense of community prevailed among these 1970s and 1980s immigrants, many of whom intended to leave Chile only temporarily while working on or anticipating the success of the cause of Chilean democracy. While the transition was easy for many, a significant number faced problems obtaining skilled work in the United States—they may have lacked professional certification

recognized in the United States or similar credentials that failed to “translate” from Chile. The turbulence of Chile could make it difficult to provide work references, and in some cases even to prove education credentials. Chilean immigrants during the Pinochet period founded the La Peña Cultural Center in 1975 in Berkeley, California, the largest cultural center for Chilean Americans.

The second wave of immigrants came after the country had begun to stabilize as free elections were reinstated. Though not possessing the professional experience of many of the first wavers, many of them still came from a middle-to-upper-class background, making the trip to the United States for an education possible. Less likely to already be fluent in English, these Chileans are likely to have settled in major cities because of the Spanish-speaking populations and the access to universities. Since 1990, Chilean immigration has remained at around 1,500 per year, declining since the Pinochet period, while South American groups like Colombians and Ecuadorians have increased their presence.

Chilean folk music remains popular in the Chilean American community, as does the tradition of the *peña*, a weekend gathering of music, joke-telling (the jokes are traditionally long and involved), and eating. Well-known Chilean Americans include actress Cote de Pablo of the TV series *NCIS*; *Sábado Gigante* host Don Francisco; Slayer vocalist-bassist Tom Araya; human rights activist Ariel Dorfman; *Lost* star Jorge Garcia; *Saturday Night Live* star Horatio Sanz; and cinematographer Claudio Miranda.

Chinatowns

Chinatowns are urban enclaves of ethnic Chinese immigrants and their descendants. Although Chinatowns exist on six continents, they are particularly common in societies that have experienced a large volume of historic or contemporary immigration from China, such as the United States, Canada, Australia, Great Britain, Thailand, Vietnam, and the Philippines. The oldest Chinatown in the world, known as Binondo, is a distinct neighborhood in Manila that dates to 1521. Easily discernible by their pagodas, temples, imperial Chinese architecture, and numerous signs written in Chinese scripts, Chinatowns are vibrant and historic locations that symbolize the social, cultural, and political influence of the Chinese diaspora throughout the world.

Chinatowns in the United States

Chinatowns in the United States date to the mid-19th century, when Chinese immigrants began to settle in the western states. Discriminatory attitudes, manifested in anti-immigrant and white supremacist sentiments, fostered the emergence of designated Chinese quarters in various cities throughout the West Coast. Chinatowns provided members of this ethnic community with housing, employment opportunities, businesses that catered specifically to Chinese clientele, recreational outlets, and a sense of social and linguistic familiarity.

Some of the key recreational and business establishments found in Chinatowns, serving to meet the cultural preferences and needs of Chinese residents, include restaurants, teahouses, theaters, banks, pharmacies, hospitals, grocery stores, temples, churches, schools, and cemeteries. The oldest and best-known Chinatown in the United States is found in San Francisco. Sacramento and Stockton (California) also boasted Chinatowns by the mid-1850s. Other notable Chinatowns today exist in New York City; Los

Angeles; Philadelphia; Boston; Chicago; Seattle; Portland, Washington; and Washington, D.C.

Despite origins steeped in xenophobia, Chinatowns throughout the United States have become popular tourist destinations over the past 40 years, in addition to their important function as important centers for social and cultural life among Chinese Americans and, to a lesser extent, other Asian Americans. The transformation of Chinatowns from exclusionary ghettos to tourist meccas reflects the nation's transition toward a pluralistic society that today more readily welcomes cultural diversity.

Overview of Chinese Immigration

The emergence of Chinatowns across the United States is directly related to the historical experiences of Chinese immigrant communities. The Chinese were the first Asian immigrants to arrive in the United States in the mid-19th century, lured to California by the Gold Rush and employment opportunities in the burgeoning railroad industry. The first recorded Chinese immigrants entered the United States in 1848; over the next three decades nearly 100,000 others followed, with most entering through the port of San Francisco. More than 60,000 Chinese migrants had settled in California alone by the end of the 1850s.

The growing Chinese population on the West Coast during the 1860s and 1870s placed them in direct competition with the larger white/Anglo population, who often viewed the Chinese with suspicion and resentment. Anti-Chinese sentiments particularly stemmed from white fears that the Chinese would displace them in the job market, but an estimated one-third of settlers in the San Francisco Bay area during the Gold Rush were white southerners who brought their racialized worldviews with them. The Chinese quickly became viewed as antithetical to American identity due to their physical appearance, language and customs, manner of dress, and religion.

The Chinese Exclusion Act, passed in 1882, effectively banned all immigration from China (with certain exemptions for spouses and children of U.S. citizens), marking the first time in American history that a specific nationality was denied entry into the country. The law was not repealed until 1942, when China became a wartime ally against the Japanese; even then, however, an annual limit

of merely 105 immigrants from China was permitted. A confluence of factors that included restrictive immigration laws, an imbalanced gender ratio of Chinese immigrants (males outnumbered females by more than 20:1, giving rise to the description of Chinese Americans as a "Bachelor Society"), and high rates of return migration to China led to a dramatic reduction of this ethnic community in the early 20th century. The Chinese American population dwindled from approximately 107,500 in 1890 to no more than 62,000 by 1920.

The Hart-Cellar Act of 1965 rescinded discriminatory national origins quotas in U.S. immigration policy and opened the doors to millions of newcomers from Asia. Since the mid-1960s, immigration policy has centered around purposes of family reunification and granting preference to immigrants with entrepreneurial, scientific, or technological expertise in high demand by U.S. employers. Since the 1960s, the gender imbalance of the Chinese American population has stabilized.

Chinese migrants today comprise one of the largest groups of both legal and undocumented immigrants to the United States. The Chinese American community is quite heterogeneous, with the population consisting of persons from mainland China (the People's Republic of China), Taiwan, and Hong Kong, as well as ethnic Chinese who have migrated from various societies in southeast Asia. The contemporary Chinese American population is also highly diverse in terms of social class. Although approximately half of Chinese immigrants enter the United States already holding a bachelor's, master's, or doctoral degree, many working-class and non-college-educated Chinese have also arrived in recent years.

San Francisco

The first Chinatown established in the United States is located in the quadrant between California, Kearny, Mason, and Broadway Streets near downtown San Francisco. Chinatown's origins date to 1852, when approximately 20,000 Chinese immigrants arrived in San Francisco amid the Gold Rush. An estimated 3,000–4,000 Chinese took up residence in boarding houses, apartments, and tents around Portsmouth Plaza, San Francisco's first public square and civic center. The majority of these early Chinese migrants

were male Cantonese-speakers from China's Guangdong Province. Soon entrepreneurs opened shops, pharmacies and herbal medicinal establishments, teahouses, restaurants, opium dens, and other businesses that catered to the growing Chinese population in San Francisco. Originally referred to as "Little Canton," the neighborhood was nicknamed "Chinatown" by the San Francisco press in 1853.

Chinatown's population increased rapidly, with the U.S. census counting 2,700 residents in 1860. Approximately 20 percent of the inhabitants were female. By 1860 Chinatown featured more than 30 grocery stores, 15 medicinal shops, and 5 restaurants. Community leaders imported a theater building from China and relocated it in Chinatown; the theater was used as a venue to showcase the Chinese theatrical troupe, thus providing a recreational outlet for local residents. The oldest temple in the United States, the Tin

How Temple, was constructed in Chinatown in 1852. The earliest Chinese American publications date to the mid-1850s, when the bilingual newspapers *Golden Hills' News* and *The Oriental* hit the presses in 1854 and 1855, respectively. During the 1870s the first fully Chinese-language newspaper, *Tangfan Gongbao*, was published. The first Chinese laundry was established at the corner of Washington and DuPont Streets in 1851, and by the 1880s San Francisco featured 176 Chinese-operated laundries. Chinatown's population reached 12,000 in 1870 and approximately 30,000 by 1880.

Originally just 12 blocks in size, Chinatown soon became known throughout San Francisco for its brightly colored lanterns and Chinese calligraphy on storefronts. The neighborhood also harbored a reputation for illicit activities, including gambling halls, brothels, opium dens, and occasional violence. The low proportion of female residents in Chinatown made prostitution a lucrative business but also placed the neighborhood under continual police scrutiny and raised the concerns of city officials. White residents in other neighborhoods often condemned Chinatown as an eyesore, citing its overcrowded living quarters and alleged filthy and disease-ridden streets.

A major earthquake rocked San Francisco on April 18, 1906, leveling much of the city as a result of both the trembling earth and the subsequent fires that raged across much of the city. Chinatown was struck particularly hard by the fires, and the immigration records of city residents on file at City Hall perished amid the destruction. Ironically, the loss of official immigration records enabled Chinese migrants to claim that they had been born in the United States, thus making them American citizens by birth. This enabled the local Chinese populace to sponsor their wives, children, and relatives to legally migrate to the United States.

In the aftermath of the fire, San Francisco's city council attempted to relocate Chinatown to a different section of the city, due to its location on highly coveted land next to the city's financial district. However, Chinese businessman Look Tin Eli secured a loan from Hong Kong and convinced city officials to keep Chinatown in its original location. Look promised to reconstruct Chinatown with authentic-looking Chinese architecture

and landmarks, thereby turning the neighborhood into a major tourist attraction that would generate revenue for the city. In addition, China's imperial Qing government and private Chinese citizens offered financial support for the rebuilding efforts. The Qing Dynasty helped establish the Zhonghua School in San Francisco, a school for Chinatown's children that taught students the Chinese language as part of its curriculum. By the 1920s pagoda roofs and dragon-decorated lamp-posts had been added to the renovated Chinatown.

Although anti-Chinese prejudices did not disappear, the post-earthquake years witnessed a gradual increase in social incorporation of Chinatown's residents into American society. In 1915 the first Miss Chinatown beauty pageant was held, and during World War I the Chinese Consolidated Benevolent Association encouraged the local Chinese community to purchase U.S. war bonds to support the war effort. Chinatown's residents served in the armed forces during both world wars, but during World War II public sympathy toward the Chinese became much more amicable as Americans learned of the Japanese empire's invasion of Manchuria.

However, the communist revolution in mainland China (1949) and the emergence of the Cold War in the 1950s—highlighted by the Red Scare and McCarthyism—rekindled suspicions toward the sympathies and allegiances of Chinese Americans. San Francisco community organizations, such as the Chinese Workers Mutual Aid Association and the Chinese American Democratic Youth League, came under Federal Bureau of Investigation (FBI) surveillance, and a 1955 report issued to the State Department alleged that the majority of Chinatown's inhabitants were illegal aliens who harbored pro-communist loyalties.

Over the past 50 years the stigma associated with San Francisco's Chinatown has waned considerably, as the neighborhood has once again regained its status as a major tourist destination, attracting visitors from across the United States and around the world. Some experts contend that Chinatown today is a more popular tourist attraction in San Francisco than the Golden Gate Bridge. One of the biggest attractions is the Chinatown Gateway, located along Grant Street at the southern end of Chinatown. Also known as the Dragon Gate, the Chinatown Gateway was

designed in 1970 as a replica of the gates common to many Chinese villages. San Francisco's gate features sculptures of fish, dragons, and lions. Another major attraction is the Chinese New Year's festival, established in 1953 by H. K. Wong to cultivate a positive image of Chinese Americans to broader American society.

Shifting attitudes toward Chinatown are linked to the more diversified profile of Chinese immigrants who have settled in the United States since the 1965 Hart-Cellar Act, many of whom are highly educated professionals from middle-class and upper-middle-class backgrounds. Today, San Francisco's Chinese American population consists of immigrants from Hong Kong, Taiwan, and various parts of mainland China, which has transformed the predominance of ethnic Chinese from Guangdong in Chinatown a century ago. Approximately 20 percent of San Francisco's residents today are Chinese American, although the majority of recent immigrants have settled in San Francisco's Richmond and Sunset districts, rather than in Chinatown.

New York City

Not long after the establishment of San Francisco's Chinatown in the mid-19th century, another urbanized Chinese ethnic enclave emerged on the opposite coast in the Lower Manhattan section of New York City. By the early 1870s, a distinct Chinese community took root around Mott and Canal Streets; today New York's Chinatown consists of a two-square-mile radius loosely bounded by Jersey and East Hudson Streets to the north, Worth Street to the south, Elizabeth Street to the east, and Lafayette Street and Cleveland Place to the west.

Small numbers of Chinese traders and sailors ventured to New York City in the mid-18th century, but it wasn't until the late 19th century that a sizable Chinese community emerged in the Big Apple. Many, if not most, of the Chinese immigrants who settled in New York City during the 1860s and 1870s had relocated from the West Coast, where a confluence of factors—including rising anti-Chinese prejudice and discrimination, the completion of the transcontinental railroad, and diminished economic and job opportunities in the wake of the decline of the California Gold Rush—made life on the East Coast more appealing. As with San Francisco, New York's Chinese

quarter was populated almost exclusively by men between 20 and 50 years of age. Some estimates in the late 1800s place the ratio of Chinese men to women in New York City as high as 200:1. The low numbers of Chinese females prompted the emergence of prostitution within Chinatown, as well as compelling many Chinese men to marry women of other ethnic backgrounds. During the late 19th century, marriages between Chinese men and Irish women became fairly common in New York City.

Historians estimate that several hundred Chinese immigrants lived in New York City by the late 1860s and early 1870s. The 1900 U.S. census counted 6,321 Chinese within the city, but immigration restrictions, return migration, and a low female population (the 1900 census counted only 132 Chinese women in New York) reduced the population to 4,614 by 1910. As the Chinese female population of New York City increased over the next several decades, in part as a result of undocumented immigration, the overall population of Chinatown began to increase. In 1920 the Chinese population of New York City stood at 5,042, and by 1930 more than 8,400 Chinese resided in the city. The 1940 census revealed that the city's Chinese population had grown to 12,753. Changes in immigration laws during the 1940s, including the passage of the Magnuson Act in 1943 that repealed the Chinese Exclusion Act and the enactment of the War Brides Act in 1945, enabled growing numbers of Chinese women to enter the city and the nation as a whole.

Unlike many other ethnic enclaves in New York City during the early 20th century, Chinatown was largely self-sufficient, stemming from a proliferation of mutual aid societies, fraternal organizations (*tang* in Cantonese, but often called "tongs" in English), and numerous Chinese-owned-and-operated businesses that catered to co-ethnics.

One of the earliest Chinese enterprises in New York City was a popular restaurant started by Wing Sing on Doyers Street in the 1870s, which featured an all-Chinese staff that served American cuisine on bilingual Chinese-English menus to a mixed white-Chinese clientele. Other restaurants (serving American and "chop suey" dishes) and Chinese-owned businesses, including laundries, banks, grocery stores, temples, and theaters,

quickly followed to meet the needs of the community and to provide employment opportunities for residents. The city boasted 56 Chinese-owned laundries by 1876, and approximately 70 percent of Chinatown's male population worked in the city's restaurants and laundries by 1930. By the 1920s New York's Chinese community had effectively established its own food industry, as Chinese farmers growing vegetables on Long Island transported their produce to Chinatown restaurants and markets daily.

Despite the burgeoning success of Chinatown's enclave economy, local entrepreneurs often found themselves at odds with the New York Police Department. Many of these confrontations revolved around the city's "blue laws," which called for businesses to remain closed on Sundays in order to observe the Christian holy day. Such policies discriminated against the largely Buddhist, Taoist, and Confucian Chinese community by commanding them to close their establishments on a day when they could otherwise remain open for business.

Similar to its counterpart in San Francisco, New York's Chinatown in the early 20th century elicited a reputation for nefarious activities, such as crime, drugs, gambling, and gang violence. Historian Mary Ting Yi Lui notes that

Places like [New York's] Chinatown, thought to be an enclave of vice and a danger to white womanhood, could not be ignored and social reformers . . . undertook campaigns to "cleanse" Chinatown through the organizing of religious missions and anti-vice crusades.

Robbery and vandalism of Chinese businesses were extremely common during the early decades of the 1900s, with the crimes committed by both fellow Chinese and non-Chinese perpetrators, and numerous insurance companies eventually refused to insure Chinese properties. Since its early years, organized crime syndicates in Chinatown have engaged in prostitution, gambling, drugs, extortion, and the smuggling of undocumented aliens.

During the early 1950s city officials outlined an urban renewal project titled the "China Village Plan" that proposed razing Chinatown's businesses and residential buildings to make way

for the construction of a high-rise housing project. This move prompted activism among community residents, who feared the destruction of Chinatown's historic core and its economy. Eventually, the project was defeated and Chinatown was left intact.

Demographic Change in New York

The liberalization of U.S. immigration policies dramatically affected the demographics of New York's Chinatown in a variety of ways. As with other cities, the influx of Chinese immigrants to New York City over the past 50 years has been extremely heterogeneous, with large numbers of Mandarin and Fujianese speakers taking up residence among the descendants of Cantonese-speaking Chinese immigrants from earlier generations. The end of the Vietnam War in the mid-1970s fostered a migration of ethnic Chinese refugees from southeast Asia. Furthermore, significant numbers of relatively higher-educated and more-affluent ethnic Chinese from Taiwan and Hong Kong have settled alongside large numbers of working-class and impoverished legal and undocumented migrants from mainland China. These dynamics have led to a distinction among some within the New York Chinatown community of "uptown Chinese" (highly educated elites from Taiwan) and "downtown Chinese" (less affluent migrants from the People's Republic of China and Indochina).

Since the 1960s New York's Chinatown has experienced a surge in population. By the late 1970s New York surpassed San Francisco as the city with the largest Chinatown. To this day, New York City remains the most popular destination for Chinese immigrants to the United States, and the city is home to the largest Chinese population in the Western Hemisphere. Chinatown's population more than doubled (from 32,831 to 69,324) from 1960 to 1970, and by 1980 the neighborhood was home to 124,372 residents. The 1990 census counted 238,919 inhabitants. This rapid population growth has resulted in the expansion of Chinatown's boundaries from its original seven-block radius in the mid-19th century to a 55-block area today that has encroached into neighboring Little Italy. Although it retains its historical and contemporary importance as the social and cultural hub of Chinese ethnic identity in New York

Located at the intersection of 10th and Arch Streets, the China Friendship Gate marks the entrance to Philadelphia's Chinatown. Established in the 1870s, the city's Chinatown was declared an official historical site in 2010.

City, Chinatown's population today also consists of growing numbers of Puerto Rican, Dominican, Vietnamese, Filipino, and Burmese residents.

Philadelphia

Philadelphia's importance as a major port city during the early years of the nation made it a point of contact and trade between the United States and China, and by 1839 Philadelphia was one of the few cities in the Western world that featured a museum dedicated to Chinese culture. Today Philadelphia is home to the only Chinatown in Pennsylvania. Although extremely historic in nature, Philadelphia's Chinatown has not generated the same degree of scholarly research as its counterparts in San Francisco and New York City. However, historians generally date the origin of Philadelphia's Chinatown to the establishment of Lee Fong's Laundromat at 913 Race Street in 1870. Philadelphia police arrested Fong and his associate, Lee Wang, in August 1882 on allegations that they were using their establishment to run an illegal gambling ring.

Religious institutions served as pillars of the Chinese community in Philadelphia from its early years. One of the most significant has been the Holy Redeemer Chinese Catholic Church and School, established in 1941. Holy Redeemer's activities have been twofold, serving the spiritual needs of the city's Catholic Chinese population

while also providing a basis of social support for Chinese immigrants. Other important Chinatown religious institutions include the Chinese Christian Church and Center (established in 1941) and the Chinese Gospel Church (1952). Since the 1950s, a number of secular community-oriented organizations have also taken root in Chinatown, including the Chinese Cultural and Community Center and the Greater Philadelphia Overseas Association.

As a city with a much smaller ethnic Chinese population than San Francisco or New York City, the vibrancy of Philadelphia's Chinatown has been bolstered, perhaps to a larger degree than those of other locales, by the involvement of other Asian American heritages in its social and political activities. Philadelphia is also home to smaller Korean, Indian, Cambodian, and Vietnamese communities. Chinatown features a number of community organizations that incorporate pan-Asian agendas, such as the Asian Arts Initiative, Asian Americans United, and the Asian American Women's Association.

Located adjacent to Center City (downtown), Philadelphia's Chinatown extends northward from Arch Street to the Vine Street Expressway and eastward from 13th Street to 8th Street. This location, near the Pennsylvania Convention Center and some of the highest real estate property values in Philadelphia, has made Chinatown the target of numerous attempts to evacuate its community and raze its buildings for development since the 1960s. In 1966, community activist Cecilia Moy Yep founded the Philadelphia Chinatown Development Corporation (PCDC) to protect the city's Chinatown landmarks from urban renewal efforts. The activism of the local Chinese community thwarted state and local attempts to build Philadelphia's Vine Street Expressway through Chinatown. In 1984 the PCDC led successful efforts to construct the China Friendship Gate at the intersection of 10th and Arch Streets, which was the first authentic gate in American society to be constructed by Chinese workers. In 2000, Mayor John Street proposed the construction of a new stadium for the Philadelphia Phillies in Chinatown, again sparking heated protests from the PCDC and the city's Chinese community. Eventually, the city opted to build Citizens Bank Park in South Philadelphia, but proposals to

build a casino in Chinatown also emerged in the early 2000s. This plan was also defeated.

The Pennsylvania Historical and Museum Commission officially designated Philadelphia's Chinatown as a historical site on October 8, 2010. The consecration ceremony included a rendition of "God Bless America" sung by neighborhood schoolchildren and a performance by lion dancers, along with speeches delivered by local Chinese American leaders, Philadelphia Mayor Michael Nutter, and City Councilman Frank DiCicco, who represents Chinatown. Nutter praised Chinatown as a vital component of Philadelphia life:

The historical marker that we are dedicating today rests on a spot where Chinatown began. It is in the middle of a very vibrant community of homes and businesses and culture. A gateway for immigrants to settle here and other places in Philadelphia, a destination location for those who want to [have] a multicultural experience in our city, and a number of businesses that help support and drive the survival of this economy.

Approximately 2 percent of Chinese immigrants to the United States settle in Philadelphia annually, and the Chinese are currently Philadelphia's third-largest immigrant group. Increasingly, the city's Chinese community is becoming more geographically dispersed outside Chinatown, however, with significant populations taking up residence in northeast and South Philadelphia. Nevertheless, Chinatown remains a key focal point in the social consciousness and collective memory of the city's Chinese American community.

Future Outlook

Chinatowns collectively occupy a special place in the collective imagination of American ethnic history and the nation's contemporary multicultural identity, as evidenced by their serving as the settings for various motion pictures such as *Gremlins* (1984), *Big Trouble in Little China* (1986), *The Joy Luck Club* (1993), and *Rush Hour* (1996), among others. Martial arts icon Bruce Lee (1940–73) was born at the San Francisco Chinese Hospital in Chinatown. From coast to coast, Chinatowns remain major tourist draws, and continued

immigration from the Chinese diaspora ensures that Chinatowns will retain their social and cultural significance for many years to come.

Oakland and Los Angeles joined the organization and soon became the nucleus of the Grand Parlor, along with San Francisco. Shortly after, affiliates in Fresno and San Diego were added to the organization and CACA became a statewide organization in California. Over the years, many cities across the United States joined CACA, making it a national organization. The lodges in San Francisco, Oakland, Los Angeles, San Diego, Fresno, Portland, Chicago, Pittsburgh, Detroit, and Boston have their own officers and associates. In 1977, women were allowed to become members for the first time. Nancy Ann Gee was the first woman elected to the office of National Grand President at the CACA convention in Phoenix in 1997.

Purpose

The Chinese American Citizens Alliance works to promote equal rights and the general welfare of Chinese Americans. The Chinese American population numbers approximately 3.8 million people and makes up 26 percent of the Asian American population, according to the 2010 U.S. census. Chinese Americans are the largest ethnic group among Asian Americans, and they constitute 1.2 percent of the total U.S. population (including people with partial Chinese ancestry).

A number of organizations exist to promote the well-being of Chinese descendants, such as the USChina Peoples Friendship Association, the National Committee on United States–China Relations, and the Chinese Students and Scholars Association. These associations mainly deal with U.S.-China relationships and political policies, whereas CACA focuses its efforts primarily on Chinese Americans residing within the United States. CACA provides updates regarding events and legislation relevant to Chinese Americans through its Web site.

Achievements

CACA has systematically promoted the well-being of Chinese Americans by supporting community projects, including helping institute the San Francisco Chinatown Playground, Mei Lun Yuen housing project, Pin Yuen housing project, and the Chinese hospital. During the past century, CACA has helped challenge discriminatory laws and bills. In San Francisco, CACA worked with parents to change policies regarding the forced

Chinese American Citizens Alliance

The Chinese American Citizens Alliance (CACA) is a Chinese American nonprofit organization with no official political affiliations. It was founded in 1895 by Chun Dick in San Francisco. The stated mission of CACA is to help Chinese Americans fully enjoy the rights and privileges of American citizenship.

The CACA began with a group of Chinese Americans born and raised in the United States who were determined to change the way their Chinese ancestors were being treated. By 1912, Chinese Americans in other communities began to form local affiliates (called "lodges") of CACA. Lodges from

busing of Chinese American children. The organization also helped challenge the Immigration Act of 1924, which caused many American citizens to be separated from their wives because of strict quotas on Chinese immigration.

More recently, CACA has helped promote bills designed to enhance the well-being of Chinese Americans, and the association keeps the public informed of relevant policies being developed that affect Chinese Americans. CACA lobbied for the passage of U.S. House of Representatives Resolution 683, which expressed regret over discriminatory laws targeting Chinese Americans. The group condemns advertisements that use derogatory or demeaning stereotypes of Asian Americans. CACA also recognizes Asian American military service, and pays tribute to the American citizen soldiers of all ethnicities who lost their lives in the Japanese attack on Pearl Harbor during World War II.

Events

CACA hosts many events, including weekend socials, picnics, athletic tournaments, beauty contests, and fashion shows. Initially, these events were organized because Chinese Americans were excluded from social gatherings hosted by mainstream U.S. organizations. Regional lodges of CACA routinely organize activities within their own communities.

The organization currently hosts three major programs. The first is its Annual D.C. Team Visit, which aims to educate top officials and lawmakers about current issues critical to Chinese Americans, including immigration policies. The second is a national essay contest. Thousands of high school students throughout the United States have participated in the contest, which encourages an awareness of current local and world events among the students and is intended to foster their creative thinking and self-expression. The third event is the Youth Leadership Conference, which usually lasts for three days and aims to build a young Asian American student community, to develop students' communication and leadership skills, and to provide opportunities for them to make friends.

The Chinese Times

The alliance previously published a Chinese newspaper, *The Chinese Times*, founded in 1924 by Walter Lum, which was the official nationwide

newspaper of the organization for over 60 years. As Chinese Americans became more assimilated into American society, fewer needed to rely on a Chinese-language newspaper for information. By 1988, all of the alliance's interest in *The Chinese Times* was sold to independent buyers. CACA currently publishes a newsletter on its Web site called the *Alliance Connection*, which covers recent activities and accomplishments of different CACA lodges across the country.

Chinese Americans

Chinese Americans are the oldest and largest Asian ethnic group in the United States, consisting of fourth- and fifth-generation Americans of Chinese descent and recent immigrants. Chinese immigrants have been diverse in terms of languages spoken (Cantonese or Mandarin, for example) and points of origin (Hakka from southern China, secondary migrations from Hong Kong, and northern Chinese or indigenous Taiwanese). Chinese immigration and the place of Chinese Americans in the United States must be understood within the broader context of American economic development, as well as domestic and international politics.

U.S. Census Data

U.S. census data do not track the diversity of Chinese immigrants to America in terms of language, class, educational levels, and region. Most of that information derives from the research of contemporary historians and sociologists. Nonetheless, a snapshot using U.S. census data is important. The 2010 census reported that the three metropolitan areas with the largest Chinese American populations were greater New York with 682,265 people, the San Jose–San Francisco–Oakland combined statistical area with 592,865 people, and the greater Los Angeles combined statistical area with about 473,323 residents. New York is home to the highest Chinese population of any city, with 486,463 residents, while the Los Angeles County city of Monterey Park has the highest percentage of Chinese Americans of any municipality at 43.7 percent of its 24,758 population.

The 2010 census figures also showed that the 10 states with the largest Chinese American populations were California (1,253,100; 3.4 percent), New York (577,000; 3 percent), Texas (157,000; 0.6 percent), New Jersey (134,500; 1.5 percent), Massachusetts (123,000; 1.9 percent), Illinois (104,200; 0.8 percent), Washington (94,200; 1.4 percent), Pennsylvania (85,000; 0.7 percent), Maryland (69,400; 1.2 percent), and Virginia (59,800; 0.7 percent). Hawai‘i has the highest concentration of Chinese Americans at 4 percent, or 55,000 people.

Western Colonialism and the Decline of the Qing Dynasty

The Qing Dynasty (1644–1912) banned emigration for fear that supporters of the earlier Ming Dynasty (1368–1644) would establish overseas bases from which to continue their efforts to overthrow Qing control and restore the Ming. However, Qing decrees on emigration were largely ignored. The first Chinese presence in North America consisted of sailors and peddlers, who visited New York in 1830. By 1849, 325 Chinese were in the United States, with large-scale migrations beginning after the first and second Opium Wars (1842 and 1860, respectively), both of which resulted in the British wresting major concessions from the Qing Dynasty in the form of access to coastal ports, extraterritoriality, and most favored nation status. The Opium Wars allowed

Britain to begin to erode Chinese sovereignty, and British imperialism in Asia and the Pacific regions soon prompted similar efforts by other European nations and, in the latter half of the 19th century, the United States. The effectiveness of the Qing Dynasty at governing a population that had always considered them to be foreign (Manchu rather than Han) was further compromised in the 19th century by natural disasters, crop failures, and rebellions, the most significant being the Taiping Rebellion (1850–64), which eventually affected 17 provinces and took an estimated 20 million lives.

Nineteenth-Century Arrivals

American missionaries sent a small number of Chinese boys to the United States for schooling. From 1818 to 1825, five students stayed at the Foreign Mission School in Cornwall, Connecticut. In 1854, Yung Wing became the first Chinese graduate of Yale University. Meanwhile, Chinese sailors and merchantmen had been arriving in Mexico and had established a small community there during Spanish colonial rule over the Philippines (1565–1815) and the galleon trade between the Philippines and Mexico. Chinese sailors were also part of fur trader John Meares’s 1788 and 1789 expeditions from Canton to Vancouver Island. The Chinese diaspora in the Asia and Pacific regions includes most countries in Indochina (dating to the 16th century), Indonesia, the Philippines, Australia, New Zealand, and other Pacific Islands, and the Pacific Rim regions of Central and South America.

In the two decades prior to the 1868 Burlingame Treaty between the United States and China, Chinese migrants consisted of merchants, craftsmen, druggists, gamblers, and actors. Some Chinese came in response to the Gold Rush of 1848, although by the time they arrived, the best mines had already been staked or were depleted. Beginning in 1865, poorly educated Chinese were brought in to work on the western portion of the transcontinental railroad, an essential transportation and communications artery that fueled American industrialization and economic prowess in the late 19th and early 20th centuries. By 1869, when the transcontinental railroad was completed, 15,000 of the 17,000 workers on the western portion of the railroad had been Chinese.

Between 1851 and 1860, 40,400 arrived in the United States. From 1861 to 1871, 64,300 more arrived, mostly settling in California, with significant numbers also scattered in the southwest and other parts of the West Coast. Most of these arrivals came from six districts in southern China. Far fewer women were allowed into the country, and in 1872, they were banned from entering altogether. The Chinese were exploited for their work ethic and their willingness to work for low wages.

Anti-Chinese Sentiment and Agitation

By the 1840s, American missionaries had brought back tales of stereotypes of the Chinese as backward and heathen. By the mid-1840s, European colonial discourse had also figured the Middle Kingdom in its category of the alien Other, and Chinese territory and resources were seen as being ripe for conquest. Chinese in the United States drew increased misunderstanding because of their foreign customs, which were met with hostility and at times violence. As a result, they tended to keep to themselves, creating tight-knit communities based on common language, customs, and often kinship. These small communities kept to the outskirts of towns and away from white Americans and traveled in small groups in pursuit of jobs. Often, when confronted by white Americans, Chinese said very little, either because they could not speak English or because they believed that silence afforded them more safety. Their behavior was in turn interpreted as clanishness and an unwillingness to integrate with the larger community.

When the Chinese felt safe enough, they would cluster in one part of town, and many of these neighborhoods became known as Chinatowns. If the Chinese community was large enough, the members formed mutual aid societies or associations, called Six Companies or the Chinese Consolidated Benevolent Association. These associations provided a sense of cohesiveness to the community of mostly bachelors and migrant workers, as well as practical assistance and a measure of protection. Not surprisingly, these organizations reinforced the image of the Chinese as secretive and resistant to assimilating into mainstream America.

Hostility toward the Chinese worsened whenever the economy went through difficult times,

This sculpture featuring anti-Chinese themes was made in New York in the late 1800s and is on display at the Smithsonian Museum of American History. It depicts a Chinese boy climbing toward white children who are protected by an American eagle.

such as the depression of the 1870s and 1880s, and the so-called Panic of 1893. As a push for anti-Chinese legislation began ramping up in the western states, the eastern part of the country was reacting against unprecedented numbers of what it termed “less desirable” European immigrants, namely those from eastern and southern Europe. However, the European influx did not lead to legislation banning those immigrants, and from 1882 to 1914, the United States admitted approximately 20 million European immigrants. The 1850s and 1860s also saw the rise of pseudoscientific theories of racial types, namely, the notion of a hierarchy of races in which “Asiatics” or “Mongoloids” were said to be genetically inferior to the Caucasian race. Moreover, it was argued that Asians were essentially

culturally incapable of assimilating into Western civilization.

Discriminatory Legislation

When Chinese communities started to coalesce in cities, local governments passed discriminatory ordinances. Chinese were not allowed to be in certain sections of town; taxes were levied based on the number of persons living together in a specific amount of square footage; laundry fees, poll taxes, and queue taxes were levied, just to name a few. Two particularly significant pieces of legislation were the Chinese Exclusion Act and a series of state Alien Land Laws.

The 1882 Chinese Exclusion Act prohibited the entry of skilled and unskilled laborers for 10 years and the naturalization of Chinese immigrants. Teachers, merchants, scholars, and officials were allowed entry. In 1892 and again in 1902, the act was extended for another 10 years, and in 1904, it was extended indefinitely. The Scott Act of 1888 prohibited the reentry of Chinese with U.S. residency status after they had visited China (affecting 20,000 who were visiting China at the time the law was passed). After 1882, the Chinese met with increased incidents of mob violence, especially in the western states. By 1910, legislation at all levels of government and extrajudicial violence combined to drive the Chinese from the mainstream labor market. Many immigrants took up laundry work or worked in the restaurant trades or did domestic work for whites. In the 50 years after passage of the 1882 exclusion act, the Chinese population dropped from 105,465 to 74,954.

The Alien Land Laws originally had targeted the Chinese living outside major cities. The laws prohibited persons ineligible for U.S. citizenship from owning or leasing land. By the first part of the 20th century, however, with the retreat of the Chinese into the cities, Alien Land Laws impacted primarily the Japanese and south Asians, many of whom were farmers.

Chinese in Hawai'i

A few Chinese sailors were part of Captain James Cook's 1788 expedition to the Sandwich Islands, the name Cook gave to what would become Hawai'i. By the mid-19th century approximately 46,000 Chinese had arrived and were working

as contract laborers on sugar plantations owned by American businessmen. Although the Chinese found that getting free of indentured servitude was difficult, once done, most of the workers gradually moved to places like Honolulu to open their own shops or to find work. Intermarriage was common for Chinese men, since Chinese women were not allowed entry to the island. The men married Hawai'ian, Puerto Rican, Portuguese, Spanish, Japanese, Greek, and a small number of half-white women. According to 2010 census figures, residents of Hawai'i who self-identified as being of Chinese descent numbered 54,249, or 4.2 percent of the total state population. The largest Asian ethnic groups in Hawai'i are Filipino American at 176,596 and Japanese American at 172,400.

Chinatowns

The period between 1882 and 1943, the year the Chinese Exclusion Act was repealed, saw the establishment of Chinatowns in a few major cities and ethnic enclaves in smaller ones. The oldest Chinatown is in San Francisco, while the largest is in New York. The first generation of American-born Chinese was confronted with the racism of Anglo-Americans and segregated schools, drinking fountains, movie theaters, and other public spaces. In the first few decades of the 20th century, Chinese Americans who managed to complete college degrees could find jobs only in Chinatowns, working for Chinese-owned businesses or, in the case of the medical profession, their practice was restricted to Chinatown as well. Many of this younger generation had tenuous connections to or understanding of their parents' China and culture, yet this younger generation was prevented from integrating with Anglo-American society.

Evolving Ties to the Two Chinas

Although the Exclusion era, also known as the Silent Decades, restrained Chinese Americans, they nevertheless continued to pay attention to and, in limited ways, kept involved in the political turmoil in China—including continued foreign aggression, the fall of the Qing Dynasty and the end of China's imperial system, the 1911 Revolution, Japanese aggression and colonialism, and civil war leading up to World War II. For example,

in the late 19th century, the Baohuang hui set up 11 regional headquarters and 25 chapters in North America. This group advocated retaining China's imperial system, while Westernizing certain aspects of society. Later, Sun Yat-sen made multiple trips to Hawai'i and the United States to raise money to overthrow the Qing and make China into a democratic republic. The Japanese invasion and, later, the armed conflict between the republican Kuomintang (KMT) and the Chinese Communist Party (CCP) under Mao Zedong led to similar fund-raising efforts in Chinese American communities, which were often split between supporters of the KMT and the CCP. The Japanese bombing of Pearl Harbor drastically changed American attitudes toward China and Chinese Americans: China became an ally. In 1943, after considerable lobbying efforts by various Chinese American groups, Congress repealed the Chinese Exclusion Act. Chinese Americans enlisted in the military, found work in war-related industries, and work outside Chinatown.

The chaotic political situation in China between the KMT and CCP during and after World War II and leading up to the defeat of the KMT and the Communist takeover in 1949 was reflected in Chinese American communities across the United States. Political affiliation in these communities spanned the political spectrum. Homegrown unions tended to support China's CCP, which waged war against the Japanese invaders. By contrast, the KMT was perceived to be corrupt and saving its military to fight the CCP after the end of hostilities with Japan. The United States, alarmed at Soviet military muscle and the prospect of China falling into the hands of the CCP, supported the KMT. Chinese American support for the KMT ranged from lukewarm to enthusiastic, similarly in the case of the CCP.

Chinese Americans and the Cold War

In the Cold War years, Chinese Americans found themselves the target of American anti-Communist investigations, sometimes disguised as investigations into residency status or other violations. Left-leaning students, newspapers, and union leaders were particularly targeted. Ironically, the Red Scare and the chauvinistic competition between the United States and the Soviet Union enabled an influx of highly educated professionals,

scholars, and talented Chinese students into the country. Among this group were students and scholars, already in the United States at the time of the Communist takeover, who then applied for political asylum. Others fled China as refugees or came from Taiwan.

More such professionals entered the country as a result of the 1965 Immigration Act, which included a specific preferential quota for professionals, scientists, and artists. Statistics from the 1970 census showed that Chinese Americans had surpassed white Americans in the number of years of completed education and that only 25 percent were in menial labor. By contrast, in the 1930s, more than 60 percent of Chinese worked in menial jobs and only 1.5 percent had attained a college degree. The popular stereotyping of Chinese Americans as the model minority and as having achieved the American Dream derives from the rise in education and professional status during this period.

Asian American Movement

The Asian American movement was part of the 1960s and 1970s countercultural, anti-Vietnam War, African American-led civil rights, Native American and Chicano, and the second wave of feminist movements. The prosperity that Americans enjoyed after World War II also led to the rise of a new middleclass that was typically white and Protestant. The model American family lived in cultural uniformity, represented by numerous identical housing tracts built after World War II.

However, the seeming democratization of the means to achieving the American Dream was not evenly distributed among the races or genders. The United States was again fighting a foreign war, having only recently concluded with the war on the Korean Peninsula. The Deep South seethed; and America's youth, disillusioned with racism, sexism, and monochromatic suburbia, rebelled, seeking inspiration not from Adam Smith or Thomas Jefferson but from Lenin, Mao, Che, and Ho Chi Minh. Japanese Americans of the sansei, or third, generation wanted the truth about the internment, while the children of working-class Chinese Americans and the professional class realized that, after more than 100 years in America, ordinary Americans still refused to learn how to distinguish between the various Asian ethnicities:

Chinese, Japanese, Korean, south Asians, or Filipinos. Chinese Americans in the United States military talked about being called “gooks” by other G.I.s.; the existence of corporate and professional glass ceilings only confirmed the reality of ongoing American racism. And unlike their parents and earlier waves of immigrants, they were not willing to stay silent.

The student demonstrations and occupations at the University of California, Berkeley and San Francisco State University ushered in ethnic studies on American campuses across the country. This coalition was known as the Third World Liberation Front. Americans of Asian heritages understood that they had to build an intra-ethnic Asian community, a crucial aspect in forging a pan-ethnic identity, as well as build multiethnic and multiracial alliances. Even more moderate Asian Americans in this movement took the stance that assimilation into the American mainstream was no longer a desirable or realistic goal. An important step occurred when husband and wife Yuji Ichioka and Emma Gee called for an Asian American alliance with the Black Panther Party and antiwar groups such as the Peace and Freedom Party. Ichioka is credited with coining the term *Asian American*. Various Americans of Asian descent came together as the Asian American Political Alliance (AAPA).

The Asian American movement dissipated in the decade following the Vietnam War, a trend of other parts of the counterculture movement. Ethnic and Asian American Studies departments in universities became rapidly institutionalized, even as they struggled to survive budget cuts and remain relevant to students of the 1980s and beyond who were more interested in degrees in high-paying fields than in learning about class struggle or their ethnic identity. Asian American community organizers of the 1960s and 1970s also gradually became less relevant or absorbed by governmental programs that succeeded in ameliorating the worst effects of poverty and racism, but without eliminating the systemic roots of inequality and injustice.

Post-1990 Asian Americans

Immigration reform in 1990 brought even more highly educated and skilled professionals to the United States, many from Hong Kong or Taiwan.

Entrepreneurs willing to invest heavily in the country constituted a new category of immigrants or resident aliens. Many of the post-1990 Chinese migrants are ethnic Chinese from Vietnam or the Philippines. Many Chinese “legal aliens” continue to work in places like Hong Kong or Taiwan, while mainland Chinese form an increasingly high percentage of arrivals in the 21st century, either as students or entrepreneurs, shuttling back and forth between their bases in the United States and China or Hong Kong. Chinatowns have undergone changes that reflect new waves of arrivals from Indochina; some of the oldest Chinatowns have become home to Vietnamese, some of whom are ethnic Chinese. In Los Angeles, suburbs like Mission Viejo and Irvine have absorbed many of the Chinese American professional class, some first-generation immigrants, and others who are first- or second-generation American. Monterey Park, about 15 miles from downtown Los Angeles, was the first suburb to which working-class residents of Chinatown moved in the 1970s and 1980s. Since the 1990s, Chinese arriving from Hong Kong, Taiwan, or China often do not pass through any of the old Chinatowns but go directly into affluent neighborhoods, preferably near exclusive college preparatory high schools or prestigious universities.

However, this picture of more recent Chinese arrivals must be examined within the larger context of this very diverse ethnic population. It is difficult to gather accurate figures on the number of undocumented Chinese immigrants who succeed in entering the country. Highly publicized incidents, such as the 1993 *Golden Venture*, a 147-foot cargo ship that ran aground on the East Coast carrying 286 Chinese, indicate that significant numbers continue to arrive annually. This undocumented population often end up in indentured servitude in factories, low-paying service jobs, or the sex trade.

Chinese Consolidated Benevolent Association

The Chinese Consolidated Benevolent Association (CCBA) emerged within the United States during the late 19th and early 20th centuries. Although the CCBA was first established in San Francisco, it has a group of related organizations across the United States (e.g., CCBA of San Diego; CCBA of New York City). Historically, the CCBA was created to help resolve disputes among local Chinese immigrants, serve as an advocate for legal rights and community respect, and assist immigrants in adjustment to U.S. culture. Currently, CCBA organizations provide diverse services, such as health care, education, transportation, and cultural enrichment, to Chinese immigrants and/or individuals of Chinese descent. In addition, the CCBA works to build connections among Chinese communities and other U.S. communities. The CCBA also extends

humanitarian aid to groups and communities outside the United States.

History of the Association

During the 1800s, there were many Chinese individuals who lived in the San Francisco area. These immigrants were from distinct regions of China, with their own dialects, customs, and beliefs. District associations emerged, in which individuals from the same region could meet to retain their cultural heritage and assist each other in adaptation to U.S. life. Within their communities, these associations engaged in activities to help their members, including offering financial assistance and dispute resolution. They also worked with citizens outside their communities to foster respect for Chinese residents and workers and to build positive social relationships.

By the 1850s, there were six prominent regional associations: Hip Kat, Hop Wo, Ning Yuen, Sam Yup, See Yup, and Yueng Wo. In 1854, these groups merged to form a single association known as the Six Companies. This association was created in order to unify efforts to represent the interests of Chinese individuals. A seventh organization, Sue Hing Benevolent Association, emerged in the 1870s and later joined with the Six Companies. At this point, the name was changed to the Chinese Consolidated Benevolent Association (CCBA).

Since the first CCBA was formed in San Francisco, several other regional organizations were created. These organizations typically formed in urban areas (e.g., Boston, Seattle) to which large numbers of Chinese individuals migrated during the 19th and 20th centuries. CCBAs were established in cities such as Los Angeles in the 1880s, but were not founded in cities such as Washington, D.C., until the 1940s. Currently, there are CCBAs in a variety of states, such as California, Georgia, Illinois, Massachusetts, New York, Oregon, Pennsylvania, and Washington.

Community Services of the CCBA

Although CCBA regional organizations vary in their history, governance, and services, they do share common principles. More specifically, these organizations focus on provision of educational, leisure, health, and social services; preservation of Chinese culture and customs; provision of

charitable aid and support; advocacy and facilitation of individuals' involvement with U.S. systems (e.g., employment, law, transportation); support of human dignity; and advancement of positive relationships between Chinese communities and other communities. These values highlight the benevolent intent of these associations. Similar to the early years of CCBAs, there is an effort to balance bicultural issues (e.g., retention of Chinese culture) with adaptation to U.S. life in the 21st century.

For example, several CCBAs offer instruction in Chinese languages (Mandarin, Cantonese); this instruction is available from early childhood through older adulthood. Although it might seem counterintuitive that older adults would need language instruction, it has been noted that some elders were never taught written language and speak a regional dialect that is not well understood by others. Thus, an argument has been made that even older adults need to share a common language. In addition, CCBAs commonly offer general instruction in American English. Some associations also offer training in specific skill areas. For example, the CCBA of Chicago provides a certified training program in food sanitation) for chefs and computer literacy courses. Beyond education, CCBAs provide health care (e.g., free clinics, exercise, meal services), legal advice, crime watch patrols, and recreational activities (e.g., dances, movies, books, opera, sports, Boy Scouts, girls' drill teams). The San Diego association runs an apartment building and recreational center for older adults.

Although these services might seem primarily internal to the Chinese community, CCBAs engage in diverse external activities that bridge to the broader U.S. community. Many associations note that they share in city events (e.g., parades, festivals) that honor several cultures and countries. The CCBA of Augusta, Georgia, formed a support group for bicultural families (U.S. parents who adopt children from China). In addition, associations participate in fund-raising activities for organizations and groups that serve other communities. For example, the CCBA of Portland has helped raise funds for a children's hospital and an art museum, while the CCBA of New York raised money to assist survivors of a Bangladeshi cyclone and Haitian earthquake.

Since the first CCBA was founded more than 150 years ago, multiple CCBA affiliates have been established across the United States. As families and communities change over time, these CCBAs have made adjustments. However, the core principles of the CCBA have provided continuity across generations.

Chinese Exclusion Act (1882)

The Chinese Exclusion Act of 1882, which halted immigration from China for 10 years and barred the Chinese from U.S. citizenship, was the first legislation in U.S. history to restrict immigration by race or nationality. The act exempted travelers, teachers, students, merchants, and American-born Chinese from the overall exclusion. The law was the first to restrict immigration by an ethnic group, and the first of multiple legislative, executive, and judicial acts imposing what many scholars regard as racist limits, including exclusions or quotas for Japanese and all other Asians.

The Chinese Exclusion Act was a foretaste of the immigration restriction laws of the 1920s that eventuated in the National Origins Act of 1929, which capped immigration at 150,000 a year and excluded Asians entirely.

In response to the Gold Rush, Chinese came to California. By 1870 the population of California included 8.6 percent Chinese, and Chinese were a fourth of the workforce. The pull was the demand on the West Coast for workers in mining, timber, canning, and railroad construction. Additionally, the Chinese owners of laundries, restaurants, and small factories in the United States wanted Chinese workers. Construction of the Central Pacific railroad from 1864 to 1869 also depended on Chinese labor.

Almost from the time of their arrival, Chinese encountered discrimination in cities and mining camps. California enacted the Foreign Miners' Tax in 1850. Levies as high as \$20 a month targeted the small number of Chinese.

Still the Chinese came, pushed by events in China. Foreign and domestic wars and religious and political rebellions caused 30 million Chinese fatalities and a virtual collapse of the Chinese economy.

The Burlingame Treaty of 1868 allowed free immigration between China and the United States. By 1868 the west was home to 100,000 Chinese, but the United States wanted more Chinese workers and promised to protect Chinese citizens in America. Not long after the Burlingame Treaty, California went into a recession. Unemployed Californians looked to scapegoat the Chinese in their midst.

But the Chinese survived, persevered, and prospered, creating San Francisco's Chinatown governed by the Six Companies (Tongs) from the 1860s. Their difference and their prosperity provoked already-racist whites: the Chinese were heathen and seemed impossible to assimilate, so they had to be stopped. Anti-Chinese stereotypes were based on white superiority and an erroneous belief that the Chinese were stealing American jobs.

White unionists and newspapers fanned the flames of violence, and China was slow to respond, not establishing an embassy in Washington, D.C., and a consular office in San Francisco until 1878. By then, hundreds of Chinese cases were pending, 300 Chinese were in jail, and Congress was debating Chinese exclusion. The Chinese ambassador told the secretary of state that exclusion violated the Burlingame Treaty. President Rutherford Hayes vetoed the exclusion bill but sought

to renegotiate the Chinese treaty in 1880. The Angell Treaty authorized the United States to suspend, limit, and regulate Chinese immigration but not to prohibit it.

In 1882 Senator John F. Miller (R-CA) proposed a 20-year suspension of Chinese immigration, with deportation and imprisonment as penalties. He also sought to block federal and state naturalization. President Chester Arthur vetoed the bill due to the 20-year provision. Congress passed it with a 10-year ban, and Arthur signed it. Non-laborer Chinese who sought to come to the United States had to have a Chinese certificate of eligibility to emigrate and had to prove that they were not laborers.

The Chinese Exclusion Act excluded skilled and unskilled workers and miners. It also mandated that those who left the United States had to have a reentry certificate. State and federal courts could not grant citizenship to Chinese but could deport them.

Between 1882 and 1891 San Francisco's district court was the site of over 7,000 habeas corpus cases for Chinese men and women detained for lack of entry certificates. Anti-Chinese violence intensified. When China offered an open-ended suspension of immigration in return for an end to violence, the United States wanted 30 years. The Chinese offered a 20-year suspension, but neither side ratified the treaty.

Congress tightened exclusion. The United States in 1884 limited the rights of Chinese-descended persons, regardless of where they were born, to enter and leave the country. The Scott Act of 1888 blocked entry of Chinese with return certificates and established an immigrant detention facility on the Pacific Steamship Company wharf.

The Geary Act of 1892 extended exclusion for another decade, required Chinese aliens to have residence certificates on their persons at all times or risk deportation, and mandated that all resident Chinese apply for a certificate within a year. In 1902 the United States extended Chinese exclusion to all its territories and renewed Geary with no termination date.

Effects

Under exclusion, many merchants left their families in China. Merchants who returned to China

were authorized by federal law to register two children for immigration. This led to a market for fraudulent claims of relationship in order to immigrate. These “paper sons” risked deportation if they failed to convince the examiner that they were truly the children of the merchant’s family. In the 1950s, the United States amnestied paper families.

Chinese exclusion remained law until World War II. Chinese served with distinction in American units in World War I. In World War II China was an ally, and the United States allowed naturalization of Chinese servicemen and citizenship for the Chinese spouses of American G.I.s. In 1943 the Magnuson Act authorized only 105 Chinese immigrants a year.

The Immigration Act of 1965 revoked the national origins policy established by the 1920s laws, and finally the Chinese were allowed to immigrate, which they did in large numbers.

Choctaw

Hundreds of years before Europeans landed on American soil, the Choctaw Indian Nation (*Chakchiuma*, *Chatot* or *Hacha hatek*, meaning “river people”) lived primarily in the southeastern United States, which included the Mississippi Valley and parts of Alabama, Louisiana, Mississippi and Florida. In 1830, these Native American farmers were forcibly moved by the federal government to southeastern Oklahoma. This became known as the Trail of Tears, the result of the Indian Removal Act, which authorized the U.S. government to negotiate with Native Americans in the southern states for their removal to federal territory west of the Mississippi in exchange for their homelands.

These Muskogean—as the group of Native Americans, which included the Choctaw, were called—were a matriarchal society. They have an interesting myth of origin. From 800 to 1500 C.E., their ancestors were located throughout the mideastern, southeastern, and eastern parts of the United States. This Mississippian culture is what Spanish explorer Juan Ponce de León encountered when he arrived in America. However, they were already diminishing in number. There is a big question about the origins of the mound-building society that preceded them. The secular version implies that these descendants of the pre-Columbian Hopewellian culture were traveling through forests with the remains of their dead. They stopped at a creek to rest during winter. One of the indentations on the mountain located near them, called *Nanih Waiya*, meaning “productive mountain” or “mother mound,” was considered sacred. When spring arrived, the well-rested tribal members had an abundance of food from the surrounding vegetation. They decided to make this encampment their permanent home, naming it *Nanih Waiya*, which today is known as Winston, Mississippi.

According to Hernando De Soto’s narratives, he may have been the first European to encounter the Choctaw. In 1540, he met the enormous Choctaw chieftain Tascalusa. Despite claiming he was a civilized Christian, De Soto attacked the tribe when they would not surrender their chief to be his enslaved servant. But the tribe did not go down without a fight, leaving the Spaniards with many casualties.

Gender Roles, Customs, and Lifestyle

Both genders of Choctaw had specific roles within the tribes. Women were farmers, took care of the children, and cooked. Men were hunters and engaged in war, if necessary, to protect their families. Horses (called “spirit dogs”), which had been introduced by the white man, were very important to the tribe’s hunting process. After the prey was hunted by the men, the women would go by horseback to track the catch, marking the trail with a twig. If the prey was deer, the woman would use a knife to dress it, then put it over her packsaddle to carry back to the village. She would leave some tobacco on the spot where the animal had lain as a sign of gratitude. Both men and women took part in oral storytelling, music, artwork and traditional medicine. Men were always chiefs, but that does not hold true today.

Their dress did not involve much adornment. The men wore breechcloths, and the women wore deerskin wraparound skirts. Though neither had much need to wear shirts, women would wear ponchos to stay warm. Both sexes wore moccasins. They eventually adopted European clothing, wearing full skirts and cloth jackets. They did not wear colorful headdresses, but both men and women wore their hair long. Some men would cut their hair in the Mohawk style, putting feathers on the fringes. The men painted their faces for festivals, lacrosse games, or battles, and often had tribal tattoos. One interesting practice was artificial head flattening. When a male child was born, a board was attached to his head to flatten it.

They lived in villages with solid, warm homes that were like log cabins. They were made of rivercane and plaster, with thatched roofs. Their villages usually had baseball fields with benches for spectators. If their towns were near a border outside their area, they would construct reinforced walls (*palisades*) for fortification. They were recognized as the preeminent agriculturalists of the southern tribes.

The Choctaw had great respect for their dead. They always appointed one member, who grew his nails long, to clean the bones of the dead before they were put into boxes in the bone-houses. Believers in spirits living on after death, they would surround graves with poles, which they looped with hoops and wreaths to aid the spirit of the deceased in his or her ascent from the burial ground.

Trail of Tears

By the 1830s, around the time Spanish missions started closing, the United States government was intent on removing Native Americans from the territory so that they could claim more land. In 1830, the Choctaw signed the Treaty of Dancing Rabbit Creek; it was the largest transfer of land (11 million acres) between the United States and Native Americans that was not prompted by warfare. The Choctaw left in three phases, spanning the years 1831–33. Nearly 15,000 left the greenery of Mississippi for the dry plains of Oklahoma. Almost 2,500 died from disease during the somber trek.

About 4,000–6,000 had remained in Mississippi and became targets of severe racism, harassment, and bullying, and encountered many legal conflicts. They eventually were left, stripped of dignity, and slowly migrated westward. By 1930, as a result of the Indian Removal Act, only 1,665 Choctaw were left in Mississippi.

Choctaw Participation in the Civil War

During the American Civil War, the Choctaw primarily sided with the Confederacy. After agreeing to the U.S. government’s treaty with Choctaws and Chickasaws, battalions started forming in Indian territories. When the war reached its peak, Union officers captured Mississippi Choctaw and shipped them to New York. During and after

Choctaws served in the U.S. Army during World War I and became “code talkers,” who used their native language to avoid being understood by the Germans. Their communications helped win key battles during the war’s last big German offensives.

Reconstruction, the Choctaw, along with African Americans, faced the brunt of Jim Crow laws.

Contemporary Choctaw

Two Choctaw tribes exist today. The Mississippi Choctaw live on a reservation, which is land they control and that belongs to them. The Oklahoma members live on trust land, which is owned by the federal government. Each of the tribes has its own police, laws, and governments. Yet, they are also U.S. citizens, and as such must adhere to American laws, too. Today's elections of Choctaw chiefs are much like elections for senators or governors. They have blended their indigenous ways with colonial customs, which include adopting a more European form of dress and practicing the Judeo-Christian religion.

Cinco de Mayo

The Cinco de Mayo (5th of May) holiday has been celebrated in California since 1863 and has

subsequently spread to other states. Although Cinco de Mayo is sometimes conflated with Mexican Independence Day (September 16, 1810), the first Cinco de Mayo celebration commemorated the battle of Puebla (May 5, 1862), when the Mexican army temporarily defeated invading French troops. Later observations of Cinco de Mayo celebrated Mexican heritage, identity, culture, and pride.

Despite Cinco de Mayo being observed by people from diverse backgrounds, Mexican immigrants have been instrumental in planning and executing the celebrations. This has resulted in Cinco de Mayo becoming less about Puebla, and more about Mexican culture within the United States. Cinco de Mayo has frequently included U.S. and Mexican flags and memorialized U.S. historical figures of Mexican ancestry, like César E. Chávez, and Mexican historical figures, like Frida Kahlo. Cinco de Mayo has also come to represent the United States' and Mexico's joint history in defending freedom in North America.

Battle of the Puebla

While the United States, under the leadership of Abraham Lincoln, was immersed in its Civil War (1861–65), Mexico struggled to keep its sovereignty from Napoleon III of France. Mexico's troubles with France began in December 1857, when Mexican conservatives, seeking to reestablish elite privileges, revolted against a newly formed liberal government. To fund their war effort, conservatives borrowed money from Spain, Great Britain, and France. After three years of bloodshed, Benito Juárez (president of Mexico from 1858 to 1872) and his liberal army regained control of Mexico City, marking a short-lived peace in Mexico. Juárez inherited the conservative government's debt to Spain, Great Britain, and France. Lacking the capital to repay the loans, Juárez declared on July 17, 1861, the first battle of the U.S. Civil War—that he would suspend payments of foreign debt for two years.

In 1862, France, Spain, and England pressured Mexico by landing troops on the shores of the Gulf of Mexico. After a few weeks, only France remained, and it became clear that Napoleon III had aspirations of conquest. Because the Mexican army had been routed by the United States in 1848, most Europeans believed that France's

elite army would swiftly defeat Mexican forces and easily take control. Therefore, the world was dumbfounded when the French clashed with local forces in Puebla on May 5, 1862, and the Mexicans won. However, French forces eventually captured Puebla, and Mexico City succumbed in 1863. Even though French troops occupied Mexico until 1867, the battle of Puebla created a sense of national pride and unity for Mexicans in Mexico and the United States alike. In May 1863, California became the first state to celebrate the Mexican victory at Puebla.

Mexican Immigration

The Gold Rush (1848–55) had attracted many Mexicans to California. These newcomers joined Californians of Mexican ancestry who came to California before 1847, when the region was still part of Mexico. These people followed the events of the War of French Intervention almost as closely as they did those of the U.S. Civil War. Moreover, Californians of Mexican ancestry and Mexican immigrants made a conscious effort to observe Cinco de Mayo because of its social implications. At the time of the battle of Puebla, Westerners believed that Mexico and the rest of Latin America lacked civilization and culture. Mexico's victory at Puebla provided people of Latin American ancestry with pride and suggested that perhaps Mexico and Latin America not as backward as critics thought.

Early-20th-century America saw another wave of Mexican immigrants searching for work and refuge from the Mexican Revolution (1910–30). These new immigrants began to outnumber Mexican Americans and Cinco de Mayo began to reflect their new perspectives and experiences. By the 1930s, third-generation Mexican Americans were participating in Cinco de Mayo celebrations organized by first-generation immigrants. This ensured that Cinco de Mayo celebrations in the United States were a reflection of Mexican culture, while maintaining roots in the United States. Cinco de Mayo has also been used by politicians to gain support from constituents who identify with Mexican heritage.

Politics, Culture, and Identity

During World War II, U.S. politicians used Cinco de Mayo as a way to obtain support for the war

effort from Mexican immigrants and Mexican Americans by invoking the interrelated nature of the American Civil War and the War of the French Intervention and the pride and traditions of Mexican people in the United States and Mexico. This trend has continued into the 21st century. For example, in 2005 President George W. Bush held a Cinco de Mayo celebration in which he thanked Latinos serving in the U.S. armed forces in an attempt to gain Latino supporters for the war in Iraq and Afghanistan. In 1998, the U.S. Postal Service released a special edition Cinco de Mayo stamp portraying two *baile folklórico* (folkloric dancers). This stamp is a testament to Cinco de Mayo's importance to people of Mexican heritage, and the impact these people have had in the United States.

Thus, Cinco de Mayo, which began as a celebration of Mexican pride and a victory for democracy, has become a holiday dedicated to Mexican identity and the contributions Mexicans have made to U.S. culture and success. The tradition was not inherited from Mexico but originated in California in 1863, and shortly thereafter spread to other parts of the country. In the United States, Cinco de Mayo has little to do with Puebla, Napoleon III, or the war debt, but rather grants people of Mexican heritage an opportunity to celebrate Mexican culture and identity.

Cisco Kid, The

The Cisco Kid—one of the most successful Hispanic heroes in American popular culture history—has been entertaining audiences for over a century. When Cisco first appeared in 1907 in O. Henry's short story, "The Caballero's Way," he was a dark outlaw who killed for fun. After appearing in a silent movie of the same name in 1914, Cisco gained fame and more likeable qualities when he was featured in the first sound western movie, *In Old Arizona* (1929). The revised character—played by Warner Baxter with gusto and a thick Mexican accent—is a charming bandit. He avoids violence, never harms the innocent, and is a champion of the common man.

Film, Radio, Books, and Music

The movie's phenomenal success led to a series of Cisco Kid films. Baxter reprised his role in 1931 and 1939. Cesar Romero starred as the Kid in six films between 1939 and 1941. Duncan Renaldo played Cisco in three movies in 1945 and then handed the reins to Gilbert Roland, who made six movies in 1946 and 1947. Renaldo then returned in three films released between 1948 and 1950.

Duncan Renaldo clinched his reputation as the most identifiable Cisco Kid by starring in a popular weekly television series from 1950 until 1956. The opening featured the dashing Cisco riding his painted pony alongside his sidekick, Pancho (played by Leo Carillo). Mexican-influenced music thundered in the background as an announcer proclaimed: "Here's adventure; here's romance; here's O. Henry's famous Robin Hood of the Old West—the Cisco Kid!"

Cisco became a multimedia star. A weekly radio show was broadcast between 1942 and 1956. Comic books were published in the 1940s and 1950s. A newspaper comic strip was syndicated between 1951 and 1967. Six graphic novels were issued after 2009. Popular music got into the act when Nick Lucas earned a hit record in 1929 with "My Tonia," a song from the first Cisco sound western. Later hits that referenced Cisco included War's "The Cisco Kid" (1973), Mark Lindsay's "Arizona" (1970), Deep Purple's "Hey Cisco" (1996), and Don Williams's "Pancho" (1998).

Ubiquitous pop culture allusions demonstrate that Cisco has become a cultural icon. Nash

Candelaria published a short-story collection titled *The Day the Cisco Kid Shot John Wayne* (1998). Characters who use "Cisco" and "Pancho" as nicknames can be found in Stephen King's "The Raft" (1982) and Michael Connelly's novels *The Brass Verdict* (2008) and *The Fifth Witness* (2011). Movies such as *Stand By Me* (1986), *Wild at Heart* (1990), and *Creepshow 2* (1987) alluded to the Cisco Kid, as did episodes of TV shows such as *Hill Street Blues* and *CSI: Crime Scene Investigation*. The continuing appeal of O. Henry's hero even fueled a made-for-TV movie in 1994 that starred Jimmy Smits as Cisco and Cheech Marin as Pancho.

Changing Image

The changing images of the Cisco Kid in popular culture reflect corresponding changes in American society and culture. The brutal character introduced in O. Henry's 1907 short story, for example, reflects the era's negative stereotypes of Mexicans as banditos or buffoons and suggests that the dominant white, Anglo-Saxon Protestant culture was not yet ready for a Hispanic hero.

After 1929, Hollywood gave Cisco a makeover in keeping with the era's Latin lover image popularized by exotic film stars such as Rudolph Valentino. Cisco became an amiable rake, who loved wine, women, song, and loot (although not necessarily in that order). Perhaps to evade the movie industry's restrictions on interracial romance, most of the Cisco films of the 1930s and 1940s played down the Kid's ethnicity by describing him as half-Portuguese and half-Old Californian. During the conservative 1950s, Cisco was transformed again. Due to strict rules governing television programming, Cisco became a clean-cut role model who promoted traditional values and did not smoke, drink, or swear. Pancho, however, remained the stereotypical comic Mexican replete with broken English.

When American society changed dramatically in the 1960s and beyond, so did Cisco. The pop icon became a nostalgic symbol for aging baby boomers. He also provided the means to address social and cultural change. The Kid was referenced in songs about growing old (e.g., War's "The Cisco Kid"), losing friends (Don Williams's "Pancho"), new trends (Fat Larry's Band's "Hey Pancho, It's Disco"), and problems of Mexican

immigrants (Rage Against the Machine's "Without a Face").

Cisco's new image reflected the era's growing sensitivity toward minorities. Both Nash Candelaria's short-story collection *The Day the Cisco Kid Shot John Wayne* and Jimmy Smits's television movie *The Cisco Kid* demonstrated America's multiculturalism by the end of the 20th century. The Hispanic cowboy's continuing success was proof that freedom and equal opportunity existed not just in the mythic west but throughout the United States.

Cisco and his lovable sidekick Pancho would probably react to the significance of their century-long cultural odyssey the same way they always concluded episodes on radio and television. The Kid would laugh knowingly and say, "Oh Pancho," to which his friend would reply, "Oh, Ceesco." Then they would gallop off once again into the sunset in search of liberty and justice for all.

Citizenship

U.S. citizenship is a complex relationship between individuals and the state. It consists of protections that the state provides to citizens who, in turn, support and maintain the state. While U.S. citizenship was grounded in ideas about natural

rights and human equality, it has always been an unequal institution. Citizenship was originally extended to free Americans, not all of whom enjoyed equal access to the rights, protections, obligations, and opportunities that the designation offered. Since the 18th century, citizenship and its benefits have been withheld and extended based on national origin, race and ethnicity, gender, religious affiliation, sexuality, and wealth or affluence. Nevertheless, Americans—immigrants and citizens—have worked to equalize access to citizenship and the enjoyment of its benefits. This history of these actions has shaped modern, multicultural America.

Foundations of U.S. Citizenship

The U.S. Constitution, as well as the original state constitutions, defined the legal category of U.S. citizenship in the 1770s and 1780s. Citizenship was something originally offered by the states, but both state and federal law defined the rights, liberties, obligations, and opportunities that citizens enjoyed. These included social rights and liberties, such as free speech and religious liberty, political rights like voting and office holding, economic rights and freedoms such as property ownership and prohibitions on the seizure of property, opportunities to own land or attend public schools, and obligations, which included service in the military and on juries.

The status of "citizen" was extended to all members of the new United States, but only a select group of men enjoyed the full benefits of citizenship. Early Americans believed that only free men with property had sufficient liberty to lead, serve, and build the new republic. Other members of society were not entirely free; women presumably deferred to their husbands, wage-workers to their employers, and servants and enslaved people to their masters. Their seeming lack of complete liberty provided justification to suspend the full range of benefits granted to citizens. These divisions would have a long-lasting effect on unequal citizenship in the United States.

Citizenship in the 19th Century

The first significant change in U.S. citizenship came in the early 19th century through a grassroots effort. The movement for universal white manhood suffrage gradually succeeded in all

states, beginning with Delaware in 1792 and ending in North Carolina in 1854. The men behind these movements were wage earners who often did not own enough property to meet state voting qualifications. They reformed franchise laws by arguing that they had property in their labor and thus were sufficiently free to vote. They built this argument by contrasting themselves to unfree, enslaved laborers. They also contrasted their race with that of enslaved people, thus tapping into broader, popular changes in ideologies about racial difference. Revolutionary-era Americans had believed that the degraded state of enslaved people was due to the circumstances of their lives and could be improved with the guarantees of freedom and opportunities of citizenship. Increasingly, during the 19th century, Euro-Americans came to believe that racial differences were indicators of lesser and inherent characteristics, moral fiber, or mental capacity. This biological racism held that differences were immutable. When rallied in support of white manhood suffrage, this racial ideology justified the elevation of the civil status of white men and eroded that of free blacks. Thus, states that granted suffrage to white men often restricted voting for black men. By 1860, almost all African American men were disenfranchised.

Ideologies of racial difference continued to inform accessed citizenship and its benefits. The *Dred Scott* decision provides one of the most striking examples of the way biological racism redefined and restricted citizenship. Scott was an enslaved man who lived for a number of years in free territory. He used his residency to sue for freedom. In 1857, the U.S. Supreme Court denied Scott his freedom and asserted that he had no standing to sue since he was not a citizen. The court added that no person of African descent could be a U.S. citizen and none had any rights recognized by white society.

The Fourteenth and Fifteenth Amendments

The far-reaching prohibition on African American citizenship and civil rights was one of the controversies at the heart of the Civil War and Reconstruction. After the United States ratified the Thirteenth Amendment in 1865 and abolished slavery, Congress addressed the *Dred Scott* decision and its ban on African American citizenship.

Congress wrote the Fourteenth Amendment and states ratified it in 1868. This amendment confirmed U.S. citizenship for all Americans of African descent.

The Fourteenth and Fifteenth Amendments significantly altered the Constitution, particularly in terms of who counted as citizens and what benefits they enjoyed. The Fourteenth clarified that all persons born in the United States enjoyed U.S. citizenship. It transitioned citizenship from a state-level institution to a national one, and, significantly, it committed the federal government to defending citizens, especially from state governments that might try to allocate justice or resources on a discriminatory basis. The Fifteenth Amendment reinforced this idea of equality by prohibiting states from using race to restrict voting rights

These amendments were the building blocks of the rights revolution that was the Reconstruction. Congress, the courts, black and white reformers, and freed people participated in the rebuilding of the Union and in the building of a new, biracial society. Many Euro-Americans still struggled with ideas about racial difference but joined nonwhite Americans in advocating greater civic equality. Reformers enjoyed certain successes in southern states where thousands of public and private schools offered the opportunity for education to freed children. Seven hundred thousand African American men registered to vote and turned out on election day. They elected the first black congressmen, including Mississippi's Senator Hiram Revels. Republican President Ulysses Grant also owed his 1868 victory to the support of African American voters.

Reconstruction had fierce supporters and opponents. Planters, Democrats, and others challenged multiracial government and worked to dismantle Reconstruction. They succeeded beginning in 1877 when Congress withdrew federal troops from the south. As a result, citizens, only official recourse to violence or intimidation was the federal courts. But these courts, including the Supreme Court, narrowly interpreted federal statutes and the new amendments. They preserved state authority to limit the civil rights of certain citizens.

Between 1873 and 1896, the Supreme Court rendered several important decisions that limited

the impact of Reconstruction. It said that the Fourteenth and Fifteenth Amendments applied only to rights defined in the Constitution or federal statutes. This allowed states to pass laws that could be implemented in discriminatory ways, such as in Kentucky, where the election inspector refused to accept a poll tax from a black voter and then denied him the vote. When the Supreme Court found actions like this constitutional, it opened the door to further discrimination and intimidation. The court struck down federal laws mandating integration in hotels, railroads, and other public facilities. In 1896, the court famously found segregation legal, saying that the Fourteenth Amendment's equal protection provision applied only to political matters (*Plessy v. Ferguson*). Thus the court played an important role in ending Reconstruction and aiding the rise of Jim Crow segregation and discrimination.

As these court challenges demonstrate, the late 19th century was an era of social and political activism that altered the civil rights of many Americans. Despite the victories of conservatives, civil rights organizations remained active and provided a foundation upon which 20th-century groups built. These included the National Association for the Advancement of Colored People (NAACP) and the National American Women's Suffrage Association.

Women's rights groups experienced setbacks and successes. In 1875, the Supreme Court denied women citizens the right to vote, and, in 1873, it said that states could bar women from certain professions based solely on the fiction that biological sex set them apart from male professionals. Women's rights organizations succeeded in securing property and wage rights and custody rights for married women. They also secured workplace protections for women and child laborers at a time when many courts overturned similar laws. Victories and defeats served to define cultures of civic, social, and political activism among women of many backgrounds and also among African Americans, Asian Americans, and Latinos.

Immigration and Naturalization

During the first session of Congress in 1790, lawmakers established a framework for naturalization that permitted only "free white people" of good moral character to naturalize. To complete

the process, candidates had to reside in the United States for two years, apply for naturalization in federal court, and swear an oath to uphold the Constitution. Subsequent laws minimally altered these requirements. During the early and mid-19th century, millions of people, many from the British Isles, Ireland, and Germany, used these laws to become U.S. citizens.

The first significant change in U.S. naturalization laws occurred in 1870, when, during Reconstruction, lawmakers expanded the racial prerequisites for naturalization to include "persons of African descent." This only narrowly expanded access to U.S. citizenship and had a negligible effect on 19th-century immigration. In the late 19th century, immigration increased from southern and eastern Europe and from the Asian Pacific. Federal courts consistently denied naturalization to people who did not fit white or black racial categories, including Native Americans and Asian immigrants.

Because immigration is often the first step to naturalization, Americans have attempted to control and limit access to citizenship by regulating immigration to the United States. Before 1875, state governments regulated immigration. States designed immigration law to prevent the poor, shiftless, or free blacks from settling locally. This led, by the late 19th century, to a patchwork of immigration laws with myriad requirements. In 1875, the Supreme Court responded to this inconsistency by ruling that immigration was a federal matter and part of the exclusive jurisdiction of Congress.

Congress passed its first immigration exclusion law that year. The Page Act of 1875 barred all criminals and Chinese women from immigrating to the United States. This was the first federal law to ban a specific group of immigrants based on gender and nationality. Congress expanded bans in 1882, when it passed the first Chinese exclusion law and prohibited the immigration of laborers from China. Lawmakers reasoned that persons barred from naturalization should not immigrate. Chinese nationals, lawmakers and federal court judges agreed, were not white or black, so they could not naturalize as U.S. citizens.

Despite these obstacles, immigrants from Asia continued to forge a place for themselves in the United States and proved they did enjoy some

civil and social rights even if they were not citizens. In 1886, San Francisco resident Yick Wo challenged a city ordinance that virtually banned Chinese immigrants from operating laundry businesses. Drawing on the Fourteenth Amendment, the Supreme Court struck down the ordinance saying it did not provide equal protection to all residents. In this, the court confirmed that the new amendments applied in the same manner as other parts of the Constitution; namely, civil and social rights and liberties protected all residents of the United States, not just citizens. Moreover, the court later found the Fourteenth Amendment's guarantee of citizenship by birth was similarly guaranteed, despite racial prohibitions on naturalization. In this case, the court confirmed that the native-born child of Chinese immigrants became a citizen at birth.

Congress dramatically expanded immigration bans in 1924, when it passed the National Origins Quota law. The law carved up the world and set a maximum quota on each region and nation. This ban—and the quotas that enforced it—represented the success of biological racism, of movements like eugenics, and the institutionalization of so-called “race science” in government. The highest quotas were allocated to seemingly “white” nations like Great Britain and Germany, while the lowest quotas (of 100) were handed to supposedly “undesirable” groups, which included Slavs, Catholics, Jews and other Semitic peoples, as well as people from southern and eastern Europe, the Middle East and Maghreb, central Asia, the Indian subcontinent, the Asian Pacific, and Oceania. No part of the Americas was included in this immigration ban.

The first cracks in this imposing shield of prohibitions came during World War II. The United States rewarded its allies by repealing certain restrictions on naturalization, which, in turn, meant that lawmakers began to relax immigration bans. Chinese, Asian Indians, and Filipinos were the first groups to whom Congress extended naturalization rights. Racial requirements for naturalization were abandoned in 1952, but the race-based quota system was maintained. Moreover, this law established new obstacles for potential migrants who could be associated with Communism. For this reason, the 1952 law made naturalization harder to achieve by implementing tests

on candidates' understanding of English, American history, and government in order to establish a candidate's “favorable disposition” toward the United States.

In 1965, Congress began to dismantle the National Origins Quota system. The new law continued to limit and count immigrants but it placed a restriction on the total number of immigrants, not on their national origin. For the first time, immigration from the Americas fell under numeric limits, and this greatly reduced immigration from Mexico and Canada. This change in the law meant that many immigrants from the Americas now became “illegal” or “undocumented” residents, a stigma most often attached to Latinos. Lawmakers grappled with this change by reinforcing U.S. land borders and altering immigration and naturalization laws. The 1986 Immigration Reform and Control Act offered amnesty and a path to citizenship for undocumented immigrants. Most recently, Congress has debated, but not passed, the DREAM Act, which would provide legal standing for undocumented immigrants who came to the U.S. as children.

New Americans/Citizens and Noncitizens

The geographic expansion of the United States also gradually expanded membership in the nation's body politic, though in a very uneven and inconsistent manner. The purchase of the Louisiana Territory, in 1803, marked the first time the United States extended blanket naturalization to residents of formerly foreign territory. This set a precedent that the United States followed with the Adams-Onís Treaty (purchase of Florida from Spain, 1819), the Treaty of Guadalupe Hidalgo (ending the Mexican-American War, 1848), and the Gadsden Purchase (purchase of what is now Arizona and southwestern New Mexico, 1853). The Guadalupe Hidalgo treaty ceding Mexican territory to the United States was unusual in two respects. First, it extended citizenship to all residents, including Native Americans. Previously, the United States had recognized Native Americans as part of separate nations and did not grant them citizenship. Second, the naturalization of former Mexican citizens bypassed U.S. racial requirements for naturalization, and in so doing established a precedent that federal courts and the census have followed. Even though Euro-American

U.S. President Calvin Coolidge stands with members of the Osage Indian tribe after signing the Indian Citizenship Act of 1924, which gave America's indigenous peoples full citizenship. The act granted citizenship to approximately 125,000 indigenous people in the United States. Others had already become citizens by other means, either by serving in the armed forces or giving up tribal affiliations.

judges often did not consider Mexican immigrants and other Latinos white, they granted naturalization based on the treaty's precedent of naturalization. For this reason, officials continue to the present day to count Latinos in the U.S. census in the "white" racial category.

When the United States expanded beyond the continent, it did not follow this precedent. The United States expanded its sovereignty but did not grant citizenship to the residents of the Alaska Purchase (1867), the Hawai'ian Islands (1898 and the islands ceded after the 1898 Spanish-American War), Puerto Rico, Guam, and the Philippines. Instead, it classified residents as "noncitizen American nationals," who owed allegiance to the United States and lived under

its jurisdiction. Noncitizens were "nationalized" but not "naturalized." They enjoyed some of the civil and social rights and liberties of resident immigrants, but they lacked a "home country" that might defend or receive them. Moreover, those noncitizen Americans who did not fit the racial categories for naturalization were barred from citizenship. Lawmakers expanded this category of noncitizenship when the United States took control of American Samoa (1899), the Virgin Islands (1917), and the Trust Territory of the Pacific Islands (1947). Beginning in 1891, the United States gradually extended citizenship to some residents of these territories, except for American Samoans, who remain noncitizen Americans, and to residents of places that

became independent, including the Philippines and the Pacific Islands.

The category of noncitizen Americans also included African Americans and most Native Americans. In the years following the *Dred Scott* decision and before ratification of the Fourteenth Amendment, African Americans were Americans without citizenship. The trajectory of the civil standing of Native Americans was far more complex because the federal government recognized native nations as “domestic dependent nations” that exercise a sovereignty within and inferior to that of the United States. Most federal laws effecting citizenship, including the Fourteenth Amendment, made explicit exceptions for Native Americans, referred to as “Indians not taxed.”

In the late 19th century, under the Dawes Act, social reformers tried to break up native nations, assimilate Native Americans, and naturalize them as citizens. This process was uneven and largely unsuccessful because reformers, whose assumptions about Native Americans were steeped in biological racism, didn’t believe that prospective Indian citizens met the peculiar requirements for naturalization. Not until 1924, when Congress passed new legislation, did many Native Americans naturalize as citizens. This law standardized naturalization requirements, and U.S. citizenship did not impair Native American property and treaty rights within their nations.

Congress addressed the rights that Native Americans (and U.S. citizens) could enjoy within the sovereign jurisdiction of native nations when, in 1968, it passed the Indian Civil Rights Act (ICRA). This law guaranteed certain fundamental rights including religious freedom, habeas corpus, and trial by jury. The Supreme Court later found that Indian national sovereignty curtailed some of the rights in the ICRA. This points to a larger ongoing controversy related to Native American citizenship. These U.S. citizens are exceptional in that they still enjoy—and struggle to enjoy—rights to natural resources or to land granted to their nations through treaties made with the U.S. government.

Modern Citizenship

Over the course of U.S. history, citizens have experienced perhaps the greatest equalization in their political rights, including voting and

office-holding. These matters remain points of controversy. Dramatic expansions in the right to vote have shifted the focus to *access* to voting. In 2006, Congress renewed provisions of the Voting Rights Act, extending federal oversight of elections in certain parts of the nation. In 1972, Americans expanded voting age of citizens to 18. Yet, voter turnout to major elections is rather low, at an average of 58 percent during this century. In the face of this seeming apathy, states, including Indiana, Arizona, Texas, and Ohio, altered their voting laws, requiring citizens to present identification at polling places before they could vote. These laws were aimed at preventing fraudulent voting, but civil rights groups argue that they prevent citizens from exercising the right to vote. Reconstruction long before demonstrated how access to voting can impact elections. Indeed, one of the highest voter turnouts was for the 2008 election when Americans elected the first African American president. This moment seemed to symbolize the success of civil rights movements and greater access to elected office. At the same time, women remain a distinct minority among elected representatives, despite accounting for half the U.S. citizen population. Meanwhile, 6 percent of Congress members are Latinos, but, according to the 2010 census, they constitute almost 17 percent of Americans. Elsewhere, the appointment of Tim Scott in 2012 made him the first African American since Reconstruction to represent a southern state in the U.S. Senate.

The 2010 census indicates that those U.S. citizens who have faced the greatest inequalities in accessing the benefits of citizenship or immigration and naturalization are becoming the majority of Americans. The historic nature of these inequalities and the challenges of overcoming them will continue to shape American society, culture, and politics in the 21st century.

Civil Rights Acts

When the United States was in its infancy, Congress passed several laws aimed at curtailing immigration and the rights immigrants and minorities would have in the new nation. Those acts, coupled with the institution of slavery, made the United States a republic that greatly favored white society. There were even early laws and also prejudices against non-Protestants, mainly Catholics. After the conclusion of the Civil War, the government set about to rectify some of these injustices, beginning in 1866 with the first of several

civil rights acts. There would be five in total over the course of 105 years, each seeking to improve upon the last and all dealing with the sober reality that many considered them to be mere scraps of paper that could and should be circumvented.

Civil Rights Act of 1866

When Abraham Lincoln signed the preliminary Emancipation Proclamation on September 22, 1862, and when it went into effect on January 1, 1863, African Americans around the United States rejoiced. The “Day of Jubilee” had finally arrived, a day many thought they would never live to see. Unfortunately, this dream—and the rights many felt should go along with it—was denied to many African Americans through various tactics, and although Congress passed several civil rights acts in order to guarantee the freedom of the former slaves, many did not fully gain that freedom for a century. What is often overlooked is the fact that these civil rights acts did benefit other minorities within society, helping them gain citizenship or other rights previously denied them.

On December 18, 1865, the 30th state ratified the Thirteenth Amendment to the Constitution, once and for all legally abolishing slavery in the United States. Many knew this was merely the first step, but the reaction from the south exceeded what many in President Andrew Johnson’s administration expected. Around the same time, Congress decided to treat the former slaves as wards of the state by creating the Freedmen’s Bureau to provide government assistance to them and others in need in the war-ravaged south. For many reasons, one of which was lack of presidential support, the Freedmen’s Bureau was an overall failure, and though they were no longer slaves, many African Americans did not see a marked improvement in their daily lives.

During late 1865 and early 1866, every former Confederate state passed black codes, a series of laws that differed from state to state but that all took measures to return the former slaves to a status as close to slavery as possible, or slavery without the chains, as it was often called. Southern whites insisted that the codes were necessary to maintain law and order, but most northern congressmen, radical and moderate, saw them as an effort to oppress the newly freed members of society. In response to the black codes, as well as

to the growing instances of violence in the south, moderates in Congress joined with the radicals, who had always championed African American rights, to look for a solution to the problem and to bring equality to everyone. They decided that equality before the law was essential and that enforcement by the federal government was an option if the individual states did not comply. They also felt that each southern state must comply with these ideals before they were to be readmitted to the Union.

These ideas became the basis for the Civil Rights Act of 1866, which was, in turn, the groundwork for the Fourteenth Amendment to the Constitution. The act defined all people who were born in the United States as citizens and specified rights to which each of them were entitled, regardless of race or previous condition, meaning prior enslavement. These rights included but were not limited to the right to make contracts, sue in court, and serve on juries as well as the right to equal benefits to what the government called the security of person and property. Interestingly enough, many of these rights had been denied African Americans as a result of the black codes. This was the first time the federal government had defined the rights of citizens in the form of a law.

It was also announced to states that the federal government was superior in the age-old “states’ rights” debate. Unfortunately President Johnson did not support the act—in fact, he despised it. The act went against his belief in states’ rights as well as his inherent and deeply entrenched racism. In defiance, he vetoed the bill. Congress overrode his veto and passed the law regardless, marking the first time a major piece of legislation passed over a presidential veto.

Knowing there would be continued opposition, Republicans in Congress pushed for more, and this led to the creation and eventual passage of the Fourteenth Amendment. It was initially passed in May 1866 but not ratified by enough states until 1868. The subsequent midterm elections in 1866 became a showdown between those who supported the Fourteenth Amendment and the preceding Civil Rights Act and those like President Johnson who opposed it. Johnson, who was not running for reelection, toured the nation campaigning against the amendment and the act. The

outcome of the election was a Republican landslide and a huge defeat for the president.

In response to the president’s position, the Republicans in Congress passed, again over Johnson’s veto, the Reconstruction Act of 1867, which returned military occupation to the south, but, more importantly, made ratification of the Fourteenth Amendment and observance of the Civil Rights Act of 1866 a prerequisite for readmission for individual southern states. These acts and the Fourteenth Amendment initially led to improvements for African Americans living in the south, as the region entered a period of true interracial democracy. African American Republicans won statewide elections in several southern states, but at every step of the way they were challenged by white society, especially the growing influence and power of paramilitary terror groups such as the Ku Klux Klan. By the early 1870s, many in the north had grown tired of the south and all of its problems. In 1872 Congress passed the Amnesty Act, which restored the political rights of more than 100,000 former Confederate soldiers, officials, and white landowners and thus stripped African Americans and Republicans of their power and influence.

The End of Reconstruction

The Civil Rights Act of 1866 was soon under attack by the newly elected, white-dominated, southern state governments, and when Reconstruction finally came to an end in 1877 and the last federal troops left the south, they took African American hopes and rights with them. Following the end of Reconstruction, one southern state after another quickly passed laws and wrote new constitutions with the aim of cementing African Americans’ status as second-class citizens. Eventually these laws, along with national laws and U.S. Supreme Court cases such as *Plessy v. Ferguson* in 1896, solidified this status. The Supreme Court’s 8–1 decision in *Plessy* dealt with the separation of races in public transportation, specifically denying African Americans the right to sit in first-class compartments on trains; but, more importantly, the ruling opened the door for other avenues of segregation, which did not end until there was a complete separation of the races by the early 20th century. In explaining their ruling, the justices who comprised the majority stated the

Separate Car Act in Louisiana, the basis for the case, did not violate the Fourteenth Amendment and thus did not violate the Civil Rights Act of 1866. It also introduced the phrase and idea of “separate but equal,” allowing segregation on the grounds that equal facilities were to be afforded to both races.

Civil Rights Act of 1957

Though civil rights activists fought and won numerous battles during the first half of the 20th century, including the landmark, 9–0 Supreme Court decision in *Brown v. Board of Education of Topeka, Kansas*, which in 1954 reversed the “separate but equal” ruling of the 1896 court, it would not be until 1957 that Congress would pass another civil rights act. Unfortunately, the Supreme Court did not give a specific timetable for implementation of *Brown v. Board*, and, in a second ruling in 1955, known as *Brown II*, the high court ordered the integration of schools “with all deliberate speed.” Many Southern states took this to mean they could decide for themselves when to follow the order issued by Washington, and most dragged their collective feet. In 1956 in Congress, 102 southern senators and representatives rallied together to sign the “Southern Manifesto,” or Declaration of Constitutional Principles, as it was officially known, to counter the *Brown* decision and to use all lawful means to prevent its implementation.

In response to this defiant act, and with an eye toward his reelection campaign and the election of 1956, President Dwight D. Eisenhower, who had up to this point stayed out of the politics of civil rights claiming it was an issue for the states, together with Attorney General Herbert Brownell sent a civil rights bill to Congress in April 1956. The bill consisted of four parts. The first part created a bipartisan Commission on Civil Rights to study racial discrimination in the United States and recommend the need for any further legislation to Congress. The second section, or Title II, created a new assistant attorney general for civil rights and a new Civil Rights Division in the Justice Department. The third section, Title III, gave the attorney general the right and power to intervene in state civil rights cases and petition federal courts for help through what is known as injunctive relief. The last segment, Title IV, strengthened the power of the Justice Department by giving it

the right to seek help from federal courts in matters relating to voting rights. Title III was the most controversial because it allowed the Justice Department to intervene even when the victims themselves did not come forward out of fear of reprisals.

In July 1956 the House of Representatives passed the bill, but it was killed in the Senate, as many expected and feared. It never got out of committee because rabid segregationist and rampant racist James O. Eastland, senator from Mississippi, chaired the Judiciary Committee. After winning reelection in a landslide over Adlai Stevenson, Eisenhower once again submitted the bill to Congress in 1957. The reaction from southern senators was swift after the bill once again passed the House. The opposition was led by Senator Richard Russell of Georgia, who exclaimed that southern senators were ready to use every tool at their disposal to fight the bill. Russell added an amendment to the bill that would have made all of the bill’s provisions unenforceable, as it called for a trial by jury for those accused of violating a victim’s civil rights. Because juries in the south were all white, the law would not be enforced. After a lengthy debate, a compromise was reached, but on August 28 South Carolina Senator J. Strom Thurmond, who had run unsuccessfully for president in 1948 on the Dixiecrat, or State’s Rights Democrat, ticket, took the floor of the Senate and began a 24-hour-and-12-minute filibuster in a last-ditch effort to kill the bill. When he finished the next day, the Senate passed a watered-down version of the bill, 60–15.

Two months after the passage of the bill, President Eisenhower enforced it by sending members of the 101st Airborne Division of the U.S. Army to Little Rock, Arkansas, in order to protect the “Little Rock Nine,” a group of African American students who were being denied entry to Central High School by Governor Orval Faubus, the Arkansas National Guard, and scores of angry white students, parents, and citizens of Little Rock. In spite of these drastic measures, many knew that more needed to be done.

Civil Rights Act of 1964

In the spring and summer of 1963, violence reached a climax in Birmingham, Alabama, nicknamed Bombingham due to the fact that more than

a dozen bombs had been planted and detonated in African American neighborhoods in the city. The city's commissioner of public safety, a staunch segregationist named Eugene "Bull" Connor, had vowed to maintain a separation of the races, and when Dr. Martin Luther King, Jr., the Southern Christian Leadership Conference, and other local and national civil rights activists descended on the city, Connor struck back. As teenagers and elementary-aged students took to the streets to protest the city's racist laws, Connor ordered the fire department to use its high-powered fire hoses on the marchers. He then ordered the police forward to disperse the crowd with their attack dogs. The gruesome images seen around the world, along with the highly successful March on Washington for Jobs and Freedom, where more than 200,000 marchers, black and white, congregated in front of the Lincoln Memorial, pushed President John F. Kennedy into action.

Kennedy and his brother, Attorney General Robert F. Kennedy, had floated the idea of introducing a comprehensive civil rights bill before Congress: a bill that would finally enforce the Civil Rights Act of 1866 and the Fourteenth Amendment. The bill made the completion of sixth grade sufficient proof of literacy, meaning that southern states could no longer block African Americans at the polls with literacy tests. The bill also banned racial discrimination in public accommodations and afforded the attorney general the right to file school integration lawsuits. The bill also dealt with expanding and extending the Commission on Civil Rights and called for the creation of an Equal Employment Opportunity Commission to monitor discrimination in government and civil jobs. The most powerful section, Title VI, gave the government the power to withhold federal funds from any local or state program that discriminated on the basis of race.

Seeing bills that had died on the Senate floor or not made it out of committee, Vice President Lyndon B. Johnson, former senator from Texas, urged Kennedy to tour the south to champion the bill, but the president did not heed Johnson's advice and instead held a series of talks at the White House. Unfortunately for the Kennedy brothers, they did not have enough votes to pass the bill in the Senate, specifically, the 67 votes needed to ensure that southern senators would not be able

to use the filibuster to kill the measure. New violence in Birmingham—the bombing of the Sixteenth Street Baptist Church—led several liberals in Congress to vow to fight Kennedy's bill because they felt it did not go far enough. Pushed by congressmen and civil rights activists, and without Kennedy's knowledge, his administration decided to expand the scope and reach of the bill—including the expansion of Title II to include private businesses and organizations, not just public accommodations—and to add language that gave the attorney general more power to bring suit on behalf of private citizens.

This did not sit well with the president; nor did it sit well with House Republicans whose support he needed. In the end, the House Judiciary Committee rejected the new version of the bill but passed the original moderate version. The bill was then sent to the desk of Howard Smith, Democrat from Virginia. He received the bill at the end of October, and it was still on his desk when Kennedy was assassinated in Dallas on November 22, 1963.

When Vice President Johnson succeeded to the presidency, he set out to pass the civil rights bill, partly because he knew it was the right thing to do and partly because there was an election in 1964 and he felt he would need the support of the more liberal northern wing of the Democratic party. Johnson immediately began to reach out to African American civil rights activists, meeting with them both in person and by phone to discuss the best way to proceed. Johnson decided to use the recently assassinated president's beloved image and memory to persuade congressmen to his side. In a speech before Congress five days after Kennedy's death, Johnson said the best way to honor him would be to pass the civil rights bill.

Still, Johnson had to overcome major opposition, mostly in the form of Congressman Smith, who could kill any bill by refusing to send it to the floor for a vote. Smith knew if he could keep the bill in committee until midsummer, Congress would go into recess and the bill would be effectively shelved until after the November election. Johnson had an ace up his sleeve: he knew he could force the bill out of committee by a procedure known as a "discharge petition," which would highlight the fact that Smith would not even consent to a hearing or debate on the bill. A couple of weeks later Smith announced that he

would begin hearings on the bill in January, and at the end of the month, the House Rules Committee voted 11–4 to push the bill to the floor, where the House passed the bill 290–130.

Johnson knew the civil rights bill needed to make it through the Senate, and he called in every favor he had due to him—he used lobbyists and former colleagues in the Senate as well as civil rights activists to pressure and convince enough senators to vote for an end to the debate and a vote on the bill. As expected, Richard Russell began a filibuster on March 9, but this brought media attention and scrutiny and rallied more to Johnson's side. Finally, by June the president had enough votes to proceed, and despite a last-ditch filibuster by Robert Byrd of Virginia, who read the text of the English Magna Carta, 44 Democrats and 27 Republicans voted to bring the debate to a close. Nine days later the Senate passed the bill, which became known as the Civil Rights Act of 1964, by a vote of 73–27. The bill was then sent back to the House, which passed it 289–126.

Hundreds packed the East Room of the White House to witness Johnson sign the bill and hand the ceremonial pen to Dr. Martin Luther King, Jr. The next month Johnson was nominated by the Democrats, and in November he defeated Senator Barry Goldwater of Arizona, who had voted against the Civil Rights Act of 1964, in one of the largest landslides in American political history to date. Johnson won 61 percent of the popular vote and 90 percent of the Electoral College. He also carried six of the former 11 Confederate states.

Civil Rights Acts of 1968 and 1971

After helping pass the landmark Voting Rights Act of 1965, President Johnson signed the Civil Rights Act of 1968 into law amid chaos and turmoil. On April 4, 1968, King was assassinated as he stood on the balcony of the Lorraine Motel in Memphis, Tennessee. The news sparked some of the worst riots the nation had seen to that point, and Johnson used the occasion to sign into law an act that was dear to King. This new civil rights bill

The photograph shows Republican senators and southern Democrats meeting to discuss amendments to the Civil Rights Bill on May 20, 1964. By June President Lyndon B. Johnson had enough votes to proceed, and although Robert Byrd of Virginia attempted a filibuster, 44 Democrats and 27 Republicans voted to end the debate. The Senate later passed the bill by a vote of 73–27.

provided for equal housing opportunities regardless of race, creed, or national origin, and included Title VIII, which was referred to as the Fair Housing Act, a follow-up to the Civil Rights Act of 1964. This section was meant to finally cement and enforce provisions of the Civil Rights Act of 1866. The act expanded on the previous bill in that it also prohibited discrimination dealing with the sale, rental, and financing of housing based on race, religion, or national origin. The last of the major so-called civil rights acts was the Civil Rights Act of 1971, which expanded the Voting Rights Act of 1965 and the Fifteenth Amendment to the Constitution, which was ratified in 1870. This act clarified provisions of the 1965 law, making it easier for those denied the right to vote to redress their grievances.

While inequalities still exist today, the five major civil rights acts, the first of which was passed in the wake of the Civil War, have transformed American society. Each built upon the last, and while most were met with resistance, either in Congress or by other outside forces, the laws have helped pave the way for the United States to fulfill the dream that was set in motion when the Founding Fathers severed the ties with Great Britain and crafted the Declaration of Independence and the Constitution.

Civil Rights Movement

The modern civil rights movement refers to specific events of political and social protest against racial segregation and discrimination in America between 1954 and 1968.

African American Civil Rights Movement

Black churches were central to the movement's organization and leadership. Churches hosted mass meetings and freedom schools. Most of the movement's major leaders were ministers.

The modern civil rights movement began with the 1954 Supreme Court decision in *Brown v. Board of Education of Topeka*, which overturned the 1896 *Plessy v. Ferguson* "separate but equal" ruling for public education. The Supreme Court's historic, unanimous ruling failed to set a timeline or procedure for school integration. Local attempts to integrate schools had varying levels of success because segregationists, the Ku Klux Klan (KKK), and white citizens' councils used vehicles of local control to resist integration. Some states even outlawed the National Association for the Advancement of Colored People (NAACP) and similar organizations. In some communities, lynchings occurred well into the 1950s and 1960s.

In 1955, the murder of Emmett Till, a 14-year-old African American boy from Chicago, made national headlines. Till was visiting family in Mississippi and said "Bye, baby" to Carolyn Bryant, a white cashier at a store in town. Bryant's husband Roy and brother-in-law allegedly kidnapped Till in the middle of the night, violently beat and murdered him, and dumped his body in the river. At trial, Roy Bryant and his brother-in-law were acquitted of all charges, though they later accepted a paid interview in which they confessed in graphic detail how they murdered Till.

Montgomery

In 1955, in Montgomery, Alabama, the Women's Political Council organized against bus segregation. African American passengers were required to sit in the back of the bus and to stand if a white passenger needed the seat. Rosa Parks's December 1 arrest for refusing to relinquish her seat marked the beginning of the Montgomery bus boycott, organized by the Women's Political Council. When the NAACP hesitated to get involved, local

ministers formed the Montgomery Improvement Association to direct the campaign. Martin Luther King, Jr., was a new minister in town and was elected to head the organization. King believed that nonviolence would effectively appeal to the conscience of American society. African Americans in Montgomery supported the boycott by staying off buses or donating cars or other resources. Citizens walked to work or participated in carpools, and taxis offered discounted fares. The boycott ended after 386 days, when the Supreme Court upheld a lower court ruling in *Gayle v. Browder* (1956) that bus segregation was unconstitutional. Nevertheless, segregationists continued to resist integration with implied and actual violence. More than 20 cities took up Montgomery's cause to desegregate their local bus systems.

Southern Christian Leadership Conference

Montgomery launched King to national fame, and in 1957, he founded the Southern Christian Leadership Conference (SCLC), an organization of primarily African American Baptists, to coordinate civil rights activism. A few of the significant leaders within the SCLC were Ralph Abernathy, Andrew Young, Fred Shuttlesworth, Wyatt T. Walker, C. T. Vivian, Hosea Williams, James Bevel, Bayard Rustin, Stanley Levison, and Ella Baker.

Little Rock

In Little Rock, Arkansas, school officials drafted plans for integration, beginning with Central High School in 1957. White parents remained strongly opposed to integration. The school district selected 75 of 517 African American students to integrate the school, eventually narrowing it to nine. On the day of desegregation, National Guardsmen summoned by Arkansas Governor Orval Faubus blocked the doors so the "Little Rock Nine" could not enter. President Dwight Eisenhower's timing to send federal troops to support the integration of Central High School was significant because the United States had been condemning apartheid in South Africa. Racial tension and hierarchy within the United States would open America to moral critique for inconsistencies with its international political statements. A year after integration, state and federal authorities remained embattled over jurisdiction. Faubus

closed all of Little Rock's secondary schools, and white parents funded private, segregated schools or left the community. (Most private schools in the south founded between 1954 and the 1970s were founded in direct opposition to the integration of public education.)

The Student Movement

In February 1960, four students in Greensboro, North Carolina, sat in at a Woolworth's lunch counter. For college students nationwide, Greensboro was the spark that ignited dozens of sit-ins. Reverend James Lawson, a Vanderbilt divinity student, led student activists in Nashville, Tennessee. After incarceration for conscientious objection to the Korean War, Lawson studied nonviolent philosophy in India and led nonviolent workshops for student activists, training them to maintain an attitude of love for their persecutors. Nashville students launched a wide-scale demonstration movement.

In May 1961, the Congress of Racial Equality (CORE) organized "Freedom Rides" to test the desegregation of interstate busing established through *Boynton v. Virginia* (1960). The interracial group of Freedom Riders would travel from Washington, D.C., to New Orleans over the course of two weeks, sitting together both on the bus and in the bus stops. At almost every stop, the riders faced verbal and physical abuse. Neither local nor national law enforcement protected the riders, and even Attorney General Robert Kennedy's associate who was sent to investigate the situation was attacked by segregationist mobs. President John Kennedy made token efforts to support civil rights work, but activists remained largely unprotected.

Student Non-Violent Coordinating Committee

SCLC director Ella Baker arranged a meeting at Shaw University in April 1960 for the student protesters. Over 200 students attended the meeting, where both King and Lawson addressed the crowd. There, the Student Non-Violent Coordinating Committee (SNCC) was born. SNCC would engage in both direct action campaigns and voter registration canvassing, rallying to be multiracial and to be democratic. Headquartered in Atlanta, SNCC began projects in southwest Georgia, Mississippi, Alabama, and across the south. Friends

of SNCC groups in the north and west raised local awareness and support for SNCC's efforts in the south. SNCC workers gave the movement a revolutionary energy, flooding jails with their "jail, no bail" policy. Their efforts created local and national tension that applied sustained pressure on elected leaders to protect the civil rights of African Americans. The students found strong support from celebrities like Harry Belafonte, Sammy Davis, Jr., Sidney Poitier, and Dick Gregory.

Birmingham

Fred Shuttlesworth, director of the Alabama Christian Movement for Human Rights, invited King to Birmingham. Project Confrontation would aim at disrupting the city's economy rather than its politicians. Police attacked the marchers—including women and children—with nightsticks, high-pressure water hoses, and police dogs. On Good Friday, 1963, King marched on city hall, knowing he would be arrested. Later that day, he drafted his "Letter From Birmingham Jail," outlining his commitment to nonviolence and projecting heightened tension if racial justice did not come quickly. With more than 3,000

demonstrators in jail, Birmingham felt the pressure. Merchants demanded that city leaders negotiate with civil rights leaders. The KKK took drastic action against movement leaders, including bombing homes and hotels, which incited President Kennedy to throw his support behind King.

The March on Washington

Civil rights leaders from the six major civil rights organizations—SCLC, SNCC, CORE, NAACP, National Urban League, and the Brotherhood of Sleeping Car Porters—pooled their efforts toward a national demonstration for civil rights. The August 28, 1963, March on Washington for Jobs and Justice gathered over 250,000 people of different races and faiths, where John Lewis delivered his famous "Which Side Is the Government On?" and King his "I Have a Dream" speech.

Two weeks later, Alabama Klansmen bombed the Sixteenth Street Baptist Church, former headquarters of the Birmingham project, during Sunday morning activities. Four young girls were killed. In fact, between 1945 and 1965, more than 50 homes and churches had been bombed by segregationists, earning the city the nickname

In September 1957, the National Guard was called out in Little Rock, Arkansas, to escort nine African American students to class at Central High School. The students and their families had sued for the right to attend Central High and had been chosen because of their excellent grades. On the first day, only one of the nine students showed up. She was harassed by protesters, and police had to take her away in a patrol car for protection. Afterward, the students had to be escorted by military personnel.

“Bombingham.” National attention continued to mount in Alabama.

When President Kennedy was assassinated in November 1963, Lyndon B. Johnson continued executive support of the movement. In 1964, Johnson ushered in the Civil Rights Bill, which denied federal money to any organization, business, or school that discriminated based on race.

SNCC Expands

SNCC workers canvassed to register voters and ran freedom schools in Georgia, Mississippi, and Alabama. They faced severe violence and intimidation tactics. In addition to the burning of crosses, bombing of homes and churches, and exploiting of economic hierarchies, civil rights leader Medgar Evers was assassinated in his driveway in front of his family, and Fannie Lou Hamer was brutally beaten in jail and involuntarily sterilized.

During the early 1960s, a dozen African countries gained national independence, and SNCC closely followed these developments, viewing their work as part of these global efforts for social justice and freedom throughout Central America and Africa. In fact, the SNCC slogan “One Man, One Vote” was taken directly from the Kenyan anticolonial struggle. Jim Forman frequently attended international anti-apartheid meetings and brought news of these developments to SNCC. Presidents Kennedy and Johnson made strident efforts to befriend the leaders of these newly independent African nations to prevent their potential alliance with the Soviet Union, but America’s racial segregation proved a sore spot to these negotiations.

In 1964, SNCC sent its top leaders to Africa, where they ran into former Nation of Islam spokesman Malcolm X. He spent a great deal of time talking with them about SNCC and sharing ideas about the philosophy of the movement. Many within the SNCC group who went to Africa described the importance of seeing independent African leadership of African nations, particularly the opportunities afforded to women.

Selma

Beginning in 1963, Bernard and Colia Lafayette led a civil rights campaign in Selma, Alabama, for SNCC. King arrived in February 1965 and used his arrest to sustain pressure against Sheriff Jim Clark’s

violation of civil rights. On February 18, during an evening march around the courthouse, local segregationists and state troopers violently attacked demonstrators and killed Jimmie Lee Jackson. In protest, demonstrators planned a 54-mile march from Selma to Montgomery, scheduled for March 7, 1965. That morning, as over 500 marchers left Brown Chapel, they reached the Edmund Pettis Bridge and found that state troopers had blocked the bridge, were armed with nightsticks and were dressed for combat. After a verbal warning not to march, the troopers charged at the marchers, trampling them with horses, gassing them with tear gas, and beating them with clubs and sticks. March 7, 1965, became known as Bloody Sunday.

This marked a turning point in the unity of the movement. SNCC became overly disappointed at King’s willingness to compromise with a federal judge who convinced him not to conduct the scheduled March 9 repeat march. When a northern white minister, James Reeb, who had come to Selma to support the march was murdered by a segregationist who was found not guilty, thousands of activists came to Selma to protest. The same federal judge who previously enjoined the March 9 demonstration permitted a March 21 demonstration involving over 3,000 marchers of mixed races and faiths.

The Selma march applied sufficient pressure to aid President Johnson’s passing of the 1965 Voting Rights Act, which removed literacy tests for voter registration and gave federal authorities enhanced authority to enforce civil rights related to voting.

Nonviolence and Black Nationalism

The year 1965 challenged the sustainability of the nonviolent approach. The sheer volume of white violence against civil rights demonstrators raised the urgency of self-defense. Many demonstrators consented to nonviolence but did not wholeheartedly believe in it. The February 1965 assassination of Malcolm X and the March 1965 Bloody Sunday struck a deep chord, and restraining retaliation was becoming increasingly difficult. Between 1964 and 1968, over 300 race riots broke out in cities across the country. King remained confident that nonviolent direct action could triumph even in the urban north, and the SCLC shifted its focus there, to economic disparity associated with racism.

Black Panthers

The 1966 “Meredith march,” led by James Meredith, the first African American to graduate from Ole Miss, lasted three days and was the last time SCLC and SNCC would walk together. Meredith was shot during the march, which exacerbated the already ripe tensions concerning the methods and leadership of the movement. Stokely Carmichael began shouting “Black Power!” and the crowd quickly joined him. King was escorted out of the march, and police attacked the marchers, much like in Selma.

In 1966, Carmichael, a Trinidad native raised in Harlem, became the leader of SNCC. Under his leadership, SNCC ousted its white members and moved toward Black Power. Malcolm X’s repeated messages for African Americans to stand up to white society had been heard, and militant activism became more mainstream, though never universal. Many communities, particularly in the urban north, reconnected with African heritage, culture, holidays, fashion, music, and art.

Black nationalism gained new momentum. SNCC leaders, including James Forman and H. Rap Brown, made bold public statements against racism, calling for drastic action against it. Huey Newton and Bobby Seale founded the Black Panthers for Self-Defense in 1966. Black Panthers wore black leather jackets and military berets, and carried rifles to guard African American communities from police brutality. The Federal Bureau of Investigation (FBI) quickly targeted the Black Panthers as an imminent threat to national security, arresting nearly half of its members and killing 28.

Moderate and conservative civil rights organizations lamented the division within the movement, particularly the animosity that black militancy elicited from white society. The SCLC and the NAACP publicly criticized the inefficiency and danger of Black Power, labeling it antithetical to the purpose of the movement. One benefit to the new black left, however, was that less radical leaders, such as King, suddenly became favored alternatives to white politicians.

Radical King

Between 1966 and 1968, King increased his public critique of the Vietnam War. As the SCLC transitioned into the urban north, King became

increasingly aware of economic injustice within racism and viewed the high draft rates of African Americans as government-declared genocide on African American men. His controversial addresses emphasized his commitment to nonviolence and highlighted the controversial nature of American forces protecting the freedoms of others in spite of American racial and economic disparity. King’s radical statements turned many of his longtime supporters against him.

En route to the 1968 Poor People’s Campaign in Washington, D.C., King detoured to Memphis to assist James Lawson with a sanitation workers’ strike, protesting poor working conditions, unfair wages, and anti-union action. On April 4, 1968, King was assassinated at the Lorraine Motel by James Earl Ray. Riots erupted nationwide and lasted eight days.

Without a nationally recognized leader figure as King had been, the movement splintered. Local organizations and national organizations continued to campaign for racial equality, but the late 1960s marked the end of organized cooperation among them. New concerns of gender equality and economic justice entered the national dialogue. Additional gains for racial equality continued in Congress and the Supreme Court. And from 1965, affirmative action has contributed to greater equality for racial minorities and women in employment and education.

Latino Civil Rights Movement

The Chicano civil rights movement, also known as the Mexican American civil rights movement, began in the 1940s. Focusing on rights to property, education, civic participation, and fair representation in media and American culture, the Chicano movement raised awareness of racial prejudice against Latinos in America and fostered a greater sense of ethnic solidarity among Latinos.

“Chicano” originally functioned as a condescending moniker for children of Mexican migrants. Marginalized by Mexicans and Americans, Chicanos were reminded that they were neither fully Mexican nor fully American. Not until the 1960s was the name *Chicano* embraced as a statement of self-determination and cultural heritage.

Since the formation of the border between the United States and Mexico in 1848, prejudice

against Latinos in America has occurred publicly and privately. The League of United Latin American Citizens (LULAC), formed in 1929, was the first attempt at a cooperative Latin American organization for civil rights, and LULAC won an important victory for integrated education for Latino children in 1945. After World War II, a group of Mexican American veterans formed the American G.I. Forum (AGIF), led by Dr. Hector P. Garcia, and collaborated with other civil rights organizations that were disillusioned with the experience of fighting for freedoms abroad that they did not possess at home. The AGIF made national headlines for its publicity of World War II soldier Felix Longoria, killed in action and not permitted to have a funeral service in his hometown of Three Rivers, Texas.

The AGIF also campaigned for increasing registered Latino voters during the 1950s and 1960s. A variety of voter registration and political organizations formed throughout the 1950s and 1960s to represent the political voice of Latinos in America. In 1962, César Chávez cofounded the National Farm Workers Association, which used boycotts and strikes to press for fair wages and employment conditions for Latinos.

Confronting prejudice legally, the 1947 *Mendez v. Westminster* case found segregation of Hispanic children and restricting Latinos from jury service unconstitutional. The 1954 *Hernandez v. Texas* insisted that Latinos and other marginalized groups deserved equal protection under the Fourteenth Amendment of the Constitution. Resembling the NAACP, the Mexican American Legal Defense and Educational Fund, established in 1968, sought legal avenues for confronting racial prejudice against Latinos, as well as political activism and leadership training.

Throughout the 1960s and 1970s, a series of student walkouts across the country protested the curriculum of public education related to Latinos and the poor quality of education available to Latinos through the public school system. Protests occurred in Los Angeles, Denver, East Los Angeles, and Houston. University students also protested the dearth of courses on Latino culture and history.

The major student organizations of the Chicano Movement were the United Mexican American Students, Mexican American Youth

Association, and the Mexican American Youth Organization. In 1969, these organizations united as the Movimiento Estudiantil Chicano de Aztlán (MEChA). MEChA initially focused on education concerns, but broadened its scope to address political and social forms of discrimination as well.

The Chicano movement also strongly protested the Vietnam War because of the disproportionate drafting of Latinos and the negative effects of the war on Latino communities.

Puerto Rico became part of the United States in 1898. The United States extended services to Puerto Rico such as health care, postal service, a government structure, and public education, but kept the island as a commonwealth rather than a fully represented state. Many Puerto Ricans have migrated to the United States, where they have faced similar difficulties as other Latino immigrants. Puerto Rican activists have debated the relationship between the United States and its own government, advocating for both statehood and independence.

Within the Chicano civil rights movement, the Comisión Femeni Mexicana Nacional, founded in 1970, advocated specifically for issues affecting Latinas. For example, in *Madrigal v. Quilligan* (1975), the Comisión fought compulsory sterilization of Latinas and advocated bilingual consent forms during medical care to prevent Latinas who did not speak English from unknowingly consenting to sterilization. Mujerista Liberation Theology examines patriarchy within Latino culture and seeks the full equality of all people.

In the 21st century, the Chicano movement has focused on developing well-educated leaders to represent Latinos in American media to counter negative stereotypes of Latinos. Examples of widely respected Latino personalities include former New Mexico Governor Bill Richardson, comedian George Lopez, and actress Sofia Vergara. The Chicano movement has also focused on communicating its values through the visual and performing arts, most notably through bright colors and expressionism.

Native American Civil Rights Movement

The original inhabitants of the Americas, the Native Americans have been seeking freedom from Western domination since the arrival of

Western explorers in the 15th century. As European settlers dominated the Americas, Native Americans were violently displaced to the margins of society. Since that time, Native Americans have pressed for equality.

Native Americans have regularly experienced discrimination in housing, education, civic participation, and religion. The National Indian Education Association, established in 1969, lobbies for educational equality for Native Americans. Additionally, many schools with mascots referencing Native Americans have changed their mascots to avoid discrimination against Native Americans.

Religion is one of the most significant aspects of Native American civil rights. European explorers imposed Christianity and Western ideas of domination on Native Americans, which had varying degrees of success. Numerous missionaries created isolated communities for Native American converts to Christianity, which contributed to the marginalization of Native Americans. In the early 20th century, the U.S. government funded several Christian efforts to evangelize Native Americans and increased its prosecution of Native American religious practices.

Native American religion differs by tribe, is both individual and corporate, and reflects a close spiritual connection with the land. Tribal religions often have unique creation accounts and a strong sense of fellowship with nature and ancestors. Many current Native American religious practices reflect syncretism between Christianity and tribal religion. Native Americans achieved religious liberty in 1978 with the American Indian Religious Freedom Act, except for practices that involve restricted species and substances, particularly peyote.

Technically citizens of their tribes, which are titled “domestic dependent nations,” Native Americans faced severe discrimination. Previously restricted from travel off reservations, the 1924 granting of U.S. citizenship to Native Americans permitted free travel. The United States also heavily restricted what Native Americans could do on their land but did grant rights to hunting and fishing on their reservations, which created tension with non-Native American hunters who must follow government regulations for hunting areas and seasons. Certain tribes were granted suffrage in the 19th century, but most Native Americans received voting rights with the granting of

citizenship in 1924. A few states—Colorado, for example—continued to deny Native Americans suffrage until the 1965 Voting Rights Act.

In 1968, the Indian Civil Rights Act was passed, guaranteeing the civil rights of Native Americans, particularly those in the Bill of Rights, property ownership, and travel. In 2012, the U.S. government recognized over 550 Native American tribes, each granted sovereignty over its own community.

Asian American Civil Rights Movement

After more than a century of discrimination by the U.S. government, including immigration restriction and internment camps, Asian Americans launched a civil rights movement in the 1960s and 1970s, pressing for political and religious equality. Nicknamed “Yellow Power,” the Asian American civil rights movement gained momentum near the end of the African American civil rights movement. Asian philosophers had played a key role in the Black Power movement, and a connection between Asian and African American civil rights seemed very natural. For example, Black Power advocates frequently cited Mao Zedong, and Black Panther Party founder Richard Aoki was Japanese American and a survivor of a World War II internment camp.

After the bombing of Pearl Harbor by the Japanese, President Franklin Roosevelt ordered all Japanese Americans—more than 100,000—to be placed in internment, or concentration, camps for fear that some might still have loyalty to Japan. Many Japanese Americans assimilated into American culture to prove their patriotism, but the camps reinforced mainstream prejudice against Asian Americans.

As African Americans, Latinos, and Asian Americans shared their experiences with each other, they found solidarity in the racial injustice they had been facing. These groups demanded that universities offer coursework in their cultural histories. The movement for Asian American equality grew predominantly through universities, and by 1970, more than 70 such groups existed. These groups pressed for greater cultural appreciation for Asian heritage and political and social equality for Asian Americans.

Before the Vietnam War, Asian Americans tended to identify with particular ethnic groups

rather than as a unified racial group. During the war, Asian Americans faced prejudice regardless of their particular ethnicity. This shared experience of prejudice facilitated a sense of racial solidarity among Asian Americans.

In the 1970s and 1980s, Asian American activist groups pressed the federal government to acknowledge the wrongs committed against Asian Americans in the 20th century, particularly the internment camps during World War II. In 1976, President Gerald Ford signed a document that acknowledged wrongdoing in the internment. In 1988, President Ronald Reagan signed the Civil Liberties Act, which awarded \$20,000 in reparations to former inhabitants of the Asian American internment camps and formally apologized for the actions of the United States against Asian Americans.

Civil War, U.S.

The American Civil War was of immediate importance to free and enslaved Africans. During the antebellum years, many of them worked tirelessly to promote the antislavery cause. Foremost among them was Frederick Douglass, an escaped slave whose riveting oratory was said to hold audiences spellbound. Douglass's autobiography, *Narrative of the Life of Frederick Douglass, an American Slave*, published in 1845, became a mainstay in the antislavery movement, while his newspaper, *The North Star*, was probably second in influence only to William Lloyd Garrison's celebrated *The Liberator*. One of the most militant African abolitionists was David Walker, who published *Walker's Appeal* in 1829, calling upon slaves to rise up and seize their own freedom by force if necessary. Henry Highland Garnet, another noted public speaker, was another who advocated direct political action by Africans to end slavery and obtain equal rights under the Constitution. Yet another advocate of direct action was Harriet Tubman, who became famous as a leader in the Underground Railroad movement to assist slaves in escaping to freedom in the north or in Canada. Sojourner Truth was active in the antislavery and women's rights movement and is best known for her famous "Ain't I a Woman?" speech delivered at a women's rights convention in Ohio.

The slavery issue was also important to the tens of thousands of new immigrants who arrived in America during the antebellum years. During its first century of national existence, the two largest groups arriving on its shores came from Ireland and Germany. On the surface, these were quite different migrations. The Irish were predominantly poor, agricultural laborers, and a high percentage of them possessed little or no formal education. Their principal motive for migration was economic, including such prompts as the enclosure movement, which placed severe limitations on the public use of land, and the great famine. Because they were so poor, most settled initially in the eastern cities where they landed, taking the lowest-paying menial jobs and living in the least desirable overcrowded slums. German migration, on the other hand, reflected a much broader spectrum of society, including small farmers, factory workers, entrepreneurs, intellectuals, and literary

figures. More affluent when they arrived, many moved quickly west where they purchased their own land to settle down as independent farmers. Some carved out ethnic enclaves among the growing eastern municipalities, while others helped found distinctly German communities within emerging western cities like Cincinnati, Milwaukee, and St. Louis.

Politically, the Irish immigrants were largely ambivalent toward the social issues of the day, including the antislavery movement, between 1820 and 1860. They were generally too poor for concerns beyond economic survival. In fact, if anything, the Irish preferred to leave slavery in place. Not that they supported it, but they feared that if it were eliminated the freed slaves would flood northern cities, competing with them for jobs, housing, and influence. They preferred the Democratic Party over the somewhat anti-immigrant stance of the Whigs and the later virulent antiforeign and anti-Catholic Know-Nothings. On the other hand, the German political émigrés of the late 1840s and 1850s not only embraced the liberal reform movements of the time but provided visible national leadership. They were ardent advocates of women's rights, education, and the antislavery crusade in which they numbered among its most strident supporters. When the Republican Party was formed in 1854 as a largely antislavery party, many were drawn to it, in contrast to the Democrats who generally fell somewhere between pro-slavery and compromise on the issue.

Among the more prominent German antislavery leaders were Karl Heinzen, editor of the radical *Deutsche Schnellpost*; Gustav Koerner, who helped craft the antislavery platform of the new Republican Party in the 1850s; early Republican activists Friedrich Hecker and Friedrich Hassauerek; and Carl Schurz, who gained a reputation for his antislavery rhetoric and became an intimate of Abraham Lincoln. The Poles Jan Tyssowski, Adam Gurowski, and Marie Zakrzewska were among the more outspoken abolitionists, as was the Norwegian Hans Christian Heg. Many of these Europeans were veterans of the democratic and nationalistic revolutions that swept Europe in the late 1840s; consequently, they were particularly interested in the cause of freedom, which they equated with the antislavery movement. Because the large majority of each of these groups settled in the free

north, they were able to speak out against slavery and in favor of the Union with little fear of overt retaliation. These European political exiles generally became active participants in the antislavery movement, and the German-language press in particular contained a large number of editors and journalists interested in promoting the cause. In 1860, there were 265 German-language newspapers published in the United States. All of them favored preserving the Union except three, and the latter were all published in the south.

Ethnic Participation in the Civil War

Determining ethnic participation in the Civil War has been the subject of much speculation and some widely divergent answers depending on whether one counts only immigrants, the second generation, or, for that matter, establishing whether an individual listed as, for example, "German" might actually be an ethnic Pole, Hungarian, or Czech. The most generally accepted estimates are that the Union army included some 516,000 immigrants comprising 23.4 percent of all Union soldiers. About 216,000 were Germans and 170,000 were Irish soldiers. Although not immigrants, 180,000 Africans constituted the second-largest group of ethnic participants in the Union army, behind the Germans and ahead of the Irish. Confederate records are less revealing, and there were much smaller immigrant communities in the south to begin with because most Europeans found jobs in northern industry or took advantage of the opportunities to purchase inexpensive land in the midwest.

With the largest ethnic presence in the war, Germans played a major role in both the eastern and western campaigns. Foremost among their leaders were Franz Sigel and Carl Schurz, two prominent Forty-Eighters who were also influential leaders in the German American community. Promoted to brigadier general because of his ethnic connections, Sigel fought well at the Battle of Pea Ridge, but was not as successful after moving east. His troops fought well in defeat at the Second Battle of Bull Run, but he was routed at the Battle of New Market in the Shenandoah Valley in 1864, effectively ending his military career. Schurz, on the other hand, while also a political appointee, performed well as a division commander in the Army of the Potomac. Assigned to the Eleventh

Corps, about 40 percent of which was comprised of German Americans, he and his troops were saddled with a largely undeserved reputation for causing the Union defeat at Chancellorsville. Despite this, they performed well at Gettysburg and, after being transferred to the western theater in late 1863, gained praise for raising the Siege of Chattanooga and their prominent role in General William Tecumseh Sherman's campaigns through Georgia and the Carolinas. Numerous regiments that were raised from among predominantly German Americans earned praise during their service, including the 20th New York (sponsored by the local Turnverein), 26th Wisconsin, 45th New York, 32nd Indiana, 9th Ohio, and the 9th Wisconsin. Among other prominent German officers were Ludwig Blenker, Hubert Dilger, Friedrich Hecker, Peter Osterhaus, Alexander Schimmelfennig, Leopold von Gilsa, Adolf von Steinwehr, Max Weber, Godfrey Weitzel, and August Willich. Approximately 5,000 Germans served in the Confederate army, the most prominent probably being Heros von Borcke, who served for a time with General Jeb Stuart's cavalry.

Irish immigrants formed a large portion of the enlistments in the Union army, and spawned much Civil War lore, which exceeded even their proportion of participation. Although, as with other groups, Confederate records are not always accurate or available, there were also several prominent Southern leaders and regiments of Irish ancestry. In the Union army, Irish units abounded, but the most famous was the Irish Brigade led initially by Thomas Meagher and later by Patrick Kelly, Thomas S. Smyth, Richard Byrne, and Robert Nugent. The brigade gained fame for its very costly assault on the virtually impregnable Confederate position behind a stone wall at Fredericksburg, and was again bloodied at Antietam. Comprised of the 28th Massachusetts, 63rd New York, 69th New York, 88th New York, and 116th Pennsylvania, the brigade suffered over 4,000 killed and wounded during the war, a number exceeding the normal enlistment for an entire brigade at full strength. Other important Irish leaders in the north included Michael Corcoran, William Gamble, Stephen McGroarty, Robert Nugent, and James Shields. In the south, Patrick Cleburne was a prominent general of Irish ancestry, along with Joseph Finegan and Walter Lane, while among the

more prominent Irish regiments were the 6th Louisiana, 8th Alabama, 2nd Tennessee, 10th Tennessee, 24th Georgia, and Cobb's Legion.

Though fewer in number than the Germans and Irish, other European immigrant groups also made noteworthy contributions during the Civil War. Poles contributed three general officers—Wladimir Krzyzanowski, Joseph Kargé, and Albin Schoepf—along with the Union's "Polish Legion" (58th New York). Italians were represented by the multiethnic "Garibaldi Guard" (39th New York) under Colonel Frederick George D'Utassy. Scandinavians raised the flag under Colonel Hans Christian Heg, who was killed at Chickamauga where the regiment suffered 63 percent casualties. The French contributed the fashionable "zouave" uniforms that were adopted by several regiments, north and south, at the beginning of the war, with the most prominent officers of French descent being the south's General Pierre Gustave Toutant Beauregard and Frenchman Camille Armand Jules Marie, Prince de Polignac. Scots raised the 79th New York "Highlanders," complete with kilts, bonnets, and bagpipes, under Colonel James Cameron.

Although the U.S. government did not actively recruit Africans into the armed forces until after the Emancipation Proclamation, the large number who served during the remainder of the conflict is testimony to their willingness to fight for their own freedom, often at the cost of being denied quarter and brutally murdered when captured. The first "black" regiment to be officially mustered into the army was the 1st Louisiana Native Guard, which entered service on August 27, 1862, to be followed shortly by several others collectively known as the Corps d'Afrique. Eventually, when the federal government began mustering segregated African regiments, with white officers and black enlisted men, they were numbered consecutively as "United States Colored Troops." By the end of the war, African troops populated 145 infantry regiments, seven cavalry regiments, 12 heavy artillery regiments, one light artillery regiment, and one engineer regiment. About 60 of these units saw active combat, while the rest were assigned largely as garrison troops. During the war they lost 143 officers and 2,751 men killed in action. No doubt the most famous of the units was the 54th Massachusetts, whose history was re-created in the popular movie *Glory*. Comprised mostly of free residents of the

north, it fought with notable courage in actions at James Island, Battery Wagner, and Olustee.

African regiments were prominent in the Union assault on Port Hudson (Louisiana) in May 1863, the Battle of Milliken's Bend (Louisiana) in June 1863, Olustee (Florida) in February 1864, Chaffin's Farm (Virginia) in September 1864, Honey Hill (South Carolina) in November 1864, the Nashville Campaign (Tennessee) in December 1864, and the Siege of Petersburg (Virginia). During the latter, two divisions of African troops took part in a doomed assault on the Confederate lines known as the Battle of the Crater at the end of July 1864, suffering heavy losses. In addition to combat losses, African soldiers also had to endure discriminatory treatment by Confederate officials. The south insisted on treating Africans captured in uniform as if they were engaging in slave insurrection, which, under southern law, was punishable by an automatic death sentence. The refusal of the south to accord African soldiers the same opportunities for exchange as other captives was one of the main causes of interruption in the prisoner exchange system. There were also instances—notably at Fort Pillow (Tennessee), Poison Springs (Arkansas), Simpsonville (Kentucky), the Crater (Virginia), and New Market Heights (Virginia), among other places—when African soldiers who attempted to surrender were murdered.

The Confederacy made a concerted effort to attract Native Americans to its cause, recruiting whole regiments of Cherokee, Creek, Choctaw, Chickasaw, and Seminole under the command of General Stand Waite, a Cherokee who eventually became the last southern general officer to surrender at the end of the war. On the Union side, nearly 3,000 Native Americans joined the army, the most famous being Colonel Ely Parker, a Seneca who served as an aide to General Ulysses S. Grant and wrote out the surrender terms at Appomattox.

Though relatively small in terms of total population in 1860, Hispanics also took an active part in the Civil War. Given the location of most along the southern borderlands, they were almost immediately placed in a position of having to choose sides. Researcher John O'Donnel-Rosales estimates that up to 13,000 Hispanics served the Confederacy, with fewer probably in Union service because of their residential pattern. Among the Confederates, José Agustín Quintero played an important role

in northern Mexico, maintaining critical supply lines into the Confederacy. Although most Hispanics in the south served in integrated regiments, recognizable groups were included in Manigault's South Carolina Battalion, the Spanish Guards from Mobile (Alabama), the Cazadores Españoles (Louisiana), the 1st Florida Cavalry, the 55th Alabama Infantry, the 6th Missouri Infantry, the Chalmette Infantry (Louisiana), and the Louisiana Zouave Battalion. Many Mexican Americans were also found in the ranks of the 2nd Mounted Rifles (Texas) and the 10th Texas Cavalry.

Among the Union forces, Julio P. Garesché du Rocher, of Cuban and French descent, designed fortifications defending Washington, D.C., at the beginning of the war and was later killed in action in the Battle of Stones River. Admiral David G. Farragut, the leading Union naval officer of the

war who was responsible for the capture of New Orleans, was of Hispanic heritage. Mexican Americans from Texas predominated in the 1st Texas Cavalry (Union) and some 4,000 men from New Mexico, mostly of Hispanic descent, mustered into the Union army. These included the 1st New Mexico Infantry under Colonel Rafael Chacón and the 2nd New Mexico Infantry under Colonel Miguel E. Pino. At the crucial Battle of Glorietta Pass near Santa Fe where a Confederate invasion was turned back, troops under Lt. Colonel Manuel Chávez of the New Mexico militia outflanked the Confederate force and destroyed its supply base, forcing the rebels to retreat back into Texas and saving New Mexico and Arizona for the Union.

Consequences of the Civil War

The most significant ethnic consequence of the Civil War was its impact on African Americans. As a direct result of the Union victory, the Thirteenth Amendment to the Constitution made slavery illegal; the Fourteenth Amendment defined citizenship to include people born in the United States, a direct attempt to provide unequivocal citizenship to people of African descent who were denied this in the earlier *Dred Scott* decision; and the Fifteenth Amendment made it illegal to deny voting rights to people based on race, color, or their “previous condition of servitude.”

The Civil Rights Act of 1866 was an attempt to protect the rights of African Americans, although the period of “Jim Crow” legislation provided the south with means to circumvent most of these attempted protections. The Civil War also led to the establishment of the Freedmen’s Bureau to assist ex-slaves, and to other initiatives, many only marginally successful, to provide for the education and legal protection of those of African descent. The war also spurred the first movement of Africans from the south to cities in the north, and to a lesser extent to the west in search of new opportunities.

Class and Ethnic Diversity

Though the United States lacks the traditional class system of countries like the United Kingdom, class as a factor dictating social and economic mobility, and emerging from largely economic factors, is certainly a very real thing. Class is complicated, of course, and there is a sort of vestigial aristocracy in the form of “old money” families (nearly exclusively white) whose opportunities and social class may exceed their actual wealth and incomes, especially relative to “new money.” Further, the

prestige of class markers varies somewhat from region to region; college ties to Tulane or Emory mean more in the south than in the north, as ties to Lehigh would mean more in the north than in the south, for reasons independent of those institutions' actual merits. Education, occupation, wealth, and income are all elements from which class emerges, and all of these things are very affected in the United States by one's race.

Some scholars have argued that class grows out of occupation, either directly—one's own occupation—or indirectly—one's parents' or forebears' occupation, as workers in a similar position develop similar lifestyles and ways of thinking, which in turn creates patterns that we call social class. Were this so, economic factors would be important mainly for their effect on mobility and insofar as some occupations are more highly paid than others. Key to the idea of class is that although it can be changed, it changes slowly, and one's own class provides at least the starting point for one's children.

Educational attainment, for instance, statistically affects not only income and wealth but the likelihood of one's children attaining a similar level of education. Asian Americans have the highest educational attainment in the United States, an accomplishment that factored heavily in their being termed a "model minority," and in many "positive stereotypes" about Asians in America. Nearly half of Asian Americans possess a college degree, compared to a third of non-Hispanic whites, about 17 percent of blacks, and about 11 percent of Hispanics.

Long-term economic studies have found that economic prosperity in the United States, especially long-term trends of prosperity, have correlated with increasing economic disparity: as upper-class and white incomes and wealth increase, the gap between them and lower-class and nonwhite incomes and wealth increases. The received narrative of American prosperity soaring in the generation after World War II, and of economic troubles in the 1970s and 1990s being brief exceptions to an overall arc of progress, is at heart a story about white Americans' success. The wealthier have become more and more wealthy, and the poor have been left further and further behind.

The white American household has twice as much median wealth as the Asian American

household, 15 times as much as the Hispanic American household, 22 times as much as the black American household, and while household net worth fell for all Americans from 2005 to 2010 thanks to the collapse of the housing market and the financial collapse, white household median net worth fell only 23 percent compared to 60 percent for each of the other three groups—despite the fact that white families are overwhelmingly more likely to be homeowners and were more directly impacted by the collapse of home values. While homeownership rates among blacks and Hispanics increased during the housing bubble, they did so on the strength of high-cost subprime loans. Asians, more likely than blacks and Hispanics to own their homes, were disproportionately affected by the housing market collapse as home values on the West Coast, where the Asian population is concentrated, fell the deepest.

Though improvements have been made, thanks in part to programs like Lyndon Johnson's Great Society, which extended and improved Roosevelt's New Deal and targeted vulnerable groups more specifically, the disparity between the class standing of whites and nonwhites in America remains severe. For instance, as a share of white family income, in the more than 60 years from 1947 to 2010, black family income rose from 51.1 percent to only 61 percent—an improvement, certainly, but a small one compared to the prosperity experienced by white Americans.

Despite the widespread belief in the United States of class mobility—the ability of the determined American to lift himself up by his bootstraps and climb to the next rung of the wealth ladder—in practice, only 3.6 percent of black children born to the bottom 25 percent of families by income ever make it to the top 25 percent, in contrast with 14.2 percent of white children born to the bottom fourth. In fact, a minority of white children born poor remain poor—about 32.3 percent—while nearly twice as many poor black children (62.9 percent) remain poor.

Ethnic Diversity and Income Quintiles

One of the common ways of discussing income groups in the United States is to divide households into quintiles, that is, groups representing one-fifth of American households, grouped according to income level, a method popularized by the *New*

York Times. The elite of the highest fifth—the 5 percent of American households with the highest incomes—are also sometimes discussed. According to a 2004 U.S. Census Bureau report, the U.S. breakdown was as follows:

- The lowest fifth was made up of 16.9 million white households, 4.5 million black households, 624,000 Asian households, and 3 million Hispanic households.
- The second fifth was made up of 18.4 million white households, 3.3 million black households, 593,000 Asian households, and 3.1 million Hispanic households.
- The middle fifth was made up of 19 million white households, 2.6 million black households, 786,000 Asian households, and 2.8 million Hispanic households.
- The fourth fifth was made up of 19.2 million white households, 2 million black households, 871,000 Asian households, and 1.9 million Hispanic households.
- The highest fifth was made up of 19.7 million white households, 1.2 million black households, 1.2 million Asian households, and 1.2 million Hispanic households.
- The top 5 percent was made up of 5 million white households, 236,000 black households, 366,000 Asian households, and 269,000 Hispanic households.

Relative to their share of the general population, whites are disproportionately represented in the three highest quintiles and underrepresented in the lowest quintile. Blacks are overrepresented in the two lowest quintiles and underrepresented in the two highest quintiles, and especially in the top 5 percent. Asians are overrepresented in the two highest quintiles, and underrepresented in the two lowest quintiles. Hispanics are overrepresented in the three lowest quintiles, and underrepresented in the two highest quintiles.

To express the data in another way: about 21 percent of American families with white heads of household are in the top quintile of income, about 30 percent of Asian-headed families; only 9 percent of blacks and 9 percent of Hispanics are. Similarly, while 18 percent of white families are in the lowest quintile of income, and 15 percent of Asians, 24 percent of Hispanic families and a

disproportionate 33 percent of black families are in the lowest quintile. Class and poverty remain very much tied to race in the United States.

In the 2010 census, 15.1 percent of the general population were found to be living in poverty (13.7 percent for working-age Americans, aged 18–64). While this included only 9.9 percent of non-Hispanic whites, it included 12.1 percent of Asians, 26.6 percent of Hispanics, and 27.4 percent of blacks. The disparity is similar when considering only children: while 21 percent of American children live in poverty, 46 percent of black children and 40 percent of Hispanic children live in poverty. Some 6.6 percent of Americans lived below half of the poverty line—primarily blacks and Hispanics. The greatest numbers of non-Hispanic whites living in extreme poverty lived in rural areas.

Economic Disparities by Race and Ethnicity

Though employer-provided health insurance and pension coverage have declined in general since 1979 to 2010, they remain benefits provided to a higher percentage of whites than nonwhites. In 2010, 48 percent of whites had employer-provided pension coverage (52 percent in 1979) and 58 percent had employer-provided health insurance (70 percent in 1979). By contrast, only 37 percent and 49 percent of blacks had pension and insurance coverage, respectively (46 percent and 63 percent in 1979), and only 24 percent and 36 percent of Hispanics did (63 percent and 60 percent in 1979). While all groups have suffered erosion of coverage, twice as many blacks lost pension coverage as whites. The disparity between non-Hispanic whites and Hispanics in employer-provided health insurance coverage has expanded the most in that period.

The majority of households with zero or negative wealth are nonwhite, despite white households remaining the majority of the population. In 2010, only 18.6 percent of such households were white, compared to 35.8 percent Hispanics and 33.9 percent blacks.

Whites are significantly more likely than nonwhites to own their homes. In 2011, 73.8 percent of whites owned homes, compared to 58 percent of Asians, 44.9 percent of blacks, and 46.9 percent of Hispanics. As home ownership rates have fluctuated, the disparity between whites and nonwhites has remained fairly steady.

In 2010, the median wealth of black families was only \$4,900—about 5 percent of the white family median wealth of \$97,000. Home ownership disparity accounts for a large part of this, because whites are overwhelmingly more likely to own their homes. American ethnic groups by median household income, according to the 2010 census are as follows:

- Indian: \$90,525
- South African: \$80,786
- Filipino: \$79,336
- Australian: \$74,341
- Taiwanese: \$73,596

The Lost Decade

After the collapse of the speculative asset price bubble in Japan at the end of the 1980s, Japan experienced a prolonged period of stagnation that has since been called the Lost Decade, though it is sometimes characterized as lasting up to 20 years. In the 1980s, the enormity of the asset bubble caused land and stock prices to triple. The severity of the subsequent collapse was proportionate

to this artificial inflation of the bubble; within five years, the government had gone from a 2.4 percent budget surplus to a 4.3 percent budget deficit, and the collapse of asset values bankrupted many companies. The contraction of the economy led to a shortage of jobs, especially for those of early retirement age and those too young to have established seniority or competitive skills.

One of the social effects was a sudden generational shock wave, as Japanese youth faced significant-enough levels of unemployment to normalize the state of not working or of working only a small number of hours. There has been much speculation about the long-term effects as this generation becomes older and greets each coming decade with less work experience, fewer skills, less savings, and often deferred marriage or children than did previous generations.

Clearly, many of the economic conditions of the Lost Decade are echoed by the global financial crisis and its immediate antecedent in the 2006–08 collapse of the housing bubble in the United States. Officials and economists alike warned of the possibility of the United States’ experiencing a Lost Decade, and employment figures seem to demonstrate some of the effects on the youngest adult cohort, the hypothetical American Lost Decade generation. In most states, it is this age group that faced the greatest unemployment—very likely greater than is shown by unemployment statistics, since those take into account only those who are actively seeking work, and in a job-shortage situation, young people living with their parents will often simply stop looking for work or enter college as an alternative.

This hypothetical Lost Decade impacts Americans differently according to their socioeconomic background. One of the few growth areas since the financial collapse, for instance, has been the opening of law schools. Despite the shrinking job market for lawyers and the shrinking paychecks for entry-level legal industry jobs, the combination of which drastically reduces the financial value of a law degree, many young middle- and upper-class students have chosen law school as their remedy to a tough job market. The perception persists that a law degree is somehow an immunization against unemployment woes, and student loans for law students are plentiful. Because the operating costs of a law school are extremely low

relative to tuition costs—unlike medical school, the equipment cost is negligible—opening a law school is virtually a guaranteed income for a university system, and the excess revenue helps subsidize more expensive programs in the system.

Recovery from the Great Recession has also been unevenly distributed. From 2009 to 2011, average real family income grew by 1.7 percent, a modest recovery. However, those gains were realized almost entirely by the top 1 percent high-income families, overwhelmingly white, who saw their incomes increase 11.2 percent while the bottom 99 percent experienced a 0.4 percent decrease. This trend continued in 2012.

Since the onset of the Great Recession, blacks and Hispanics have experienced the worst effects, with income declining and unemployment rising at rates significantly greater than those experienced by whites. This fits a general pattern of economic disparity, and disparity of economic trends, in modern American history. From 1983 to 1989, for instance, black household wealth consistently declined, while white household wealth consistently rose, a trend that reversed from 1989 to 1992. From 1992 to 2010, black household wealth declined very slightly, ending just lower than it had been in 1983. In the same period, white household wealth rose steadily, especially from 1995 to 2001 and 2004 to 2007, before plummeting at the onset of the Great Recession. Even with that drop, in 2010 white household incomes were slightly higher than they had been in 1983.

Classical Music and Ethnic Diversity

American classical music until the end of the 19th century largely adhered to the European tradition. Bohemian composer Antonín Dvořák, who came to the United States from 1892 to 1895 to head the National Conservatory of America, was the first to urge American composers to embrace ethnic elements in the formation of a national musical identity. Adapting musical materials from African American melodies in his symphony *From the New World*, Dvořák catalyzed the emergence of a unified American classical music. Rooted in the European tradition, this music amalgamated diverse ethnic sounds and influences, including those of Native American, Anglo-Saxon, Anglo-Celtic, Germanic, African, West Indian, Asian, and Jewish musics. The persistence of immigration to the United States has allowed composers of diverse ethnicities to play leading roles in the development of American classical music.

Native American Music

Native Americans created their songs spontaneously for religious and community ceremonies.

Classical composers of the Indianist movement in the 1880s began to carry out systematic adaptation of Native American music. Notable among these composers was Arthur Farwell, who founded the Wa-Wan Press in 1902. In its 11-year history, the press specialized in publishing Indianist compositions, including Farwell's *Impressions of the Wa-Wan Ceremony of the Omahas* for piano.

European Influence

Prior to the mid-19th century, masters of Anglo-Saxon descent in New England singing schools promoted Protestant hymns, psalmody, and liturgical music. Singing masters, chief among them William Billings, composed and published numerous collections of hymns, anthems, songs, and fuguig tunes. Influence of these compositions can be found in later orchestral works, notably William Schuman's *New England Triptychs* and Virgil Thomson's *Symphony on a Hymn Tune*. This style spread to the American south and continued to thrive into the 20th century as shape-note singing and gospel songs.

The Anglo-Celtic Appalachian tradition was introduced by Scottish and Irish settlers, who brought their ballads as they migrated to Appalachia and the Mississippi Valley after the Louisiana Purchase in 1803. The Anglo-Celtic folk style commingled with local popular songs and African American songs and evolved into the Appalachian style. Appalachian tunes provided musical material for later composers including Aaron Copland, who used the tune "Simple Gifts" as the theme in his 1944 ballet score *Appalachian Spring*.

German-speaking settlers in the 19th century supplied the bulk of performers and teachers in American music schools and orchestras. These settlers highly valued musical literacy, and established choral societies and instrumental ensembles such as the Chicago Symphony Orchestra, the Philadelphia Orchestra, and the Handel and Haydn Society in Boston.

Jewish Influence

The wave of Jewish immigrants at the turn of the century spurred musical exchange with American classical music. Liturgical music was infused with western styles, instruments, tonalities, and harmonization in some communities; liturgical music found an audience as concert pieces. The

interaction is exemplified by the 38 commissions by Cantor David Putterman of New York's Park Avenue Synagogue, which were later compiled in the 1951 anthology *Synagogue Music by Contemporary Composers*.

Among the most prominent American composers of Jewish descent are Arnold Schoenberg, Leonard Bernstein, and Steve Reich, each of them succeeded in drawing on their heritage in their western-style compositions. Among Schoenberg's serial works are his cantata *A Survivor From Warsaw* and the choral setting of *Mima'amakim*; Bernstein employed his own tonal language in his choral works *Chichester Psalms* and *Hashkiveinu*, as well as in *Symphony No. 3 (Kaddish)*; Reich applied minimalist techniques to cantillation in his Hebrew psalms setting *Tehillim*.

West African, West Indian, and Cajun Styles

Peoples of West African and West Indian descent brought to the United States as slaves had little contact with their native cultures and developed a unique song tradition as a result. Their call-and-response singing, in particular, resonated with the "lined-out hymnody" of the New England tradition, in which a leader articulates one line of song, which then is immediately repeated by the group. The synthesis of these two traditions gave rise to the religious spiritual. The migration of French settlers from Acadia to Louisiana brought about further intermingling of ethnic styles that later evolved into blues, ragtime, and jazz. Melodies and metric patterns of these musical forms have been adopted in all types of American music.

In his compositions for piano, Louis Moreau Gottschalk, a half-English, half-Creole native of New Orleans, was the first composer to integrate the African and West Indian styles with European pianistic techniques. Henry F. B. Gilbert introduced spirituals and ragtime into orchestral music, notably in *Comedy Overture on Negro Themes*, *Negro Rhapsody*, and *Dance in Place Congo*. Gilbert's outreach paved the way for the acceptance of African American composers, such as William Grant Still. George Gershwin, son of Russian Jewish immigrants, achieved great recognition for integrating ragtime, jazz, and Anglo-American art songs with Yiddish musical theater, as evident in *Rhapsody in Blue* and *An American in Paris*, and in the score of *Porgy and Bess*.

The rhythms of West African music entered the American classical repertory in the 1970s through Steve Reich's works, including *Drumming*, *Music for 18 Musicians* and *Different Trains*. By the late 20th century, in a new area of stylistic development, American minimalist and experimental classical music had incorporated the rhythms and meters of non-Western music.

Minstrelsy

The music of minstrel shows took African American songs and infused them with Anglo-Celtic elements. In the mid-1800s, Stephen Foster was the best-known composer of minstrel songs. Foster's prolific output and widespread popularity made a lasting imprint on American song and classical music, especially on composer Charles Ives. Ives drew musical quotations from Foster's melodies, as well as deploying ethnic vernacular tunes (including Protestant hymnody, German songs, and Scottish ballads), defamiliarizing and transforming these materials. Ives's ecriture is epitomized in his collection 119 Songs, as well as in the Concord Sonata for piano and Three Places in New England for orchestra.

Asian Influence

Asian musics entered the consciousness of American composers in the early 20th century. Henry Eichheim's *Oriental Impressions* was based on melodies he heard in travels to China, Japan, Korea, and Thailand. His two orchestral works, *Java* and *Bali*, include Javanese gamelan instruments. American impressionist composer Charles T. Griffes reflected the orientalism of the times in *The Pleasure-Dome of Kubla Khan* and in song settings for Chinese, Japanese, and Javanese texts.

Turning away from Western notions of individual expression, such as a composer's authorship and a musician's performance, John Cage made extensive use of Taoist aesthetics and divinatory methods in his compositions. For Cage, the holistic listening experience (including silence and environmental sounds) and random chance played central roles in determining the actual musical rendition. Cage also developed the "prepared piano," where various materials are inserted between strings to create a range of pitched percussive sounds evocative of south Asian and Indonesian music. Among his best-known compositions

are "Sonatas and Interludes," "Cartridge Music," and "4'33."

In 1998, Chinese American cellist Yo-Yo Ma founded the Silk Road Project to promote innovation in cross-cultural research and education. The organization has commissioned and performed numerous new works by composers of various ethnic origins.

Clothing and Ethnic Diversity

Clothing is a visual cultural document. Contemporary American culture emphasizes visual blending rather than national heritage or ethnic group identification. Donning clothing is a normative act that both conceals and reveals; how one is dressed will be considered appropriate or inappropriate by viewers. Clothing aids in social interaction, signaling members of social groups. Specifically, how this process is articulated varies by culture and through time. For thousands of years artists drew pictures illustrating how Egyptian scribes dressed to denote their occupation. Hurons living near the Great Lakes used hair styles to distinguish themselves from the Erie or Seneca. French royalty reserved purple to denote their ascribed status. Samurai in Japan earned the right to wear

special sashes, and American businessmen in the early 20th century wore dark suits to denote their status as serious, middle-class professionals, as distinguished from laborers.

Age, gender, sexuality, occupation, geography, status and rank, religion or faith, culture, education, nationality, kinship, ascription, class, achieved status or rank, and ethnic heritage—all basic sociological variables—are signified in clothing, anchored by how it is worn and moves on the human body. Add to this situationally and temporally contextualized body adornment and it is easy to see that items of body art and sartorial accoutrement help individuals and social groups produce ensembles that sartorially mark who they are and who they want people to think they are. Clothing is a potent marker of identity.

Social and Ethnic Markers

Clothing ensembles are visible and rapidly seen symbols in the United States used to signal ethnic identity or heritage. They constitute cultural constructs, conjoined into a unified, imagined identity that labels a social group and asserts its members' heritage and right to claim that heritage. Clothing as a social marker offers individuals and social groups comfortable, convenient, and often unquestioned mental filters to make sense of the world's complexity and gives wearers a means to assert or claim distinctiveness. This is an important social feature for a society with a large heterogeneous population, like the United States or Canada, because it can call into question the basic social identity of the nation-state. To counter this potential divisiveness, most Americans separate unifying but gendered, basic everyday attire, which tends to be based on fashion rather than ethnicity from ethnic dress.

To wear ethnic clothing in America with its emphasis on blending in and not emphasizing national heritage or ethnic group identification in dress can engender ridicule and outright prejudice in many situations. Canada has a law that permits ethnic clothing in the workplace unless the occupation requires a particular uniform or the ethnic attire presents a safety hazard. Thus, a man who is a Sikh can wear a turban rather than the regulation police helmet in the Royal Canadian Mounted Police, but not a robe. There is no such law in the United States, and ethnic attire

combined with physical appearance (race) has been used by security groups to identify potential threats; this is often referred to as ethnic profiling.

In contemporary America, people who are descendants of immigrants use heritage clothing on special occasions or for celebrations that mark a simplified ethnic ancestry that utilizes nationality and ethnic or linguistic group but more rarely village or regional origins. Thus one shows Polish heritage but not that of Krakow or Polnaz as regional variants. Usually what was worn by rural (nonelite) populations in the early to mid-19th century in the home country is now worn without subregional (i.e., village) or class markers.

Many immigrants tried to quickly blend into American populations, especially in urban areas, often by changing their clothing to that worn by Americans on a daily basis (if they could afford it) when they first arrived in the United States. Scholars have called this cultural authentication and the adopted styles are mixtures of the old and the new.

After two or three generations, however, their descendants like to reassert and proudly reaffirm their home country origins. The distinctive best attire from a source country has become an indicator of distinction from the general mass of Americans and what they wear on a daily basis. It is on special occasions (often celebratory or festive) and in certain types of situations that ethnic attire becomes a key symbol of both distinctiveness and community.

To wear ethnic dress at school or on a construction site or at the supermarket would be inappropriate. But at a folk festival, it is suitable to wear a German dirndl or a Japanese kimono as an identity marker; in this special space it is how wearers can claim an ascribed status and a right to express this heritage in public. Ethnic dress tends to also be worn on occasions that signal life cycle changes, passing from one social stage to another: weddings, graduations, and funerals come readily to mind. Ethnic attire (also called folk costume or peasant attire) functions like cultural property that labels an individual or a group distinctive and exclusive. They are citizens of the political nation-state, but wearers are unique citizens with claims to heritage from other places. This is marked verbally by a heritage designation and sometimes a hyphen before the word *American*.

They are German Americans, Greek Americans, Native Americans, Mexican Americans, Japanese Americans, and Croatian Americans while in heritage attire. The American is always constant in the equation.

Indigenous Native American Attire

Ethnic attire for indigenous groups reflects a respect for and reaffirmation of the cumulative experiences of ancestors. Native Americans wear attire to demonstrate that they are part of this continuum and will carry it into the future. This does mean that the attire itself is static. The continuum is constantly changing or adapting but still reflects environmental constraints, like fur-lined parkas in the Arctic for the Yupiaq or Inuit or cotton cloth in the desert southwest. In the past, native attire has been culturally specific and still is in some cases. For example, Navajo elders

wear distinctive attire in their daily lives—the velvet long-sleeved shirt and long full skirt. Younger Navajo reserve this attire for ceremonial or ritual events, public ceremonies with blessings, selling art to peoples from other cultures who like to see ethnically costumed artists as part of their buying experience, giving entertainment or dance performances, or participating in transnational beauty pageants, rodeos, and powwows.

In the United States, 60 percent of American Indians live in urban areas for extended periods of time and not on their home reservations, working in the same types of occupations, with the same dress expectations, as members of the general society. Blue jeans and T-shirts for students, ranchers, farmers, and construction workers rule the day. Professional men and women and elected officials wear business suits, dresses, short-sleeved cotton shirts, and khaki pants, as well as the latest

A sari can indicate a practitioner of Hinduism, while the burka or hijab head covering indicates an adherent of a Muslim sect. The sari is a strip of unstitched cloth draped over the body in various manners. The traditional sari was sold mainly to south Asian women in the United States until the 1970s, when its popularity grew along with the global growth of Indian fashion trends.

fashions obtained from upscale department stores or Native, New York, and Parisian haute couture, as long as it is suitable for the season.

Those working in professions requiring uniforms wear attire that is no different from their non-Native colleagues; Opata miners in Mexico wear hard hats, Navajo ranchers wear cowboy hats and boots, and O'odham or Maricopa tribal police are easily recognized by their blue uniforms, as are the Western Apache's famous firefighting contingent who wear protective clothing when battling wildfires in the western United States.

Elders living on reservations, particularly in isolated or remote regions, or in border towns tend to wear older styles of attire or housedresses, skirts and blouses, holding onto workable but outmoded or classic clothing traditions in the same manner as rural Euro-Americans or Mexican families living among or near indigenous groups. However, it is not unusual for Native individuals to wear adornment symbols, such as silver and turquoise jewelry, or hair styles (long and straight for both men and women or tied with head scarves, beaded barrettes or woven hair ties) to establish and emphasize through these easily recognizable visual cues their Native identity, which makes them distinct from the general population.

National Heritage, Culture, and Religion

Ethnic dressing for other national heritages is an established cultural and social practice in the United States and works in similar ways to clothing donned by Native Americans. Ethnic dress includes any attire, supplement, or modification to the body to cover and adorn oneself and provide readily understood visual clues about the ethnic heritage of the wearer. Ethnic dress can include fashion and traditional costume but these tend to be conservative, reflecting the historic attire of an ethnic group or nation as used on festive occasions in the home country.

Thus, the attire that a woman of Hungarian ancestry on Hungarian Day in Lorain, Ohio, near Cleveland consists of a full skirt with two rows of rickrack near the bottom hem, an embroidered short-sleeved blouse, a fitted vest, apron, and hair ribbons or a head scarf. In the past this attire would have been donned by any woman working at the 75-year-old fall harvest festival and reflected

the village or region of Hungary her ancestors emigrated from. Over time, these regional distinctions have been lost and the nationality has become homogenized and simplified, obscuring any ethnic, regional, or class variation that existed in Hungary. Today the attire tends to be reserved for those who perform traditional Hungarian dances minus the regional variation. Rather than a symbol of family or geographical district, it has become a symbol of national heritage. It is thus safe for the country and its national identity as a unified people with a single culture.

While ethnic attire tends to be conservative and preservationist, this does not mean that it is static. What is considered tradition and traditional is an evolving, adaptive concept in any society. Some cultures change faster than others; some cultures like change, others distrust it. While a core of bedrock tradition is always present, so is innovation, experimentation, diffusion or borrowing, modification, and ultimately, rejection or acceptance based on the needs and philosophies of the community over time. Tradition is adaptable and has been so since the beginning of each culture's creation.

This adaptability is seen in ethnic attire even when groups strive to freeze attire in time. For groups like the Amish, descendants of Swiss dissenters from the Anabaptist movement, and the Mennonites, plain, unadorned dress in subdued colors that was worn between 1750 and 1850 is now a symbol of exclusivity. Men wear black broadfall trousers with buttons (no zippers), short jackets fastened with hooks and eyes, solid-colored shirts and straw or felt hats. Women wear long one- or two-piece dresses with matching aprons and an 18th-century-style bonnet, black stockings and shoes. Amish attire will remain stable because it is worn as a marker of faith and a social boundary between the Amish and outsiders ("the English"). To don outsider clothing risks shunning; to add individualizing ornamentation—jewelry or patterned fabric—smacks of pride. Plain dress visualizes the tenets of faith.

Ethnic dress is combined with religious and caste symbols and it is these sartorial combinations that are seen in daily attire in contemporary America. Religious sartorial markers include black hats for Sephardic Jewish men or a yarmulke for Hasidic groups, *imama* or turbans for

Arabs, Hindi or Sikhs. These hats signify faith, visible markers that men adhere to the moral and behavioral rules of their religion. For some Arab Muslims, a man's head is the place of his honor, manhood, and dignity; to leave it uncovered is considered shameful. These headpieces can be combined with a piece of tribal or traditional attire. For example, Arab men in the Gulf region wear the traditional long, ankle-length *jillaba*, or *dishdasha*, *kaffiya*, and *agal*, along with a Western-style man's suit jacket and dress shoes.

Most American Muslims do not follow any dress code, nor do they feel it is obligatory. Women can be similarly marked; some religions require women to wear a head covering in daily life or while praying. A sari indicates a Hindu practitioner and the burka or hijab, an adherent or a Muslim sect. Hare Krishna members wear saffron robes all the time, while members of the Church of Jesus Christ of Latter-day Saints (LDS) must wear only white (a symbol of purity) when they are in the LDS temple. At other times, they wear fashionable attire. Orthodox Jews avoid wearing any fabric that is a mixture of linen and wool, a combination expressly forbidden in the Torah because it was sacred to the ancient Egyptians. The sartorial political considerations of 2,500 years ago continue to this day.

The nonverbal message hopefully conveyed by donning ethnic attire concentrates on reverence for national heritage, cultural pride, and distinction. It is a way for the descendants of migrants to the United States (or any other nation) to show respect for their ancestors, a desire to keep language and/or customs alive. For example, while Korean immigrants wear Western-style clothing for daily life, the bride dons a traditional *hanbok* for her wedding. These dresses tend to be passed down in families, if possible.

Recent political refugees, like the Hmong who left much of their clothing behind as they fled from southeast Asia, have created new courting and wedding dresses based on old silhouettes. New attire is also made, new materials used, slight alterations in design that eventually lead to major changes. Details and basic structure change but these changes are usually discussed by the entire group, accepted or rejected. Those that are seen as unaltered through time tend to be called "traditional."

Creating a Fashion/Political Statement

Time-honored ethnic dress has entered the world of fashion as urban or retro chic, bringing the nonmodern, traditional, or old into the realm of the rapidly changing new. Pull up the term on an Internet browser and you get hundreds of cyber-sites selling ethnic attire, especially Indian and African-based attire, that has been adjusted to conform to time-specific fashion.

The 1960s and early 1970s hippie attire was based on a blending of ethnic attire that was reinterpreted and given new meanings as countercultural. Another piece of headwear, the West African head wrap has become high fashion for many African Americans, as has the Ghanaian dashiki, a colorful, collarless man's shirt, made from kente cloth or a long sheath-style dress for women, both worn with an Afro or cornrow braids hairstyle. It is here that ethnic attire meets political statement and fights against discrimination and stereotypes.

Code Talkers

“Code talkers” are individuals tasked by the U.S. military to use their traditional languages as codes to disguise military radio and written transmissions. With the exception of Basque individuals, code talkers were frequently of American Indian descent. This unique application of traditional language represented a continuation of enduring warrior traditions in modern warfare. The United States owed much of its success in World War I, World War II, and later conflicts to the strength of codes based on indigenous languages and to the individuals who valiantly served in code talker capacities.

American Indians have a long, proud history of military service in the United States. This is commonly attributed to the warrior traditions of many indigenous cultures. While the warrior role involves much more than being a combatant, colonization processes (e.g., land rights disputes, massacres, economic woes, and intercultural friction) made war endeavors more frequent and intense. Warriors who previously provided for and protected villages and clans from traditional rivals now found themselves locked in perilous and asymmetrical battles with the skirmishers, infantry, cavalry, and artillery of a fledgling state. Until the 1900s, American Indian nations fought against or alongside the United States, depending on each individual nation’s alliances. When the United States joined the Allies during World War I, thousands of American Indians, who had not yet been granted citizenship, volunteered for service abroad.

World War I

It was World War I that saw the inception of code talker initiatives. All the Allies’ codes to date were repeatedly cracked, and their forces were desperate for a more effective means of shielding strategic intelligence. As legend has it, an American officer overheard two Choctaw soldiers speaking to each other. This eventually prompted an evaluation of the integrity of codes based on Native languages in the war zone.

World War I code talking programs included members of several tribal nations, including Choctaw, Comanche, Seminole, Meskwaki, Cherokee, Osage, Dakota, and Lakota. Two

types of code languages were developed: Type I and Type II. Type I code talking consists of an encoded language based upon a parent language (e.g., *wakaree’e*, Comanche for turtle, was code for *tank*). Type II involved the use of noncoded parent languages (i.e., direct translations of terms). These codes were incredibly successful and never broken. The valiant and crucial efforts of code talkers and multiple non-code talking American Indian enlistees contributed to the U.S. government’s recognizing all American Indians as citizens in 1920.

World War II

Though code talker programs based on several Native languages were used during World War I and World War II, the Navajo code talker program was the largest and best known. These members of the Navajo Nation enlisted in the Marine Corps (USMC) during World War II and spoke in code to send and receive messages in the battlefield and on warships. This Type I code is credited with aiding the Allies’ success in the Pacific theater. It was used to engage and confound the Japanese and was never broken or deciphered. The program remained classified until 1968 and did not become public knowledge until 1970.

Inspired by the success of American Indian-based codes in World War I, 29 Navajo men were recruited and trained in a first-ever all-Navajo platoon at Camp Pendleton near San Diego, California. These Marines were sent to Camp Elliot for basic communications training and to develop the code using the basics of word- and letter-substitution encryption methods. When a code talker received a message, the end result would be translated into unrelated Navajo words. However, only the first letter of the English equivalent was relevant for the code to be deciphered. For example, the Navajo word for “ant” would be spoken over the radio and the receiver would translate those words into English and combine the first letters of the subsequent words together. An entire coded transmission would take 20 seconds to relay battle maneuvers and tactics as opposed to machinery that took over 30 minutes to accomplish the same task. In August 1942, the USMC ordered that 200 more Navajo men be recruited into the program. The code was developed into a manual

(or codebook) for the recruits and had to be memorized entirely.

Code talkers were sent to engage the Japanese in Guadalcanal, Tarawa, Peleliu, Saipan, and Iwo Jima. Small groups of 13 to 16 Navajo Marines were assigned to various Marine divisions. Sometimes, fellow non-Navajo Marines mistook Navajos as enemy Japanese in disguise and treated them in a hostile manner. Despite occasional tension in the ranks, the code talkers received praise from commanders in the field for accuracy and swiftness in transmitting and receiving coded messages. At Iwo Jima, Major Howard Connor commented, "If it weren't for the Navajos, the Marines would never have taken Iwo Jima." Connor employed six Navajo code talkers to work during the first two days of the battle for Iwo Jima. Those six transmitted, received, and decoded over 800 messages with incredible accuracy. The Japanese, who were considered skilled code breakers, could decipher codes transmitted by the U.S. Army with ease but remained bewildered by the Navajo and were unable to decrypt the codes they used.

Because of the Type I structure of the Navajo code talker program, a fluent Navajo speaker would not be able to decipher a transmission without knowledge of the code manual. In May 1942, the Japanese had an opportunity to decipher the code when U.S. Army Sergeant Joe Kieyoomia was captured during the infamous Bataan Death March. Kieyoomia was Navajo and a fluent speaker, but he was not a code talker. He endured brutal torture and was forced to listen to and decipher some coded messages; however, Kieyoomia could not understand what the code talkers were saying. To him, the code was merely a string of random words in Navajo. He informed his captors that he was unable to translate/decipher the messages and they continued to hold him prisoner until his eventual escape following the bombing of Nagasaki.

Recognition

The Navajo code was so effective during the war in the Pacific that the military continued to use it in the Korean War and in the Vietnam War. It was not until 1968 that the code was declassified, and it was not until 1982 that the Navajo Marines were recognized for their service as Navajo code talkers by President Ronald Reagan. President

Reagan declared August 14 as "Navajo Code Talkers Day." In 2001 in Washington, D.C., President George W. Bush presented the Congressional Gold Medal to four surviving code talkers and to 24 posthumously.

Cofradía

Cofradías are lay religious institutions with their own charters and regulations, formed with the purpose of promoting charitable endeavors. After their inception in Europe, these fraternal institutions were reproduced across the oceans after the conquest of the Americas by Catholic nations.

In the early Middle Ages, religious confraternities formed by lay people arose in Europe in order to support church charitable institutions and to promote charity works and mutual aid. In many medieval cities, these confraternities became important institutions for the growing middle class as well as for the elite. Other important institutions arising at the time were the trade guilds; even though sometimes confraternities and trade guilds could form alliances, confraternities always maintained their religious purpose. It is important to note that initially, these lay associations functioned under the aegis of Church authorities.

In the late Middle Ages, Spanish society incorporated the confraternities—known in Spanish as *cofradías*—into a mixed form encompassing trade guild and religious confraternity, preserving the economic characteristics of the former and the sacred imperatives of the latter. In this manner, *cofradías* were able to serve their population in an ampler way. Uniquely equipped to face societal change and instability, as well as to bridge different demographics, *cofradías* became an important part of Spanish and, eventually, American society. Besides charity and community-building, *cofradías* provided—and continue to offer—opportunities for social networking, integration, and entertainment.

Cofradías in the Spanish Americas

Spanish colonization of the Americas—and the Portuguese conquest of Brazil—brought a massive influx of Catholic missionaries to the new colonies. *Cofradías* were soon organized in the new colonies, where they flourished among the Spanish, Creole, mestizo and indigenous populations, becoming a central institution in many villages and towns. Thus, the *cofradías* of Latin America, the Caribbean, and Spanish North America inevitably took a different character than their European counterparts. Of special interest to many contemporary historians and social scientists, for example, are the diasporic *cofradías* in Latin America initially formed by the enslaved Africans, and the hybrid Catholic and indigenous religious rituals adopted by many native-born *cofradías*. Indeed, although the majority of *cofradías* have always been linked to a particular church or saint, a few *cofradías* in the 18th and 19th centuries took on a unique character; such is the case of the *Cofradía de los Hermanos de la Costa*, a confraternity of pirates and buccaneers, which operated in the Caribbean and eschewed any religious or national allegiance, and those formed by escaped slaves (*cimarrones*).

Cofradías in the United States

Cofradías have appeared in the United States in regions with large immigrant populations, to serve as mutual aid societies and help with other community needs. Some confraternities are uniquely American while others have ties to their counterparts in their countries of origin. However, the Catholic religion is not the majority in the United States as it is in Latin America, and Protestant

Though *cofradías* were never widespread in the United States, some important U.S. confraternities exist, such as the Knights of Columbus. In 1917, the National Catholic War Council and the Knights of Columbus organized a national agency to coordinate the war effort of the American Catholic community.

cultures have not adopted the Catholic confraternity model. The lifestyle in the United States never proved fertile ground for the traditional *cofradía* model spreading as far and wide as in Latin America, so that it has remained a much smaller cultural phenomenon. Nevertheless, despite the dispersion effects of globalization, confraternities in the United States remain a notable institution in their communities.

The image of the *Virgen de la Caridad del Cobre* has a sanctuary in Miami and counts approximately 57,300 devotees. Its confraternity is one of the earliest religious organizations founded by Catholics in the United States. Its Miami chapter was restarted in 1968 by a group

of Cuban exiles and church officers led by Miami Archbishop Coleman Carroll and dedicated to an image of the Virgin of Charity brought from Cuba in the 1960s. The original confraternity, however, was created by the Cuban archdiocese in the 17th century to serve as a link between the Spanish colonizers in Cuba and Floridian Native Americans. This confraternity disappeared in the early 1600s when Florida was ceded to the British. In 2001, the confraternity was elevated to the status of arch-confraternity by Archbishop John Favalora. Since then, the image has become a cultural and identity focal point for Cuban Americans, has expanded to other U.S. cities, and has attracted a growing number of worshippers from Latin American communities and nations.

Some important confraternities in the United States with chapters across the nation are, among others, the Knights of Columbus, founded in 1882 by Father Michael J. McGiveney in New Haven, Connecticut, today with almost 2 million members, the largest Catholic confraternity worldwide; the Legion of Mary, founded in Ireland in 1921 by Catholic layman Frank Duff, today with a membership of 250,000 to 500,000 in each of the countries where it is established; and Santo Niño de Cebu, founded by Spanish conquerors in the city of Cebu, Philippines, in the early 16th century, today with chapters in the United States where it is worshipped by Catholic Filipinos and Filipino Americans. This icon shares followers with the images of Santo Niño de Atocha and the Infant Jesus of Prague, both of which have multicultural followings worldwide, including the United States.

Colombian Americans

With a population of approximately 908,000 in the United States as of 2010, Colombian Americans are the largest South American ethnic group and the sixth-largest Hispanic population in the United States. The group is defined as citizens of the United States who can trace their heritage back to Colombia, South America. Colombian Americans have had a significant cultural impact upon several urban areas and upon American culture generally.

History

The first Colombian immigrants in the United States probably arrived in the 1800s and were not concentrated in groups, working hard to assimilate. Like many Latino communities in the United States, however, they were not formally counted as a distinct group until the 1960s. The Colombian American community first made its cohesive presence known after World War I, mostly in the New York City area, particularly in Jackson Heights, Queens. At that time, Jackson Heights was a middle-class community close to Manhattan, and this influx of Colombians into the United States after World War I consisted largely of skilled professional people, such as nurses and other medical personnel, accountants, and office workers. Young people from relatively well-off families also stayed in the United States after attending college.

The number of Colombians migrating to the United States rose only slightly each year until the early 1950s, when the unrest of civil war coupled with a shift into urban areas increased the numbers of Colombian immigrants. By the early 1970s skilled and semiskilled workers made up

more of the population of Colombian Americans than did professionals.

Immigration and Social Turmoil

In the late 1970s, more and more Colombians relocated to Miami, probably in the wake of the large influx of Cubans, while the 1980s saw Colombian Americans migrate from urban centers to suburbs. The 1990s once again saw political turmoil erupt in Colombia, and the presence of more guerrillas there once again boosted the number of Colombians in the United States, particularly in California, although the Colombian American populations of New York City and Miami remained the largest in the country.

Many Colombian Americans experienced a language barrier as they lived under conditions that didn't offer many opportunities for gaining proficiency in English. Like other immigrants, Colombian Americans also felt the backlash of anti-immigrant fervor in the period of economic recession during the late 1980s and early 1990s. Popular concerns about drug-related crime also had a profound impact on Colombian Americans during this time, culminating after Manuel de Dios Unanue, editor of *El Diario/La Prensa* and critic of the Cali drug cartel, was murdered in 1992.

Culture

Colombia's population is very ethnically diverse, with mestizos making up the majority of the population, Afro-Colombians, and the rest consisting of indigenous Colombians and Colombians of European ancestry. In the early years of Colombian migration to the United States, the influx of immigrants consisted mostly of mestizos and those of European ancestry. In more recent waves of immigration, however, all Colombian ethnicities have been represented, so modern Colombian Americans are also from all Colombian ethnic groups.

Colombian Americans have thriving musical and culinary scenes in the United States. Popular Colombian musical styles include salsa and cumbia, and Colombian cuisine has contributed the empanada, sancocho, and arepas to American food culture. Soccer is wildly popular in Colombian American communities, and there are a number of Colombian American soccer stars in the United States, including Juan Agudelo, who

plays in New York and also for the national team. Colombian Americans are also well represented in Major League Baseball.

Colombian Americans tend to maintain strong cultural ties to Colombia. Many Colombian Americans endeavor to work within Latino social and professional networks while maintaining their distinct identity as Colombian Americans rather than some more generic Latino identity.

Contemporary Scene

Today Colombian Americans play a significant role in American culture. Entrepreneur María Elena Ibanez formed International High-Tech Marketing, a firm that sells computer equipment in more than 100 developing countries. The books of Nobel Prize-winner Gabriel García Márquez were among the first Latin American works widely read by an English-speaking audience. Actor and comedian John Leguizamo has achieved major success not only as an actor but also as a playwright. Many other successful Colombian Americans shape today's American culture.

Current populations of Colombian Americans are highest in south Florida, the New York area, Boston, Philadelphia, Houston, Los Angeles, and Washington, D.C. The majority of Colombian Americans are proficient with English. Colombian Americans overall have higher marriage rates and lower unmarried fertility rates than other Latinos in America. The percentage of Colombian Americans living in poverty is lower than that of the general American population and significantly lower than that of Hispanics in the United States. Colombian Americans also have higher levels of education than the Hispanic American population overall. All of these factors as well as other census data show that today's Colombian American population is stable and thriving.

Color Purple, The

Alice Walker, who wrote the novel *The Color Purple*, belongs to the generation of the authors like Toni Morrison and Paula Marshall who galvanized African American literature in the 1980s and 1990s, foregrounding in their novels the themes related to African American women. *The Color Purple* (1982) is the first African American epistolary novel. The narrator, Celie, is a poor African American girl from the rural American south. She is raped by her stepfather and bears two children whom he takes away from her. Celie's letters to God are the only outlet for her misery, since her stepfather forbids her to speak about her abuse. Nettie, her younger sister, teaches her to read and write but their bond is severed when Albert, a brutish sharecropper and the man Celie was forced to marry, makes Nettie leave.

Nettie goes to Africa as a missionary with the couple who adopted Celie's children. Her letters about the African Olinka tribe, their religion, culture, and language, provide an important insight for Celie's community into their African heritage and constitute a broader anthropological framework of the novel. Colonization of Africa and destruction of the Olinka on the macrocosmic level parallel on a microcosmic level the oppression of the African American community in the American south in the first part of the 20th century. Both

sisters explore detrimental effects of the divisions among sexes, races, and classes in a patriarchal system. Celie witnesses numerous cases of oppression of African American women by the men in their community and by the white people, while Nettie describes oppression of women in Africa, particularly genital mutilation.

Celie manages to find strength thanks to the greatest influence in her life, Shug, a sultry female blues singer with whom she falls in love. Their lesbian relationship defies rules of the society and presents another form of female liberation. In the novel Celie functions as a catalyst, inspiring change in other characters. She becomes a successful businesswoman, sewing pants whose size symbolically fits all.

Purple as Metaphor

The novel examines the role of religion as patriarchal oppression of women. Celie develops a broader, more pantheistic view of religion and worships beauty in the world of which the color purple is the main metaphor in the novel. She rejects the idea that God can be defined on the basis of gender and skin color. The breakthrough in each relationship in the novel happens when a person accepts both the masculine and feminine parts of his or her personality.

Walker created a matrilineal paradigm in the novel, relying on African American female heritage. Female characters go through three phases Walker considered crucial in the liberation of women: from being physically and psychologically oppressed, to being torn by contrary instincts and struggles between roles imposed by the community and the need to realize their potential, to finally attaining freedom and unleashing that creativity by relying on the experience of their female predecessors. The female characters all represent different responses of women to their oppression. It is only through mutual sustenance and building of a female network that they manage to arrive at self-definition.

Stereotypes, Motherhood, and Tradition

Walker exposes negative stereotypes of African American women, such as mammy, tragic mulatta, and wanton black woman and conjurer, labels that had imprisoned them for centuries. By showing their baselessness, she offers instead positive

images of strong, African American women who encourage each other to overcome their traumas.

Walker explores different forms and definitions of motherhood, from adoption and surrogate motherhood to nurturing and imposed motherhood. She explores its positive and negative aspects and the role of mothers in African and American societies. She also focuses on the importance of matrilineage, since the novel traces transmission of oral heritage and culture through women. Walker drew inspiration from African American women writers, such as Rebecca Johnson and Zora Neale Hurston, and claimed them as her predecessors. The central place of language in the novel illustrates its role in the creativity of African American women as storytellers based on oral tradition. Walker wanted to preserve the way of speaking of her female ancestors, particularly African American vernacular, and transmit it to younger generations of African Americans. Thus, Celie's change is evident in her letters, as her language becomes more complex and reflects her newfound freedom and spiritual growth.

The novel contains elements of pastoral romance and patchwork. Patchwork enables Walker to juxtapose different materials and perspectives. She subverts established literary forms as epistolary, Victorian novel, and spiritual autobiography, placing them in African American female literary tradition and showing limits of the traditional forms to represent experiences of African American women. In comparison, she offers alternative modes of writing that include plurality of voices. Patchwork is also a metaphor for matrilineal tradition because it represents domestic work of women based on their creative transformation of everyday materials.

Pulitzer, Movie, and Musical

The Color Purple received the Pulitzer Prize and National Book Award for fiction in 1983. A film based on the novel was directed in 1985 by Steven Spielberg and starred Whoopi Goldberg, Danny Glover, Margaret Avery, and Oprah Winfrey. Although the film was praised for the performances, musical score, and cinematography, it was also criticized for stereotypical portrayal of African Americans, particularly men, and avoidance of the theme of homosexuality. Walker herself expressed dissatisfaction with the screenplay

and caricaturing of African Americans. She was particularly critical of the ending, which she felt gave more agency to Celie's brutal husband Albert than to Celie.

The Color Purple musical opened on Broadway in 2005 and later toured the United States. It won one Tony and three Theater World awards. The novel is required reading in many courses on African American and American literature in colleges throughout the world.

Colorism

Colorism refers to a form of skin tone bias that generally favors light skin over dark skin. Commonly connected to race, colorism is based on a social hierarchy in which the level of acceptance of an individual is derived from the social meanings attributed to skin color. Research has linked colorism to lower marriage rates, inferior education, lower salaries, fewer job prospects, and longer prison terms for darker-skinned individuals.

Colorism is typically viewed as a form of intraracial prejudice and discrimination; however, colorism is more than an intraracial phenomenon.

Members of racial/ethnic groups as well as some outside racial/ethnic groups use skin tone coupled with other Eurocentric beauty ideals to assess an individual's worth.

The History of Colorism

Novelist Alice Walker is credited for having coined the term *colorism* in 1982; however, colorism has existed for centuries and can be traced back to the early days of institutional slavery in the United States. European colonialism created a system of white supremacy and racist ideology that supported the enslavement and oppression of Africans. Differences in skin tone positioned whites at the top and blacks at the bottom.

Rooted in slavery, colorism is particularly prominent among African Americans. During the era of legalized slavery in the United States, it was common for white male slave owners to engage in sexual intercourse with black female slaves. The light-skinned offspring were the tell-tale signs of these unions that produced individuals with both African and European ancestry. The terms *mulatto*, *quadroon*, and *octoroon* were created to identify a person with one-half, one-fourth, and one-eighth African ancestry, respectively.

Slave owners did not acknowledge their mixed-race children as kinfolk officially; however, they awarded them privileges that dark-skinned slaves did not have. Typically, white plantation owners assigned dark-skinned slaves outside chores and/or the most physically demanding jobs in the fields, while they gave light-skinned slaves domestic chores in and around the house or gave them more esteemed positions than their darker counterparts. Therefore, light skin was viewed as an asset among the slave community.

White plantation owners' preferential treatment of light-skinned black slaves created an internalized social hierarchy and division among slaves, signifying that one is superior to the other based on biological differences in skin color. This established mind-set among black slaves continued after emancipation and is still pervasive among blacks in the United States today.

Outside the United States, colorism may be related to class more than to white supremacy. Though European colonialism has left its mark globally, colorism is believed to predate European

contact in various Asian countries. In such cases, the notion of white skin superiority may stem from the fact that people of the highest social classes had lighter skin than those of the lowest social classes. Working classes had darker skin due to the fact that they became suntanned as they labored outside daily. Upper classes had lighter complexions because they did not have to exert themselves in the sun daily. Consequently, dark skin was associated with the lower classes and light skin with the aristocrats. In contemporary Asian societies a preference for lighter skin remains prevalent. This partiality may be a result of past history and cultural influences of Western societies.

Among African Americans

There is a distinct correlation between skin color and social class affiliation among African Americans. Colorism, as a system of social stratification, reinforces the notion that privilege is contingent upon skin color, where lighter skin equates to higher social standing and darker skin equates to lower social standing. For example, black people created "blue vein societies," "brown paper bag tests," and "the bleaching syndrome." These skin color-based evaluations, created and used by blacks themselves, perpetuated social privileges for light-skinned blacks and helped perpetuate the notion of colorism for the general public.

Blue vein societies, created by light-skinned black people, considered themselves higher up the social ladder than those with darker skin tones. Blue vein societies' superiority stemmed from the fact that their skin was so light that their blue veins were visible. Blue vein societies discriminated against darker-skinned black people to the extent that they were refused membership if their skin tone was not light enough for their blue veins to show.

The "brown paper bag" was considered the center marker of blackness that distinguished "light skin" from "dark skin" on a continuum from black to white. For lighter-skin circles, the paper bag was a symbol of exclusion and exclusiveness.

African Americans employed the brown paper bag test as the criterion for admission at various social events, social clubs, churches, and black fraternities and sororities. If an individual's skin color was not equal to or lighter than a brown

paper bag, the group denied that person admission. Moreover, early on, prestigious Historically Black Colleges and Universities (HBCUs) based admissions on skin color by requiring applicants to submit a photograph in order to be considered for admission.

Skin bleaching is the practice of using chemical substances to lighten skin tone, oftentimes in an effort to emulate a European standard of beauty. Skin bleaching is a manifestation of conflicting circumstances in which those with darker skin internalize light skin and other mainstream cultural ideals as the point of reference for full assimilation into the dominant culture.

The dominant group has the most access to power, wealth, and prestige. Those who achieve success in these areas have lighter skin and can more easily blend in or assimilate into the dominant culture. Through socialization they internalize and adopt dominant cultural ideals and views of beauty: that the lighter one is the better one.

Light skin is so coveted that skin-lightening cosmetics remain a booming business with sales continuing to rise around the globe, including in the United States, Asia, India, and other countries. The fact that skin-bleaching products have persisted for decades signifies the enduring legacy of colorism.

Colorism and the Media

The media play an important role in how light skin and dark skin are perceived. Advertising and/or film industries continue to perpetuate the white beauty ideal.

Blacks who have light skin and more physical features (e.g., nose shape, eye color, lip size, hair texture, etc.) that align with Eurocentric ancestry rather than African ancestry tend to enjoy greater professional success. For example, film producers hire lighter-skinned African Americans more frequently, television producers choose lighter-skinned cast members, and magazine editors choose models with European features.

The first black woman to be crowned Miss America in 1984 had very light skin and other physical features close in proximity to Eurocentric standards. Black people who are featured in prominent magazines are disproportionately light skinned. Likewise, light-skinned women are over-represented as models in beauty product ads in

popular black magazines. Light skin preference is also seen in the fact that the most successful black actresses have light skin, or that those who make it to the top in the music industry have light skin. Light skin bias is also prevalent in the news media as light-skinned anchors dominate major networks.

On the other hand, darker-skinned African American men are stereotyped or represented disproportionately in the media as being violent and menacing. Because dark skin in the media equates to misconduct, crime, incivility, violence, lack of intelligence, and poverty, the general public has preconceived notions about darker-skinned men.

Colorism Around the Globe

Colorism occurs most notably among African Americans in the United States; however, skin-tone stratification is a global phenomenon seen in every racial/ethnic group where there is skin tone variation, including Latin America, Asia, Africa, and the Arab world.

In Latin America (particularly, South America), light-skinned people are privileged over those who have dark skin. Skin color among the races is significant in Brazil. Due to the transatlantic slave trade, Brazil is home to the largest population of African descendents outside Africa. Individuals who have lighter skin typically experience greater social mobility. Light skin is considered to be more attractive as most entertainers, actors, and actresses have European features (e.g., light or pale skin, straight hair, light eyes, and narrow protruding nose).

Light skin represents power in Mexico and Brazil. In general, light skin is symbolic of wealth and a high social status. Those with dark skin tend to be among the poorest and most disenfranchised. A dark-skinned person is most likely to experience discrimination in Brazil.

Individuals residing in south Asia viewed light skin as more beautiful than dark skin. In British India, for example, a light-skinned complexion corresponded to a higher social status. Therefore, those individuals with lighter skin tones enjoyed more privileges and opportunities than their darker counterparts. Anglo-Indians with European features tended to be more affluent and upwardly mobile, enjoying privileges in both education and employment. Darker-skinned

individuals experienced social and economic disadvantage in most European-organized colonies.

In east Asia, light skin preference is common. In ancient China and Japan, for example, pale skin preference can be traced back to ancient art that depicted women and goddesses with fair complexions. Skin-whitening products are common among east Asians, particularly in Hong Kong, the Philippines, South Korea, and Malaysia.

Skin bleaching among women is popular in Senegal and other west African countries. In Liberia, descendants of African American settlers partly defined social class by elevating those with lighter skin above those with darker skin. The first Americo-Liberian presidents had lighter skin, due to the fact that they had substantial proportions of European ancestry.

Mixed-race populations in South Africa were given more social privileges than unmixed indigenous African groups. During the apartheid era, the government classified South Africans into four main racial groups, by law: blacks, whites, Coloureds, and Indians. There were advantages afforded based on racial classifications. For example, Coloureds (those who possessed ancestry from Europe) did not have to carry identity documents that were designed to restrict the movements of nonwhites. The Griqua, another indigenous African group, had to carry the identity documents.

In Angola, mixed-race Portuguese who are descendants of indigenous Angolans and white Europeans are the elite in the country. Though small in number, they exercise disproportionate influence and control in the government.

Racial mixing was a common occurrence in the Arab world. Mixed-race children from white fathers and dark mothers brought about their own light-skinned hierarchy. Like the classification of Coloured in the former apartheid South Africa, mixed-race mulatto in Arab societies were a higher class than native Africans or Indians.

Conclusion

The meaning of skin color has changed over time. In the mid-20th century exceptions to light skin preference began to appear in Western culture. Tanned skin that used to be associated with the working/lower class became fashionable. Though a preference for lighter skin still prevails today,

many people in the United States regard tanned skin as healthier and more attractive than pale skin. Pale skin is associated with indoor office work while tanned skin is associated with good health and leisure activities that accompany wealth and a higher social status.

Columbus Day

Columbus Day is a holiday celebrated annually on the second Monday in October in the United States, and on October 12 elsewhere, including Spain, Latin America, and other New World countries. The holiday is named after Genoese explorer Christopher Columbus, who arrived by ship in the present day Bahamas on October 12, 1492. In all, Columbus completed four voyages across the Atlantic Ocean and is credited with the "discovery" of the American continents, according to European perspectives, that eventually led to settlement and colonization. In Latin American countries, the holiday is sometimes referred to as Día de la Raza (Day of the Race) and celebrates the Spanish heritage of the Latin American peoples. Columbus Day has become an increasingly controversial holiday in recent years as more focus has been placed on the brutal treatment of indigenous populations and the enforced colonization of the New World by European conquerors. In

response, some locales have refused to participate in Columbus Day celebrations or have replaced such festivities with other events commemorating native peoples.

Columbus's first voyage was carried out in an effort to reach Asia through a western passage. After departing from Spain in 1492, Columbus and his crew landed on an island in the Bahamas. His subsequent three voyages took him to other coastal locations of the American continents. Columbus remained convinced he had reached Asia, and it wasn't until the end of the century, with the voyages of explorer Amerigo Vespucci, for whom the continents are named, that the land was deemed the New World.

Becoming a National Holiday

Columbus Day was first celebrated in New York in 1792, the 300th anniversary of Columbus's fated voyage, primarily as an ethnic holiday for Italian Americans. It did not become celebrated as a nationwide holiday until the 1860s in the United States. In 1866, an annual sharpshooting contest in New York incorporated festivities honoring Columbus. This initial celebration expanded to a parade and carnival by 1869. That same year, Italians in San Francisco celebrated "Discovery Day." As of 1876, numerous large U.S. cities, including Philadelphia and Boston, held events promoting recognition of Columbus, which became annual traditions.

After a failed attempt at canonizing Columbus, Italian Americans and the Knights of Columbus, a Catholic fraternity, among other groups, succeeded in gathering support for Columbus Day as a national holiday. Congress approved the new holiday, declaring that it would be celebrated in 1892, 400 years after Columbus sighted land. The Columbus Day celebrations of 1892 were rather elaborate. A large statue of Columbus was erected in New York on Columbus Avenue, and the Columbian Exposition the following year at the Chicago World's Fair boasted replicas of his three ships. President Benjamin Harrison encouraged children in schools across the country to acknowledge the holiday in classrooms.

Colorado became the first state to recognize the holiday in 1905. By 1910, 15 states observed Columbus Day, and this number increased to 34 by 1938. Due to calendar shifts and the placement

of Sundays in October in 1892, the first Columbus Day was set as October 21, but this had changed back to October 12 by 1910. In 1968, President Lyndon B. Johnson signed a bill declaring Columbus Day would fall on the second Monday of October. Despite being observed in an increasing number of states, Columbus Day did not become an official national holiday until 1971.

Opposition

Although the Columbus Day of the 19th century was apparently well received on a national level, it was not free from criticism. Early opponents of the celebration argued that the holiday meant the spread of Catholicism. Suffragettes critiqued the attention given to Columbus's discovery, while the fight for the advancement of women's rights went largely ignored.

Further, some Columbus Day events coexisted with blatant discrimination against African Americans and American Indians, who were portrayed as "the conquered" in the 1893 Columbian Exposition. More recently, arguments against Columbus Day have included the holiday's failure to recognize the inhumane treatment of indigenous populations by settlers. For instance, Columbus enslaved the Taino people of Hispaniola, decimating the native population within 40 years, as well as introducing wide-scale poverty, enslavement, and disease.

While these critiques remain central to the discourse on Columbus Day, the holiday is still celebrated in most U.S. states. However, several states do not recognize Columbus Day. For example, Hawai'i acknowledges Discoverers' Day, which celebrates the arrival of Polynesian settlers to the islands, and South Dakota celebrates Native American Day. In 2002, Venezuela renamed the holiday *Día de la Resistencia Indígena* ("Day of Indigenous Resistance") to recognize native peoples. Several cities in the United States, including San Francisco and New York, continue their holiday traditions established in the late 19th century. In many cases, however, the celebration has become less about Columbus and more a celebration of Italian American heritage.

Comanche

Cultural and linguistic similarities lead anthropologists to conclude that the Comanche were originally part of the Northern Shoshones. Originally hunters and gatherers, they may have begun as a mountain tribe who roamed the Great Basin region of the western United States. History did not record when and how the Comanche first acquired horses, but sometime during the late 17th century, they became horse masters. From that time on, the horse defined the Comanche way of life. They became a nomadic people, buffalo hunters whose horsemanship was legendary. Horses also made them powerful warriors and astute traders. It wasn't until the Red River War of 1874 depleted their mounts that they were defeated.

For more than eight decades, Comanche culture was little more than a memory. Then, buoyed by a wave of Indian nationalism in the 1960s, the Comanche began to work to rebuild their society. According to the U.S. Census Bureau, in 2010, there were 12,284 people who claim Comanche as their sole ethnic identity.

The first recorded reference to the Comanche comes in 1706 from the colonial Spanish government in Santa Fe that had been informed by allies in Taos Pueblo that the Ute and the Comanche were about to attack. Twenty years later, accounts of fierce slave raiders who were at war with all nations began to multiply. The southern migration gave the tribe access not only to horses but also to a more abundant supply of buffalo and to French trade goods, including firearms, through barter with the Wichita Indians on the Red River.

It was only after their arrival on the southern Plains that the tribe acquired the name by which they are known. They called themselves Nermer-nuh, or "the People." It was the Spaniards who called them Comanche, a word derived from the Ute word *Komántcia*, meaning "enemy," or, literally, "anyone who wants to fight me all the time." Fighting clearly worked for the tribe. An area of the south Plains that included a substantial portion of north, central, and west Texas, soon became Comanche country, or Comanchería. Bands, or family groups, of Comanche ranged from the mountains of New Mexico to what is now western Oklahoma and north to the Arkansas River.

From their acquisition of horses until the forces of the United States proved strong enough to separate them from their horses, the Comanche remained a nomadic people. The buffalo they hunted supplied not only food but all they needed to sustain their lifestyle. The tepee constructed of tanned buffalo hides provided them with portable shelter. Buffalo robes protected them from the cold. They bartered buffalo products, along with horses and captives, for manufactured items and foodstuffs. But not even the buffalo were more important than their horses. Children were taught to ride when they were very young, and women as well as men were exceptionally skilled riders. Horses allowed them to follow the buffalo herds and gave them an advantage when hunting or making war.

Confronted with the formidable power of the Comanche, the Spanish tried to negotiate a peace agreement. Various attempts failed until the Spanish-Comanche Treaty of 1785, a document that the Comanche honored, with only minor violations, until the end of the century. When the Spanish became unable to supply gifts and trade goods, the Comanche raided Spanish settlements for horses to barter to traders entering Texas from the United States. Eager to acquire the horses, Americans traded goods that included arms and ammunition.

Comanche dominance seemed little affected by changes in government. They had built their power under the Spanish, continued it under the Mexicans, and defended it ferociously under the Texans. With the Mexican Colonization Law of 1824, settlers from the United States entered

the area in droves. The mutually beneficial trade relationship that had existed between the Anglo-Americans and the Comanche deteriorated when the new arrivals directed covetous attention to Comanche hunting grounds. Comanche raids on frontier settlements from San Antonio to northern Mexico were common. In May 1836, at Fort Parker, a settlement of some 34 persons near the Navasota River, the Comanche and their Kiowa allies attacked the blockhouse, killed several settlers, and took five hostages. One of the hostages was 9-year-old Cynthia Ann Parker, who lived with the Comanche for 24 years. Parker married a Comanche chief and became the mother of Quanah Parker, the last great Comanche chief.

Texas joined the Union in 1845, and the U.S. government took charge of Texas Indian affairs. Peace efforts were interspersed with outbreaks of violence. There was no room for negotiation

between the white settlers' hunger for land and the Comanche will to protect their hunting grounds. Reservations proved a failure both because of the many bands of Comanche and because the Comanche refused to be contained.

In 1874, the Red River War began. Its purpose was to force all Comanche onto a reservation. A surprise attack on a Comanche camp in Palo Duro Canyon destroyed their horse herd. Few Indians were killed, but so few mounts survived and supplies were so low that they could not survive the winter on the Plains. Reservation life threatened the essence of Comanche culture, and the end of the reservation in 1901 brought new problems. Individual Comanche lost their allotted land to poor judgment, weak finances, and fraud. Many left the area to find work elsewhere, a trend that increased during World War II and the years afterward.

This photograph by Edward Curtis shows six Native American leaders on horseback in ceremonial dress around 1900. Chief Quanah Parker of the Comanche appears without headdress at center; to the right of him is Geronimo of the Chiricahua Apache tribe. The others were from the Piegan, Ute, Brulé Sioux, and Oglala Sioux tribes. Parker, who is considered the last great Comanche chief, died in 1911.

In the 1960s, Native Americans became more aggressive in pursuing their civil rights. Court action was taken to protect or recover tribal lands, the American Indian Movement was founded, and the Comanche seceded from the intertribal body that had served as their government since passage of the Oklahoma Indian Welfare Act of 1936. They established their own government and began to reclaim their heritage.

The Comanche Nation is now headquartered in Lawton, Oklahoma. In 1995 the Comanche had an enrolled tribal population of 9,722 scattered across the United States. In 2010, 23,330 people self-identified as Comanche wholly or in combination with another tribe. Tribal gatherings celebrate Comanche history, culture, and kinship ties.

Commission on Civil Rights, U.S.

The U.S. Commission on Civil Rights was created in 1957 after the passage of the Civil Rights Act of 1957. Continuing to this day, the U.S. Commission on Civil Rights currently consists of eight members; four members are selected by the president and four by Congress. The president designates

the chair and vice chair. While the Equal Employment Opportunity Commission (EEOC) conducts much of the federal civil rights enforcement, the Commission on Civil Rights remains an independent agency dedicated to gathering information and improving the administration of civil rights legislation.

The U.S. Commission on Civil Rights has a checkered history. After a groundbreaking early era it became a locus for conflict with the presidency, such as the Reagan administration's attempts to reshape civil rights policy and the executive branch. Throughout the decades, it has struggled to retain independence and to exercise influence. At certain points, the continued existence of the commission has been in doubt. However, the commission has survived and recently conducted hearings in an emerging area of policy debate: state-level immigration restriction legislation directed at undocumented immigrants. The U.S. Commission on Civil Rights represents a fascinating example of the trajectory of civil rights politics and policy over the past half-century.

Origins and Mission

The U.S. Commission on Civil Rights is distinctive because it was formed as a result of congressional legislation: the Civil Rights Act of 1957. The first civil rights legislation passed since Reconstruction, the legislation was signed into law by President Dwight Eisenhower. The Commission on Civil Rights was given the duty to investigate allegations that people were being denied their right to vote on the basis of color, race, religion, and national origin. In addition, the law charged the commission with gathering information regarding equal protection violations and working with the federal government regarding civil rights policies. The commission lacked enforcement power but could subpoena people to appear at hearings. Six part-time commissioners were to be appointed by the president. To assist the commissioners, the legislation called for a staff director and a small staff.

The Civil Rights Act of 1957 represented a congressional breakthrough that built on nearly two decades of the exercise of executive power. The first federal civil rights agency, the President's Committee on Fair Employment Practices (FEPC), was formed in 1941 when President

Franklin Roosevelt issued Executive Order 8802. The agency ended in 1946 but Presidents Roosevelt, Truman, and Eisenhower continued to use executive authority since congressional action was impossible. As attempts to pass federal civil rights legislation began to increase in frequency during the 1940s, southern Democrats working with western and midwestern Republicans successfully blocked the legislation. Both Harry Truman and Eisenhower made efforts to pass modest civil rights legislation. The October 1957 standoff at Central High School in Little Rock, Arkansas, had Governor Orville Faubus leading the charge against integration. The ensuing crisis and international attention forced President Eisenhower and the Democratic Congress to act and overcome the opposition of southern segregationists in Congress.

Early Activities

When the United States Commission on Civil Rights was created, the EEOC did not yet exist and much of civil rights legislation and enforcement was limited to the state level. Staffing the commission and appointing commissioners proved to be a challenge. Members were not initially appointed to fixed terms, a practice that would develop problems in future years. President Eisenhower initially appointed five white men and one African American man to serve on the commission.

The first chair of the commission was John Hannah, who as assistant secretary of defense had worked on integrating the military during a career that also saw a long tenure at Michigan State University. The African American appointee was Ernest Wilkins, a moderate lawyer from Chicago who was serving as assistant secretary of labor. An appointee who represented the views of the south was also selected. Father Ted Hesburgh, the young president of Notre Dame University and a figure who would have a strong influence on civil rights and immigration policy for the next several decades, was also appointed.

Dealing with few resources and no enforcement authority, the commission worked within institutional constraints to accomplish its mission. One method utilized was the State Advisory Committees appointed to observe conditions. State Advisory Committees were possible even

in many states of the former Confederacy; only in Mississippi and South Carolina were committees not formed. The State Advisory Committees, or SACs, continue to be an important part of the commission's work to this day.

The commission was initially formed for only two years. In September 1959 Congress passed the first two-year extension of the work the commission was doing. Future reauthorizations often were for similarly short periods of time. Gaining attention and resources while maintaining independence is an enduring theme of the commission's history.

The Eisenhower administration inaugurated one of the enduring themes in the history of the commission: inattention and conflict with the executive branch. Commissioners had to be confirmed by the Senate Judiciary Committee, dominated at that time by its chairman, Mississippi Senator James Eastland. That created limits in terms of who could be appointed.

During the Kennedy and Johnson administrations the commission conducted a great many investigations regarding the lack of voting and civil rights in a south where many were fighting to retain segregation and the disenfranchisement of African Americans. In addition, commissioners assisted in having measures such as the 1965 Voting Rights Act adopted. By the end of the 1960s, the commission was monitoring civil rights efforts at the federal level and continuing to navigate the increasingly difficult terrain of civil rights politics and policy.

New Challenges

After the passage of civil rights legislation in the 1960s, the increasingly contentious issues of busing and desegregation became the focus of the commission's work. In addition, the 1969 election of Richard Nixon began a move toward more conservative civil rights policies at the federal level. Throughout the country federal judges began ordering busing in specific communities, counties, and municipalities. Students were bused to schools throughout a particular jurisdiction in order to desegregate school systems. Busing was a highly contentious policy, leading to violence in cities such as Boston. The commission both criticized the slow pace of federal desegregation policy and made statements supportive of busing.

Father Ted Hesburgh, one of the founding commissioners, was asked by President Nixon to resign in late 1972. Hesburgh was seen as too outspoken, and Arthur Flemming was nominated by Nixon in 1973 to serve as the new chair of the commission. During this era groups such as Native Americans and Mexican Americans began to gain greater attention from the commission. Each racial and ethnic group impacted has unique needs and challenges, and the commission has worked to explore the circumstances of many traditionally marginalized groups.

Mary Frances Berry was appointed to the commission by President Jimmy Carter in 1980. Berry, who would later serve as chair of the commission, became one of the most prominent commissioners and often became the center for controversies that would emerge. In filling a commission seat with Berry and others designed to appeal to Democratic constituencies, Carter was seeking to fortify his credentials during a difficult reelection campaign.

The Reagan Years and the 1980s

The election of Ronald Reagan in 1980 shifted federal expectations regarding civil rights. While Reagan often denounced racism and discrimination and did not appear to harbor racist views, many civil rights leaders were concerned about his attitude toward civil rights enforcement. The U.S. Commission on Civil Rights had consistently supported policies such as affirmative action and the Equal Rights Amendment, which were opposed by Reagan and many of his appointees.

Just as Reagan sought to change the federal judiciary through conservative appointees, his administration extended those changes to the Commission on Civil Rights. In November 1981, Clarence Pendleton, a black conservative Republican, was selected as the new chair. Pendleton was previously head of the San Diego Urban League and joined former Republican National Committee chairperson Mary Louise Smith as Reagan's first appointees to the U.S. Commission on Civil Rights.

Initially these changes did not produce much of an impact. Smith was a moderate Republican appointed as Republican National Committee chair in the 1970s by Gerald Ford and she voted with the other commission members in several 5–1 votes. The Reagan administration began to receive criticism for attempting to seriously

curtail the independence of the U.S. Commission on Civil Rights.

After attempting to replace Berry and Commissioners Blandina Cardenas Ramirez and Rabbi Murray Saltzman, the Reagan administration's plans to influence the commission ended up backfiring. The three replacement nominations were not considered by the Senate and the three existing appointees remained in office. In 1983 the Reagan administration once again attempted to replace the three commissioners in an effort to weaken the independence of the commission.

A compromise was worked out that allowed the commission to survive while reconfiguring its appointment structure. The number of commissioners would be expanded from six to eight. Of those, four would be appointed by the president, two by the House of Representatives, and two by the Senate. Rather than being subject to the advice and consent of the Senate, commissioners would serve six-year terms. Removal could occur only for cause. The changes helped reinforce the independence of the commission and put it in a position to serve as watchdog. However, a lack of resources and the outspoken comments of certain commissioners continued to be a burden for the commission.

By the end of the 1980s the U.S. Commission on Civil Rights suffered from bad publicity, reduced funding, and a lack of credibility among civil rights groups. In 1989 debates emerged regarding whether the commission should even be reauthorized. However, in 1989 a five-year reauthorization was approved and the work of the commission continued, albeit with limited resources.

In 1989 President George H. W. Bush appointed Arthur Fletcher, an African American Republican who implemented affirmative action programs during the Nixon administration, to the commission. The first Bush administration toed a fine line between seeking to support civil rights and maintaining the support of the conservative Republican base. Bush's veto of civil rights legislation in 1990 and 1991 and subsequent signing of legislation shows the difficulties and paradoxes of his politics and policies. One accomplishment during this era was the 1990 passage of the Americans with Disabilities Act, based in part on a report from the commission recommending the legislation.

Mary Frances Berry, who had criticized Republican presidents, their policies, and their appointees to the U.S. Commission on Civil Rights, was confirmed as chair of the commission in 1993. Berry, who had been the center of controversy during the 1980s, continued to use her position to vigorously argue her views. The Bill Clinton years saw conflict between progressives such as Berry on the commission and the pragmatic moderation of the Clinton presidency. The U.S. Commission on Civil Rights was most recently reauthorized in 1994 with the passage of the Civil Rights Commission Amendments Act of 1994. Passed by a Democratic Congress and signed into law by President Clinton, the law assured the continued existence of the commission.

New Challenges

George W. Bush assumed the presidency in 2001 with a promise to be a compassionate conservative. He appointed a more diverse administration than any previous Republican president and sought the support of African American leaders for his faith-based initiatives. However, like President Reagan, he sought to shift the commission toward a more conservative direction. One move was the replacement of Mary Frances Berry as chair of the commission with Albert Reynolds, a prominent African American conservative. Once again Berry was the center of controversy over the commission's independence.

The election in 2008 of Barack Obama, the first African American president, created a new opportunity for the U.S. Commission on Civil Rights. President Obama appointed Martin Castro, the chair of the commission as of 2012, and Roberta Achtenberg. Achtenberg, an open lesbian long active in Democratic politics, represents a possible opportunity to expand the reach of the commission to issues of sexual orientation. President Obama's appointees represent the diverse possibility of the current needs of the commission.

The Commission Today

The organizational structure of the U.S. Commission on Civil Rights is currently led by the eight commissioners nominated by the president and confirmed by the U.S. Senate. The Office of the Staff Director provides the overall leadership of the agency. The commission has six regional

offices and offices to support counsel, evaluation, management, congressional affairs, and public affairs.

After over a half-century of existence, the U.S. Commission on Civil Rights has continued to become involved in emerging civil rights concerns. In August 2012 the commission held hearings in Birmingham, Alabama, regarding state-level immigration restriction legislation. Many of the over 10 million undocumented immigrants in the United States are Latinos. The focus on undocumented immigrants illustrates one of the enduring themes in the work of the commission: the expansion of interest and efforts to groups beyond the African Americans who were first impacted by the commission.

Conclusion

Five and a half decades after its establishment, the U.S. Commission on Civil Rights continues to fulfill an expanded mission. Ideological conflicts and attempts by presidents such as Ronald Reagan and George W. Bush have often hampered the work of the commission. Like many federal agencies, the commission has struggled with issues of resources and independence. As long as systematic discrimination persists, the U.S. Commission on Civil Rights will most likely continue in the future to reflect the conflicts over politics and policy regarding traditionally marginalized groups.

Compensatory Education

The civil rights movement of the 1960s focused a tremendous amount of attention on the education of poor children, as well as their levels of attainment compared with other groups. In response to the perceived low levels of educational achievement, a slew of compensatory education programs were initiated to help children of color, the disabled, students from low socioeconomic status (SES) households, and English language learners. Coupled with this move to provide compensatory education was an increased interest in multicultural education. Although compensatory education programs have achieved some level of success, some offerings have been criticized as inefficient and ineffective. As the scrutiny of all education initiatives has increased since the advent of the No Child Left Behind legislation, compensatory education programs will no doubt continue to be analyzed, appraised, and assessed.

Background

Since the 1960s, the federal government has taken a leading role in devising and promulgating programs designed to promote equality of opportunity. In the wake of the landmark U.S. Supreme Court decision in *Brown v. Board of Education*, (347 U.S. 483, 1954), which determined that separate educational facilities for white and black children were inherently unequal, politicians, teachers, parents, and school administrators were aware of the many disparities among public schools. As the majority of children attended neighborhood schools, and as neighborhoods often reflected the racial discrimination still present in American society, solutions were sought that would provide a better educational experience for low-income students.

Title I of the Elementary and Secondary Education Act (ESEA) was part of President Lyndon B. Johnson's War on Poverty and since 1965 has served as the single biggest program for U.S. schools. Title I, which currently accounts for nearly \$15 billion in funding, was intended as a means to close the fiscal gaps between low- and high-revenue schools within a given state. Although at times Title I funding has seemed

endangered, it has been renewed every five years since implementation of the program in 1965.

Programs

Title I funding was soon joined by other compensatory education programs. All of these compensatory education programs were designed to assist "at-risk" children, although how this was defined varied depending upon the program at hand. Programs such as Head Start, designed to assist low-income, traditionally underserved, or language-minority children, seek to provide services and interventions that will help at-risk children to reach their full potential.

In 1975, the Education for All Handicapped Children Act (EAHCA) strengthened protections for children with disabilities in an effort to ensure that students with special needs receive a free and appropriate public education in the least restrictive environment. The EAHCA was later reauthorized and strengthened as the Individuals with Disabilities Education Act (IDEA). Students with an identified disability in one of the following areas qualify for special education services under IDEA:

- Autism
- Behavior disorders
- Deafness/blindness
- Developmental delays
- Emotionally disturbed
- Hearing impairments
- Intellectual impairments (formerly mental retardation)
- Multiple disabilities
- Orthopedic or physical impairments
- Other health impairments (such as attention deficit hyperactivity disorder)
- Specific learning disabilities
- Speech and language disabilities
- Traumatic brain injuries
- Visual impairments

Once a child has been determined to have a disability, a meeting of various school personnel is held to determine an individual education program (IEP) for the child. Depending on the disability, the IEP may focus on compensatory education, provided through either a special day class, a pull-out program, or in-class services.

Bilingual education is defined by the U.S. Department of Education (DoE) as an education program for children with limited English proficiency. Although bilingual education entails a variety of services, certain parts of a bilingual program are also compensatory in nature. Bilingual education first was addressed by legislation on a federal level through the Bilingual Education Act of 1968 (BEA, or Title VII of ESEA), which established voluntary programs for school districts promoting ways of educating minority-language students. The U.S. Supreme Court determined in *Lau v. Nichols* (414 U.S. 563, 1974) that school districts must provide English language instruction to students whose primary language is not English as failure to do so would deny the children of their rights under § 601 of the Civil Rights Act of 1964, which prohibits discrimination based upon race, color, or national origin.

Coupled with the passage of the Equal Educational Opportunity Act of 1974, the BEA was amended in 1974 to emphasize that bilingual education must provide children instruction in English *and* in their native language, thereby maintaining the children's native language and culture while also allowing them to progress through the educational system. In 1978, additional amendments by Congress emphasized that English-speaking children could enroll in bilingual programs, expanded the number of English language learners (ELLs) that the program could serve, and stressed that native language instruction was to be temporary. Further amendments in 1984 and 1988, as well as a reauthorization of the BEA in 1994, increased the flexibility of programming that schools could offer, expanded funding to state agencies to support bilingual education, and set up preferences for those programs that developed proficiency in two or more languages.

With the passage of No Child Left Behind (NCLB) in 2001, however, the BEA was rewritten and renamed the English Language Acquisition, Language Enhancement, and Academic Achievement Act. As the new name indicates, post-NCLB increased emphasis on achievement, especially as measured by standardized testing. Although the federal government still provides funds to support compensatory education that is part of bilingual

education programs, the total pool of money available to these programs is less than half what it was before NCLB.

NCLB, which replaced ESEA, initially enjoyed tremendous bipartisan support. Its passage saw a tremendous increase in the funding provided to K–12 schools, with the \$42.2 billion provided in 2001 increasing to \$55.7 billion by 2004. While the total funding for compensatory education greatly increased, however, the degree of latitude given to state departments of education and local school districts regarding the types of compensatory education used was greatly diminished by NCLB. Nonnative English speakers had to be assessed using English tests after three years of native-language assessments, and only certain reading programs could be used. NCLB required school districts to track the academic achievement of traditionally underserved groups, including children from low socioeconomic status (SES) backgrounds, English language learners, students with disabilities, and members of major racial and ethnic subgroups. All of these groups were to make adequate yearly progress (AYP) as measured by performance on standardized tests or the school districts would suffer a variety of penalties, including decreased funding, loss of autonomy, replacement of teachers and/or administration, or permitting students to transfer to other schools.

Trials and Triumphs

From the initial flood of funding in the 1960s, compensatory education has received a variety of responses from researchers, teachers, administrators, and policy groups. Many of the differences in response are due to a lack of consensus on how best to serve needy students. While most constituencies enjoy the increased government largesse that compensatory education programs provide, different groups have differing priorities regarding how these funds should be spent.

On the one hand, traditionalists have often seen the major purpose of compensatory education as a closing of the gaps between majority and multicultural groups. As a result, traditionalists have favored directing funding to poor school districts where the money can be used to fund systems that are perpetually in need. Reformers, on the other hand, have tended to view compensatory education as a means to assist students

A bilingual class of immigrant Chinese students from Hong Kong and Taiwan in New York City in 1964. The Bilingual Education Act of 1968 (BEA) established voluntary programs for school districts promoting ways of educating minority-language students. In 1974 the BEA was amended to state that bilingual education must provide children instruction in both English and their native language.

and clients who have great needs. For this reason, reformers often prefer that compensatory education take place outside the traditional services and programs provided by school districts and instead advocate a separate set of services tailored to student needs. Because reformers have tended to carry the day regarding compensatory education programs, the focus has for the most part been on new programs especially designed for students from low SES backgrounds.

From the beginning, federally funded compensatory education programs were supposed to supplement, rather than supplant, education services the recipients would have received through state and local programs and expenditures. Funding for compensatory education was intended to be spent on “disadvantaged” children, and the hope

was that focusing additional resources on needy students would permit them to break the cycle of poverty. Unfortunately, evaluations of Title I programs conducted throughout the 1970s suggested that many school districts were diverting compensatory education funds away from the most needy students and instead using the monies to benefit other groups. For this reason, many Title I programs began to structure services as out-of-the-classroom experiences to ensure that the funds would be spent on the most needy children.

Although some initiatives, such as reading laboratories, achieved gains in performance, others, such as ill-defined “enrichment” services, were less successful. While not all compensatory education initiatives were successful, the existence of these programs worked to solidify the belief

that the government was responsible for trying to help the neediest children. Such initiatives also increased the expectations of traditionally underserved groups, such as students from low SES backgrounds, children of color, and ELLs, to expect more from education and to envision themselves as part of the system.

Compensatory education often seemed conflicted regarding who were the intended beneficiaries of its programs. Certainly needy children were the focus of many programs, but in many cases so too were their parents and other community members. The Head Start program, for example, was intended from the beginning to provide both an enriched preschool experience for children of poverty and employment opportunities for their mothers and other women from the communities in which they were located. While many compensatory education programs were similar in nature throughout the nation until the early 1980s, the administration of Ronald Reagan sought both to reduce the level of federal spending on education and to return more control of programming to state and local authorities. As a result, half of Title I funding was made available to states as competitive block grants, which each state spent as it considered best. While this increased the diversity of programs funded, it also made comparisons of results difficult.

During the 1990s, further reforms reduced the threshold level for schools to qualify for Title I funds to a 50 percent poverty rate, down from 75 percent. Reading/language arts and mathematics standards were implemented, in part to help authorities determine the effectiveness of given programs. Local authorities were also given additional control over funding, a change that permitted DoE officials to waive federal requirements that interfered with school improvements. Since the passage of NCLB, the concentration on improving children's performance in reading/language arts and mathematics has continued, but the DoE has exerted increasing levels of control over how funds may be spent, reducing state and local district autonomy to a degree many have protested.

Congress of Racial Equality

The Congress of Racial Equality was organized in Chicago in 1942 by George Houser and James L. Farmer, Jr., Methodist seminary students and staff members of the Fellowship of Reconciliation's Chicago office, with James R. Robinson and Bernice Fisher. CORE formally organized the following year under its present name with chapters in several midwestern cities. By 1947 CORE had 13 local affiliates, challenging segregation in restaurants, swimming pools, parks, and barber shops in the north with sit-ins, picketing, and other nonviolent tactics. Farmer, national chairman from 1942 to 1944, later recalled: "CORE from its early days was oriented towards the techniques of nonviolent direct action to show the world that nonviolence can solve social problems." Houser summed up their generally successful campaigns in *Erasing the Color Line*, published in 1945.

Farmer and Houser initially proposed their plan for an interracial organization committed to nonviolence to A. J. Muste and other leaders

of the Fellowship of Reconciliation (FOR), an international organization of religious pacifists. Through FOR's work on historically black campuses in the late 1930s, its leaders recognized that race relations were a major American problem and decided to nurture an autonomous CORE, cosponsoring its activities and paying its bills. Houser ran CORE as its unsalaried executive secretary from the Cleveland FOR office from 1944 and later shared that role with Bayard Rustin in the New York office of FOR.

The Freedom Rides and Other Bold Actions

In 1947 Houser organized the Journey of Reconciliation, a joint project of FOR and CORE, to test a Supreme Court decision outlawing segregation on interstate buses and in bus terminals by sending an interracial group by bus from Washington, D.C., to New Orleans, Louisiana. Houser and Rustin

were among 13 "Freedom Riders" who met with no serious opposition until they reached North Carolina, where they canceled the trip. The same year CORE began an annual summer Washington Interracial Workshop, where college students gained hands-on experience in nonviolent efforts to eliminate segregation in the nation's capital, sitting in at drug store lunch counters and demonstrating at theaters, park playgrounds, and pools.

By 1954, the year of the Supreme Court decision in *Brown v. Board of Education* and of the beginning of the Montgomery Bus Boycott, CORE and its local affiliates had achieved a great deal in eliminating racial barriers in some communities in the north. Some in FOR thought CORE had become too radical and confrontational, while others in CORE wanted it to take radical stands on issues unconnected with race. FOR determined to end financial and staff support for CORE, so

Congress of Racial Equality (CORE) members carry picket signs outside Columbia University in New York City in support of employee demands for union representation in 1964. CORE volunteers were recruited on many college campuses from 1962 to 1964, and Brooklyn CORE sought to prevent access to the 1964 New York World's Fair on its opening day unless executives agreed to hire more minorities.

CORE had to reorganize. Houser stepped down but continued on an ad hoc national action committee with James and Lula Farmer, James Robinson, LeRoy Carter, and James Peck in 1954–57. FOR sent Houser on an extended African trip from April through October 1954, followed by a nationwide speaking tour in 1955. He left FOR and CORE to work on ending apartheid in South Africa. In another reorganization in 1957, Robinson became executive secretary and the National Action Committee was given official status.

After the successful Montgomery Bus Boycott, CORE, so far an exclusively northern organization, began organizing in the south. CORE worked closely with Martin Luther King, Jr., and the Southern Christian Leadership Conference (SCLC) he founded in 1957 and he joined CORE's advisory council. CORE also had close ties to the National Association for the Advancement of Colored People (NAACP) as CORE began a drive for southern chapters. James McCain developed a string of CORE chapters in South Carolina. Wyatt T. Walker built chapters in Norfolk and other Virginia cities.

Anna Holden, who led the Nashville chapter, focused on public school desegregation. CORE published her pamphlet, *A First Step Toward School Integration*, in 1958. On CORE's National Action Committee, Holden stressed nonviolent action to achieve goals. She later led Ann Arbor, Michigan, CORE members in campaigns to end discrimination in housing, employment, and education. CORE chapters in Miami and Tallahassee, Florida, also focused on ending segregation. James McCain and other southern organizers favored an emphasis on voter registration drives.

When four college students sat at a lunch counter in Greensboro, North Carolina, on February 1, 1960, McCain and Gordon Carey of CORE made sure their bold action became a national movement. Student members of Tallahassee CORE were among the first to hold their own sit-in. CORE chapters in the north picketed Woolworth's and Kresge's stores in support.

Farmer returned to the leadership of CORE as national director early in 1961. One of his first actions was to sponsor a second Journey of Reconciliation. Once again 13 CORE members would board either a Greyhound or Trailways bus in Washington and travel to New Orleans on

a Freedom Ride. Farmer was to have ridden with them, but he left the bus at Atlanta to attend his father's funeral. The Greyhound bus was attacked and set on fire near Anniston, Alabama. Passengers on the other were brutally assaulted when their bus pulled into the Trailways station in Birmingham. Farmer, under great pressure, called off the Freedom Ride, but Diane Nash, a Fisk student who had just organized a Student Non-Violent Coordinating Committee (SNCC) there, insisted it continue. CORE and SNCC members volunteered for more Freedom Rides.

Voter registration drives increased in 1962–64 with CORE volunteers recruited on many college campuses to staff Freedom Schools during Mississippi Freedom Summer. James Cheney, Andrew Goodwin, and Michael Schwerner, who were murdered near Philadelphia, Mississippi, in 1964 were CORE members. Northern chapters meanwhile mounted nonviolent campaigns to bring change to their communities. They tackled economic as well as social issues with some successes, often stirring up controversy within the organization as well as with the public, as in a proposal by Brooklyn CORE to prevent access to the 1964 New York World's Fair on its opening day unless the fair executives agreed to hire more minorities.

The rise of Black Power and dissatisfaction with nonviolence splintered CORE. Farmer was forced out in 1966 and Floyd McKissick took CORE in a more militant direction. Roy Innis succeeded him in 1968 and continues as national director, promoting conservative and libertarian issues. CORE maintains a New York office, but there are no local chapters.

Congressional Black Caucus

The Congressional Black Caucus (CBC) was founded in 1972 by 13 African American members of the U.S. House of Representatives. Initially called the Democratic Select Committee, the CBC is the self-proclaimed voice of the voiceless and the “conscience” of the U.S. Congress. Historically, the CBC has comprised members of the House of Representatives from minority-majority congressional districts, with a majority of African American and Democratic voters. The membership has grown from its initial 13 to 43 as of the 112th Congress in 2011.

Emergence of the CBC serves as a significant historical marker in the acquisition of unprecedented political power for African Americans at the federal level of government. The CBC, like other caucuses in Congress, is a vehicle to amass votes for a shared agenda that benefits a group of constituents. In distinction from other caucuses, the CBC membership and constituents are people who sojourned from slavery to freedom, from being treated as second-class citizens without the right to vote to over 10,000 elected officials, including three U.S. senators and the 44th president of the United States, Barack Hussein Obama, Jr., elected in 2008 and re-elected in 2012.

Historical Context

The story of the Congressional Black Caucus is a subset of the story of people of African descent in America. The odyssey of black, colored, Negro, and African American folk in the United States has been a journey that spanned over 500 years. It began with the arrival of sub-Saharan Africans. The odyssey continued with a Virginia tobacco planter’s well-documented account of the arrival of “20 odd negroes” who came to Jamestown, Virginia, via Cape Comfort in August 1619 as indentured servants. The wave of slave ships brought scores of Africans to America as the progenitors of the “Negro, colored, black and African American” people who would inhabit the Americas.

Originally with no political rights by law, African Americans used nonelectoral political tools to obtain full citizenship, with rights guaranteed

by the U.S. Constitution. Methods for attaining these rights included organized work stoppages, political speech making, coalition building, revolt, protest, appeals to the international community during the abolitionist movement, and fighting on both sides of the U.S. Civil War. The end of the war brought an end to slavery and the rise of federally protected and states-based rights to the franchise.

The first African Americans to serve in the U.S. Congress arrived during Reconstruction, served from 1865 to 1901, and were all southern Republicans. One of two U.S. senators and 10 of the 21 congressmen were formerly enslaved. The first “colored” U.S. senator and six congressmen came as a result of the end of slavery, and represented former slave-holding states. Hiram Rhodes Revels served as senator from Mississippi. Robert Carlos De Large, Robert Brown Elliott, and Richard Harvey Cain were the three representatives from South Carolina. Benjamin Sterling Turner was from Alabama. The number of African Americans in Congress grew from zero in 1864 to two senators, and 21 representatives having served by 1901.

The 1877 Compromise, also known as the Great Betrayal, an informal, unwritten deal by Rutherford B. Hayes, resulted in a political pact between the southern legislative delegation and the presidential hopeful to pull back federal troops from the south in exchange for electoral college votes and, ultimately, the presidency. In response African Americans, over the ensuing decades, sometimes in coalition with progressives, launched civic and benevolence organizations, black political conventions, court cases, the civil rights movement, the Black Power movement, and lobbyist efforts aimed at presidents and members of Congress. Throughout that time, voting rights have served as a holy grail of political goals. Through its obtainment black elected officials were possible on the local, state, and federal levels of government. The Congressional Black Caucus was possible, in large measure, because of the Voting Rights Act of 1965, signed by President Lyndon B. Johnson, a Democrat.

After a marked absence, African Americans returned to Congress in 1929, with the election of Oscar DePriest of Illinois. It took until 1971 to reach 10 elected African American representatives, and they became the original organizers

of the caucus. As 2.2 percent of the members of Congress, they spoke for 22.6 million blacks, 11 percent of the American population.

Founding Members

After Reconstruction African American members entered Congress initially through northern congressional districts, not southern states. The trend continued in the 20th century with Adam Clayton Powell, Jr., a Democrat from Harlem, New York, who also was a full-time pastor; Charles Diggs, a Democrat, who, like his predecessor Oscar DePriest, came from Chicago, Illinois; Louis Stokes, a Democrat from Cleveland, Ohio; and John Conyers, a Democrat from Detroit, Michigan. The CBC was founded during the 92nd Congress (1971–73). Founding members include Shirley Chisholm (D-New York), William L. Clay (D-Missouri), George W. Collins (D-Illinois), John Conyers (D-Michigan), Ronald Dellums (D-California), Charles Diggs (D-Michigan), Augustus F. Hawkins (D-California), Ralph Metcalfe (D-Illinois), Parren Mitchell (D-Maryland), Robert Nix (D-Pennsylvania), Charles B. Rangel (D-New York), Louis Stokes (D-Ohio), and Washington, D.C., delegate Walter Fauntroy.

Establishing a Charitable Foundation

In 1976, members of the CBC established the Congressional Black Caucus Foundation (CBCF), a nonprofit, nonpartisan, public policy research and educational institute to enhance black involvement in the political process. The first official meeting of the foundation was held on September 30, 1976.

CBCF's influence extends to African American intellectuals and others focused on policy and legislative issues. Each September, thousands of elected officials, industry leaders, celebrities, media, emerging leaders, and everyday Americans come to Washington, D.C., for the organization's Annual Legislative Conference. The conference features participation by the CBC and includes dozens of policy forums, general sessions, exhibits, a job fair, book signings, and vast networking opportunities.

In addition, CBCF produces district-level forums throughout the country to explore public policy concerns, promote public health care and financial empowerment, and solicit opinions and

recommendations of local citizens. CBCF and its volunteers through the Congressional Black Caucus Spouses also sponsor an annual scholarship classic that raises hundreds of thousands of dollars for educational and training opportunities for college students.

Four Decades of Accomplishments

President Richard Nixon and the CBC had a strained relationship. In 1970, the Democratic Select Committee (the predecessor to the CBC) requested a conference with Nixon but was denied. In 1972, the Democratic Select Committee became the CBC, boycotted Nixon's State of the Union address, and was subsequently invited to a meeting with the president where its members went over a list of demands. That was also the first year of the CBC Annual Legislative Caucus dinner. Actor Ossie Davis was the keynote speaker and delivered the "It's Not the Man, It's the Plan" speech. The CBC began sponsoring national conferences on topics such as health, education, business, media, and politics. During that time, Shirley Chisholm, a CBC founder, ran as the first African American female candidate for the U.S. presidency. At the March 1972 National Black Political Convention in Gary, Indiana, Chisholm failed to receive the full support of CBC members. In 1978, CBC members met with Jimmy Carter to discuss the Humphrey-Hawkins Bill, which established the federal government's responsibility to ensure full employment for U.S. citizens. When it was signed into law in October, Carter credited the CBC for its role in the advocacy for its passage.

The 1980s were a period of consolidated power and effectiveness for the CBC. The CBC achieved Legislative Service Organization (LSO) status, referring to a group organized to pursue common legislative goals. The House Committee on Administration prohibited LSO's from receiving outside funding, but the members were allowed to establish tax exempt foundations to carry out research and other activities. Congressman Conyers employed Rosa Parks in his congressional office in Detroit after the Montgomery Bus Boycott. He also sponsored legislation calling for a national holiday for the Reverend Martin Luther King, Jr, immediately after his assassination in 1968. Fifteen years later, in 1983, President

Ronald Reagan signed into law the Martin Luther King, Jr. holiday. Before announcing his candidacy for president in 1984, the Reverend Jesse Jackson met with a coalition of black elected officials in Chicago, including CBC Members, to gain their support for his campaign. Ultimately, half of the CBC members supported the campaign, and the other half did not.

Also during the 1980, CBS's years of lobbying, protesting, and advocating for an end to anti-apartheid paid off. In 1985 William Gray III, a black Democratic congressman from Louisiana and chairman of the Budget Committee, introduced a bill that prohibited loans and new investment in South Africa and enforced sanctions on imports and exports with the nation. A year later, the CBC cosponsored the Comprehensive Anti-Apartheid Act of 1986, which passed into law.

This bill called for sanctions against South Africa and stated preconditions for lifting the sanctions, including the release of all political prisoners. Among these political prisoners was Nelson Mandela. President Ronald Reagan attempted to veto the bill but was overridden. The override marked the first time in the 20th century that a president had a foreign policy veto overridden. Mandela was freed from a South African jail.

The 1990s proved to be a tipping point for the CBC's aspirations to effectively impact national dialogue in the quest for jobs and justice. The 1992 election of President William Jefferson Clinton fostered a functional working relationship between the White House and the CBC. The effort to cut social programs was met with resistance and mutual compromise. Welfare to Work legislation was passed into law. In 1995, the Republican majority in the House led by Speaker Newt Gingrich abolished all LSOs. Republican Congressman Pat Roberts of Kansas was among several GOP members who campaigned against the public subsidization of caucuses. All caucuses were forced to move out of congressional office space and become congressional member organizations or private corporations.

Clinton's reelection provided another four years of a functional relationship between the CBC and the White House, and a plethora of African American cabinet-level secretaries that increased CBC access. Alexis Herman served as secretary

of labor, Hazel O'Leary as secretary of energy, Togo West as secretary of Veterans Affairs, Rodney Slater as secretary of transportation, and Dr. Joycelyn Elders as surgeon general.

Introducing legislation into Congress has been a tool of the CBC, particularly when the interests of their constituents are immediately threatened. After Hurricane Katrina, all 42 House members of the CBC introduced the Hurricane Katrina Recovery, Reclamation, Restoration, Reconstruction, and Reunion Act of 2005. The bill was designed to provide for the recovery of the Gulf Coast region and for the reunion of families devastated by the storm. The same year, CBC members met with President George W. Bush to discuss the renewal of the Voting Rights Act and its amendments, which were set to expire in 2007. Shortly thereafter, CBC members cosponsored the Fannie Lou Hamer, Rosa Parks, and Coretta Scott King Voting Rights Act Reauthorization and Amendments Act of 2006.

In 2006, the election of Illinois Senator Barack Obama provided the CBC with help in the U.S. Senate. The short-lived support was increased with his 2008 presidential election. Members of the caucus campaigned for the president in their congressional districts in the 2008 and 2012 presidential election cycles. From 2006 to 2013, CBC members met with Obama on a plethora of issues and legislation, including support for the landmark Affordable [Health] Care Act of 2010; the 2012 modifications on the National Mall, including the unveiling of the Dr. Martin Luther King, Jr., statue; and the erection of the Smithsonian African American Museum of History and Culture, slated for completion in 2015. Members of the CBC also critiqued the increased use of drones in U.S. military operations. Throughout the meetings with Obama, the caucus affirmed its motto: "We have no permanent friends, we have no permanent enemies, we have just permanent interests!"

Congressional Hispanic Caucus

The Congressional Hispanic Caucus (CHC) is made up of the Democratic members of Congress of Hispanic descent. The CHC goal is to voice and advance, through the legislative process, issues affecting Hispanics and Latinos in the United States, Puerto Rico, and U.S. territories.

In 1978, the CHC created the Congressional Hispanic Caucus Institute (CHCI). The institute offers a wide range of programs and activities to support the educational and professional aspirations of Hispanic youth, from high school through graduate school and into their careers. CHCI programs serve more than 1,500 young Latinos annually.

With Latinos expected to comprise one-quarter of the population by 2030, the CHC promises to be a critical vehicle in shaping the lives of Latinos and the future of the nation.

Foundation of the Caucus

The Congressional Hispanic Caucus was founded in December 1976 as a legislative service organization of the House of Representatives. The five founding members were Hispanic congressmen Herman Badillo (New York), Baltasar Corrada del Río (Puerto Rico), Kika de la Garza (Texas), Henry B. Gonzalez (Texas), and Edward Roybal (California). The founders' idea was to work in conjunction with other groups, both inside and

Representative Nydia Velázquez of New York with three other members of the Congressional Hispanic Caucus in 2009, the year she became chair of the caucus. Representative Velázquez was also the first Puerto Rican woman elected to Congress.

outside Congress, to strengthen federal commitment to Hispanics and heighten community's awareness of the operation and function of the American political system.

A few years after its formation, the Congressional Hispanic Caucus became organized as a congressional member organization, governed under House rules. The CHC aims to address national and international issues and their impact on the Hispanic community. The function of the caucus is to serve as a forum for the Hispanic congressional members to coalesce around a collective legislative agenda.

To best address their diverse concerns, members work in smaller task forces that draw on their expertise to develop legislation within each area of concern. The executive activity of the Congressional Hispanic Caucus is organized into eight task forces: agriculture and rural community, civil

rights; diversity, economy and workforce, education; health care, housing and financial services, and immigration and international relations. Each task force is composed of two or three members. The only exception is the immigration task force, which includes all members because of its importance.

Legislative Priorities

CHC legislative priorities cover all areas that have a direct impact on the Hispanic or Latino community. According to an October 2010 report by the Pew Hispanic Center, Hispanics rank education, jobs, and health care as their top concerns. Immigration ranks as the fourth most important issue. The Congressional Hispanic Caucus actively supported President Barack Obama's health care reform and celebrated it as a victory for all Americans, including the 16 million uninsured Hispanics. Access to health care has been a long-standing concern to the Hispanic community, as Latinos are far less likely to get preventive services but have a greater chance than whites of being diagnosed with diseases like diabetes. The benefits of the health care reform will have a huge impact on the Latino community. Nearly 750,000 young Latinos have been able to get coverage through their parents' plans and by 2014, when the reforms are fully implemented, 9 million more uninsured Latinos will be eligible for coverage.

Immigration is the next most important issue for the CHC and has become a polarizing subject nationwide, and one that has been an intrinsic part of the fabric of American society. Since 2006, the United States has accepted more legal immigrants as permanent residents than any other country in the world. That same year, an NBC/*Wall Street Journal* poll revealed that the U.S. public was equally divided on whether immigration helps or hurts the country. However, a recent Pew Research Center study suggests that the issue will remain at the forefront of the American political agenda for many years to come.

One of the CHC's main efforts is to push for comprehensive immigration reform not seen in the country since the early 1980s. Hispanic congressmen have championed solutions to legalizing the nation's estimated 11 million to 18 million illegal immigrants. A secondary purpose of the House Congressional Hispanic Caucus is to expand its

membership by electing more Hispanics to congress. An expanded Hispanic caucus would gain enhanced prominence as a voting block and lead to more effective representation of America's Hispanics. Although officially founded as a bipartisan organization, the CHC is currently comprised entirely of Democrats. The Republican members left in the late 1990s over policy differences and, in 2003, formed their own group, the Congressional Hispanic Conference.

Battle for the Latino Vote

The split of Republican members from the CHC is also a consequence of the historic battle for the Latino vote. Throughout the years, Hispanics have always leaned toward the Democrats. In every presidential contest since 1992, Republicans have won at minimum about a quarter of the Latino vote, while Democrats have won at least half. Up for the grabs in most years have been the remaining 25 percent. But the Latino vote is a voter bloc in name only. There is a common ancestral language that binds nationalities, family histories, and geographic allegiances. Local differences matter, but so do those things that distinguish Latinos from other ethnic groups. While support for the Democratic Party among Hispanics has remained strong, some Hispanic leaders have criticized the party for not doing enough to help Hispanic candidates advance to the party's highest elected offices.

The main divider between Hispanics and Republicans centers around the differing views and perceived harsh rhetoric on illegal immigration. Eighty-one percent of Latinos believe that unauthorized immigrants should not be deported, while most of the Republicans encourage tightening the immigration system. GOP members also support efforts to enforce deportation laws, while welcoming immigrants who enter America through legal avenues.

In any presidential election, Latinos' increasing voting power is going to be a decisive factor because of their increasing presence in key battleground states. Their growth is not homogeneous around the nation. In 2008, Nevada counted a 13.5 percent Hispanic population; Arizona had 18.3 percent; Colorado, 12.6 percent; Florida, 14.5 percent; North Carolina, 2.1 percent; and Virginia, 2.3 percent. Four years later, those states

accounted for 15.1 percent, 19.2 percent, 13.7 percent, 15.9 percent, 2.9 percent, and 3.7 percent, respectively.

Obama's second term in the White House was largely secured by record numbers of votes from ethnic minorities, while his popularity among whites plummeted, according to exit polls. Hispanics, the fastest-growing demographic in the United States, accounted for 10 percent of all voters in the election. Of these, 71 percent voted for Obama, up from 67 percent in 2008. In a sign that Republicans are failing to win over this increasingly influential ethnic group, the polls show that GOP candidate Mitt Romney won just 27 per cent of the Hispanic vote. Hispanic voters were possibly alienated by Romney's tough stance on immigration in the primary election, calling for "self-deportation" and making life difficult for undocumented immigrants. During his campaign, Romney said that if he were elected he would also veto the DREAM Act, Obama's 2010 bill aimed at helping undocumented youth. By comparison, Obama garnered support for his June decision to allow young immigrants to stay in the country.

The trend toward presidential candidates losing the Hispanic vote can be seen even earlier than the recent election. In 2004, for example, George W. Bush won 44 percent of Hispanic votes. Four years later, that figure plummeted to 31 percent for Republican contender John McCain.

Historic Numbers

The 2012 congressional elections also provided fresh blood for the Congressional Hispanic Caucus, increasing its membership from 20 in the 112th Congress to 25 the 113th. In general, for Latinos across the country, the 2012 election symbolized much more than two candidates contending for presidential office. It marked the potential for change and new leadership, emphasized by the record number of Latinos who won the seats in both the House and the Senate.

Forty-nine Latino candidates—16 Republicans, 32 Democrats, and one without party affiliation—ran for office, making history as the largest number of Latino candidates to run for Congress. A record-setting 31 Latinos now sit in the 113th U.S. Congress. Three of them—Ted Cruz (R-Texas), Marco Rubio (R-Florida), and Robert

Menendez (D-New Jersey)—joined the Senate, while 28 headed to the House of Representatives. The new Latino representatives lean heavily to the left, with 23 of them hailing from the Democratic Party. The Hispanic milestone came as Latinos bumped up their share of the electorate to 10 percent, making the country's largest minority an increasingly important demographic for politicians.

Congressional Hispanic Caucus Institute

A successful endeavor of CHC is the Congressional Hispanic Caucus Institute, whose mission is to develop the next generation of Latino leaders by promoting higher education and providing career development. It was founded in 1978 by a small group of Hispanic congressional members with the vision of bringing the promise of the American Dream to the next generation of Latinos. CHCI programs serve more than 1,500 young Latinos annually. Many are the first in their family to go to college, and the majority come from families with annual incomes below \$30,000.

CHCI's model of educational services and leadership development consists of promoting college readiness, supporting college attainment, and providing direct access to the most powerful network of Latino leadership. CHCI runs three internship sessions a year that offer Latino college students job opportunities in congressional offices on Capitol Hill, as well as an opportunity to participate in CHCI's leadership and professional training program.

CHCI also provides nine-month fellowships to Latinos who have completed college and to those who have finished their graduate studies, working in congressional offices and federal agencies in Washington, D.C., focusing on public policy in areas critical to U.S. competitive positions. These intensive, weekly education sessions include interaction with national government and private-sector leaders around public policy challenges. CHCI also organizes programs each year that give more than 1,200 high school students access to the tools, resources, role models, and motivation they need to go on to college. The institute awards more than \$375,000 in college scholarships annually to Latino students with financial need. It also offers an online Education Center for young Latinos, which has been

visited by more than one million people a year who have downloaded about 600,000 education publications.

Congressional Hispanic Conference

The Congressional Hispanic Conference (CHC) is a Republican-dominated coalition in the U.S. Congress. The CHC was founded in 2003 with the stated objective of promoting policy outcomes of relevance to Americans of Hispanic or Latino and Portuguese descent. The Congressional Hispanic Conference should not be confused with the older Congressional Hispanic Caucus, a similar organization dominated by the Democratic Party. In 2003, conference members also formed the Congressional Hispanic Leadership Institute (CHLI), a public outreach arm equivalent to its Democratic counterpart's Congressional Hispanic Caucus Institute.

In the beginning, the two groups were in fact one bipartisan organization. But in the mid- to late 1990s, Republican members of the Congressional Hispanic Caucus—Mexican American Henry Bonilla of Texas and Cuban Americans Ileana Ros-Lehtinen and Lincoln Diaz-Balart of Florida—resigned in protest over the caucus's support for improved relations with Cuba. While

Ros-Lehtinen remained active in the caucus's public outreach arm, the Congressional Hispanic Caucus has since been comprised solely of Democrats.

Forming a Republican Coalition

In 2002, feeling there was significant need for another Hispanic congressional group, newly elected Florida Representative Mario Diaz-Balart began to organize a coalition for Hispanic Republicans to counter what they perceived as Democratic dominance over Hispanic political affairs. On March 17, 2003, in an open letter published in the *Wall Street Journal*, Diaz-Balart announced the formation of the Congressional Hispanic Conference.

Another impetus in forming the conference centered on the debate surrounding the appointment of conservative lawyer Miguel Estrada to the District of Columbia Circuit Court of Appeals. Diaz-Balart decried what he perceived as Hispanic Democratic efforts to frustrate the nomination of Estrada, a selection seen by some at the time as a possible fast track to the U.S. Supreme Court. Joining Diaz-Balart in the new group were his brother Lincoln, as well as Bonilla, Ros-Lehtinen, and newly elected colleague Devin Nunes, a California congressman of Portuguese descent.

Two more Portuguese American congressmen, Richard Pombo of California and Patrick Toomey of Pennsylvania, soon joined the conference. Like its Democratic counterpart, the conference also allows members from the Senate. Mel Martinez, the first Cuban American U.S. senator, joined the group right after his 2004 election. The conference is also open to non-Hispanic "associate" members who represent districts with significant Hispanic populations or generally approve of the conference's public policy goals.

Creating a Cohesive Legislative Agenda

The Congressional Hispanic Conference seeks to emphasize both national and international issues that have a significant impact on Hispanic communities in the United States. The Congressional Hispanic Conference is intended as a forum for congressional members to collaborate in the creation of a cohesive legislative agenda. The CHC's priorities include support of the war against terrorism, the Free Trade Agreement of the Americas

(FTAA), tax relief to families and the over 2 million Hispanic- and Portuguese-owned small businesses, and support for faith-based initiatives. The CHC emphasizes that small businesses play a vital role in the American economy and have been responsible for the creation of 64 percent of all new jobs in the past 15 years. The CHC aims to foster small businesses and supports an environment in which they can create jobs and grow the economy.

Another CHC goal focuses on reduction of public spending. According to the CHC, by keeping Americans' taxes low and decreasing government regulations, Congress can create an environment for the private sector to thrive.

Trade is considered by the CHC as a crucial part of the U.S. economy, and the conference takes the stand that the government should enlarge the nation's trading opportunities through expanded free trade across Latin America. According to the CHC, eliminating tariffs and other barriers through free trade agreements will expand trading opportunities and help create jobs at home.

Like its Democratic counterpart, the Republican Congressional Hispanic Conference supports immigration reform but from a more conservative viewpoint, arguing that the government's priority is to secure its borders for the sake of national security and economic prosperity.

The CHC considers children's education to be fundamental to the nation's future. However, the organization is critical of the federal government's role and states that education policy should be made by state and local officials.

Charitable Arm Looks to the Future

Related to the CHC is the Congressional Hispanic Leadership Institute (CHLI), founded by Republican congressional members to advance the Hispanic community's economic progress with a focus on social responsibility and global competitiveness. It is dedicated to fostering a broad awareness of the diversity of thought, heritage, and views of Americans of Hispanic and Portuguese descent. CHLI has focused its efforts on developing and strengthening tomorrow's leaders and has funded close to \$1 million in educational programs.

CHLI supports Hispanic youth and young professionals through two programs: CHLI Global

Leaders Internship and Fellowship Program and CHLI Future Leaders Conference.

Constitution, U.S.

The U.S. Constitution provides the basic structure of the federal government. It separates the legislative (congressional), executive (presidential), and judicial (court) powers. It corrects the major flaw of the previous basic law, found in the Articles of Confederation and Perpetual Union (1781–89), primarily by asserting the fundamental supremacy of federal over state law in places where they conflict.

The Constitution originally consisted of only seven articles, formally defining the scope and means of federal powers. By its own text, the Constitution can be amended by congressional action, with consent of three-fourths of state legislatures, or by national convention. Hence, some provisions in the original articles have since been struck down by the 27 constitutional amendments. The first 10 of these amendments were promised from the time of the convention as a way to induce the states to ratification. They were passed by the first Congress and are collectively known as the Bill of Rights.

Fifty-five delegates from 12 colonies (the 13th, Rhode Island, declined to participate) negotiated and drafted the Constitution over the course of four months in Philadelphia in the summer of 1787. The majority of the delegates were prominent politicians who had served in the recent Revolutionary War, commanding Continental army forces, or in the Continental Congress. Nearly all members were wealthy; all were white males; and all but two identified themselves as Protestant Christians, from seven denominations (the other two described themselves as Catholic). Twenty-five of these delegates owned enslaved workers.

The U.S. Constitution has a mixed record with regard to pluralism and minority rights. Constitutionally, the federal government has the right to delimit citizenship, mandate federal voting eligibility, define religious freedom, and count ethnic and religious populations in the mandated decennial census. All of these provisions ensured a central role for the Constitution in forging as well as bridging political cleavages based on race and culture. The original Constitution also included provisions that upheld the institution of race-based chattel slavery in the United States. Slavery, the status of Native Americans, the evolving constitutional idea of citizenship, the religion clauses of the First Amendment, and contemporary debates over hate speech comprise the most prominent examples of the Constitution's longstanding role in regulating American pluralism.

Native Americans

Most Native Americans were not defined as citizens by the original Constitution, and only became definitively classified as such with passage of the Indian Citizenship Act of 1924. Originally, Article 1, Section 2 of the Constitution specifically excluded "Indians not taxed" from being counted for purposes of determining congressional representation. The theory among the delegates was that most Native American communities were legally, if not also physically, outside the boundaries of the national sphere. The presence of significant numbers of Native Americans within "white" settlements did little to alter this assumption.

At the same time, the Constitution gave Congress the power to regulate commerce "with

foreign nations, among the several states, and with the Indian tribes." Hence, the Indian commerce clause has been broadly interpreted as implying not only some level of tribal sovereignty, but a sovereignty different from that of either the states or foreign governments. Significant jurisprudence followed from this constitutional distinction, tending to define Native American tribes as political communities that were separate from, but not independent of, the state and national governments. The common, though controversial, classification of tribes as "dependent domestic nations" has arisen from this distinction.

Since the 1970s, historians have debated what impact Native American ideas had on the framing of the Constitution. By then, prominent Iroquois members had been promulgating the idea for many decades that the Iroquois Confederacy's Constitution served as a model in the crafting of the U.S. Constitution. Proponents argue that the Iroquois "Great Law of Peace," which predated the U.S. Constitution by hundreds of years, provided a model on the American continent of confederated governance with virtual representatives who voted on behalf of their tribal constituents. Despite considerable skepticism among constitutional scholars, who emphasize the differences in structure and formal rules between Iroquois practice and the Western Lockean liberal tradition, the Great Law of Peace has attained widespread acceptance in the popular imagination as a constitutional influence. A 1988 congressional resolution formally recognized the impact of Iroquois confederation ideas on the founding generation.

The enormous impact of Native American presence on the framers has been less controversial. Because they lived in close proximity to Native Americans, had prior careers as Indian treaty negotiators, and because Native Americans constituted the primary threat to westward expansion, the delegates had ample cause to consider Indian tribal politics relevant to the formation of a strong central government. Claiming federal supremacy in Indian affairs was the Constitution's way of attempting to prevent states from pursuing inconsistent Indian policies that might lead to conflict among the states, or to an inadvertent national war. And claiming the right to quell domestic insurrections in the climate of ongoing

Indian conflict was another way of suggesting that Native Americans had a liminal status in the U.S. political sphere—they were, to the extent that this clause referred to Native American uprisings, “domestic,” but not citizens.

Slavery

Many major debates at the Constitutional Convention of 1787 divided delegates over the problem of slavery, though the problem took a number of surprising forms. Few northern states had completely banned slavery at that time, but the institution was more prevalent in the tobacco, rice, and, later, the cotton-growing regions of the south. Compromises among regional interests therefore necessarily required compromises over slavery. Because several of these compromises have had long-standing effects on matters far removed from their roots in the regional debate over slavery, they have collectively given rise to a debate among constitutional scholars over whether the original Constitution was fundamentally “pro-slavery.”

The word *slavery* can be found only once in the original language of the Constitution; “other persons,” or “Person[s] held to Service or Labour in one State” were terms that mollified delegates who disdained references to enslavement in their founding document. Nonetheless, five provisions in the original Constitution dealt with slavery directly. Two of these, both in Article 1, present the infamous “three-fifths” clauses, by which slaves were to be counted as three-fifths of a person for representation and taxation purposes. The three-fifths clauses ensured that the slave population, despite being disenfranchised, contributed to the level of white southern representation in Congress without excessively increasing the level of taxes that the state would owe to the federal government. Another provision in Article 1 barred Congress from banning the international slave trade before 1808; a fourth provision, in Article 5, prohibited amending the provisions to do with slavery that were found in Article I until that same year. The fifth constitutional provision for slavery, in Article 4, Section 2, required states to uphold a fugitive enslaved person’s status as a slave; that is, enslaved people could not be emancipated merely by escaping across state lines.

Many other parts of the Constitution gave indirect support to slavery. The domestic

insurrections clause in Article 1, Section 8, gave Congress the power to “suppress insurrections,” referring to slave rebellions that were widely feared among white Americans. Another provision, in Article 1, Section 8, simply asserted absolute federal control over the national capital, at a time when the apportionment of representation in the Senate ensured for decades that slave states had the power to maintain slavery and the slave trade in Washington, D.C. By the same token, the requirement in Article 5 that any constitutional amendment must have three-fourths support among state legislatures guaranteed that slave states would retain the power to block any anti-slavery amendment that the Congress passed.

The delegates at the convention were aware of the role of slavery in shaping their Constitution. For example, Constitutional delegate Rufus King noted that the prohibition on federal taxes of exports was intended as a way to protect the slave economy from being indirectly taxed by protecting the major exports that enslaved people produced. In part, because the northern states’ shipping interests also benefited from the tax exemptions, King’s objection gained little traction at the convention.

Many constitutional provisions became flashpoints of contention in the decades of controversy that followed, particularly after the 1830s, as the northerners’ perception of their economic benefit from southern slavery declined. At a rally on July 4, 1854, in Framingham, Massachusetts, abolitionist William Lloyd Garrison famously set fire to a copy of the Constitution and decried it as a “covenant with death” and an “agreement with hell.” Until shortly before the southern states seceded in 1860 to 1861, Garrison was a proponent of northern secession to break that “covenant” because he believed it to be irredeemably pro-slavery.

The Constitution was central to the buildup to the Civil War, from the infamous *Dred Scott* decision by which the Supreme Court interpreted the Constitution as meaning black people could not have standing in court since they were not U.S. citizens to the raging debates about the constitutionality of the Fugitive Slave Act, which required citizens of free states to comply with the return of slaves who fled slave territory. The Constitution

was unable, either symbolically or in judicial interpretation, to quell these disputes, which culminated in the Civil War.

At the end of the war, three amendments eradicated the explicit slavery provisions from the Constitution. The Thirteenth Amendment formally abolished the practice of slavery in the United States. The Fourteenth Amendment, among its provisions, reversed the *Dred Scott* ruling and expanded citizenship beyond its racial basis. The Fifteenth Amendment provided for voting rights regardless of “race, color, or previous condition of servitude.” But many of those provisions that were, originally, indirect by-products of the system of slavery remained in effect.

Race, Citizenship, and Suffrage

The original Constitution said little about qualifications for U.S. citizenship. The document merely imposed citizenship qualifications for Congress and stricter citizenship standards for the presidency, and gave Congress the authority “to establish an uniform Rule of Naturalization.” The first Congress established that rule in 1790, on a racial basis. Adding some residency restrictions and the requirement to take an oath, they decreed that citizenship would belong to all free white persons who had migrated to the United States.

Property restrictions that prevented white male citizens from voting were, for the most part, gradually dropped in the three decades following ratification. In many states, partial black suffrage was achieved in the same period; New York, for example, passed a law in 1811 that made voting legal for a “black or mulatto” man who could document that he was free, though that documentation could be difficult to provide. In general, however, Congress used the Constitution to ensure white citizenship rather than prohibit black or any other form of racial or ethnic citizenship. In the antebellum period, widely differing state and local practices meant that racially exclusive citizenship was normal, but neither uniform nor universal across localities or the system.

The Fourteenth and Fifteenth Amendments excluded race as a determinant of citizenship and voting rights in constitutional theory, but late 19th and early 20th century Jim Crow laws

A painting by Junius Brutus Stearns depicts George Washington signing the Constitution at the Constitutional Convention of 1787. The first 10 amendments are known as the Bill of Rights; a total of 27 amendments have been added.

used grandfather clauses, literacy tests, and poll taxes to keep de facto racial barriers in place. These barriers disproportionately affected Italian, Jewish, Chinese, and eastern European immigrants, among others, although they were mainly intended to discriminate against African Americans at the polls. The Supreme Court repeatedly found “separate but equal” segregation provisions and voting restriction policies to be constitutional until the opinion in *Brown v. Board of Education* expanded the constitutional meaning of the Fourteenth Amendment’s protection clause. Along with the civil and voting rights reforms of the 1960s, which relied on expansive interpretations of Congress’s constitutional powers under the commerce clause, *Brown* went a long way toward neutralizing the racial differences in voting and suffrage that previous courts had believed the Constitution allowed.

National Language

The U.S. Constitution does not establish an official national language, nor has any act of Congress since ratification. Multilinguality was widely considered at the time of the nation’s founding as a sign of a quality education, an education many of the delegates had received. Moreover, the United States contained sizeable linguistic minority

groups. In the first census, the largest of such groups were German speakers, who constituted about 10 percent of the population.

Though the status and quantity of new immigrants to the United States changed considerably over time, curricula taught entirely in non-English languages continued to be relatively common in public schools well into the Progressive Era of the early 20th century. Immigrants to the United States have conventionally learned English in the first or second generations after entering the country.

Since the 1980s, however, a majority of states have passed “official English” laws, and a movement to establish English as the national language either by federal statute or by amending the Constitution has been an object of cultural controversy. “Official English” advocates see monolinguality as a tool for promoting social cohesion and reducing the costs associated with translating official materials. Their critics (who sometimes call the movement “English-only”) believe that a single official national language would erode the cultural benefits of language diversity, undermine free speech guarantees, and erase the country’s polyglot history. At the federal level, English remains the “preferred language” for official communication.

Religious Pluralism

The Constitution—unlike the Declaration of Independence—includes no reference to a divine or supernatural being. Religion in the United States is regulated primarily by the First Amendment, which guarantees that “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof.” The “no establishment” guarantee was intended to prevent the formation of an exclusive state church (like the Church of England), whereas the “free exercise” clause ensured that the practices of religious minorities would be allowed. At the time, the provision ensured that states, such as Pennsylvania, with its legislature’s Quaker majority, and Maryland, with a large Catholic population, wouldn’t be threatened by national unification.

In practice, legal scholars have often seen the “establishment clause” and “free exercise” as being in conflict. It can be difficult for the state to make provisions that allow religious practitioners

to freely practice their faiths—like allotting Muslim federal employees space for daily prayers, or granting churches tax-exempt status—without, in some sense “establishing” a state support of religion. In *Abington Township v. Schempp* (1963), the Supreme Court considered a case to determine whether a mandatory prayer in a public school was constitutional. The court ultimately decided that, to be constitutional, laws must have a generally secular purpose and their primary effect must not be to establish religion. These “secular purpose” and “primary effect” rules also pertain to religious displays on public grounds. Jurisprudence tests the state’s neutrality and separateness.

Individually and in concert, the goals of First Amendment religious freedom—that no particular religion is preferred, that religious people are not unduly burdened by the state, and that religious belief in general does not unduly affect the state’s secular purposes—have been difficult to maintain. Religious observances and spectacles in public places like town squares, public schools, and prisons remain ongoing indicators of the ambiguity of constitutional meaning with respect to freedom of religion.

Hate Speech

Hate speech is typically defined as rhetoric or symbolic gestures that malign on the basis of some aspect of a person’s identity, including race, religion, gender, sexual orientation, or nationality. In the United States, hate speech is protected under the free speech clause of the First Amendment. By judicial interpretation, it becomes illegal only where it provides an incitement to violence, or, in other words, rises to the level of “fighting words”; even then, the violence must imminently follow from the incitement in order to qualify.

Many universities’ “speech codes” and corporate antidiscrimination policies have been or would be found unconstitutional under this controversial constitutional interpretation. Ongoing campus debates around the status of hate speech are among the most visible edifice of the Constitution’s present role in managing race relations in the United States.

Constitutional Amendments

The Thirteenth, Fourteenth, and Fifteenth amendments to the U.S. Constitution were originally intended to grant former enslaved African Americans basic rights of freedom, including citizenship and the right to vote.

Since the time of their ratification, however, and with the rapid growth of immigration of people from diverse parts of the non-Western European world, the interpretation of these rights has been expanded and contracted by the U.S. Supreme Court and by federal and state legislatures in ways that have had deep effects on all people of color in the United States and, to a lesser extent, on the dominant white culture.

These amendments have been known as the Civil War (1861–65) amendments or the Reconstruction amendments. Congress passed the Thirteenth Amendment in January 1865, and it was ratified in December of that year. The Fourteenth Amendment was ratified in 1868, and the Fifteenth Amendment in 1870.

The Thirteenth Amendment

The Thirteenth Amendment states that neither slavery nor involuntary servitude shall exist anywhere in the United States. President Abraham Lincoln issued the Emancipation Proclamation on January 1, 1863, as the nation approached its third year in the bloody war. However, this act did not immediately free all enslaved persons, as its target was to free those enslaved in the confederate states and in territories rebelling against the union. Furthermore, without any means of enforcing the proclamation, the act had little to no effect until the end of the war, with the surrender of Confederate General Robert E. Lee in April 1865, and Union General Gordon Granger's regiment subsequently crushing resistance in Texas on June 19. Granger then declared all slaves to be free. This declaration, two and a half years after the original proclamation by President Abraham Lincoln, formed the basis of the amendment—and the Juneteenth celebration in African American culture.

The Fourteenth Amendment

The Fourteenth Amendment states that persons born in the United States and subject to its jurisdiction are citizens of the United States and of the state in which they reside. In addition, no state may make or enforce any law to decrease the privileges and immunities of U.S. citizens, nor shall any state deprive any person of life, liberty, or property without due process of law, nor deny to any person the equal protection of the laws.

Section 2 of the amendment calculates apportionment for representation in Congress. But the basis of representation can be decreased if any males in that state are denied the right to vote, except if the denial is due to participation in rebellion or other crime. Section 3 denies continuing membership as a federal or state representative to anyone who participates in rebellion against the United States or gives "aid and comfort" to enemies. Section 4 states that the U.S. public debt

shall not be questioned, including debts incurred in suppressing rebellion against the United States. But claims incurred in rebellion, including claims for the loss of or emancipation of any slave, are null and void.

The Fifteenth Amendment

The Fifteenth Amendment states that any citizen's right to vote shall not be denied on account of race, color, or previous condition of servitude. This amendment directly superseded state laws that had banned black people from voting. In 1870, Congress enacted the Enforcement Act of 1870, which contained criminal penalties for hampering the right of black people to vote, and the Force Act of 1871, providing for federal election oversight.

Enforcement of the Amendments

Each of the three amendments concludes with a section providing for Congress to enforce the amendment via appropriate legislation.

While the language of these amendments appears simple and clear, ever since their ratification, much debate, lawsuits, U.S. Supreme Court opinions, and federal and state legislation have occurred over definition of words and phrases in the amendments, such as “person,” “citizen,” “life,” “liberty,” “property,” “privileges and immunities,” “aid and comfort” to enemies, and even “servitude” versus “slavery.” Furthermore, the perceived lack of enforcement of the amendments has even spurred calls for reparations to African Americans for slavery as being a necessary response in the face of constant resistance to or lack of enforcement.

Jim Crow Laws

Legal challenges to Jim Crow laws began in the late 19th century in an attempt to enforce the rights of African Americans, which Congress was not doing as required by the three amendments. From the 1880s into the mid-20th century, the states of Alabama, Arizona, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Texas, and Virginia continued to enforce segregation—despite the three amendments—through use of local state and city laws, which came to be known as Jim Crow laws. The laws got their name from a derogatory minstrel show character who dressed in blackface to make buffoons of African Americans.

One of the earliest challenges to enforce rights guaranteed by the amendments came in 1896 in *Plessy v. Ferguson*. In a landmark ruling, the U.S. Supreme Court upheld the constitutionality of state laws regarding segregation in public facilities under the “separate but equal” doctrine.

Challenges to the amendments persisted. A case that would become a precursor to *Brown v. Board of Education*—which held that separate was not equal—came in 1938 in *Missouri ex. rel. Gaines v. Canada*. In it, African American student Lloyd Gaines sued after being denied admission to the University of Missouri law school because of his race. In this case, the U.S. Supreme Court upheld a Missouri judge's ruling that the state had to either build a law school at the state's historically black Lincoln University equal to that at the University of Missouri or admit Gaines to the state university's law school.

Who Is a “Person” Under the Fourteenth Amendment?

The original intent of the Fourteenth Amendment was to extend to formerly enslaved black males specific rights already assumed to belong to white males, especially that of “personhood.” In *Santa Clara County v. Southern Pacific Railroad* (1886), the U.S. Supreme Court ruling granted constitutionally protected personhood to a corporation for the first time. Although the question of the personhood of a corporation was not before the court, Chief Justice Morrison R. Waite remarked right before argument began that the court would not be hearing any argument about whether or not the equal protection clause applied to corporations, as everyone agreed that it did. The court reporter, whose headnotes are supposed to give a summary of the court's decision, wrote down that the defendant corporations were persons under Section 1 of the Fourteenth Amendment and thus entitled to equal protection rights, therefore putting the justice's oral remark into law, a beginning to almost two centuries of controversy.

Since the ratification of this amendment, additional Supreme Court rulings relating to the Fourteenth Amendment have involved the expansion of the rights of corporations than have involved the rights of African Americans.

In *Ozawa v. United States* in 1922 the court held that Takao Ozawa, a Japanese man, could

not become a naturalized U.S. citizen because he was neither white nor of African descent by birth as required by the 1906 Naturalization Act. Ozawa argued that Japanese people were included in the definition of “white.” The court maintained that only Caucasians could be white.

In *United States. v. Bhagat Singh Thind* in 1923, the U.S. Supreme Court held that Thind, an Indian Sikh, was not able to be a U.S. citizen since he was not a white person as the definition was commonly understood.

Brown v. Board of Education

Up to the time of the decision in *Brown v. Board of Education* in 1954, an important feature of Jim Crow laws was that black children could not attend public schools that white children attended. Most of the schools attended by black children were inferior in quality of instruction and physical facilities to those attended by white children. This reality violated the separate but equal doctrine put in place by the *Plessy* decision.

The court put aside whether the writers of the Fourteenth Amendment had the segregation of schools in mind at the time its writing. They based their decision on whether segregated schools prevent black schoolchildren from enjoying equal education opportunities under the law under the Constitution. The court decided they did not.

A decade later, President Lyndon Johnson signed the Civil Rights Act of 1964, banning discrimination of all kinds based on race, color, religion, or national origin. But even with the passage of this act, the three amendments still needed more action by Congress and the president to ensure the chances and reliability of their enforcement, especially when it came to access to education.

The Right to Vote

At the time of the ratification of the Fifteenth Amendment, only white male property owners could vote. The Fifteenth Amendment expanded that right to black males. It was not until ratification of the Nineteenth Amendment in 1920, after decades of struggle, that the right was expanded to females. But that was only the beginning.

In July 2012, reports came out that the state of Ohio had a long-standing problem with noncounting of provisional ballots and that disqualification was not the voters’ fault. Blame for the problem

was placed on a confusing mix of state laws, administrative directives, court rulings on voting procedures, and errors by voters and poll workers.

Also in 2012, Pennsylvania passed a new voter-ID law requiring that residents show identification every time they vote and only a valid photo ID is acceptable, meaning that it must have an expiration date and the date cannot have expired. Reports indicated that such new voter ID laws are confusing to voters, many voters don’t even know of the new rules, and they disproportionately affect people of color.

The state of Florida in 2008 and also in 2012 engaged in purging of voters from the rolls, which it called “citizenship list maintenance practices.” The U.S. Justice Department claimed such practice violated the Voting Rights Act. Other states showed increasing interest in developing some kind of system to check voter rolls in the face of widely publicized partisan calls from politicians to eliminate voter fraud.

Constructivism, Intercultural

Constructivism is an epistemological position commonly found in communication theory, cultural anthropology, developmental psychology, and learning theory. It holds that knowledge and

experience of the world is constructed, not discovered. Constructivism is the primary perspective of intercultural communication, which seeks to coordinate meaning and action across cultures. The idea of constructivism is important to multicultural and intercultural contexts because it supports cultural adaptation, the practical alternative to assimilation. Without constructivist theory, it is difficult to imagine how cultural groups can coexist other than segregating from each other or one assimilating to the other. Constructivism allows a third alternative, which is bicultural adaptation. The following paragraphs trace the paradigmatic roots of constructivism and show how it informs the intercultural adaptation strategy.

Paradigms

Paradigms are comprehensive sets of assumptions that guide scientific theory. While the concept of paradigms originated in the physical sciences, the idea is also useful in understanding changes in social science, including intercultural communication theory. The three major paradigms in physics are Newtonian, Einsteinian, and quantum. Their translations into social science (usually with a significant time lag) are termed positivist, relativist, and constructivist.

Like Newtonian physics, positivism assumes that there is a single absolute reality that can be described, predicted, and controlled by an objective observer. The idea of “culture” in a positivist paradigm is something like “civilization,” a position that lies at the top of a pyramid of human beings. Below civilized people are barbarians—people who have the potential to be civilized, but who need the help of colonization or nation building to join the upper ranks. Below barbarians are subhuman savages who can be exploited for their labor without concern for elevating them to higher levels. This idea drives a kind of “social Darwinism” that thrived in the 18th and 19th centuries and has found new favor in some forms of libertarian capitalism. In this view, a few talented people who are more “fit” than others will appropriately rise to the top and enjoy the richest fruits of civilization, while less fit people populate the lower ranks and make do with more modest tastes of culture.

At around the turn of 19th to the 20th century, Albert Einstein introduced the idea of relativism into physics in a move that is now considered a

paradigm shift. The absolute reality of Newton gave way to a relativistic universe where the position and perspective of the observer was intrinsic to how reality was apprehended. In social science, this view became the basis of systems theory, where events always needed to be understood in context. An important context for events was culture, and the notion of cultural relativity successfully challenged the pyramidal model of civilization. In the new paradigm’s view, cultures represented more or less autonomous worldviews that could not be evaluated according to a single absolute standard of civilization. Instead, each culture needed to be understood in its own context; Hopi Indian culture—its worldview and its products—represented just as much a sophisticated civilization as French culture or Chinese culture.

While (ideally) cultural relativism freed the myriad ways of being in the world from the hierarchical judgments of social Darwinism, colonialism, and imperialism, it also separated cultures from any single, objective base of meaning that could be used for communication. Cultural relativism does not suggest how people of different cultural contexts might understand one another, short of becoming resocialized in the different cultural context. But global business, international education, and a host of other activities in multicultural societies and the global village depend on successful short-term communication among different cultural groups. This need for intercultural communication could only be addressed from a different paradigm.

The quantum paradigm in physics was established more or less concurrently with the Einsteinian paradigm, but it has come more slowly into social science as constructivism. While some concepts of constructivist epistemology certainly predated quantum physics, that paradigm articulated the idea that observers are intrinsically involved not only in the viewing of reality but also in the construction of reality itself. In other words, observers cannot be separated from that which they observe—they coevolve each other. This idea is key to how constructivism supported the development of intercultural communication.

Intercultural Communication

The idea of coevolution was applied to understanding culture by the constructivist sociologists

Peter Berger and Thomas Luckmann. In their seminal text *The Social Construction of Reality* they defined the circular process whereby people are born into a society filled with institutions that focus their attention on certain constructions of reality, which are internalized through socialization to become the cultural worldview, which in turn is externalized through role behavior that supports the continuing existence of the institutions. Thus culture is constantly being re-created by people acting out their experience of the cultural institutions they were born into. Rather than being an absolute thing like civilization in the positivist paradigm, or even a relativist thing like a cultural system, culture in this constructivist view is not a thing at all. It is a process of being, and, when employed as a description, it is simply a way of observing human behavior.

In using the idea of constructed culture, intercultural communication is able to address several limitations of cultural positivism and relativism. Considering culture as a process of being avoids the essentialization and reification of culture that occurs in a positivist paradigm, positions that contribute to ethnocentrism and negative stereotyping. In this view, culture is not like a submerged iceberg waiting to smash into unsuspecting sojourners; it is simply the way groups of people habitually understand one another. We can learn those habits or not, but in either case we need not be threatened by the simple existence of alternative ways of being in the world.

The idea of culture as a process also avoids the romanticizing and exotifying of cultures that sometimes occurs in a relativist paradigm, positions associated with simplification and positive stereotyping. By virtue of their existence, all ways of being are viable. We may prefer one way of being over another, and we may even believe that a particular process is a better way for people to organize themselves. But the responsibility is with us, the observers, to be making such a judgment—superiority or inferiority does not exist in culture itself.

We are both the perceivers and the creators of cultural boundaries. This allows us to define and participate in multiple cultural groupings simultaneously, generating a “multilayered cultural identity.” Thus, a person can simultaneously be a member of a national group such as U.S. American, an

ethnic heritage group such as African American, a generational group such as millennial, and a sexual orientation group such as heterosexual. We may feel affiliated with those groups, or we may be ascribed membership in them by other observers, or we may both participate in and be observed to participate in the groups. Sorting through the complex layers of cultural identity is one of the tasks facing all of us in a multicultural society, and a constructivist definition of culture allows us to do so more intentionally.

Intercultural communication employs the idea of “constructed etic categories” to provide a means of comparing cultures without recourse to an objective standard like “civilization.” The term *etic* refers to the cross-cultural applicability of the categories. Typical etic categories are those of language use, nonverbal behavior, communication style, cognitive style, and cultural values. Each of these categories allows us to perceive certain cultural differences, for example, variations in greeting rituals, eye contact, verbal directness, abstractness, or individualism/collectivism. These differences lie in a constructivist paradigm, which means that they do not have an a priori existence in the cultures being described. For instance, people within a culture do not typically perceive themselves as engaging in greeting rituals; they are just communicating with one another. But by differentiating this particular behavior, an observer is able to contrast it to that of other cultures in a way that allows for possible misunderstanding to be identified and for possible adaptations to be considered. Note that people can be observers of their own cultures, in which case it generates “cultural self-awareness.”

Finally, constructivism provides an authentic way to adapt to other cultures. In a positivist paradigm, there is only civilization, those that have it, and those that might get more of it through acculturation. In a relativist paradigm, there are only cultural contexts, and to change context demands that the old one be rejected as part of assimilating to the new one.

But in a constructivist paradigm, it is possible to expand one’s worldview to encompass both a primary socialization and one or more alternative ways of being of the world, that is, to develop a bi- or multicultural identity. On the way to doing so, people attain various levels of expertise in

At this ceremony performed at Dover Air Force Base in Delaware, U.S. Air Force leaders observed a Native American ritual performed by members of the Nanticoke and Lenape Tribes during the Air Force's celebration of Native American Heritage Month in November 2009. Participants experienced the ritual—and its alternative perspective—by gathering in a circle to give thanks and by accepting pieces of prayer sage given with the intent to bring peace to “the country, the military, and Mother Earth.”

perceiving cultural differences, generating alternative worldview elements, and experiencing the world in alternative ways.

A foundational idea in constructivism is that of “experience.” Because reality is coevolving with our perception of it, we do not have experience simply by being in the vicinity of events when they occur. Rather, our experience is a function of how we perceive (discriminate, construe) those events. In cross-cultural terms, this means that a U.S. American does not have a French experience simply by being in France; rather, he or she is likely having an American experience in the vicinity of French events. Similarly, a European American does not have a minority experience simply by being the only white person in a group of blacks; he or she is really having a dominant-culture experience in a minority situation. And certainly a man does not have a woman's experience

simply by living with one; men are having their own experience in the vicinity of women. This doesn't mean that it is impossible to have an alternative cultural experience; it just means that we must perceive the world in an alternative way to have that kind of experience.

The process of reorganizing our perception of the world to enable an alternative experience is called “empathy.” Empathy allows us to intentionally shift our perspective toward that of another culture and eventually toward that of another person in that cultural context. By allowing ourselves to have an embodied experience of the world through the alternative perspective, we temporarily expand our worldview to include that alternative way of being. When we enact the alternative experience in our behavior, we are adapting (not assimilating, not acculturating) to the other culture. At any moment we can choose

to enact our primary cultural experience. In the process of constructivist empathy, we do not lose ourselves; we gain authentic alternative selves.

Cooper v. Aaron (1958)

Cooper v. Aaron (1958) was the Supreme Court ruling to put into effect the decisions in *Brown v. Board of Education*—the landmark cases that held that racially segregated public schools were inherently unequal and therefore denied black students the equal protection rights guaranteed by the Fourteenth Amendment to the U.S. Constitution.

The two decisions in 1954 and 1955, referred to as *Brown I* and *Brown II*, respectively, ordered the states to desegregate the schools. However, *Brown I* did not specify guidelines on how to proceed, and *Brown II* included a mandate only to begin desegregation "with all deliberate speed."

In Arkansas, the Little Rock School Board presented a six-year plan to integrate its schools. In May 1955, the board indicated it would start integration in the fall of 1957, with a small number of black students attending Central High School. In the fall of 1960, the board stated that desegregation of junior high schools would begin. A date for integration of the state's elementary schools was not even incorporated in the scheme.

National Association for the Advancement of Colored People Intervenes

After observing what it perceived as the Little Rock School Board's inadequate desegregation plan, the Little Rock chapter of the National Association for the Advancement of Colored People (NAACP) decided to sue. However, before a suit could be filed, black parents had to try to register their children at white schools. In January 1956, parents' attempts at registering were denied by school officials. The following month, the NAACP, representing 33 African American students, filed *Aaron v. Cooper* (reversed by the Court of Appeals for the Eighth Circuit and affirmed by the U.S. Supreme Court as *Cooper v. Aaron*) in the U.S. Court for the Eastern District of Arkansas, compelling immediate integration. Lawyers, including Thurgood Marshall, represented the students. The students were listed alphabetically, putting John Aaron's name first on the plaintiffs' list. The defendants were William G. Cooper, president of Little Rock's school board; the school district's secretary; the superintendent of schools; and the state's school districts.

At trial, on August 15, 1956, NAACP lawyers failed to convince the court that there were serious problems with the board's desegregation plan. Judge John E. Miller found that the plan did not violate *Brown*. The NAACP appealed the decision to the Eighth U.S. Circuit Court of Appeals, which upheld the lower court's decision.

Little Rock Nine

In the fall of 1957, nine black children, who became known as the Little Rock Nine, prepared to enroll at Central High School. On September 2, in the face of growing hostility from the white community, the Little Rock Nine tried to enter the school grounds. Ignoring the Supreme Court's decision in *Brown*, Arkansas Governor Orval E. Faubus used

armed guards to intimidate and stop the children. On September 20, federal Judge Ronald N. Davies filed an order against Governor Faubus, and Faubus withdrew the guards, but a violent mob continued to prevent the children from entering the school. On September 25, President Dwight Eisenhower ordered the National Guard to stand watch for the rest of the school year. Despite harassment from many white students, the Little Rock Nine survived the school term.

NAACP Gears for Battle Again

In the beginning of February 1958, with the departure of one of the nine students, the school board sought to delay its desegregation plan and amended its petition to set the postponement date for January 1961. The board pointed out that the reason to delay was the strong public resistance to desegregation. On June 3, 1958, the NAACP dusted off *Cooper v. Aaron* and once again defended its position in district court. On June 20, the court issued a ruling that supported and endorsed the board's delay in implementing its desegregation plan. This time, the plaintiffs, rather than appealing to the Eighth Circuit, went directly to the Supreme Court, but the justices refused to consider the appeal before the Eighth Circuit had heard it. On August 4, the Eighth Circuit heard the argument and reversed the district court's ruling. The school board appealed the decision.

The Supreme Court convened a special session to hear the case and on September 29 issued a unanimous opinion ordering the school to continue with its desegregation plan. Thus, *Cooper v. Aaron* marked the first major test in *Brown v. Board of Education* to desegregate the school. In a series of cases that followed, the Supreme Court handed down one decree after another, authorizing schools to desegregate.

Cooperative/ Collaborative Learning

Cooperative learning is a teaching strategy that uses small groups within the classroom to teach the course concepts. Each group member is responsible for learning the material, as well as teaching it to another student. Assignments are worked through until each student understands and completes them.

Collaborative learning, on the other hand, is the umbrella term describing the many forms of group learning, including both collaborative and cooperative strategies. In other words, cooperative learning is a type of collaborative learning.

Cooperative/collaborative learning has been shown to be effective across cultural groups, including African Americans, Hispanics, and Vietnamese. Research shows that Lao, Cambodian, and Vietnamese students favor group learning irrespective of gender or academic achievement. Further, group learning has been shown to be particularly effective with secondary students of diverse backgrounds.

Results imply that teachers who work with diverse populations could benefit from incorporating cooperative and collaborative learning

methods. These strategies are applicable on the university, secondary or elementary school levels.

African Americans

The research of University of Austin mathematics professor Uri Treisman done in the late 1980s at University of California, Berkeley, focused on finding a program that would help minorities succeed in math and science. In a study comparing the retention rates of African American students over a five-year period, the retention rate was higher for those involved in collaborative group learning (65 percent) than for those who were not (41 percent). Similarly, cooperative learning has also been found to have a positive effect on the learning of African Americans. A meta-analysis study analyzing 122 individual studies concluded that cooperative learning was much more effective than traditional learning for African American students. One study in particular assessed the learning of African American middle school students. Results showed these students made more progress with cooperative learning than with traditional learning, even to the point of closing the gap between them and white students.

Findings also reveal that cooperative learning is a well-researched approach that might provide a venue in which African Americans and Caucasian groups could move beyond the existing stereotypes to see each other as equals within the classroom setting.

Findings tentatively show that cooperative learning increases the self-esteem of group members. Prejudice is linked to low self-esteem. Consequently, when one's self-esteem increases, the prejudice level decreases, and one might come to accept a person of a different cultural group. Finally, results showed that students who participate in cooperative learning activities are more likely to name students of other races as their best friends or close friends.

Hispanics

Research conducted by the Center for Research Education, Diversity, and Excellence, whose focus is on improving education of students challenged by barriers of language, culture, and poverty, suggests that cooperative/collaborative learning are effective research-based methods for teaching Hispanic students. Conclusions from

their research show that Hispanic students benefit from:

- A setting where students have defined roles, and proceed to accomplish tasks
- A setting where students work together to learn concepts
- A setting where students debate, discuss, and defend their ideas; this act improves their verbal skills
- A setting where the learning is student-centered and focused on interdependence among the students and the teachers
- A setting where students develop social skills and relate to other ethnic groups better because they learn to clarify, assist, and challenge the ideas of other group members
- Cooperative learning, helping students become proficient in English, by providing them with opportunities to integrate reading, writing, pronunciation, and listening skills
- Collaborative learning in small groups

Ethnic Group Friendships and Interactions

Findings of Spencer Kagan and Robert Slavin, leading researchers on cooperative learning, have shown that the method has a positive effect on friendships among different ethnic groups. Findings also reveal that the attitude of participants improved toward students of different ethnic groups, and even toward students who were not a part of the same group.

As part of the research on ethnic groups interactions, findings of research conducted by Sabine Oishi revealed that the Team Assisted Individualization (TAI) activity had positive effects on ethnic group interactions, inside and outside the classroom. The TAI activity combines group instruction with individually paced instruction. Developed by Robert Slavin, TAI is a cooperative learning approach developed to teach mathematics to elementary and secondary students.

Other studies, such as those by Sharan Studies of Group Investigation, also link cooperative learning to improved group relations. Those studies were conducted in Israel and involved analyzing friendships between Europeans of Jewish descent and Middle Easterners of Jewish

descent. Findings revealed that cooperative learning improved relations between the two ethnic groups. Spencer Kagan's work focused on the most widely used methods in cooperative learning. His work tested and refined the most successful methods, including "think-pair-share," a three-step interview process, involving round-robin brainstorming.

Criticisms of Collaborative Learning

Critics have raised several objections to cooperative learning theory. One of the most frequent refers to the fact that cooperative learning can be too complicated. In other words, through elaborate instruction and assigning of specific group roles, teachers sometimes make cooperative learning more difficult than it needs to be. For many critics, it seems obvious that cooperative learning is not reflective of how true collaboration works in the real world.

In a group setting, it is too perfect. Further, with cooperative learning, there is the danger of becoming overly dependent on group learning and not being able to translate that experience to another setting. The following problems may occur with group members: there is a tendency for some group members to do all of the work, while others do nothing; there is the tendency for group members to compete against one another, both within and outside the group setting; and the group as a whole may get off task or become "rowdy."

A serious dilemma for some critics is that "cooperative" may be equated to "groupthink," a term used to describe an irrational decision-making process that occurs in cohesive in-groups in which members hastily attempt to reach a unanimous decision without considering alternative courses of action. Similar to cooperative learning, one of the criticisms of collaborative learning is that it also incites groupthink while creating a culture of conformity in which members may be hesitant to challenge others. Although a consensus is reached, the decisions adhere to those more forceful members of the group while ignoring the voices of the less powerful or marginalized.

Conclusion

A preponderance of evidence shows that cooperative/collaborative learning is a research-based

practice that can be used across cultural groups, including African American, Hispanic, and Asian students. Further, group learning, in general, seems to be effective for students of diverse backgrounds. It has a positive effect on friendships. Findings also imply that cooperative/collaborative learning can be responsive to the needs of English-as-a-second-language students, who often face a double challenge of learning an academic subject while also become English proficient.

Moreover, teachers who teach diverse populations could benefit from incorporating cooperative learning strategies into their classes. The teaching strategy could be used with students of varying ability levels. Cooperative learning may be an effective teaching method for ethnic groups from collective cultures, as well as African Americans and Hispanics.

Coptic Christian Americans

The Coptic Orthodox Church traces its founding to St. Mark, the apostle and evangelist who brought Christianity to Egypt in the 1st century after the birth of Jesus. The cultural heritage of the ancient church survives today in the liturgical services and the language. The Copts are part of the family of Eastern Orthodox churches that includes the Greek and Russian Orthodox Churches. The first significant group of Coptic Christians in the United States included students who came for graduate study or professional training and persons who fled Egypt after the revolution of 1952. By 1962, there were enough Copts in America for Pope Kyrillos to place them under the pastoral care of the bishop. Less than a decade later, four Coptic churches were established in North America. Over the next 40 years, the Coptic Orthodox Church became the second-largest Orthodox Church in America. In 2011, after President Hosni Mubarak's resignation and the installation of a conservative Islamic government, thousands more Copts immigrated to the United States from Egypt.

The Egyptian revolution of 1952 brought nationalization and agricultural reform that resulted in wealthy Copts losing much of their property and physical assaults on Copts becoming common. As a result, tens of thousands fled Egypt in the 1950s, the greatest number immigrating to North America, Great Britain, and Australia. In 1962, Pope Kyrillos VI ordained Makary al-Syriani, who had attended graduate school in the United States, as Bishop Samuel for Social and Ecumenical Services, including the pastoral care of the Copts in Europe, America, and Australia. Bishop Samuel paid frequent visits to the United States and Canada, administering sacraments in host churches of other denominations or in the homes of Coptic families.

After Egypt's 1967 defeat in the Arab-Israeli war, the number of Copts immigrating increased again. Approximately 15,000 Egyptians immigrated to the United States from 1967 to 1977. By 1970, four Coptic Orthodox churches had been established in North America, including St. Mark in Jersey City, New Jersey, the first Coptic

St. Mark Coptic Orthodox Church, shown in the photo above, was built in Bellaire, Texas, in 1977. The largest population of Copts living outside Egypt is in Canada and the United States. The U.S. population alone numbers approximately 200,000.

church in the United States. The years following showed a steady flow of Copts entering the country, many of them through Lebanon, under the auspices of the World Council of Churches, the Catholic Missionary Services, and other organizations. By 1989, there were 41 Coptic churches in the United States, and the number of Copts was estimated between 160,000 and 180,000.

The Coptic population had grown sufficiently by 1995 for the single Archdiocese of the United States to be divided into six dioceses, with the heaviest concentration of the 200 worshipping communities in New York, New Jersey, and California. As Copts moved into new areas, they borrowed or bought unused churches from other denominations, frequently at a nominal cost and sometimes without payment. In places with a population too small to have their own church, a Coptic priest from a nearby church held mass at regular intervals. As the congregations grew and became more affluent, they adapted these churches or built new ones to reflect their own architectural and religious traditions. The 2010 U.S. Census Bureau statistics placed the number of Coptic churches at 100 with 300,000 members.

Emigration of Coptic Christians from Egypt increased steadily in the year following the ousting of Mubarak as violence against Coptic churches and individuals escalated. Some estimates place

the number of Christians fleeing the oppression as high as 100,000. Even those who argue that the actual number is lower acknowledge that concern over Coptic emigration is legitimate. In 2012, reports placed the number of Copts living in the United States at approximately 400,000, or 71 percent of Coptic Christians outside Egypt.

The U.S. Department of Homeland Security's Office of Immigration Statistics reported in May 2012 that the number of Egyptians granted asylum in 2011 almost doubled the number a year earlier. The report does not include the number of Coptic Christians among the total for Egypt, but anecdotal evidence from lawyers working with Copts on asylum cases and leaders of local Coptic churches suggests that the number is substantial. One American expert in Coptic studies expressed fears that the number was likely to rise even higher as persecution intensified in the aftermath of the anti-Islamic film *Innocence of Muslims*, which provoked outbursts of violence in North Africa and the Middle East. Nakoula Basseley Nakoula, a Coptic Christian who lives in the Los Angeles area, was reported to be the film's director. Coptic Christians in the United States were quick to distance themselves from the film; many expressed concern for Egyptian Copts who are vulnerable to the violence.

Immigration to the United States may bring Coptic Christians a greater sense of personal safety for themselves and their families, but it brings its own challenges. Assimilation into American society and intermarriage makes maintaining a strong communal identity more difficult. There is already pressure within the church to compromise on the observance of Christmas, presently observed on January 7. A greater push concerns the language used because many American-born Copts speak neither Coptic nor Arabic. In April 2012, St. Timothy & St. Athanasius Church in Arlington, Virginia, opened its doors under the leadership of Anthony Messeh, the first American-born Coptic priest, who conducted the service in English.

Corrido

The corrido is a narrative ballad, traditionally without refrain, which tells the story of an important event or person. It emerged as a popular vehicle of communication in the southwest of what is now the United States during the Texas independence movement of the 1830s. It survived until the present in its historic form but has expanded from its custom of being based on a true story. The form now includes dance corridos and fictionalized corridos, such as the controversial *narcocorrido* of the U.S.-Mexico border region. Other names for the corrido include *tragedia* (tragedy), *homenaje* (homage), or *moraleja* (moral tale), depending on the story being told; corridos to John F. Kennedy after his death were titled corridos, homenajes, and tragedias. The corrido is one of the best documented and analyzed forms of Chicana/o popular culture, literature, and history.

The word *corrido* originates from the Spanish verb *correr*, meaning to run or to flow. One theory of the song's origin is that it descends from the Spanish romance tradition and was brought to Mexico during Spain's 300-year colonial rule. Prior to World War II, the singer of the ballad, the *corridista*, presented information as a first-person witness to the event being narrated. The typical corrido had no chorus, thus its name, and its structure is a common four-line stanza, eight syllables per line. As the focus of the corrido was the story, the instrumentation was simple and

repetitive so the singer could focus on the lengthy narrative, involving one or two singers and a guitar or accordion. Often the corridista presented key information about the event within the first two stanzas and incorporated dialogue into the song to reinforce the illusion he was there. When performed live, audiences used *gritos*, or yells, to show their approval. When recorded, corridos initially captured two sides of a 78 RPM record.

After World War II and the development of amplification, corridos also developed into fictional and dance varieties. These were shortened to one side of a 45 RPM record, occasionally included a refrain, and more women served as corridistas. They presented women's stories in a more positive light than had characterized the genre for the previous century.

One series of fictionalized corridos about La Camelia, a drug-running woman, featured morals that suggested that running drugs led to bad outcomes, but also simultaneously demonized women as the downfall of men. Esteban Jordan created La Camelia in 1975, and she was so popular a literary figure she was picked up by Ramon Ayala y los Bravos del Norte in their 1977 *Contrabando y Traicion*. After several other songs about La Camelia in which she escaped at the end of the song so she could appear in another singer's corrido like a telenovela, two movies were made featuring this character.

Function

The corrido serves many important functions in the Chicana/o community. First, it acts as a newsreel, capturing important events, people, and socioeconomic conditions. It serves as oral history, preserving and making accessible the stories of ethnic Americans with uneven literacy rates who were often overlooked by archives, libraries, or museums. The peak of the corrido during the Mexican Revolution (1910–17) reflected the need for information as revolutionaries attacked railroads, telegraph, and newspapers, communications owned by and symbolizing foreign investors, particularly Americans.

The conflict with Anglo-Americans after 1836 featured prominently in corridos, particularly in Texas. The telling of stories about Mexican American resistance in the face of rampant inequality and hostility in what was once their

native land was an oral manifestation of the social banditry that punctuated the late 1800s. It not only captured resistance but *was* resistance. Corridos also offered a vehicle to promote social action and provide social commentary. As Mexican Americans became more politically active in the post–World War II era, corridos emerged that promoted voting and supported a particular candidate for office, such as John F. Kennedy or Henry Cisneros. The corridista also provided personal support for a candidate, a lyrical endorsement that signified the importance of the person and paid him/her homage—and simultaneously educated those who found poll and literacy taxes and a lack of ethnic candidates to present little incentive to vote.

More recently, controversial narcocorridos extol the exploits of one drug lord or another for profit or safety and reflect a radical reversal of messages about the drug trade from the corridos about La Camelia. Tragically, Ramon Ayala, a three-time Grammy winner who condemned drug running in corridos in the 1970s, was arrested in 2009 for performing at a private home raided by the Mexican navy as belonging to an accused drug runner. Ayala characterized his arrest as a terrible mistake and it did little to diminish his following, but it demonstrates the radical deviation from the corrido's socially conscious tradition.

Cosby Show, The

Starring Bill Cosby, *The Cosby Show* is a television situation comedy that aired on NBC between September 20, 1984, and April 30, 1992. During its eight seasons, the show centered on the day-to-day events of the Huxtable family in Brooklyn Heights, New York. Featuring an affluent African American family, the show raised various questions about appropriate portrayals of African Americans on television. It was a show about the American Dream. The Huxtable family concerned itself with few issues and concerns that most families, both black and nonblack, had to worry about. The family's fundamental value was love. Race did not matter. It was an affluent and upwardly mobile family. Its audiences seem to have considered the show a 30-minute escape from reality and a way to experience temporary utopia.

The show is considered one of the most popular programs of the 1980s. It was based on Bill Cosby's stand-up comedy. Television critics argue that *The Cosby Show* opened a door to two genres of television programs. On the one hand, it enabled shows about African Americans to be more acceptable in the American television industry. Programs such as *In Living Color* and *The Fresh Prince of Bel-Air* appeared during the succeeding period. On the other hand, it popularized shows on family life, frequently a not-so-eventful life of a family. *Home Improvement* and *Everybody Loves Raymond* fall into this category. Of the eight seasons it was on air, *The Cosby Show* was ranked number one by the Nielsen ratings for five consecutive years.

The show's protagonist is Bill Cosby acting in the role of Cliff Huxtable, the father of the family. He is an obstetrician, married to his wife, Claire. Claire is an attorney. They have five children: Sondra (age 18), Denise (15), Theodore (13), Vanessa (11), and Rudy (5). Although many of the family events and issues the show captured were comical and uneventful, the show also discussed many of the current topics, including teenage pregnancy, dyslexia, drug use, parenting, and others. However, it is notable that the show is characterized by its lack of struggles. Although many African American families in the 1980s continued to suffer from poverty, lack of housing, racism, and other forms of dispossession, the Huxtable family was

Bill Cosby in February 2011. Cosby began his career as a stand-up comic, landing his first acting role in 1960. He later starred in *The Cosby Show*, which reached number one in the Nielsen ratings for five straight years and aired for eight seasons.

distanced from them. For example, when Theo's notebook accidentally falls off the kitchen table to reveal his possession of marijuana, Theo explains to his parents that it does not belong to him, and they believe him. Still not convinced that his parents trust him fully, Theo goes on to bring his friend to whom the marijuana belongs. Situations such as this illustrate that the Huxtables are an exceptional family whom social malaise does not concern.

Furthermore, the show rarely discusses the matter of race. For a program whose cast and characters were predominantly African American, this was a rarity. Most other similar shows, such as *The Jeffersons*, mention race very frequently. When *The Cosby Show* refers to American racial politics, it is often in relation to the civil rights movement. The show underscores the values of artistic works by African Americans such as James

Brown, Miles Davis, Stevie Wonder, Michael Jackson, Duke Ellington, Dizzy Gillespie, and others. One of the few examples of the show referring to African American racial politics includes the picture of Martin Luther King, Jr., in Sondra's bedroom and King's "I Have a Dream" speech appearing on the television in the family's living room. Although critics agree that these are relatively implicit signs of the show giving recognition to the struggles of civil rights and African American leaders for the affluent lifestyle that the family is leading, the show also seems to underestimate the reality of racial dynamics in the country.

Cliff Huxtable's occupation as an obstetrician has a particular meaning. American history has clearly shown that African Americans have long been considered as hypersexual beings whose sexual desire and urge could not be contained. When a black slave and a white slave owner were involved in a consensual copulation, black hypersexuality was to be blamed, even though historical documents clearly show that white males frequently coerced a sexual relationship. As Michel Foucault argued, medicalizing sexuality was an effective means to contain African American sexuality. By turning Cliff Huxtable into an obstetrician, he and his sexuality were medicalized. Therefore, it was safe for him to discuss sexuality and to live within a female-dominated household, especially in the eyes of white audiences in the 1980s.

The show won numerous awards, including an Emmy in 1985, a Golden Globe in 1985, and the NAACP Image Award in 1988. *TV Guide* in 2002 ranked the show as the 28th-greatest TV show of all time. Similarly, the magazine ranked Cliff Huxtable as the greatest "TV Dad" of all time. In addition to these awards, the second half of the 2000s saw DVD releases of the show, serving as a sign of the show's continuing popularity even in the 2010s.

Costa Rican Americans

Costa Rican Americans constitute one of the smallest Hispanic immigrant communities in the United States, with 126,418 people of Costa Rican descent living in the country, according to the 2010 U.S. Census. Despite its small size, this group experienced a significant population increase in the past decade, growing 84 percent from the 68,588 people who identified themselves as Costa Rican in the 2000 census. The largest concentration of Costa Rican Americans is found in the New York–New Jersey region.

Migration of Costa Ricans to the United States has been documented since the 1930s. Most of the early immigrants came for business reasons or to attend school. According to census figures, the Costa Rican community grew slowly, accounting for only 5,400 individuals in 1960. Since then, the number of Costa Rican Americans grew at a faster pace, reaching 16,700 in 1970 and 29,600 in 1980, only to decrease to 22,300 in 1990.

Unlike immigration from Mexico and most of Central America, Costa Rican immigration is unique because it has occurred more as a constant trickle rather than through several distinct waves. Also, because of the relative political stability and economic prosperity attained by Costa Rica during most of the 20th century, Costa Ricans coming to the United States have not fled as refugees or as a result of political oppression or extreme economic circumstances. The relatively small population of Costa Rica (4.5 million in 2010) is another factor that helps explain the historically low number of people migrating from this nation to the United States. An additional distinction is that most Costa Ricans who stay illegally in the United States have entered the country legally with some form of nonimmigrant visa, which is not the case of most Mexican and other Central American immigrants.

Around the mid-1980s, conditions changed in Costa Rica that resulted in a different migration pattern to the United States. The decline of international coffee prices, paired with the adverse impact of structural adjustment policies on the agricultural sector, led to the impoverishment of rural communities whose economies heavily depended on farming. People from the Los Santos and Pérez Zeledón regions, in particular, began leaving the country to support their families and to try to secure a better economic future. Further deterioration of Costa Rica's welfare state and austerity measures imposed during the past 20 years have contributed to this migration drive. These new Costa Rican immigrants are typically employed in the food service, agriculture, landscaping, and construction industries. And since most of them are undocumented, census figures are widely considered an undercount of this population. Costa Rican consulates estimate that there are at least 220,000 undocumented Costa Ricans in the United States, which is far more than the official census count for all Costa Ricans in the country.

The majority of Costa Rican Americans live in large metropolitan cities. According to the 2010 census, the New York–northern New Jersey–Long Island area is home to the largest population of Costa Ricans. Other significant communities have been established in Miami; Los Angeles; Washington, D.C.; Houston; Dallas; Chicago; and the Charlotte area. Since there are relatively fewer Costa Rican Americans than other Hispanic groups in the United States, they normally do not form traditional ethnic communities, or *barrios*, as is usually the case with Mexican Americans or Puerto Rican Americans. However, Costa Rican Americans have managed to create some culturally differentiated spaces in their communities, including grocery stores with favorite food fare from the homeland and restaurants serving traditional dishes (pork tamales wrapped in banana leaves, and the rice-and-beans breakfast known as *gallo pinto* among them). Civic committees in various Costa Rican American communities also help preserve a sense of “home away from home,” celebrating popular holidays such as Independence Day (September 15) or organizing soccer tournaments.

Culturally, Costa Ricans tend to identify themselves as white rather than Hispanic, blending in

with the general English-speaking population or forming working and friendly relationships with other Latinos. As a result, they have acculturated at a faster rate than those immigrants who reside in large ethnic enclaves. Despite their generalized cultural blending and acculturation, Costa Rican Americans keep close ties with their homeland, traveling back and forth often. Also, their rates of naturalization are low compared to those of immigrants from other countries, as many Costa Ricans prefer to return to their country of origin after a period of residence in the United States. For example, between 1996 and 2005, only 14,514 Costa Rican-born immigrants became U.S. citizens.

According to census data, Costa Ricans in the United States obtain higher levels of education compared with many other Latin American immigrant groups, with more than 50 percent of them having some form of college education. Their median family income is just slightly lower than that of the overall population. Just like in their homeland, Costa Rican Americans are predominantly Catholic. The August 2 celebration of Costa Rica's patron saint, the Virgin of Los Angeles, has been transplanted to the United States, becoming an important religious and cultural event.

Prominent Costa Rican Americans

The most famous Costa Rican American is physicist and National Aeronautics and Space Administration (NASA) astronaut Franklin Chang-Díaz (1950–). He was the first naturalized U.S. citizen to become an astronaut and the third Latin American in space; he shares the world record for the most spaceflights (seven expeditions). His daughter, Sonia Chang-Díaz (1978–), was the first Latina elected to the Massachusetts Senate in 2008. Other notable Costa Rican Americans include writer and scholar Rima de Vallbona (1931–), actress Madeleine Stowe (1958–), CNN en Español anchor Glenda Umaña (1961–), and dancer/actor Harry Shum, Jr. (1982–).

Cotton Club

One of the most iconic places in New York, the Cotton Club was a jazz supper club that featured popular black artists performing for white patrons, including wealthy celebrities, literary luminaries, and political figures. During its heyday in the Jazz Age and Prohibition era, the Cotton Club launched the careers of Duke Ellington, Cab Calloway, Sammy Davis, Jr., and Lena Horne.

Club De Luxe

Jack Johnson first opened the club in 1920 under the name Club De Luxe. Johnson had risen to prominence years before as the first African American to win a world heavyweight boxing championship, a distinction he held from 1908 to 1915. He was one of America's first celebrity athletes, leading a life marked by unparalleled successes and tabloid-worthy scandals; *Great White Hope*, the 1967 play and its 1970 film adaptation, both starring James Earl Jones and Jane Alexander, is based on his life. By the time Johnson opened Club De Luxe, he was a hero in the black community for winning the so-called Fight of the Century, appearing in several films and radio shows, endorsing several popular products, and recording an album for Ajax Records. Club De Luxe was located in a busy area in central Harlem, at West 142nd Street and Lenox Avenue, only a block from where the famed Savoy Ballroom, a popular Harlem dance venue, would open in 1926.

In 1922, Johnson sold Club De Luxe to Owen "Owney" Madden, an Irish-born organized crime figure who had been recently paroled after serving nine years for the murder of rival gangster, Little Patsy Doyle. Madden reopened the club in 1923 as the Cotton Club. Madden

lived lavishly, romantically linked to a number of women, and allegedly connected to even more killings. He had joined the Hell's Kitchen street gang, the Gophers, in his early teenage years, and developed a reputation as a dangerous and violent criminal. With Prohibition, which had been in effect in the United States since 1919, Madden saw an opportunity to use the Cotton Club to sell his bootleg beer. The police discovered the bootlegging business, and the Cotton Club was shuttered for a brief period in 1925.

Along with his business partners, William "Big Bill" Dwyer and George Jean "Big Frenchy" De Mange, Madden owned more than 20 New York nightclubs in the 1920s and 1930s. Before the end of the decade, Madden and his cronies even managed to gain partial ownership of the Stork Club, Manhattan's most exclusive supper club.

The Cotton Club Revues

The Cotton Club's real attractions were its African American club acts. White patrons were willing to make the long trek uptown to Harlem to see the most famous black singers, dancers, and instrumentalists in show business performing at the club. Among regular performers were Billie Holiday, Ella Fitzgerald, Ethel Waters (where she introduced the standard "Stormy Weather" in 1933), the Dandridge Sisters (featuring a teenage Dorothy Dandridge), Count Basie, Louis Armstrong, Dizzy Gillespie, Adelaide Hall, the Will Mastin Trio (which included Sammy Davis, Jr.), Nat "King" Cole, and the Nicholas Brothers. At age 16, Lena Horne made her professional debut in the chorus; she was later promoted to a featured soloist.

Madden hired Fletcher Henderson's orchestra as the house band in 1923. Fletcher Henderson was a prolific composer, musician, and bandleader who arranged music for the orchestras of Benny Goodman, Isham Jones, and Teddy Hill. Although his orchestra was not especially well known outside Harlem, his music was foundational in the development of swing and big band sounds.

In 1927, Duke Ellington's orchestra replaced Henderson. In addition to being a bandleader, Edward Kennedy "Duke" Ellington was a gifted pianist and composer. During his 50-year career, he composed over 1,000 songs, including jazz, classical, gospel, and show tunes. Acknowledging the breadth of his influences, he referred to

his compositions as “American music” rather than jazz. For his contributions to the American songbook, Ellington was awarded a posthumous Pulitzer Prize in 1999. During his four-year tenure as orchestra leader at the Cotton Club, Ellington wrote over 100 compositions, including “Mood Indigo,” “Rockin’ in Rhythm,” “Black and Tan Fantasy,” and “East St. Louis Toodle-Oo,” many of which were broadcast nationally on NBC radio.

Cab Calloway’s orchestra replaced Ellington’s band. In addition to working with his orchestra, which included Dizzy Gillespie, Danny Barker, and Leon “Chu” Berry, Calloway was also a noted jazz singer, helping popularize scat singing. Over the course of his career, he appeared on Broadway (*Hello, Dolly!* with Pearl Bailey), film (*Stormy Weather* with Lena Horne), and opera (*Porgy and Bess* with Leontyne Price). Calloway’s revue, *Brown Sugar*, played at the Cotton Club through 1934.

The Jimmie Lunceford Orchestra was the next house band. Lunceford, a jazz alto saxophonist and bandleader, led an orchestra that integrated vaudeville-style comedy into its performances. Despite their comic antics, Lunceford’s band was as well regarded as Henderson’s, Ellington’s, or Calloway’s ensembles. The Jimmie Lunceford Orchestra remained at the club until it began an extensive European tour in 1937.

Racial Politics at the Cotton Club

The Cotton Club’s aesthetics were contoured by the racial politics of the time. The revues and décor of the Cotton Club consistently employed jungle and plantation themes. Only light-complexioned African Americans above 5’6” and under 21 years of age were cast as chorines.

There are apocryphal stories that indicate that the Cotton Club instituted “paper bag” policies that limited participation in the chorus line to women whose complexions were at least as light as a brown paper bag. Eventually, the Cotton Club’s whites-only policy—which forbade entry to any patrons who were not white—was eased after Ellington expressed his longtime unhappiness with it.

Last Days of the Cotton Club

Madden moved the Cotton Club in 1936 to midtown Manhattan, just north of Times Square, on

the top floor of a building at West 48th Street and Seventh Avenue. The location had housed the Ubangi Club the year before, and the Palais Royal from 1900 to 1935.

Madden took advantage of the prime location to attract larger audiences by producing lavish Broadway revues at the nightclub. Songs were contributed by Harold Arlen, Donald Heywood, Jimmy McHugh, and Dorothy Fields. The Cotton Club closed permanently in 1940, replaced by Lou Walters’s Latin Quarter in 1942. In 1978, a new incarnation of the Cotton Club opened on West 125th Street in Harlem; it featured chorus line, tap-dancing, jazz vocalist, and swing orchestra acts inspired by those who played at the original Cotton Club.

The Cotton Club on Broadway

The Cotton Club has served as the setting for a number of Broadway musical revues: the Tony and Emmy Award-winning *Ain’t Misbehavin’* (1978), developed by Richard Maltby, Jr., around songs associated with Thomas “Fats” Waller and starring Nell Carter, André De Shields, Charlaire Woodard, Ken Page, and Armelia McQueen; Julianne Boyd’s *Eubie!* (1978), which featured songs by Blake and Sissle, choreography by LeTang, and starred Gregory Hines, Maurice Hines, Alaina Reed, and Jenifer Lewis; Rosetta LeNoire’s *Bubbling Brown Sugar* (1976), with songs by Eubie Blake, Cab Calloway, Billie Holiday, W. C. Handy, Avon Long, Thomas “Fats” Waller, Noble Sissle, and Bert Williams, and starring Avon Long, Josephine Premice, Vivian Reed, Ethel Beatty, Joseph Attles, and Cecila Norfleet; and Donald McKayle’s Tony Award-winning *Sophisticated Ladies* (1981), with songs by Duke Ellington and featuring Gregory Hines, Judith Jamison, Phyllis Hyman, Priscilla Baskerville, Hinton Battle, Valarie Pettiford, Gregg Burge, Pauletta Washington, Mercer Ellington, Mercedes Ellington, and Maurice Hines.

More recently, *Cotton Club Parade*, a musical revue based on Duke Ellington’s act at the Cotton Club, played separate engagements off-Broadway at New York City Center in 2011 and 2012, with a cast including Amber Riley, Adriane Lenox, Brandon Victor Dixon, Kyra Da Costa, Christopher Jackson, Carmen Ruby Floyd, La Tanya Hall, and Karine Plantadit, and a band led by

Jazz musician and Cotton Club orchestra leader Duke Ellington at his piano in 1954. During his 50-year career, he composed over 1,000 songs in a variety of genres, writing more than 100 of them during his time at the Cotton Club.

Grammy Award– and Pulitzer Prize–winning jazz musician Wynton Marsalis.

The Cotton Club's Legacy

The Cotton Club, a 1984 motion picture cowritten and directed by Francis Ford Coppola, dramatizes the rivalry between organized crime figures in the Harlem numbers racket. The film, which starred Richard Gere, Diane Lane, and Gregory Hines, with a stellar supporting cast that included Laurence Fishburne, Maurice Hines, Lonette McKee, Novella Nelson, Fred Gwynne, Gwen Verdon, Larry Marshall, and Giancarlo Esposito, was well received by critics and received two Golden Globe and two Academy Award nominations. Broadway choreographer Henry LeTang, who had wanted to join the male chorus line at the Cotton Club in

his youth, staged the film's dance sequences. The movie accurately depicted the Cotton Club as a hub for celebrity clientele, with James Cagney, Charlie Chaplin, Fanny Brice, Gloria Swanson, Joan Blondell, and Ted Husing all portrayed on screen. In addition, James Haskins's 1977 picture book, titled *The Cotton Club*, highlighted the nightclub's connections to organized crime and bootlegging.

Counseling and Therapy, Multicultural

The notion of culture has been historically defined by anthropologists as a set of beliefs, values, morals, customs, and institutions that people inherit through interaction in a particular social environment. Important characteristics include language, signs, symbols, events and celebrations, shared values, views of mental illness, and the role of social status. More recent definitions include beliefs and practices that are influenced by the dynamics of social conflict, power, and migration experiences.

In therapeutic settings, a counselor's knowledge and understanding of the variations of cultural diversity in client populations is crucial for building strong therapeutic alliances and ensuring integrity through the therapy process. A mental

health therapist who understands cultural elements and subsequently devises helpful treatment plans that match the cultural lifestyles or experiences of his or her diverse clients is considered to be practicing in a culturally competent frame (i.e., cultural competence). Although not always necessary, it is likely advantageous for the client and therapist to share common values, attitudes, norms, patterns of communication, and language. If, however, the therapist is not of the same cultural background as the client, a therapeutic alliance could still be formed by the therapist assuming a stance of “not knowing,” whereby the client is the expert and educates the therapist on the client’s culture, including practices and belief systems.

A therapist must keep in mind that each individual’s experience is unique, and groups are not homogenous, as there are often many within-group differences in any cultural group. For example, under the broad category of Asian American, there are 40 ethnic groups, each with unique linguistic, cultural, and religious backgrounds and immigration history. A similar phenomenon occurs in groups that fall under the umbrella designations of Latino American or Hispanic American.

Language and Culture

Language and culture (in the broadest sense) are often considered the central components of culturally competent mental health services. In fact, the various mental health professional associations in the United States (e.g., psychology, psychiatry, social work, counseling, marriage and family therapy) all emphasize the provision of culturally sensitive services as part of their code of ethics. For many ethnic or minority clients, having no English or limited English-speaking skills, as well as holding treatment expectations based on traditional worldviews rather than Euro-American-centric views typically held by a therapist, can contribute to poor treatment outcomes and underutilization of mental health services.

There seem to be several links between culture and the underutilization of mental health services in the United States. Statistics show that ethnic groups and minorities are underrepresented in therapeutic caseloads, and about half of them drop out of treatment after the first visit, compared to 30

percent of whites. Sociocultural factors, such as a client’s lack of awareness of available services, lack of transportation, inconvenient geographic location of mental health centers, and lack of health insurance (or inadequate insurance) contribute to low utilization rates. In short, these are issues that relate to health care disparities and marginalization of minority groups in the United States.

Additionally, low acculturation or adaptation to the host culture or majority group is associated with lower rates of mental health service utilization. Many members of minority and/or ethnic groups turn to helpers who are not mental health therapists or counselors. For example, studies have demonstrated that Mexican Americans often consult with family physicians, ministers/priests, chiropractors, and traditional folk healers, such as herbalists or curanderos, rather than psychotherapists. These types of healers are often sought because they share the worldview of their clients, make diagnoses that seem appropriate to that worldview, and use treatments that coincide with the clients’ belief systems. In this population, as in many other diverse groups, mental health problems are often attributed to physical and/or supernatural/spiritual causes, rather than psychological causes. For many individuals, mental health problems and treatment are often associated with stigma and shame. Furthermore, many of the existing psychotherapeutic approaches are not culturally sensitive in that they do not take into account many of the values often associated with Latino populations, including the importance of family (*familismo*), hospitality or relationship building (*personalismo*), respect for generational hierarchies and professionals (*respeto*), and the maintenance of traditional gender roles.

The literature also describes “acculturative stress” as the stress that is often faced by minority immigrant groups and involves the associated difficulties in transitioning to the host culture. The challenges depend on many factors, including age at the time of immigration (i.e., younger people find it easier to adapt to a new culture), socioeconomic status (lower income groups report greater perceptions of prejudice by the dominant culture), and perceived acceptance by the majority culture, as well as the degree of family and community support. Thus, immigrant groups can be vulnerable to psychological distress, and part

of providing competent multicultural therapy is the acknowledgement of these difficulties, as well as the incorporation of the internal and external resources that these clients bring with them.

Ethnic Identity

“Ethnic identity development” is closely tied to acculturation, where the former refers to how individuals negotiate their association and attitudes toward their own group and the latter describes not only the adaptation to a new culture but also the individual changes or transformations that result from contact with the host culture. Studies involving Asian Americans have shown that individuals who hold a positive ethnic identity report greater psychological well-being and self-esteem than those who do not. Ethnic identity also has implications for help-seeking behaviors, explanatory theories of mental illness, and what is considered culturally appropriate treatment.

Asian Americans in general uphold certain cultural values, such as family honor, the importance of ancestral legacy, and the belief in the harmony of mind-body-spirit connection, whereas mental health issues are often somaticized and treated either with “alternative medicine” (e.g., herbs, acupuncture) or by a physician, rather than a mental health provider. For both Asian Americans and Latino Americans, culturally adapted, evidence-based therapies (i.e., therapies that are empirically validated) are emerging within the fields of psychotherapy as promising interventions that are more tailored to fit the ideologies held by ethnically diverse groups.

Worldviews

Clyde Kluckhohn, an American anthropologist in the early 1950s, proposed categories for understanding the concept of worldviews, defined as a group’s beliefs and value orientations about human nature and social relationships (individualistic versus collectivistic), orientation to time, action (doing versus being), and man’s relationship to nature and the cosmos, among others. For instance, Western theories of counseling are based on the premise of autonomy, independence, and individualism, whereas family and community relationships are viewed as secondary. Families, communities, and religion or spirituality, and the interdependence of all of these facets are in many

diverse cultures the foundation for healing and ameliorating suffering. Additionally, the collectivistic perspective held by immigrants from areas such as Latin America, the Caribbean, Asia, south Asia, Africa, and the Middle East, to name a few, assume the notion that the welfare of the family, clan, and nation is emphasized over individual needs and well-being.

For instance, African Americans, in general, tend to be a spiritual and religious people. Clergy are often a natural source of help. Black church congregations, regardless of denomination, serve as communities that provide both protective factors against stress and sources of support during times of hardship. But what is most important to consider, beyond the notion of participation in organized religion, is the inherent spiritual and communal perspective to the African American worldview that is tied to African origins (later influenced by colonialism and Christianity). This group makes sense of the world in holistic terms and engages in spiritual and/or religious practices that can include dance, prayer, scripture reading, and music (e.g., gospel), and considers fellow congregants or community members as “brothers and sisters.”

Although the terms spirituality and religion are used interchangeably, spirituality is often defined in the literature as a relationship with whatever is considered divine that fosters human meaning and purpose in life and has an effect on an individual’s relationship to self, others, nature, and God or a higher power; whereas religion is often thought to flow from spirituality in institutionalized forms.

The worldviews of African Americans also include the impact of institutional racism and oppression. Experts have noted that the 300-year history of mandatory migration and hostile enslavement, combined with continued acts of discrimination and oppression by members of the dominant culture within American society, have left many African Americans with the collective mindset of hopelessness, ill will, trauma, and a mistrust for people outside their racial group, particularly in a counseling environment. African Americans tend to see themselves within the context of kinship and in relationship to all other members of this very expansive “family” that serves as a source of support.

When African Americans enter mainstream mental health services, it is with some trepidation; some common challenges include establishing rapport in an interethnic situation, as well as the tendency for mental health therapists to pathologize members of this group. For example, there has been a tendency in the United States to overdiagnose schizophrenia and underdiagnose affective or mood disorders among African Americans, and these errors could be related to therapist misinterpretation of the hallucinatory signs and symptoms which sometimes can accompany severe depression in this group. This “misinterpretation” is disproportionately seen when comparing African American clients with white clients, and the difference has speculatively been attributed to the hastiness of non-African American therapists to view psychotic symptoms in African Americans as somehow “worse” than those seen among their Caucasian counterparts. Although the American Psychiatric Association acknowledges differences in symptom presentations among diverse cultures, this has nevertheless been an area of debate and contention as misdiagnosing continues to occur with deleterious consequences.

Native Americans and other indigenous groups have also suffered from generational and historical racial oppression and have the highest rates of various health-related problems. These groups include some among the poorest people in the United States and their members tend to die at younger ages than those in the general population. Although there are many different tribes that espouse diverse belief systems, the dominant mainstream approaches to health and mental health have lacked an appreciation for models of disease that incorporate the biosocial-spiritual worldviews held by members of these groups. Once again, a consideration for the importance of family and the respect for nature, elders, ancestors, and the relevance of ritual, symbol, and traditions in daily living need to be part of culturally competent diagnostic assessment and treatment.

Another example of worldviews can be taken from Arab American immigrants, who represent 22 countries from Asia and Africa, with many characteristics of the Near and Far East. Acculturation plays a significant role for Arab Americans in therapy. Language barriers are an issue because there are differences between communication

styles and dialects depending on where an individual is from, his or her socioeconomic status, level of education, and migration experiences. A special emphasis placed on complex communication styles, for example, the articulation of suffering and pain in one’s native language may elicit a greater emotional response and complexity than the expression of the same suffering in the acquired language (i.e., English). Losing this meaning in therapy may result in a lack of relational cohesion between the therapist and the client, especially if the client feels the therapist does not understand the weight and importance of what was communicated, even when through the use of interpreters.

Researchers have also observed a great degree of variance in the construction of the notion of mental illness, with a variety of explanatory models around the world that utilize culture-specific verbal expressions of psychological distress that need to be better understood. Even the concept of psychotherapy is a socially constructed notion derived from a Euro-American framework that is foreign to many other cultures. Furthermore, some theorists have argued that psychology as a discipline reflects the ideology of Euro-American (white) superiority and domination, whereas conventional approaches (i.e., talking therapies) are thought to withstand the rigor of scientific inquiry, and traditional healing or spiritual practices are often considered primitive and illegitimate. Spiritual emergencies, encounters, or experiences (i.e., instances in which people report hearing voices or seeing auras) are viewed in the West as abnormal, and thus counseling reinforces the norms and values of society.

Religion

Religion (Christian or Muslim) is knit into the fabric of Arab American culture and must be taken into consideration when working with this population. In the Islamic world, mental health manifests in the unblemished belief in Allah as the Ultimate Maker and Doer, hence any deviation leads to disintegration and disruption of inner harmony. Mental or emotional distress in the observant Muslim community is generally understood as stemming from either a moral transgression or the result of divine will. Thus faith-based practices, such as fasting,

repentance, and recitation of the Koran are considered the treatment of choice. There are no dichotomies, such as mind-body, but rather the American Arab worldviews incorporate a balance of all aspects of being, including soul, spirit, mind, heart, psyche, and body. Studies have indicated that for Muslim Arab Americans religiosity may be a stronger predictor of mental health than any particular acculturation strategy. American Arabs considering therapy, in general, find psychiatric and psychological interventions stigmatizing, especially for women, as this could damage their marital prospects, increase the likelihood of separation or divorce, and be used by a their Muslim husband as leverage for obtaining a second wife.

As in many other ethnic cultures, it is best to incorporate family, religion, and historical background into therapy, as well as to consider the impact of discrimination this group has faced in the United States, especially in light of the 9/11 terrorist attacks. The current sociopolitical climate and heightened media attention have fed into American fear and anger toward Islamic groups or what is better understood as the religious terror by extremists. Negative stereotypes of Muslim American Arabs and the experience of covert and/or overt acts of racism toward this group could render them vulnerable to mental health problems and further discrimination in mental health settings.

Recommendations for Multicultural Counseling

The ultimate goal is to promote mental health services that are compatible with individuals from diverse cultures. Such approaches include location of the agency in the client's community; provision of referral to services for social, economic, legal, and medical problems; use of family members or kinship networks in the therapy process; referral to clergy and the use of traditional or alternative healers in the treatment process; and client involvement in determining and evaluating services (as well as language-matched mental health providers). Many experts recommend that counselors shift away from models that base their approaches on client deficits, and instead celebrate and embrace the unique characteristics of each minority cultural group while

simultaneously recognizing the qualities and strengths of all individuals. They also recommend that therapists recognize the cultural connections between mind-body-spirit and use multiple tools to explore and diagnose psychiatric illnesses that could manifest in psychosomatic forms.

Holistic, multicultural models of treatment could successfully value the clients in a way that welcomes them into a collaborative relationship with the therapist and would take into account all cultural aspects that aid in psychiatric healing. A critical aspect in the therapeutic process is providing ample opportunities for minority clients to explore and discuss their racial and ethnic identities, including the experience of discrimination, trauma, and grief. Therefore, therapists must strive to remain flexible in both their thinking and use of alternative modalities when working with people from diverse cultures, while also examining their own biases, and display humility in their counseling approach. Additionally, counselors should understand the historical context and the contemporary realities their clients face.

Various experts espouse that a multicultural model for competent therapy should consider the interactive processes of a combination of factors, such as clients' help-seeking attitudes; the current U.S. political climate with regard to a particular ethnic group; client demographic variables; within-group differences; clients' ethnic identity and degree of acculturation; the role of family; gender issues; clients' mental health needs; and the intersectionality and interplay of the therapist-client characteristics, values, and beliefs. However, ultimately, it is very difficult to prescribe an ethnic or culturally specific intervention, mostly because of within-group differences and lack of homogeneity in any one group. Therapeutic success may be more related to counselor credibility (i.e., based on a client's perception of a therapist's effectiveness and trustworthiness) and the notion of giving (i.e., the client's perception of receiving a "gift" from the therapist in offering immediate benefit through empathic listening).

Coverture Laws

The British common law doctrine of marital unity, or the notion that husband and wife were one in marriage, shaped a range of coverture laws that determined married women's status in the British colonies and in the United States. Coverture perpetuated men's control of property and authority as head of household. In concert with anti-miscegenation laws, laws defining slavery, and laws dispossessing Native Americans of land, coverture laws guaranteed that only white men were fully entitled to marriage's financial and inheritance rights. While most vestiges of coverture have vanished from U.S. law, its legacies continue to shape immigration law in ways that favor husbands and privilege heterosexual married relationships.

In the British colonies, when a woman married she lost her civil identity and became "covered" under that of her husband. Sir William Blackstone wrote in the 18th-century commentaries that codified British common law, "The very being or legal existence of the woman is suspended during the marriage, or at least is incorporated and consolidated into that of the husband." With no legal identity of her own, she could not make contracts such as wills, buy and sell property, or decide whether or to whom children would be apprenticed. Her husband became owner of her personal property, and while a wife retained title to land she brought to a marriage, her husband managed it.

Most single women, regarded as *femme sole*, remained under the tutelage of fathers with their property held in trust until they married—at which time it passed to husbands. Some widows and, by the 19th century, Irish Catholic nuns, amassed wealth individually or collectively. Spanish and French colonies upheld the authority of fathers but adopted community property practices rather than coverture.

Coverture obligated wives to render domestic services. Even marital rape and domestic abuse (chastisement) were condoned under coverture.

The logic of coverture determined women's political status. When revolutionary leaders carefully maintained coverture, it followed that women would not have the right to vote since they had no public voice separate from that of their husbands.

Native American societies were not ordered by coverture. Iroquois and Cherokee society, for

example, followed a matrilineal pattern in which lineage and land passed through the line of the mother. Policies such as the Dawes Act of 1887, which offered U.S. citizenship to individual Native Americans who accepted allotments carved out of reservation lands, undermined women's authority. The act turned native men into private landholders, farmers, and heads-of-households. This pathway to citizenship followed the logic of coverture.

While single women could receive allotments, married heads of household received larger ones, and then the property belonged to the husband. Women's path to citizenship was vague; only allottees—and thus predominantly male heads of households—were designated citizens. In 1888, Congress legislated that native women became citizens if they married white male citizens, thus becoming citizens through coverture.

African American women and men were denied the inheritance rights that coverture provided whites. Slaves were subject to laws stating that the child's condition followed the line of the mother. Slave marriages had no legal standing, making the children of enslaved women illegitimate with no rights to property or their father's name. A white slave owner might father several enslaved children and profit from their sale; he need not worry that they had any rights of inheritance. Slaves were legally forbidden from property ownership.

Legal Challenges

Coverture laws faced their first legal challenges in the mid-19th century, when states such as Mississippi and New York passed laws allowing women property rights and custody of their children. Male legislators sought to ensure that sons-in-law would not squander estates—which often included slaves—which fathers passed to daughters. Women's rights to their wages followed. Immigrant daughters, however, continued the custom of turning pay envelopes over to male heads of household into the 20th century. Most 19th- and early-20th-century immigrant women from Europe and Asia came from societies that were structured along similar patriarchal models in which women attended to domestic responsibilities and deferred to male heads of household. In the U.S., immigrant women worked for wages to sustain family economies.

The presumption that women were secondary or temporary wage earners followed from coverture and resulted in low wages and job segregation for women. The low wages then guaranteed that most women would marry for economic security and come under the authority of a husband.

Coverture laws extended to citizenship rights in which women's racial, ethnic, or national identity was subsumed under their husbands'. Coverture laws overlapped with anti-miscegenation laws that forbade marriages to white people across racial lines. In 1855, Congress decreed that any foreign woman would become a U.S. citizen if she married a male U.S. citizen and if she herself were eligible for naturalization. Such women circumvented normal naturalization proceedings.

In immigrant families, when the husband naturalized, his wife's status automatically followed. Similarly, children born abroad of citizen fathers, but not of citizen mothers, were deemed U.S. citizens. Since Congress had not specified how courts should deal with women who married foreign men, courts dealt with these cases unevenly. Often American women who married foreign men lost their U.S. citizenship, a practice that became law in the 1907 Expatriation Act. Such provisions left some women stateless because they might not qualify for citizenship in their husbands' countries.

In 1909, when the white daughter of the archdeacon of San Francisco's Grace Cathedral, Gladys Emery, married Japanese Gunjiro Aoki, she lost her citizenship although their five children were citizens by virtue of their birth on U.S. soil. In 1933, only after Gunjiro's death, could Gladys successfully apply to have her citizenship restored.

Coverture and Immigration Law

In 1922 Congress provided some redress to women with the Cable Act, which stated that the right to become a naturalized citizen would not be limited due to sex or a woman's marital status, and U.S. women who married foreign citizens could retain their citizenship so long as they married men who were eligible for naturalization. By the 1920s, Asian immigrants were still ineligible for naturalization. Thus, the law meant U.S. women—especially Asian American women who were likely to marry Asian men—lost their citizenship if they did so. Whiteness remained a

crucial category that, through coverture laws, set boundaries limiting full citizenship.

Coverture also influenced family reunification preferences in U.S. immigration law. Even under the Chinese Exclusion Act of 1882, which forbade entry by Chinese laborers, wives of scholars and merchants could continue to join their husbands since their status was defined by their husbands'. Immigration policies have regularly been loosened to admit the foreign-born wives of U.S. military men stationed overseas. Still, because coverture fostered the idea and conditions that made women dependent upon men, it also led to the detention of women at U.S. entry points where women were deemed "likely to be a public charge" without a male sponsor.

Today U.S. family reunification clauses are gender-neutral, but spouse-based immigration is still predominantly female and limited to heterosexual unions. Women from developing countries have a better chance of entering the United States through spousal or parenting relationships than they do if they are waiting for work visas. Moreover, the statutes continue to promote the idea of marital unity when they give the U.S. resident or citizen, who is more likely to be male, control over initiating the process to establish legal residency.

In 1994, Congress recognized that immigrant women were vulnerable to abuse when their husbands held control over their immigration status and included language in the Violence Against Women Act (VAWA) to protect them. Although the protections were weaker than women's advocates hoped, subsequent VAWA revisions have strengthened battered noncitizen women's ability to establish residency separate from their husbands. Same-sex spouses and women married to undocumented immigrants remain unprotected under VAWA.

In 1992, the U.S. Supreme Court in *Planned Parenthood of Southeastern Pennsylvania v. Casey* acknowledged, "Women do not lose their constitutionally protected liberty when they marry." Coverture's legacies lasted long into the 20th century in the denial of the right of married women to serve on juries and the refusal of lending agencies to offer credit, and even into the 21st century, as seen in spouse-based immigration policies.

Cowboy Culture and Ethnic Diversity

Cowboy culture exists in many places throughout the world. It originated in the Americas as a livelihood for men on horseback to tend cattle. This article describes the formation of cowboy culture in the United States and Mexico over a broad time period. Cowboy culture started with Spain's colonization of what is now Mexico and the southwestern United States. Christopher Columbus's second trip to the Americas imported all sorts of livestock, including horses and cattle. After the conquest of Mexico (1521), wealthy Spaniards established *haciendas* to raise cattle on an open range. Overtime, smaller haciendas cropped up. These were called *ranchos*, the precursors of family-owned and -operated ranches.

Haciendas were modeled after Spanish manors. A wealthy landowner (*patrón*) ruled over peasants

(*peónes*) of Indian, African, or *mestizo* (mixed Indian-Spanish) origins. They were bound for life to the *patrón* and were forced to tend cattle without horses. This was difficult. Cows were restless, bulls temperamental; both wandered about, causing confusion about the cattle's ownership and making catching and branding them impossible.

Vaqueros

Peónes, now *vaqueros* (cowmen), solved the problems. They asked for and were given horses to round up cattle, brand them, and drive them to markets. They soon became independent vaqueros, able to ride away to work on other haciendas. And many did, emancipating *peónes*, free to work for a salary. On haciendas and ranchos, vaqueros honed their craft and developed requisite tools, such as the saddle (*silla*), leather or hemp rope (*laso*), and lariat (*la reata*, or twirling of rope) designed to catch cattle.

Seasonally, vaqueros traversed the open range to brand and drive their cattle to market. Vaqueros called this event *rodear* (roundup.) Spare time during roundup was spent in contests pertaining to ranch work, such as roping calves, riding untamed horses (*broncos*), and so forth. In the 19th century, Anglo-Americans dubbed the roundup games "rodeo," an Anglicized pronunciation of *rodear*.

Colonization via ranching expanded to central Mexico, then took major leaps to what now is the southwestern United States. The expeditions, usually led by a wealthy Spaniard to establish a hacienda and a Catholic priest to form a mission, took cattle ranching and Christianity from central Mexico to near Santa Fé, New Mexico (1598), then over time to Nacogdoches, Texas; Tucson, Arizona; and as far north as San Francisco, California. By 1776, cattle ranches with vaqueros existed throughout the southwest. These colonization expeditions introduced horses to the Plains Indians, who quickly became adept horsemen, significantly changing their way of life.

Buckaroos and Cowboys

Americans commenced migration to the southwest after 1820 when it was under Mexican rule. They admired what they saw—full-blown ranching with skillful vaqueros on horseback handling cattle. Texas folklorist J. Frank Dobie placed the birth of the English-speaking cowboy in the

brasada (brush) country of southern Texas, covering a large open range from Brownsville on the south to San Antonio on the north. These horsemen called themselves "buckaroos," an Anglicized pronunciation of "vaqueros," rather than "cowboys," a name they adopted later.

The word *cowboy* was first used during the American Revolutionary War. British Loyalists coined it as an epithet about the young men who rode their horses over the crops of British loyalists, who saw cowboys as rebels trampling the British army's food supply. Revolutionary colonists had an opposite view: cowboys were free spirits, fighting for the cause of liberty.

After the Civil War, American ranchers thrived as immigration increased dramatically, including former Confederate soldiers and freed African slaves. By the peak of cowboy culture in the 1870s, its ethnic mix included young men of English, Welsh, Irish, Scottish, German, Czech, Mexican, Indian, Cajun, and African roots. The former slaves found the cowboy occupation open to them and developed a respectable reputation as working cowboys and rodeo performers. During this era, the term *cowboy* replaced the term *buckaroo* to connote frontier virtues of self-reliance and bravery in the face of danger.

Cattle Trails

A system of cattle drives was devised to herd cattle over hundreds of miles of open range to railheads, thence to eastern markets. By the 1870s, many cattle trails existed, such as the Chisholm Trail. It ran through Texas, through Indian Territory (now Oklahoma), and into Kansas to railheads in such towns as Dodge City and Abilene, Kansas. Via the trails, thousands of Texas longhorns flooded into midwestern cow towns, were loaded onto trains, and shipped east for sale and processing as tallow, leather, and meat, stimulating the growth of stockyards and tanneries in cities such as Kansas City and Omaha.

Cattle on the long trail were arranged in a cone-like shape, the tip being the herd's leading end. The trail boss, the cattle rancher or his appointee, led the herd. Behind him was the "coosie" (from Spanish *cocinero* for cook) with a "chuck" (cook) wagon stocked to prepare food for the cowboys. To the trail's right, a wrangler (*caverango*) tended surplus horses (*remuda*) to be rotated during the

After the U.S. Civil War, former soldiers and others came west seeking work. These included a significant number of freed slaves hoping to escape the high level of discrimination in the eastern states. These groups joined with the Mexicans and American Indians working in the west and increased the already diverse range of ethnicities among American cowboys. The photo shows a modern rodeo, the name for which came from the original Spanish *vaquero's* term *rodear*, meaning roundup.

drive. Two cowboys rode “point” at the herd’s head, one at each side of the herd; two rode “swing” farther back; two rode “flank”; and three or more rode “drag” at the end of the herd, wearing bandanas over their mouths and noses for protection from trail dust.

Culture and Rodeos

Although life was difficult and lonely on the range, cowboys entertained themselves with rodeos, songs, and dances. Songs like “Streets of Laredo” and “Cowboy’s Prayer” borrowed melodies from English and Irish sailor tunes; dances imitated the Irish jig, the German polka, and the Mexican *corrido*, a line dance now known as the Cotton-Eyed Joe. Musical instruments also reflected an ethnic mix: guitar (Spanish), fiddle (Scots-Irish), and accordion (Czech).

In the 20th century, individual family ranching replaced the hacienda system and became mechanized, but the horsemanship associated with it remained, spawning rodeos as a sport. In the United States and Canada, the Professional Rodeo Cowboys Association and the Women’s Professional Rodeo Association regulate professional rodeos, comprising the following events:

- *Calf roping*: Cowboy ropes a running calf around the neck, his horse stops, sets back on the rope while cowboy runs to calf, throws it on the ground, and ties three feet together.
- *Team roping*: Two cowboys chase steer. One cowboy lassos its horns, the other its hind legs. Both then pull the steer till it falls down.

- *Bull wrestling*, aka *bull dogging*: Cowboy rides beside bull, jumps from his horse, takes bull's horns, and wrestle bull to the ground.
- *Bareback bronc riding*: Cowboy attempts to ride bucking bronco with only a girth-rope to hold onto.
- *Saddle bronc riding*: Same as bareback bronc riding, except horse is saddled, and rein is attached to horse's halter.
- *Bull riding*: Like bronc riding, except cowboy attempts to ride full-grown bulls.
- *Barrel racing*: This is a timed race for women. Riders gallop around a clover-leaf pattern of barrels, making agile turns without knocking the barrels over.

In Mexico, the rodeo developed into a distinctive style, *charro*, referring to a horseman from Mexico's central-western regions. The terms *ranchero* and *vaquero* are similar—*gaucho* in Argentina—but *charro* differs in unique ways, as seen in the *coleadero y charreada*, a unique kind of rodeo, the national sport of Mexico regulated by the Federación Mexicana de Charrería. It is an amateur sport with 10 events:

- *Cala de caballo*: Charro demonstrates horse's ability cantering, galloping, slide stopping, etc.
- *Piales en lienzo*: Charro throws a lariat, lets the horse run through the loop, catching it by its hind legs.
- *Coleadero*: Charro rides alongside bull, wraps its tail around his right leg, and tries to trip the bull as he rides past it.
- *Jineteo de toro*: Charro rides a bull holding the girth-rope until bull stops. Charro must not be thrown; must dismount and remove the girth-rope.
- *Terna en el ruedo*: Three charros attempt to rope a bull, one by the neck, one by the legs, third ties its feet together, all within six minutes.
- *Jineteo de yegua*: Charro rides bareback on wild mare (bronco), may hold girth-rope with two hands, legs held horizontal to the ground.
- *Manganas a pie*: Charros on horseback chase a horse while charro on foot tries

to rope horse by front legs, causing it to fall and roll over.

- *Manganas a caballo*: Same as Manganas a pie, except charro is on horseback.
- *El Paso de la muerte*: Charro rides beside loose, bareback bronco, leaps onto it, and rides it till it stops bucking.
- *Escaramuza*: Teams of women perform precision equestrian events riding sidesaddle.

Rodeos are manifestations of cowboy culture found in the Americas, Australia, New Zealand, the Philippines, and parts of Europe. Because rodeo performers compete in the execution of traditional ranch work and wear the attire of their respective cultures, they embody a living history of the ethnic diversity of cowboy culture.

Creek Confederacy

The Creek Confederacy is the name given to a loose political, economic, and military alliance forged largely during the height of the American colonial era, a confederacy made up of remnants of several disparate Native American tribes that had lived in present-day southeastern Georgia but dominated by the powerful Muscogee (or Creek) tribe.

Since before 1500, the Muscogee had thrived in the American southeast—their ancestors had been engineers, mound builders, creating, among many spectacular monuments, the striking flat-pyramid structures at the Etowah Mounds in northern Georgia. Beginning in the mid-1600s, however, the Muscogee realized the practical benefits of creating alliances with other agrarian fragment-nations—the combined pressures from hostile invading tribes from the north, most notably the Cherokee, and the emerging intrusion of European colonials had encouraged the Creeks to center this confederacy along the broad Ocmulgee River (what European settlers called the Creek), which ran for more than 250 miles through the heart of the swampy woodlands of Piedmont Georgia. In doing so, the Creek Nation pioneered a political and economic alliance that would become a sophisticated community organization to rival those forged by the Mayans and the Incas and in many ways would suggest the colonists' later conception of towns, counties, and states.

The Creek Confederacy centered on the construction and maintenance of tightly organized and often fenced-in settlements, separated sometimes by miles of open country. Each settlement preserved the language and culture of its dominant tribe. The tribes in the Creek Confederacy were agrarian and thus sought permanent rooted settlements. They built the architecturally sophisticated long house, or lodges, or individual huts with thatched roofs and wood shingles for siding and chimneys for heating and cooking to support long-term inhabitation.

The settlement, or *italwa*, served as a kind of county seat for numerous satellite villages. At the center of each *italwa* was a community plaza that gave the settlement its organizing core. It was used for religious rituals, most notably an annual ceremony celebrating the corn crop, and for annual sporting events that brought to town athletes from the outlying villages to compete in feats of strength and speed. In addition, the plaza was used as a market for the exchange of crops from the outlying areas. At the hub of this community plaza was a round open-aired building (the geometric shape reflecting the tribal belief in the sacred inclusiveness suggested by the circle), a public building that served as a kind of town hall where the settlement's chiefs and elders met.

Organization

Politically, the settlements of the Creek Confederacy were each a sophisticated hierarchy of shared power—a chief, the dominant authority and final word on decisions involving the welfare and evolution of the settlement, most importantly, military concerns and questions about the defense of the settlement; the assistant chief, who delegated responsibilities at the direction of the chief and facilitated the day-to-day operations of the settlement; and a chief speaker, who acted as liaison, bringing to the settlement's most powerful figures the concerns of those who lived there.

The structured government ensured that each settlement maintained its political autonomy; thus the confederacy was a loosely knit political entity and one able to grow and evolve as new groups of wandering tribes, many of them victims of European aggression, their homes lost, joined (typical settlement populations ranged from 400 to 600 citizens before breaking off into their own settlement) or as long-standing member tribes withdrew to pursue better farming conditions farther south and west. But any new settlement (at its height the Confederacy consisted of more than 50 such settlements) remained tied to the original *italwa* in a political, military, and economic alliance that suggests the contemporary idea of a state, particularly as over the 18th century the Creek Confederacy itself became more agricultural and the settlements came to spread out for miles to allow for farming and livestock grazing.

Removal

Eventually, of course, long after European settlements no longer competed with the far-flung Creek Confederacy for arable land, the U.S. government enacted a series of protocols designed to relocate the Creek Nation entirely, removing them from the southeast and the long-cherished lands of their ancestors to the so-called Indian Territory in distant Oklahoma. Between 1836 and 1838, the U.S. government forcibly relocated more than 20,000 members of the Creek Confederacy to six million acres in south-central Oklahoma along the Arkansas border. There, the remnant Creeks reestablished the political and economic superstructure of the Confederacy and its settlements thrived once again in the years leading up to the Civil War. The war, however, proved far more problematic.

Allegiances among the Creek Confederacy were split between the Union and the Confederacy, and in Reconstruction plans designed to punish the Creeks (slavery had long been part of its agrarian life), the Creeks lost more than half of their government reservation land. The old Creek Confederacy model gave way to a simpler political model of representative government.

Historically, the Creek Confederacy was a visionary exercise in decentralized urban planning that not only helped evolve the inhospitable rural south into political and economic efficiency but recognized as well that the common needs of a united, if disparate people outweighed any individual vested interests. In creating a template for a flexible government that encouraged individual settlement identity while pursuing a sense of a joint enterprise, the Creek Confederacy defended as well the cultural integrity of the Creek Nation against the slow incursion first by European settlers and eventually by the far reach of the new American government.

Creoles

The term *Creole* throughout history has referred to many different cultures and ethnicities. In the most general sense, Creole refers to locally born people with foreign ancestry. In the United

States, it can be applied to people of all races, but most often to those who share a French background but were born in the American colony, as opposed to Europe. Traditionally, the word *Creole* has been used to describe descendants of French settlers in Louisiana.

The definition was later broadened to include those of Spanish descent in the Louisiana area, to distinguish them from immigrants and later include those of African descent born in Louisiana. Today, French Creole indicates a person with European history, while Louisiana Creole describes people of mixed race.

The term was first developed to distinguish those born in Louisiana from new arrivals, particularly immigrants from Africa. Over time, the language evolved, and black Creoles created a French and West African hybrid language called Creole French or Louisiana Creole French. Although the language is not typically spoken any more, phrases and words are still used. The Creole population also represents a sociopolitical group, whose culture shows a variety of native customs.

Creole society generally comprises whites who were Creoles, Americans, inhabitants of European origin, free blacks, and enslaved people. But those of African descent who were free did not share the same rights and freedoms as whites. However, immigrants to the Louisiana region during the 19th century of German, Irish, or Spanish descent were also considered Creoles, and they merged with the predominantly French culture.

It is important to note that Creole culture is distinctly different from Cajun people. While Cajuns also descended from French-speaking refugees in the 1700s, their Acadian background, rural lifestyle, and French-Cajun language sets them apart.

Birth of New Orleans

New Orleans was founded in 1718 by the Mississippi Company, a corporation that held a business monopoly in the French colonies of North America and the West Indies. The Chitimacha, a Native American tribe, originally inhabited the land. The city took its name from the Regent of France Philippe d'Orléans, Duke of Orléans.

What began as a French colony was given to the Spanish empire in 1763, as a stipulation in the Treaty of Paris, which ended the American Revolutionary War against Great Britain. New Orleans'

proximity to the ocean had made it a strategic location to import military equipment during the war. For a brief time, from 1801 to 1803, the colony reverted to French until the United States acquired it as part of the Louisiana Purchase.

During those years, an influx of Anglo-Americans from New England and the south, along with Africans, Germans, and the Irish began arriving in the territory. The land had a unique presence. French Creoles, those born in Louisiana but of French heritage, clashed with traditional Americans and with a free class of mixed-race people. The French language was most commonly spoken. Very briefly, English was declared the official language by Louisiana's first governor, W. C. C. Claiborne, but it later reverted to French after New Orleans locals rioted over the forced changes.

The mixed-race population of New Orleans and Louisiana continued to grow with the onset of the Haitian Revolution in 1804. The revolution occurred on the French colony of Saint-Domingue (present-day Dominican Republic) in the Caribbean and created the first republic (Haiti) led by blacks. As a result, however, many whites and free blacks sought refuge in Louisiana. Because the people of Louisiana felt so passionate about preserving the French language, they welcomed the refugees. An overwhelming 90 percent of the refugees came to Louisiana, doubling the French-speaking population. The immigration brought 2,731 whites, 3,102 free persons of African descent, and 3,226 enslaved persons of African descent.

The caste system of slavery was very much embedded in the south since its inception in the 18th century. In the early 1700s, many slaves were offered freedom for military service, heroic duty, or, in some cases, if they could prove Indian heritage because Indian slavery was prohibited. As time wore on, however, the emancipation of these individuals became rare. A 1763 census of lower Louisiana cited only 82 free persons of color, although that number grew dramatically as the century progressed, rising to 1,701 in 1788 and 18,467 by 1860. This growth was matched by a rising economic status. Prominent free people of color became successful musicians and writers, including Armand Lanusse, Louis Charles Roudanez, and Basile Bares.

Their rise in ranks did not last long, however. A binary racial society had evolved between the whites and blacks—both free and those enslaved. While the Civil War offered an opportunity for emancipation of enslaved blacks, it also meant anxiety for free people of color because the United States would not recognize a three-tiered society (white, black [freed or enslaved], and Creole).

After the Civil War, many experienced the same impoverished state that enslaved people had experienced before the war. Those were who free persons of color, however, had the advantage of an education and could advance themselves. Many became part of the civil rights movement or moved to France to pursue careers. Tensions grew between the Afro-Creole and white Creole segments within the society. Those free people of color who were able to advance clashed with the whites as they often assumed leadership positions in Louisiana's government.

Evolution of the Language

The Creole language developed as a pidgin language, that is a language that develops between two or more groups of people who do not share a common language. In the instance of Creole, it developed from European and French-based languages of the Caribbean islands. Over time, this simplified common language became the primary language of the community, replacing the former languages and becoming officially known as Creole. As with many languages, different variations emerged. Roughly 10 million to 15 million people around the world speak a Creole-based language. The Creole dialect usually consists of a predominance of French or Spanish vernacular with grammatical elements of the native language.

The Gullah language is a Creole-based English spoken mainly by African American populations in the east central coastal United States, including North Carolina, South Carolina, Georgia, and northeast Florida. Other spin-offs of the Creole dialect include Jamaican Creole, Sranan, Krio, and other coastal areas of West Africa.

Creole Home and Culture

In the 19th century, Creoles maintained a patriarchal home life, in which the father was dominant. Generally speaking, Creoles had large homes and large families. During this time, the white male

population was greatly outnumbered by the white females. For this reason, it became quite common for white males to exploit their enslaved female servants and take them as mistresses or common-law wives. The children they had together, children of mixed race referred to as mulatto, were often granted freedom. This led to the growing population of free blacks and mixed-race men and women. Men would offer money, education, apprenticeships, and, moreover, freedom to these women and their children.

Creoles were predominantly Catholic and heavily influenced by the French colonial era. Traditional upper-class Creole families, who were quite often white, generally took fencing lessons, went horseback riding, and played polo. “Coming out” parties were common for young women who were expected to marry by the age of 25. Often held at the popular Theatre d’Orleans, these debuts marked the start of a young girl’s search for a husband. Prior to marriage, a dowry was negotiated to protect a family’s future.

Not to be confused with Cajun, Creole cuisine is a unique style of cooking that involves chopped celery, bell peppers, and onions. The food is a combination of styles from French, Spanish, African, Native American, and Caribbean influences. One popular Creole dish is gumbo, a stew with seafood, sausage, or chicken. Gumbo stems from the traditional French dish *bouillabaisse*, although it adds ingredients native to New Orleans. The name *gumbo* derived from the French word for okra. It contains the “Holy Trinity” of ingredients: celery, bell peppers, and onions, and is served over rice. It’s traditionally seasoned with saffron and other aromatic herbs. Jambalaya is another popular Louisiana Creole dish, which combines ingredients similar to gumbo, including seafood, chicken, sausage, rice, and tomatoes. It can be tomato based, giving it a red color, which is the traditional Creole jambalaya. The Cajun jambalaya omits the tomato, which gives it a brown color.

A unique music style attributed to Creoles also developed out of the Louisiana bayous. Called zydeco, it came into being in the early 1900s in and around southwest Louisiana and combines the styles of swamp pop, blues, jazz, and Cajun music and rhythms. The washboard is an instrument commonly found in this music.

Americanization

“Americanization” of the New Orleans region began in earnest in the late 1800s and has continued to erode the Creole culture and identity. Since the end of the 1800s, with the influx of Anglo Americans to Louisiana, the French language in New Orleans has been fading and become less important due to the influx of English-speaking residents. Today, the language is dying out in the areas surrounding New Orleans; however, there are many families who speak it and are determined to keep it alive. The U.S. census in 2010 estimated that 250,000 people in Louisiana speak French in their homes. Louisiana French and Louisiana Creole are most commonly spoken in rural areas. In Louisiana and surrounding regions, Creole is rarely spoken in administrative and educational settings because of a stigma attached to the language’s association with slavery and social inferiority. Many celebrities are of Creole descent, including Beyoncé, Angelina Jolie, Johnny Depp, and Ice T. In popular culture, the Nickelodeon television show *Gullah Gullah Island*, which aired in 1994, was the first show to feature a Gullah family, whose members speak a Creolized language and live in the coastal regions of the eastern United States. Despite outside influence, New Orleans has established itself as one of the most picturesque and unique cities in the United States. Though the Creole language may be on the decline, its French-Creole culture is still a rich part of the city’s history.

Criminal Justice and Ethnic Diversity

Criminalization and punishment have always been racialized affairs in the United States. The specificity of this racialization, however, has shifted widely in concert with shifts in the larger racial order. For example, whereas 99 percent of people incarcerated in Alabama in 1864 were white, 85 percent were black by 1888. Most recently, the prison boom—the fivefold increase in the use of incarceration that happened during the last quarter of the 20th century—increased the salience of racial disparities by increasing the reach of the criminal-legal net. Historically, criminalization has served to marginalize and contain Asians, Native Americans, and white ethnics. In its current incarnation, criminalization disproportionately targets blacks and Latinos. In all periods, this criminalizing of racialized minorities is not something that happens only to individuals but to communities as well.

The History of Racialization in Criminalizing and Punishing

Slave codes. Before emancipation, slave owners were legally free to punish their slaves for any offense without intervention from the judiciary. This meant that punishment of blacks was generally inflicted on the body and that a conviction—or any legal process—was not necessary as a precursor to punishment. Slave codes stipulated that blacks were subject to some punishments to which whites were not. For example, in Virginia, it was typical for slaves who ran away to be sentenced to castration or hobbling, while no such status or crime existed for whites, and there was no crime for which whites could be sentenced to either of these punishments. On the

rare occasions when blacks were tried for their offenses—generally slaves whose alleged offenses affected the larger (white) community and free blacks—they were often subject to separate legal codes, especially in the south.

Black codes. While the term *black codes* most often refers to penal codes enacted in former Confederate states in the wake of the Civil War, they existed both before the Civil War and in Union states. Boston’s black codes included a curfew that applied only to Native Americans and blacks as early as 1703. The Illinois black code of 1853, one of the harshest in the nation at the time, extended a complete prohibition against black immigration into the state.

All former Confederate states enacted black codes immediately after the Civil War, in 1865. These codes granted blacks certain rights—such as legalized marriage, ownership of property, and limited access to the courts—while denying them the rights to testify against whites, to serve on juries or in state militias, or to vote. Some also declared that those who failed to sign yearly labor contracts could be arrested and hired out to white landowners. Several states limited the occupations open to blacks and barred them from acquiring land, and others provided that judges could assign black children to work for their former owners without the consent of their parents. These codes also criminalized blacks’ possession of weapons, use of “foul language” near white women, and being outdoors past newly enacted curfews. Even for behaviors that were criminalized for both blacks and whites, prescribed penalties were lighter for whites than for blacks. Virginia, for example, decreed imprisonment for whites but death for blacks convicted of a variety of felonies, from buying or receiving a stolen horse to rape. In addition, blacks were tried in separate courts without juries, comprised of county justices and sometimes slave-owning assessors. Because these codes stipulated incarceration as a punishment for misdemeanors for the first time in U.S. history, they resulted in the building of the first county jails.

After winning large majorities in the 1866 elections, the Republicans placed the south under military rule. This began the era referred to as Reconstruction. They held new elections in which blacks and poor whites could vote; both groups

were newly enfranchised. The new governments repealed all the black codes. The Civil Rights Act of 1866 and the adoption of the Fourteenth Amendment in 1868 ensured that the black codes could not be reinstated. A contemporary division of legal codes that shares structural resonance can be found in the intersection of criminal and immigration law: noncitizens accused of criminal behavior are subject to a different set of laws than are citizens accused of criminal behavior.

Convict lease. Although black codes were struck down by the Supreme Court during Reconstruction, new methods of racializing criminalization sprouted up in the period following the Compromise of 1877, the beginning of the period southern whites named Redemption. Throughout the former Confederacy, states and counties began erecting the system we now refer to as convict lease. This system, in which convicted individuals were leased to local plantation owners, mining

Processing a gang-related arrest by U.S. Marshals in Tulsa, Oklahoma, on May 4, 2011. In 2009 African American males constituted 39.4 percent of the prison population, despite accounting for only 13.6 percent of the national population.

companies, and other businesses, was achieved through the deadly combination of the criminalization of everyday life and fee systems. This system succeeded in criminalizing much of black behavior and thus in permanently flipping the racialization of criminalization and punishment in the south.

Before emancipation, Alabama prisons were 99 percent white; by 1888, 85 percent of people incarcerated in Alabama state prisons and 95 percent of those incarcerated in Alabama county jails were black. States and counties criminalized vagrancy, curfew violations, and many other vaguely defined and, in any case, common behaviors. For example, in Alabama, one could be charged with vagrancy if your employer claimed you were a “stubborn or refractory servant,” “a servant who loiters,” or “a servant who refuses to comply with a contract for a term of service,” in other words, who quits. Regardless of the reason for this charge, conviction would result in being fined up to \$50 (over \$1,000 in 2012 U.S. dollars) or incarcerated for six months. These strict new vagrancy laws were color-blind in language but were applied almost exclusively to blacks. Another new crime was participation in deadfalls, or buying and selling goods after sunset—a practice most blacks engaged in since they needed to work their fields during the day.

Once blacks were brought into the criminal legal system, they were charged fees for nearly every moment of criminal processing and made to work off the fees through forced labor. However, prisoners did not labor for the state; rather, they were leased to private individuals and businesses. Alabama had the most profitable prisons with nearly all black prisoners leased to large mining companies. Unlike during slavery, laborers were not owned and thus not valued, even as property; when someone died of the intense labor and wretched conditions, the state simply sent a replacement. As a result, in some county mines, one out of every three leased prisoners died in a given year. Shockingly, the convict lease system stayed in place until 1928.

Criminalization techniques and land grabs. Techniques developed for crime control were also used to facilitate the privatization of Native American land under the Dawes Act. This act, adopted by Congress in 1887, authorized the president to

survey tribal land and divide it into allotments for individual Indians. Once this had been accomplished, dactyloscopy, a method of studying fingerprints to establish identity, was used by the commissioner of Indian Affairs of the Department of the Interior to document payment on land deeds. When individuals missed payments, their land was confiscated and sold to whites for little money.

Contemporary Criminalization and Punishment, 1970 to the Present

After remaining conspicuously stable for nearly 100 years, the number of people under criminal legal control increased nearly fivefold during the last quarter of the 20th century and by another 13 percent during the next decade. During this “prison boom,” racial and ethnic disparities in criminalization and punishment remained high and intensified. Today, prisons and jails in the United States house nearly 2 million people. Blacks are more than six times, Native Americans more than five times, and Latinos more than twice as likely as whites to be in jail or prison on any given day. Asians’ imprisonment rates are similar to whites; however, this obscures differences among Asians wherein some Asians of particular national backgrounds, Laotians for example, are incarcerated at rates that are higher than other Asians.

Wars on drugs (and sex work). Drug arrests have more than tripled over the past four decades, from just over 450,000 in 1975 at the beginning of the War on Drugs to more than one and half million in 2011. While antidrug legislation was passed throughout the 20th century, the modern-day War on Drugs has its roots in the Richard Nixon administration’s War on Crime, a hard-line reaction to the youth and countercultural movements of the late 1960s. The War on Crime morphed into the contemporary War on Drugs under Ronald Reagan in response, at least on the surface, to the introduction of crack cocaine and the concomitant violence in the new, unstable, and highly profitable black market. Since that time, the government has pursued an aggressive policy of criminalization focused primarily on arresting and jailing substance users, while putting minimal efforts into harm reduction practices, like needle exchange and safe injections sites, or treatment.

Increases in the number of people imprisoned for drug crimes accounted for 20 percent of the increase in state prisoners and 61 percent of the increase in federal prisoners between 1990 and 1999. The effects of the government’s punitive measures are not evenly distributed among the population. According to one study that examined the sources of racial disparity in Seattle’s drug-delivery arrests, not only do police focus overwhelmingly on crack cocaine, the one drug whose delivery is primarily controlled by blacks, but black arrests outnumber white arrests in methamphetamine, ecstasy, powdered cocaine, and heroin—drugs whose delivery is primarily undertaken by white dealers. Racial disparities are further exacerbated by police concentration on traditionally black-controlled outdoor markets.

Less visible than the war on drug, in large part because no politicized war has been declared, the criminalization of sex work has followed a trajectory similar to the criminalization of drugs, with an entrenched system of racialized enforcement that focuses primarily on people of color while ignoring similar crimes committed by whites. New laws, such as Illinois’ “End Demand” legislation, further criminalize sex workers and their customers who would otherwise have no reason for contact with the criminal legal system. Further, when policing sex workers, police focus almost exclusively on street-level prostitution, the one sector of the sex-work market occupied primarily by nonwhites and women and men of low socio-economic status, while ignoring indoor forms of sex work like brothels and escort services that are more likely to include white sex workers.

Moreover, research finds that police routinely assume that women of color, and especially trans*—including transgender, transsexual, and gender-nonconforming—women of color, are sex workers; this assumption increases women of color’s contact with the police and, thus, their likelihood of being arrested and convicted of an offense. Criminalization of drugs and sex work creates its own harms, specifically the racialized criminalization of black women and Latinas and increased violence due to the creation of unstable, profitable, black markets.

Policing. Beginning in the late 1980s, police in many cities adopted new, ever more invasive

policies and practices legitimated by the concept of broken windows policing, which contends that crime is encouraged by the signaling effects of disorder and vandalism. Advocates of this system cite the fact that aggressive misdemeanor arrest policies in New York City occurred during the same time as the drop in crime during the 1990s; however, this crime drop happened in cities across the country regardless of policing style and was largely attributable to the economic boom and concomitant low unemployment.

Street crime units and paramilitary, or S.W.A.T., units were introduced hand in hand with broken windows policing, justified by a similar logic of crime deterrence and swift retribution. New York's Street Crime Unit gained notoriety for the killing of Amadou Diallo, an unarmed immigrant at whom police fired 41 shots. The Street Crime Unit was responsible for the death of many other unarmed men—including Anthony Baez, a young man from the Bronx killed by an illegal police chokehold—almost all of whom were young men of color. After Diallo's death, New York's Street Crime Unit was disbanded.

S.W.A.T. teams are equipped to conduct drug raids with militaristic weapons and tactics. They are deployed almost exclusively in black and Latino neighborhoods and are connected with numerous injuries and deaths of unarmed suspects. In 2003 Alberta Spruill, a 57-year-old Harlem woman, suffered from a fatal cardiac arrest resulting from a standard no-knock, S.W.A.T. entry procedure that entailed entry preceded by a flash-bang grenade and abrupt entry. Following Spruill's death, many victims and witnesses came forth and disclosed their experiences to the city of New York, detailing traumatic encounters of indiscriminate verbal abuse and physical violence at the hands of S.W.A.T. units. Unfortunately, deaths of unarmed individuals from S.W.A.T. operations have continued. In 2010, Detroit police fired a flash grenade through the front window of a street-floor apartment, burst in, and fired a shot killing seven-year-old Aiyana Mo'Nay Stanley Jones. The suspect they were looking for was in the apartment upstairs.

Legal changes. Defendants with the same legal characteristics do not always receive the same criminal legal outcomes. Moreover, even if every defendant with the same legal characteristics

received the same sentence, only a small decrease in racial disparities would occur. This is because criminality is race salient. White people, for example, disproportionately engage in tax fraud, embezzlement, insider trading, and many other types of white-collar crime. Although these crimes cost more money per capita than all street crime combined, sentences for these crimes are, on average, less severe than sentences for even nonviolent street crime. Black people are disproportionately arrested for street crime—violent and nonviolent. Thus, in addition to sentencing disparities that arise during criminal processing, some disparities are built into criminal codes. Even though some people arrested for white-collar crime are black and some people arrested for street crime are white, the laws do not classify on the basis of race and so are distinct from the separate codes for blacks and whites that were in place before emancipation.

Mandatory terms and sentencing enhancements, for example, are thoroughly, albeit implicitly, racialized and gendered. Mandatory terms increase penalties for crimes, such as drug crimes, for which black people are disproportionately likely to be arrested. Moreover, because they ignore level of culpability and primary care responsibility while heavily rewarding prosecutorial assistance, giving information to prosecutors that will aid them in other cases, they are unduly hard on women. Criminal legal officials do not like mandatory terms and thus circumvent them regularly; hence, when they are applied, it necessarily means the person sentenced under these policies receives a longer sentence than do many others who engaged in the same behavior.

Sentencing enhancements, on the other hand, add terms of imprisonment onto a base sentence for behaviors or characteristics that are generally noncriminal in their own right. Moreover, while the base crime needs to be either proven "beyond a reasonable doubt" or pled to, sentencing enhancements are added for any behavior or characteristic for which there is a "preponderance of evidence," a much lighter burden of proof. As with mandatory terms, sentencing enhancements target behaviors (such as engaging in criminal behavior in or near certain public spaces, including public housing or schools) or characteristics (such as having a prior conviction) that are deeply race salient. As with mandatory terms, sentencing

enhancements disproportionately impact women by ignoring levels of culpability and primary care responsibility while heavily rewarding prosecutorial assistance, which women—precisely because they are generally less culpable—are frequently unable to give. While there was some hope that *United States v. Booker* (2005) would render enhancements unconstitutional, its reach has been considerably less broad.

Sentencing guidelines, which establish both minimum and maximum sentences for offenses and precise measures for the influence of mitigating and aggravating factors, are often derided for having produced mass racialized incarceration—with the help of mandatory terms and sentencing enhancements—during the last quarter of the 20th century. However, guidelines vary in their form, content, and authority. While it is true that sentencing guidelines that mandate harsh punishments, sanction and necessitate deep disparities, and leave no room for judicial discretion have been part of the fuel that has fed mass racialized incarceration, all sentencing guidelines are not equally guilty.

Minnesota's sentencing guidelines, adopted in the late 1970s, have been the most successful in holding mass racialized incarceration at bay. The guidelines are associated with an 18 percent reduction in racial disparities in convicted people's likelihoods of being sentenced to incarceration and a 60 percent reduction in racial disparities in sentence lengths. Minnesota's guidelines have also been somewhat successful at minimizing punishments, or at least in making it difficult for legislators to increase punishments, by insisting that legislators can only increase the sentence associated with a particular offense if they simultaneously decrease the sentence for other crimes, thus maintaining an even rate of incarceration.

Criminalization as a method of immigration control has a long history. For example, while Chinese workers were welcomed during the 1850 to 1870 labor shortage, following the 1870s recession, anti-Chinese xenophobia developed into organized hate. In 1904 and 1905, police in Boston and New York conducted warrantless raids in which hundreds of Chinese people were arrested for not having papers. This approach, the use of criminalization as immigration control, has been rationalized by laws enacted in the last quarter

century. In particular, since 1996, immigration law has increasingly turned to criminalization as a tool of enforcement and legitimation.

The 1996 passages of the Illegal Immigration Reform and Immigrant Responsibility Act (IIRIRA) and the Anti-Terrorism and Effective Death Penalty Act (AEDPA) connect “illegal immigration” to contemporary crime control. Specifically, IIRIRA reclassified a number of minor felonies to aggravated felonies for immigrants only, such as driving under the influence (DUI), shoplifting, and minor drug charges, and mandates deportation for immigrants convicted of these criminalized behaviors. IIRIRA also stripped immigrants of judicial review; as a result, a customary and constitutional recourse was no longer available to adequately contest deportation. Finally, section 287(g) of IIRIRA empowered local police officers to enforce immigration law, exponentially expanding the reach of the state. Enacted in the same year, AEDPA coupled concerns about terrorism with concerns about crimes committed by “illegal” immigrants. AEDPA requires the mandatory detention of noncitizens convicted of a wide range of offenses, including minor drug offenses, and limits the power of federal judges to grant relief under habeas corpus. The AEDPA increased funding to the Immigration and Naturalization Service (INS) dramatically, making it the largest federal law enforcement agency at the time. Together, the laws invested unprecedented authority to hunt and deport immigrants considered a threat to America.

Finally, the U.S. PATRIOT Act expanded the powers of the Department of Justice and the INS for dealing with immigrants, particularly immigrants who “pose a threat to national security.” While many of these laws were first used to target Arab and Muslim immigrants, they are now overwhelmingly applied to Latino immigrants. The combined effect of these laws is simple: immigration law now uses the criminalization as one of its main paths of enforcement; in fact, 55 percent of people “removed” by Immigration and Customs Enforcement (ICE) in 2012 had been convicted of a crime.

Since the passage of these laws, the number of detention beds have grown exponentially, border patrol has been beefed up, worksite raids and other covert immigration stings have been launched repeatedly, and yearly deportation of immigrants

has more than tripled. In 1998, two years after the passage of IIRIRA, more than 106,000 immigrants were deported, which the INS estimated as 52 percent more than in 1997. Fifteen years later, in 2012, the United States deported 409,849 immigrants. In addition, nearly 429,000 immigrants are detained in 2011 and roughly 33,000 immigrants are incarcerated in detention centers on any given day—and the numbers are still rising steeply each year. Making the link between criminalization and deportation clear, more than 60 percent of the 380,000 immigrants detained in 2009 were turned over to ICE by local and state police through the Criminal Alien Program, which identifies potential “illegal immigrants” in local jails.

Pretrial processing. Over a quarter of the individuals incarcerated in the United States are being held in local jails and over half of these individuals are being held pending trial. Blacks and Latinos are overrepresented among those held pretrial. This disparity is generated by a combination of factors. First, many characteristics that are correlated with race and ethnicity, like residential stability and employment status, have been codified as legal factors that criminal legal officials are supposed to consider when making pretrial decisions. Second, there is strong evidence that racial and ethnic stereotypes influence criminal processing at this stage. Finally, because black and Latino people have fewer financial networks and resources, they are less likely to be able to post bail when it is required for release. Besides being a significant and detrimental experience in itself, pretrial incarceration also impacts later processing decisions. People who are held pretrial are both more likely to be sentenced to incarceration than those who are released pretrial and, when sentenced to incarceration, are given longer sentences than those who were released pretrial. Thus, disparities in pretrial incarceration are significant both in themselves and due to their contribution to disparities in later criminal legal outcomes.

Pretrial diversions are the practice by criminal legal officials of channeling out of the criminal process classes of offenders who, as a consequence of their probable and assumed guilt, could theoretically be handled by the criminal process. Further, while the proportion of felony defendants who receive pretrial diversions is small, it is not

negligible. Police arrest nearly 14 million people each year, over one million of whom prosecutors charge with felonies. Roughly 60 percent of these defendants are convicted, almost exclusively through guilty pleas. Through these convictions, defendants either join the ranks of or reaffirm their membership among this permanent underclass.

However, nearly 8 percent of people who police arrest and charge with felonies are singled out by prosecutors for pretrial diversions. Because defendants' charges are dropped so long as they complete the diversion program, pretrial diversions channel defendants out of the criminal legal system. This allows defendants a chance to avoid both the stigma and the concomitant material consequences of a criminal record. As such, the racial disparities that exist in legally similar defendants' odds of receiving pretrial diversion are likely to breed racial disparities in the broad array of social and economic outcomes associated with felony convictions, including employment, income, family stability, and mental health. While research in this area is scant, the research that does exist finds that prosecutors are more likely to grant pretrial diversions to whites than to legally similar blacks or Latinos.

Sentencing (prosecutorial and judicially controlled decisions). With the enactment of sentencing guidelines, the decision to press charges and charge setting become the most important determinants of punishment in the post-arrest criminal legal process. Prosecutors control both of these decisions. Under traditional criminal codes, prosecutors often convince defendants to exchange guilty pleas for a recommended sentence at the bottom of the permitted range. However, moves to determinate sentencing, and to sentencing guidelines in particular, have narrowed sentence ranges so much that this offer often no longer provides sufficient incentive with which to extract a guilty plea. Faced with this situation, prosecutors instead offer to drop a defendant's charge from the most serious arrest charge to a less serious charge, often helping the defendant avoid mandatory terms or sentencing enhancements in the process. This practice is called charge bargaining and the result, pleading to an offense less serious than the most serious arrest charge, is referred to as receiving a charge reduction.

Black and Latino people are more likely to be sentenced to incarceration than white offenders with the same legal characteristics, especially among individuals charged with drug crimes. While fewer studies examine Native Americans' sentencing decisions, those studies that do find Native Americans are also more likely to be sentenced to incarceration than are legally similar whites. In contrast, among offenders sentenced to incarceration, the length of the sentence is almost completely determined by legal characteristics. Whereas judges have wide discretion when deciding whether or not to incarcerate an individual convicted of a crime, sentencing ranges are often "recommended" if not mandated, leaving judges little room to adjust sentences for a given offense.

Race affects sentencing decisions most in counties where the percent black and economic inequality are both low. Finally, while most large studies find that young unemployed black men receive the least beneficial sentencing outcomes, qualitative accounts point to another damning intersection of race and gender. Transgender women of color, who are often excluded from employment and housing opportunities and who face intense police scrutiny, according to the limited data available, receive more punitive criminal legal outcomes—including bail outcomes, plea bargains, sentences, and revocation decisions—than do members of any other group.

Release and revocation. Incarcerated individuals are often released from prison after serving a portion, rather than the entirety, of their sentence. In some states, release is determined by parole boards; in other states, release is calculated using a formula that considers the original sentence, "good behavior," and other quantifiable traits. In states with parole release, black offenders serve longer portions of their sentences before being released than do white offenders. This may be due to the influence of traits such as family instability and unemployment, both correlated with race, in parole decisions. Once released, parolees—those adults conditionally released to community supervision after serving a prison term, whether by parole board decision or by mandatory conditional release—are subject to being returned to jail or prison for rule violations or other offenses. Black people are more likely to have their release

revoked due to a technical violation, like failing to keep a job or returning home after their established curfew, than are either white or Latino people; of federal parolees, 20 percent of Latinos, 21 percent of whites, and 34 percent of blacks had their paroles revoked for such violations in 2003.

Collateral consequences. Native Americans, blacks, and Latinos are substantially overrepresented among the more than eight million people living in the United States who have been convicted of felonies. These convictions function as legitimate stigmas that exclude people from employment, lower formerly convicted people's incomes, when they do find work, throughout their lifetimes, and decrease the quality of their family lives. People who have been convicted of felonies are locked out of a plethora of welfare programs: denied access to public housing, barred from receiving educational grants, and, in some states, even denied food stamps. In many states, individuals who have been convicted of felonies are stripped of the most basic right of citizenship, the right to vote. Racial disparities in felony convictions, therefore, help produce and maintain racial disparities in employment, income, education, housing, health, family stability, and a host of other outcomes. In other words, felony convictions operate to create a permanent underclass of people who have lost nearly all civil rights. The racialization of criminalizing and punishing ensures that this underclass is disproportionately black and brown.

Critical Pedagogy

Rooted in classical Marxist theory, critical pedagogy has its foundation in early-20th-century German Jewish theorists, a group of radical leftist thinkers who founded the Institut für Sozialforschung (Institute for Social Research) in Germany. Their ideas were considered a threat to extreme Nazi ideology in World War II Germany, and a number of critical theorists fled to the United States because of the rising persecution of Jews.

Upon conclusion of World War II, the school was reestablished in Frankfurt, Hesse, in Germany and the critical tradition became known as the Frankfurt school. Frankfurt school theorists were united in their critique of capitalism and its negative impact on society, primarily focusing on the effects of the free market’s domination of the economy and the world’s social structure. Although influenced by classical Marxism, they depart from Marxists in their understanding of freedom and emancipation. Theorist Peter McLaren points out that critical pedagogues often differ in their ideas, beliefs, and theoretical framework. However, they

are united in their objectives that call for them to empower the powerless and uplift their less fortunate brethren, challenging the inequalities and inequities in public schools.

Schooling and Culture

Critical pedagogues define culture as specific ways that certain social groups live out, express, and interpret their life circumstances and social situation. Culture has to do with how certain groups make sense of the world and how their values, beliefs, and practices reflect their worldview. One of the primary aims of critical pedagogues is to critically examine the dominant culture in the United States and its influence on American public schools. They argue that schools are currently sites that privilege and advance the ideas and ideals of the dominant culture, thus perpetuating the status quo and disenfranchising those who fall outside that norm. Students who do not possess the cultural capital of the middle and upper classes and do not fit into the prevailing culture’s model of success typically do not perform well in schools.

Certain forms of social life are legitimized and others are not. In fact, many students of low socioeconomic status are viewed as deviant, as they lack the proper sociocultural capital to be successful. Public schools introduce and indoctrinate students into the inequities and inequalities that exist in the world. These youth often do not realize that the system can be challenged because they are steeped in the dominant culture and view it as a commonsense way of reading the world. In other words, they view the oppression as the way things are supposed to be. Schools have made inequality into a type of common sense for the public in that they rationalize structures of classism, racism, and sexism, creating classroom environments centered on capitalist notions coupled with competition and ethnocentrism.

Challenging the Dominant Culture

Critical theorists further break down the notion of culture into three main categories: dominant culture, subordinate culture, and subculture. Dominant culture is defined as the practices and norms advanced by the cultural group that has ideological, sociological, economic, and political control of society. Any group or culture that is not a part of

the dominant culture is considered to be a member of a subordinate culture. Critical pedagogues then in turn define subcultures as any subset of either the dominant or subordinate culture. An example of this would be the hip-hop subculture, as it has its own language, style of dress, musical genre, and distinct ideas that challenge the status quo. Another example is the working-class subculture, generally a part of the larger subordinate culture. Working-class people are noted for challenging the status quo of the dominant cultural group. In public schools, children of the working class often have trouble adjusting to the middle-class values and curriculum put forth by the school system.

Everyday cultural practices of the working class and certain ethnic and religious groups are often viewed as deviant. This fact often results in many poor African American young men receiving more disciplinary actions in schools than their white middle-class counterparts. Critical theorists argue that this can be attributed to the black youth's lack of cultural capital and ability to adopt the practices and beliefs of middle-class white society. In other words, they are often not versed in the practices that will help them be successful in mainstream society. Subcultures challenge the cultural norms of dominant society. Critical theorists also argue that the dominant culture never has full control of society but is always in opposition with the subordinate groups and is further trying to suppress them.

Critical Multiculturalism

McLaren has also called for a "critical multiculturalism," a combination of critical pedagogy and multicultural education. McLaren attacks as "conservative multiculturalism" the idea of the "melting pot" and more broadly the agenda of constructing a dominant mainstream culture that absorbs or obfuscates subordinate cultures and subcultures, such as by undermining bilingual education or stigmatizing nonstandard English dialects. In this view, the implied stance of conservative multiculturalism is that the United States has a multicultural past from which a monocultural present has emerged. He is equally dismissive of "liberal multiculturalism," which focuses on providing social and educational opportunities but is unconcerned with or denies the relevance of cultural differences; and of "left-liberal

multiculturalism," which tends to essentialize cultural differences while ignoring the situatedness of those differences. Critical multiculturalism is McLaren's neo-Marxist proposal to understand race, class, ethnicity, and gender in the context of social struggles over signs and meanings, while rejecting essentialism and deconstructing the dominant culture of conservative multiculturalism.

Also known as a critical theory of education or the new sociology of education, critical theory deconstructs the American school system's ideology and the learning process students undergo in public schools. This deconstruction has been a key element of multicultural education in America, as the traditional narrative of American history as that of Christian whites and their manifest destiny is challenged by the examination of the history of women, immigrants, and the Native Americans and Mexican settlers who were displaced or disenfranchised by American expansion.

Critical pedagogy analyzes schools from a political, historical, economic, and sociological perspective. It is an educational movement that aims to empower students, leading them into becoming conscious of their freedom. It challenges hegemony and authoritarian structures within public schools that inhibit a healthy transformative process of learning and education. Hegemony is when subordinate cultures allow the dominant culture to exert domination over them not by force but through consent. Hegemonic forces advance the dominant worldviews in society that are imposed on people without their knowledge, but they simultaneously give consent to their oppressors.

Critical pedagogy intersects with multicultural education at the realization that educating a multicultural America requires a transformation of ideology and a curriculum that better reflects that America. Multiculturalism is understood not as a simple statement about the country's "melting pot" but as a dynamic system of social, historical, economic, and cultural relationships among the cultures and groups making up the United States. Critical pedagogues challenge the dominant culture's ideology in these educational environments and examine the social construction of knowledge, the relationship of power and knowledge, and the notion of hidden curriculum.

Critical pedagogy overlaps with and draws from postcolonial studies, which examine history

and present-day society in the aftermath of colonialism and imperialism. Howard Zinn's *A People's History of the United States*, for instance, is one of the better-known texts of critical pedagogy. In its focus on early European explorers as exploiters and on the relationship between elites and common people, it is also a key postcolonial work; since its publication in 1980 it has made a deep impact on the inclusion of postcolonial studies in high school and college curriculums. The rise of multiculturalism in the education industry has required history texts that present American history accordingly, rather than as a predominantly white narrative. Social sciences such as economics and political science are especially impacted by challenges to hegemonic structures in education.

The concerns of critical pedagogy are mirrored by what is sometimes called antiracist mathematics. The difference in mathematics performance by different race groups can be explained by the sociocultural context in which mathematics education transpires. Antiracist mathematics consists of antibias curriculums that counter that cultural bias. How this is done, and what is meant by that bias, varies from theorist to theorist. Some seek only a way to correct the performance deficit of blacks and other nonwhite students in standardized tests.

Others challenge the preference in school curriculums for Western mathematics while appropriating ideas introduced by Muslim and Persian sources. The approach sometimes called ethnomathematics would, in contrast, discuss the mathematical knowledge of non-European civilizations. Education reformers have also called for a wider variety of cultural origins of names used in story problems and other textbook narratives in order to better engage students.

Critical Race Theory

Over the past two decades, critical race theory (CRT) has changed how society and culture, especially within the context of education, the legal system, and other institutions, are analyzed in the United States and in other nations. Much like multicultural education, CRT examines some of the foundations laid as a result of the intergroup education movement to make schools places where prejudice and discrimination are examined and minimized or prevented. CRT has become a basic tool for those studying multiculturalism, especially with regard to how law, power, and race interact and shape power structures and marginalize people of color. Originally based upon tools used in critical legal studies (CLS), CRT emerged as its own field and takes a multidisciplinary approach to examinations of society and culture. CRT uses aspects of a variety of disciplines, including anthropology, ethnic studies, history, law, philosophy, sociology, and women's and gender studies. It has been used to examine a variety of institutions and structures,

including education, medicine, public health, and urban planning.

Background

In the aftermath of the initial burst of change that sprang from the civil rights movement of the 1960s, a movement of like-thinking scholars, many of them scholars of color, began arguing that law and power could not be separated and indeed must be examined in conjunction to gain a true understanding of legal policies and procedures. This led to an examination of how race and racial power are constructed and represented in American culture. As many of the initial scholars who examined these issues were from law schools, the movement initially concentrated upon the deep structure of categories and tensions at play in legal texts. Adopting methods used in other disciplines, such as structuralism in linguistics or deconstruction in philosophy, the field of critical legal studies (CLS) developed to explore how best to examine intuitive and formal ways of reasoning, to make these explicit, and to determine both their meaning and relative merit.

In many ways, the roots of CLS can be traced to American legal realism, a school of political philosophy that emerged in the early 20th century to challenge classical legal thought. Unlike the traditional belief that legal institutions made available an autonomous and self-executing system of law untainted by politics, proponents of American legal realism embraced the moral, political, and social conflicts that comprise the legal field. Indeed, the American legal realism movement insisted that the legal system was anything but neutral, apolitical, and impartial. This greatly influenced other schools of thought related to social theory. The Frankfurt school, for example, centered on the beliefs of neo-Marxists, who disagreed with the dogma embraced by traditional communist parties and traditional capitalism and sought an alternative explanation of social development. CLS borrowed the process of looking at many issues through the lens of “enforced opposites,” such as control and freedom, objective and subjective, and private and public. Such binary pairs force the examination of both the meaning and the relative value of each of the constructs.

CLS has not produced a single, monolithic narrative but instead has generated a series of common

themes that permeate the literature. Adherents of the CLS school assert that wealth protects individuals and organizations against the demands of the poor and those in subordinate positions, such as women, the disabled, ethnic minorities, indigenous peoples, gay/lesbian/bisexual/transgendered individuals, and the like. Second, CLS explores how legal documents, such as statutes and case law, do not alone determine the outcome of legal disputes but asserts that outside influences place significant constraints upon judges and juries. Third, CLS embraces the concept that all law is politics and that many statutes and legal decisions focus on constructing and maintaining a certain type of social order. Fourth, CLS forces an examination of many of the law’s central assumptions, suggesting that individual petitioners lack full agency but instead act or fail to act because of certain economic, political, or social constraints as they remain tied to class, communities, gender, race, and other life conditions. Finally, CLS sometimes maintains that the law produces a series of rules that are inherently contradictory, based on the opposition between the preference for strict rules that protect individuals and the need for broad standards that provide flexibility. All of these themes have influenced CRT.

Evolution of CRT

CRT research can differ dramatically from author to author. CRT’s objects, arguments, accents, and emphases differ greatly depending upon the perspectives and experiences of the scholars who conduct a particular study or write a certain essay. Despite these differences, all CRT remains solidly committed to the development of two common themes. First, CRT scholarship seeks to understand how the regime of white supremacy and the subordination of people of color have come to occur in the United States and how this supremacy and subordination have been maintained. To better understand this, CRT explores the relationship between professed ideals such as “equality” or “liberty” and the social structure that exists. Second, proponents of CRT are not seeking to merely better understand the connection between society and racial power but to affirmatively change it so that a world more focused upon social justice exists. Those involved in CRT scholarship share a moral dedication to human

liberation and social justice. Although the specific directions in which to proceed and the steps that need to be taken may vary, the concrete expression of engaged scholarship does not.

CLS had sought to examine how issues of class might make a particular legal system unjust. CRT scholars, on the other hand, were more likely to be persons of color and believed that the CLS focus on class ignored race and the many harms racism caused institutions, individuals, and society. CRT scholars maintain that social reality is constructed through narrative and that much of the focus of research should be focused upon creating exchanges where these narratives may be discerned and understood. Narrative thus becomes the compound agent that embraces the interdisciplinary approach. From a variety of narratives, CRT scholars begin by defining certain components that are used to analyze race and racism in society and culture.

First, CRT scholars understand that “race” is not a fixed term, but is instead a socially constructed phenomenon. As a socially constructed phenomenon, race has political implications for members of both the accepted and the marginalized groups. CRT asserts that race has no biological determinants, but that, instead, race and racism stem from a complex set of relationships that develop from a complex self-reinforcing process that is subject to macroforces and microforces. Social and political struggles work as macroforces to influence society how understands race and racism. For individuals, these same influences operate as microforces that affect daily decisions and interactions. Although race has no biological basis, it is indeed “real” insofar that it affects the experiences of people of color with regard to class, gender, and racial hierarchies.

Second, legal scholar Derrick Bell created the term *interest convergence* to emphasize that policies that seek to achieve racial equality are likely to be enacted only when they are advantageous to mainstream white society. Bell observed in his work that within the United States, the implementation of laws and policies supporting integration and civil rights for African Americans occurred only beginning in the 1950s. Bell posited that this change was predicated upon the United States’ dual campaigns against Communism in Europe and supporting independence for

colonies elsewhere throughout the globe. Television depictions of protests, beatings, and other acts of intimidation by whites toward blacks in the United States were detrimental to the nation’s positions opposing Communism and colonialism. As a result, laws and policies began to change as a result of the interest convergence in favor of more racial equality.

Third, CRT uses narrative in a central way to better gain understanding of the experiences and processes of many communities of color. Traditional scholarship has traditionally ignored the experiences of communities of color, and CRT seeks to make these comprehensible to a wider audience. Indeed, given CRT’s focus on the interaction between race, class, and gender with culture and society, lucid narrative often provides better insights than abstract theories and studies that confuse or misinterpret findings. To encourage comprehensible understanding of these experiences, CRT focuses on the narrative of members of communities of color.

Key Applications

CRT scholars are much more aggressive in their pursuit of social justice and societal transformation when compared to liberalism’s more measured approach to change, which concentrates on color “blindness” as a goal. As a result, CRT advocates favor a race-conscious approach to transformation and place great emphasis on political organizing. The emphasis on storytelling and counter-storytelling is based on the perceived importance of using narrative to delve into experiences of racial oppression and to illuminate appreciation of events. As a result of these factors, CRT has been used frequently in examinations of hate crimes and hate speech. While most assessments of legislation designed to prevent hate crimes and hate speech focus on concepts of free speech and equal protection, CRT scholars focus instead on the history of hate crimes and racist speech, their context, and the actual injuries that such acts cause.

Similarly, the tools of CRT, as well as the predisposition of most CRT scholars, have led to a spotlight on affirmative action, both theoretically and in practical situations. CRT has coined the term *white privilege* to define the variety of social advantages, benefits, and courtesies that inure to

members of the dominant race. Within the context of hiring or admission situations, CRT scholars maintain that to use traditional metrics such as test scores, grades, and other accomplishments is to ignore a multitude of past oppressions that have been borne by people because of their class, gender, or race. CRT also emphasizes that the interaction of various factors—race, class, gender, national origin, sexual orientation—combine to play out in various forms of oppression. As a result, the needs of an Asian female differ from those of an African American male and these needs may well have to be promoted differently.

For the most part, CRT scholars adopt an existentialist philosophy, whereby the experience of a category (race or gender) may be reduced to the experience of one subgroup (black women or Latinas). In essence, this means that all oppressed people share the commonality of oppression, although since oppression varies by category, different aims and strategies will be more appropriate for different groups. Institutionalized racism is comprised of the policies, practices, procedures, norms, and structures that result in different levels of access to goods, opportunities, and services as a result of race, class, or gender. As a result, institutionalized racism is often legalized and represents an inherited disadvantage to members of oppressed groups. More radical adherents of CRT have advocated cultural nationalism or separatism, arguing that even small acts of racism act like water dripping on a rock and serve to devastate oppressed communities. Over time, the victims of oppression begin to internalize the ideology that they are inferior and that whites and white culture are superior. For that reason, CRT scholars sometimes argue that “reparations” is a better term for monies provided to the oppressed than “welfare” or “foreign aid.” Recently, CRT scholars have begun working in the field of psychology, examining unconscious bias in order to explore discrimination in the workplace and the effects of discrimination.

Croatian Americans

Croatian Americans are descended from the Croats, a Slavic people. There are major Croat populations in Croatia and in Bosnia and Herzegovina (where, along with Bosniaks and Serbs, they are one of the country’s three constituent peoples). Early migration as well as large-scale migration in the 15th century during the Ottoman Empire’s incursions into Croatia led to long-established Croat communities in Serbia (Croatian is the official language of the province of Vojvodina), Montenegro, Hungary, Slovenia, Romania, Austria, Italy, Slovakia, and the Czech Republic. There is also a large Croat diaspora created by more recent immigration, especially from the dawn of the 20th century, when Croats left for North and South America for economic opportunities; the middle of the 20th century, when Croats fled the new Communist regime; and in the 1990s, when refugees fled the Yugoslav wars. The wars began in 1991 when Croatia declared its independence from the former Socialist Federal Republic of

Yugoslavia, prompting war with its Serb minority and the Yugoslav People's Army. More than half a million Croats were displaced during the wars.

The United States has the largest population of Croatians outside of their native land: 420,763 in a 2007 survey, a decrease from the 1990s' peak as many immigrants returned home after the end of the Yugoslav Wars. This number does not reflect the Croatian heritage of many of the Americans identifying as Austrian, Bosnian, Yugoslav, Slav, or Dalmatian. Most Croatian Americans are Catholic, though there are sizable Protestant, Eastern Orthodox, Muslim, and Jewish groups.

The largest Croatian American populations are found in Pennsylvania (50,350), Illinois (43,613), Ohio (41,812), California (29,071), New York (23,650), Wisconsin (16,202), Missouri (8,941), and Indiana (8,433). Croatians are fairly well distributed throughout the country.

The earliest Croatians to come to the United States likely arrived before the Revolutionary period. There has been some recent scholarship suggesting the possibility of Dalmatian contact with the New World before Columbus, one of many different theories about Columbian predecessors to contact the New World; the theory has not received widespread support. But the Dalmatians were adept sailors and were certainly present in the United States in that role early in the nation's history. More sustained immigration from Croatia began toward the end of the 19th century, as immigration from the region in general became more common, with immigrants—usually young men without families—coming to America in search of work. The Industrial Revolution offered numerous opportunities for laborers on the railroads, in the mines, and in factory towns. The farms of the midwest and the factories of northern cities became home to most of these immigrants, though only a minority settled permanently; the rest returned home once they had earned enough money. In California, the oyster farming industry was established by Croatian Americans. The oldest restaurant in California, San Francisco's Tadich Grill, was founded by Croatian Americans in 1849 and remains Croatian owned today.

The descendants of those who stayed settled throughout the country. In the late 19th and early 20th centuries, part of the motivation for

The Tadich Grill in San Francisco, founded in 1849 by Croatians, is the oldest restaurant in the state. There was significant Croatian immigration from the late 1890s and early 1900s.

the institution of free public education throughout the country was cultural assimilation: the “melting pot” of the United States was powered by public schooling, which taught English, civics, and American history to the children of immigrants, reducing the odds of immigration populations remaining self-contained enclaves. Croats were especially prominent in the mining and forestry industries as they expanded in the early 20th century, and the Croatian American population figures in Minnesota and Wisconsin are likely drastically underestimated as many Croatian American descendants from this period have assimilated so completely they no longer identify as such, or identify more broadly as Slav. Later immigrants, especially from the 1960s on, were more likely to settle in large cities where there was more access to affordable housing, education, and employment opportunities. Political and religious freedoms were frequent motivations.

Croatian American culture is strong, maintained by cultural centers and fraternal organizations and a number of Croatian Catholic churches. The Croatian Fraternal Union was founded in 1894 in Allegheny City, Pennsylvania, and since 1904 has published a biweekly newspaper. It maintains over 100 lodges in the United States and several dozen in Canada. The Croatian Catholic Union publishes the *Nasa Nada* newspaper. There is also an independent weekly newspaper for Croatian American news, the *Croatian American Times*, published in Douglaston, New York, and distributed nationally. The bilingual newspaper has a circulation of 5,000.

Between 1880 and 1940, some 3,000 Croatian American organizations were founded, though most of these served a specific geographical area, and have dissolved as it has become easier for national and regional organizations to operate. Organizations were devoted to education, political organization, furthering Croatian business interests, supporting the needy back in Croatia, preserving and celebrating Croatian culture, and athletics, among other focuses. Like many ethnic fraternal organizations, Croatian fraternal organizations often offered their members insurance; in part this made up for the lack of an extended family such as more established American families might have to rely on in times of need or tragedy.

Croatian Americans have found success in sports (Roger Maris, Nick Saban, Bill Belichick, Fred Couples), entertainment (Jenna Elfman, Judah Friedlander, Denise Richards, Scott Bakula, John Malkovich), and politics (John Kasich, Dennis Kucinich).

Cross-Cultural Psychology

The field of psychology typically is simplified as the study of human behavior. However, further definitions delineate the field as the examination and application of an understanding of mental processes and human behavior. Within the field there are also many specialized disciplines. One field, with momentum impacting many fields of inquiry, is cross-cultural psychology. Cross-cultural psychology continues the rich traditions of its umbrella discipline of psychology, applying the scientific method and clinical applications to diverse cultural and ethnic conditions. Essentially, cross-cultural psychology is specifically the study of the acquirement and presentation of human emotions, thoughts, and behaviors in light of how they are both universal and different across cultures.

In the expanding field of psychology, there exist many theories on universal human growth and development in terms of physiological as well as behavioral and mental processes. Cross-cultural psychology, in particular, has identified the existence of universal principles of basic human growth and development processes while identifying variation in how these processes are exhibited. For example, cultural differences in the development of thoughts, behaviors, and emotions all influence and create variances in processes such as how one makes decisions. Other variations include how one views the world and how it operates, where one fits into society, occupational and educational attainment, what is considered normal and abnormal, where one fits in with the family and what role each plays according to gender norms (including masculinity and femininity), age norms (treatment of the elderly and their role), relationship dynamics (including attachment styles), marriage norms, identity of the self and personal meaning, how one conducts social interactions and communication styles,

definitions of beauty and appearance, and perspectives on authority.

Consequently, a major objective of cross-cultural psychology is to examine and understand human behaviors and mental processes through specific cultures and their worldviews while looking for potential universal occurrences. However, as mentioned, within any one culture there is great variance in behaviors, emotions, and cognitions due to these cultural influences. Examination attempts to avoid looking at other cultures only through the worldview of the researcher's culture. Too often traditional approaches examining the psychological aspects of other cultures have taken an ethnocentric approach (judging other cultures through the values of one's own culture), not a multicultural approach that attempts to understand diverse cultures through the members of other cultures.

Two Lenses

In cross-cultural psychology, ethnic and cultural examination is often done through one of two specific lenses. The first involves looking at how specific cultures differ from each other. For example, researchers may choose to look at discipline of children across cultures. To do this, researchers must first develop a solid operational definition of what defines discipline and what defines children. This is vital, as some cultures define childhood primarily by age while others define childhood by the passing of rituals or even physical development. After the researchers first define each construct (e.g., discipline and children) they can then move forward to examine how cultures display differences. This lens is often referred to as "between cultures." A disadvantage to this approach, however, is that often the dominant culture may still be viewed as "normal," while oppressed, marginalized, or minority cultures may be viewed as the "different" culture. Cross-cultural inquiry attempts to remove such value-based examination and instead observe and record what happens without bias.

Cross-cultural psychologists also often adopt a second lens of inquiry. This approach attempts to reveal what are similarities, universal observations that occur across various cultures. This lens looks for commonalities and consistencies that occur across cultures. Cross-cultural psychology

has indeed been successful in finding some common, universal constructs across cultures. For example, sadness is a universal emotion found across all contemporary cultures. Additionally, toddlers and children across ethnicities and cultures are able to recognize faces that display this universal emotion. Sadness as a human emotion and experience occurs across all genders, ethnicities, societies, and subcultures. Where variation does occur, for example, is in the manifestation of grief, a human behavior. The expressions of the underlying emotions of grief, such as sadness, are displayed in many different ways across cultures through differences in such behaviors as public versus private mourning and funeral rituals.

A Scientific Study

Cross-cultural psychology adheres to empirical study and examination. The focus of behavior analysis is conducted in methodological approaches that draw upon research methods from psychological methods. Natural observation, surveys, and psychological assessments are some of the common means of inquiry. However, many of the foci of study, such as personality or intelligence, involve constructs that are very difficult to operationally define and this becomes important in understanding the various factors that comprise diverse cultures. Cross-cultural psychology first attempts to understand basic human emotions and behaviors across ethnicities and cultures, and researchers also attempt to look at many other complex behaviors of cultures as well. For example, family relationships, eating patterns, parenting styles, and even the expression of psychological distress continue to be examined.

Cross-cultural psychologists and researchers consider that within any culture there are a myriad of differences within the culture and a vast number of subcultures. This requires an acceptance that cultures differ internally within themselves. For example, within any larger culture there are variations based on age, ethnicity, socioeconomic class, sexual orientation, and gender, just to highlight a few. It is commonly found that variation within an ethnic or cultural group is greater than the assumptions many nonmembers hold. When researchers and laypersons fail to adopt such an understanding there are the all-too-common consequences of overgeneralizations, biases, and even

prejudices of ethnic and diverse cultures. Unfortunately, outside of cross-cultural psychology and related fields, it is common in historical analyses of cultures to forgo looking deep enough within a culture to see the rich differences that occur.

Related Fields and Applications

Many fields are now incorporating concepts from cross-cultural psychology. Consequently, to say these concepts are unique to cross-cultural psychology would be incorrect. Theoretical studies in fields such as business, leadership theory, anthropology, and political science are all incorporating knowledge and adding to the domain of multicultural research and cross-cultural psychology. For example, in the study of effective business and management practice, it is almost a uniform practice to have businesses understanding and engaging ethnic and cultural diversity in order to be effective. It was once considered “enough” in such fields to be aware and understand that differences do occur in various cultures. However, this has been taken to a new level. Now the goal is often to incorporate and embrace the differences brought to the workplace by understanding that variation in ethnicity and culture may be utilized to increase the strengths, ideals, and practices brought to the workplace to the benefit of the company. Fields such as education, leadership development, and communications are also looking at how diversity brings strengths to their arenas. This encourages organizations of all types to admit and encourage the various abilities, strengths, and perspectives that various cultures and subcultures may offer, thus providing for a great number of skills and perceptions.

Cross-Cultural Psychology and Mental Health

The importance of cross-cultural psychology is also being embraced by contemporary psychologists, counselors, psychiatrists, and others in the field of mental health. The expression of mental health disorders, psychopathology, and, ultimately, what is “abnormal” is understood to differ greatly across cultures and subcultures. In the application of the fields of mental health, the conversation is often focused on psychopathology. This is typically identified by an individual’s ability to carry out everyday activities

and relationships in an adaptive and functional manner that is safe, healthy, and beneficial to the self and others. Essentially, diagnosis of psychopathology requires defining what thoughts, behaviors, and emotions are indeed normal and abnormal—this is essential to the diagnosis and treatment of psychopathology. The traditional Western concept of abnormality may not be in alignment with what is considered acceptable or normal in other cultures. In particular, the process of assimilation and acculturation has a notable influence on behavioral and mental processes and the functionality of a minority culture within a different majority culture. Therefore, a thorough understanding of psychology in terms of other cultures is imperative for accurate assessment of abnormality, diagnosis, and treatment.

As with all other scientific disciplines, the basis for and growth of a field should be accurate and scholarly research. Therefore, research that informs fields of mental health must utilize and create culturally relevant variables in research that can accurately measure the constructs that are under study, such as personality behavior, measures of intelligence, milestones of proper childhood development, and self esteem, all of which can differ from culture to culture. In terms of diagnosis, Western descriptions of disorders are primarily categorized by the *Diagnostic and Statistical Manual of Mental Disorders* (DSM-IV-TR). Diagnoses, such as schizophrenia, have the potential to inaccurately label an individual as disordered when in fact the exhibited behaviors are typical of a culture’s religious activities and rituals, as opposed to being behaviors that are abnormal. For example, common or even enduring experiences such as visions and dream states could be identified as “abnormal” by majority or Western culture when in some cultures they are a typical, desired component of religious practices. In addition, another paramount cultural variable that should inform the mental health field is collectivism and individualism.

The expression of this as variations across cultures elicits various thoughts, behaviors, and emotions in response to an array of situations. For example, collectivism is a perspective in which the well-being and function of systems ranging from the family to larger institutions such as government is focused on the group rather than on the individual. Therefore, decisions and resulting

behaviors are informed by the benefit of the whole rather than a single individual, while in other cultures individualism and independence are thought to be of great importance to mental health.

Conclusion

In summary, traditional psychology emerged in Western society founded upon ideals, constructs, and beliefs seeped in these traditions. Cross-cultural psychology embraces the fact that this limits and focuses research and application. Consequently, even when psychological concepts are applied to non-Western societies, the constructs as defined are typical of Western origin. This is the challenge of cross-cultural psychology. Such challenges exasperated by the universal human need for and creation of categories to describe people have often created a sense of “us” versus “them” when surveying other cultures. This basic human cognitive process is beneficial for helping people understand the world they live in but can result in interactions between and among different cultures negatively affected by way of the development of stereotypes, bias, and prejudice. Therefore, not embracing cultural ideals, constructs, and beliefs can potentially affect researchers and outcomes, impacting how diverse individuals and cultures are treated by leaders, teachers, mental health providers, and others in general.

However, through studying cultural differences and similarities, cross-cultural psychologists are gaining a better understanding of complex behaviors across cultures, even finding universal behaviors and mental process experienced by all. This allows for a deeper understanding of the complex and rich expressions of behaviors and mental process as they occur across cultures.

Crow

The Crow are a Siouan tribe who in the mid-16th century lived in southeastern Manitoba. Historically related to the Hidatsa, the tribe began migrating westward, eventually meeting the Mandan people and settling near them along the Missouri River in what is now North Dakota. Perhaps as early as 1735, they acquired horses and became buffalo hunters. The tribe still maintains a small herd of buffalo. The nomadic ways of the Apsáalooke, as the tribe refer to themselves, brought them into conflict with other tribes, most notably the Blackfeet and the Lakota (Sioux). Heavy losses led the Apsáalooke to side with the U.S. Army in the Plains wars of the 1860s and 1870s.

White men called the tribe “Crow,” probably because of a misinterpretation of Apsáalooke, which means “children of a large-beaked bird.” In 1868, the Crow agreed to move to a reservation, beginning a series of moves and ever-increasing loss of land area. The U.S. Census Bureau reported that 5,322 American Indians lived on the Crow Reservation and Off Reservation Trust Land in 2010, compared to 4,724 in 1990 and 3,954 in 1980. Tribal records of membership put their number at approximately 11,000 in 2012; 7,900 reside on the Crow Indian Reservation. Unlike many Native American tribes who are

struggling to preserve their language, 85 percent of the tribe speak Crow as their first language.

When the Crow began their westward migration, they moved with the Hidatsa tribe. Archaeological, linguistic, and oral history fail to agree about when the tribes separated, but the Apsáalooke became a separate tribe. Sometime between the mid-17th century and the early 18th century, they also became nomadic. The tribe itself became divided into the Mountain Crow, who settled north of the Yellowstone River in the Rocky Mountains, and the River Crow, who settled farther south along the Bighorn, Powder, and Wind River valleys. Their new lifestyle revolved around the buffalo and the horse. The buffalo provided food, fuel, tools, clothing, and tepee covers. Well over a century after the vanishing of the great herds of buffalo, the Crow still maintain a small herd, and on rare occasions, buffalo meat is served at the feast following a Sun Dance or for some other celebration. The horse provided transportation, entertainment, and increasingly a means of trade. The Crow established themselves as the middlemen, trading horses, bows, and clothing decorated in the quill work for which they were famous to the Plains village tribes for guns and metal goods, which they traded in turn to the Shoshone in Idaho.

Losses in battle and disease posed a real threat not only to the survival of a clan but to the entire tribe. Greatly outnumbered by their enemies and suffering hundreds of deaths from smallpox, the Crow were in danger of extinction. Between 1830 and 1870, non-Indian observers questioned the tribe's ability to survive. One account placed the number of families at 800 in early days but found them reduced to 460 by 1862. It may have been such losses that prompted the Crow to aid the U.S. military. In 1865, they assisted the U.S. military in protecting travelers on the Bozeman Trail, named for John Bozeman, who used the trail as a shorter route to the Montana gold fields. More than a decade later, they were still serving as scouts for the military. In 1876, Crow scouts were primarily responsible for preventing a more serious defeat of General George Crook at the Rosebud Battle with the Lakota and Cheyenne.

Such assistance brought them few concessions in the long term. The Fort Laramie Treaty of 1851 granted the Crow Nation 38 million acres. A second Fort Laramie Treaty (1868) reduced

the grant to 8 million acres. In 1872, the tribe was moved to a new reservation, Rosebud River, near present-day Absarokee, Montana. Congress reduced Crow land again in 1882, and the same year congressional action provided the Northern Pacific Railroad with 5,084 acres of Crow land, for which \$25,000 was provided in compensation—to be spent for the Crow at the discretion of the secretary of the interior. In 1884, the Crow were moved once more to a reservation near Billings, Montana. Cessation of Crow land continued through 1904 when the reservation was reduced to its present size of 2.3 million acres.

The land continues to serve as the basis of Crow economy in the 21st century. Not only is it used to support livestock operations, but the nonrenewable resources are vast and varied with potential for oil and methane gas. In May 2005, the tribe secured a minerals lease agreement with Golden Arrow Energy of Wyoming to begin production on 7,680 acres south of Crow Agency.

The language as well as the land provide the present-day Crow with a living link to their past. Although the United Nations Educational, Scientific and Cultural Organization (UNESCO) placed the Crow language on an endangered list in 2012, 85 percent of Crow speak the language. Most are bilingual, with English as the language of daily discourse. Traditional culture within the Crow community preserves the language through the traditional clan system and religious ceremonies. The cultural vitality of the Crow can also be seen in Chichaxxaasuaa, the Crow Fair that claims to be the largest family reunion in the world. Over 10,000 of the Crow people gather on the banks of the historic Little Bighorn River to celebrate through displays and events that link them to their ancient traditions.

Cuban American National Foundation

Founded in 1981 by Raúl Masvidal, Carlos Salmon, and Jorge Más Canosa, the nonprofit Cuban American National Foundation (CANF) is the largest and most politically influential Cuban exile organization in the United States. Más Canosa fled Cuba for Florida in 1960 and took part in the unsuccessful Bay of Pigs invasion in April 1961, and the Cuban exile has been an ardent critic of communism and the Castro regime ever since. Although its national headquarters is located in Miami, home of the largest Cuban American community in the United States, CANF also has offices in Chicago, Los Angeles, Tampa, Jacksonville, New Orleans, and San Juan (Puerto Rico). Since 2007, CANF has been chaired by Jorge Más Santos (Más Canosa’s son), and former U.S. Marine Francisco Hernández has served as president.

The organization’s agenda includes bringing about the removal of Fidel Castro from power, ending communism in Cuba, and steering Cuba toward democracy and capitalism. According to its Web site, CANF also aims to “advance human rights in Cuba, educate public opinion on the plight of the Cuban people, dispel prejudice and intolerance against Cubans in exile and promote Cuban culture and creative achievements.” Since its founding the CANF has operated as a major lobbying organization, seeking to influence U.S. foreign policy toward Cuba. Many consider CANF to be the most effective and politically influential Latino advocacy group in the United States.

Major Activities

Throughout the 1980s, CANF promoted a hard-line anti-Castro, anticommunist stance that

mirrored the strong opposition toward communism espoused by then-president Ronald Reagan. Claiming to be the voice of the Cuban American community, CANF successfully lobbied Reagan to establish Radio Martí in 1983. The first Radio Martí broadcast aired on May 20, 1985. Modeled on Radio Free Europe, Radio Martí consists of Spanish-language radio broadcasts laced with anticommunism programming that is transmitted directly from the United States to Cuba. CANF achieved another major success in 1990 when it helped establish TV Martí, which transmitted anti-Castro televised programming to Cuba. During the 1990s, CANF founded its own radio station, *La Voz de la Fundación* (The Voice of the Foundation), to transmit anti-Castro broadcasts into the Caribbean island nation.

Also during the 1980s, CANF expressed strong support for the Reagan administration’s policy of extending assistance to the Contras of Nicaragua in their fight against the leftist Sandinista regime. As the Nicaraguan struggle against communism resonated with numerous Cuban American exiles, Reagan sought to use CANF to court Cuban voters into the Republican Party. Given the importance of the Cuban voting bloc in Florida as well as Florida’s electoral significance in presidential elections, Republican recruitment of Cuban voters has had a profound impact on American political history.

The collapse of the Soviet Union in 1991 marked the official end of the Cold War. Nevertheless, the fiery and outspoken leadership of Jorge Más Canosa enabled CANF to convince elected officials of both major political parties to maintain the trade embargo against Cuba and to eschew diplomatic talks with the Castro regime in the era of post-Cold War geopolitics. Más Canosa met with political figures from around the world throughout the 1990s to cultivate international support for his anti-Castro agenda, including Russian President Boris Yeltsin and Argentine President Carlos Saúl Menem.

CANF helped lead relief efforts in the wake of Hurricane Andrew’s destruction across southern Florida in August 1992 by donating money, food, and clothing to aid victims. The organization also provided resettlement assistance to Cuban refugees, a move that endeared CANF to many members of the larger Cuban American community and even drew praise from non-Cubans.

Criticism

CANF, along with its tactics and activities, has not been without criticism. Critics have bemoaned Más Canosa's proclivity to claim that his organization reflects the viewpoints of the larger Cuban American community. Although CANF denies that it advocates the use of violence or terrorism to achieve its political objectives, allegations persist that the organization has supported incidents of violence against Cuban enterprises and government institutions. Critics have also spoken out against the alleged fanaticism and zeal with which CANF promotes its anti-Castro agenda, which some claim has exacerbated negative sentiments toward Cuban Americans among non-Cubans. Such was the case during the aftermath of the Élian González saga in 2000, following the Bill Clinton administration's decision to return the 6-year-old González to his father in Cuba rather than to grant custody over González to his extended family in Florida. This decision resulted in widespread protests and civil disobedience among Cuban Americans in Florida, which evoked counterprotests by Anglo and African Americans. Prior to his death in 1997, Más Canosa openly criticized various public officials who did not support CANF's objectives.

Since the late 1990s, CANF has lost a significant degree of its once-formidable political influence. Más Canosa's death profoundly affected the organization, as his son has adopted a more moderate tactical approach toward CANF's activities. Más Santos has expressed support for a peaceful transition to democracy and capitalism in Cuba and also has led the organization to become more involved in humanitarian causes on the island and in Florida.

Cuban Americans

Cuban Americans constitute the fifth-largest Latino ethnic heritage in the United States, after persons of Mexican, Puerto Rican, Salvadoran, and Dominican ancestry. The 2010 U.S. Census counted 1,785,547 Cuban Americans, accounting for 3.5 percent of total U.S. Latino population. Similar to the overall Latino population, the Cuban American population is rapidly growing, as the 2010 census documented a 44 percent growth in this community since the 2000 census. Although the vast majority of Cuban Americans live in the southern United States, particularly Florida, ethnic Cuban communities also exist in New York, New Jersey, and Pennsylvania, as well as other states.

Early Migration and Settlement

By the end of the 19th century, Cuban communities had been established in New York City, Key West, Tampa, and New Orleans. Tampa and Key West quickly became major centers of Cuban cigar production in the United States, with numerous cigar factories in both cities that employed thousands of workers. The migration of Cubans continued during the early decades of the 20th century, with an estimated 25,000 Cuban migrants settling in the nation during the 1920s and 1930s.

More than 25,000 Cubans entered the United States in the 1940s, followed by nearly 80,000 during the 1950s. Employment opportunities in the shoe and leather industries attracted many Cubans during this time, while professional baseball teams began seeking talented players from Cuba. Cuban Americans gained a national face during the 1950s with the dawn of the television age and the popularity of *I Love Lucy*. The classic comedy program starred Anglo comedienne Lucille Ball alongside her real-life husband, Cuban-born Desi Arnaz, in the two lead roles.

Fleeing Castro's Communism

The largest waves of Cubans to the United States occurred after Fidel Castro's overthrow of Fulgenio Batista on January 1, 1959. Once in power, Castro established the Caribbean island as a communist dictatorship backed by the Soviet Union. These developments set in motion the dynamics of Cuban migration to American shores over the

past half century. During the height of the Cold War, the early waves of Cuban refugees fleeing the Castro regime in the 1960s were generally welcomed by Americans and extended benefits, including financial and nonfinancial assistance, by the federal government that eased their transition to life in the United States.

The first wave of Cuban refugees included former officials and administrators from the deposed Batista regime, followed by a larger influx of upper-middle-class and highly educated professionals with entrepreneurial or technical skills, such as merchants, bankers, businesspeople, engineers, physicians, attorneys, teachers, and professors. A third wave of refugees, many of whom already had relatives in the United States, entered the country between 1965 and the late 1970s.

The vast majority of post-1959 Cubans entering the United States chose to settle in southern Florida, particularly within the Miami metropolitan region. Located only 90 miles from Cuba across the Florida Straits, Miami shared a sunny tropical climate identical to the refugees' homeland. Miami's proximity to Cuba also allowed exiles to retain a strong sense of Cuban identity, as many people during the early years of the Cuban influx aspired to return to Cuba once Castro had been removed from power.

To facilitate the entrance of Cubans, President Dwight D. Eisenhower created the Cuban Refugee Emergency Center in Miami in 1960 and allocated \$1 million in federal funds to assist refugees with the resettlement process. President John F. Kennedy expanded this resettlement assistance with federal programs that helped Cuban refugees find employment, obtain job recertification to enable professionals to resume their careers in the United States, and provide refugees with access to health care, education, and food.

A fourth major influx of Cubans during the spring of 1980 shifted public perceptions of the Cuban American community. This influx, known as the Mariel Boatlift, began when Fidel Castro eased restrictions on Cubans wishing to leave the island by opening his nation's ports and permitting those who did not support his regime to freely depart Cuba with the stipulation that they would never be allowed to return. This move resulted in 125,000 refugees, a significant portion of whom were darker-complexioned

Afro-Cubans and from the island's lower-income and working classes (in contrast to the relatively lighter-complexioned and European-descended Cubans who formed the majority of earlier refugees), settling in the United States within a matter of weeks.

The overwhelming majority of *marielitos* took up residence in the Miami area, which evoked a degree of backlash among some within the city's Anglo and African American communities who opposed the shifting demographics and growing Cuban cultural influence in southern Florida. In November 1980, voters approved a referendum that declared English the official language of Dade County (this ordinance was eventually repealed in 1993). The referendum was highly influential as similar initiatives and legislation quickly spread to other regions of the country, making Miami the birthplace of the English-as-the-Official-Language movement in the United States.

The Cuban American population of southern Florida has grown rapidly. By 1980, Dade County, Florida, had become home to nearly 600,000 first- and second-generation Cuban Americans. More than 900 Cuban-owned businesses had been established in Miami by 1967, a number that increased exponentially to more than 8,000 by 1980. By 2012, more than one-third of all businesses in Miami were Cuban-owned, and the city's transformation into a major international center of commerce and banking, combined with its strong Latino cultural influences and bilingual flavor, had earned Miami the designation "the capital of Latin America." Outside Florida, significant Cuban American communities exist in New York City, Los Angeles, and the New Jersey cities of West New York and Union City. More than one million persons of Cuban ancestry lived in the United States by 1993.

A growing number of Cuban Americans have won election to public office since the 1980s, giving the community a voice in local and national political affairs. For example, Xavier Suarez won election as mayor of Miami in 1985. Suarez's mayoral tenure was succeeded by Joe Carollo and Manny Diaz, each refugees from Cuba, in 1989 and 1991. At the federal level, the Cuban American vote helped elect Ileana Ros-Lehtinen and Lincoln Diaz-Balart to the U.S. House of Representatives in 1989 and 1992, respectively.

A Distinct Latino Community

The nation's fifth-largest Latino population, Cuban Americans on the whole exhibit several social and cultural characteristics that distinguish them from other Latino populations. Mexican immigrants have had a long and turbulent relationship with the U.S. government, finding themselves in high demand during periods of labor shortages and subject to mass deportations during times of economic hardship. On the other hand, Cuban refugees were received warmly by the U.S. government for their rejection of the communist regime imposed by Castro. Cuban Americans have the highest per capita income levels of all Latino nationalities in the United States, a trend that reflects the large influx of Cuban professionals and moneyed elites who relocated to American shores after Castro's rise to power.

The political preferences of Cuban Americans also stand apart from that of other Latino populations. Whereas Mexican Americans and Puerto Ricans are primarily affiliated with the Democratic Party, Cuban Americans have historically supported Republican candidates in local, state, and federal elections. The tendency for Cuban Americans to favor the Republican Party derives from several factors, including the higher rate of small business ownership among members of this ethnic community relative to other Latino groups, and the perception that the Republican Party has maintained a stronger anticommunist position than the Democratic Party. President John F. Kennedy's failure to remove Castro from power during the failed Bay of Pigs invasion in 1961 and the Cuban Missile Crisis of 1962 alienated many within the exile community, and anti-Democratic sentiments manifested again in 2000 when the Bill Clinton administration decided to return six-year-old Cuban national Élian González, who had been rescued by the U.S. Coast Guard at sea, to the custody of his father in Cuba instead of his relatives in the United States.

Staunch Cuban American support for the Republican Party may be starting to wane, however. Political scientists noted that in recent presidential elections, the Cuban bloc in Florida has split its votes, helping President Bill Clinton carry Florida in his reelection campaign in 1996 and enabling Barack Obama to narrowly win Florida in 2008. A generation gap in party allegiance

appears at play, with older Cuban Americans holding more conservative and Republican-leaning voting preferences, while members of the younger generation who have no recollection of pre-Castro life in Cuba and have spent their entire lives raised in the United States are more likely to support the Democratic Party.

Notable Cuban Americans

As the size and sociopolitical influence of the Cuban American community has grown substantially in recent decades, so has the presence and visibility of Cuban American political figures and celebrities. President George W. Bush appointed Mel Martinez, a child refugee who came to the United States in 1962 during Operation Pedro Pan, as secretary of housing and urban development in 2001. Florida voters elected Martinez to the U.S. Senate in 2004. Floridians also elected Marco Rubio, whose parents migrated to the United States during the Batista regime, their U.S. Senator in 2010. Bob Menendez, also the son of parents who fled Batista, served as a U.S. congressman from New Jersey from 1993 to 2006 before becoming a U.S. senator.

Pitbull (born Armando Pérez) is one of the leading hip-hop and Latin pop recording artists; he captured the 2012 Billboard Music Award for Top Radio Song with his multiplatinum single "Give Me Everything." Other famous Cuban American musicians include Gloria Estefan, her husband Emilio Estefan, Jon Secada, and Celia Cruz. Gloria and Emilio first achieved acclaim as part of the band Miami Sound Machine in the 1980s, and Gloria has since launched a successful solo career that has earned her seven Grammy Awards. She was also awarded the Ellis Island Congressional Medal of Honor in 1993, the nation's highest award for a naturalized civilian citizen. Celia Cruz, perhaps the most famous salsa performer of all time, helped expose millions of Americans to this genre of Latin music throughout her lengthy singing career that spanned 50 years. Cruz defected to the United States upon Castro's assumption of power in 1959 and often performed with Puerto Rican salsa stars, such as Tito Puente and Willie Colón.

While salsa enthusiasts danced to Cruz's music, Andy García, whose family fled the Castro regime in 1962, has thrilled moviegoers with his acting talents since the mid-1980s. García has starred in

such critically acclaimed films as *The Untouchables*, *Stand and Deliver*, *The Godfather Part III*, and *Ocean's Eleven*, in addition to producing and directing *The Lost City*, which recounts life in Cuba before and after Castro's rise to power. Garcia's performance in *The Godfather Part III* earned him an Academy Award nomination for Best Supporting Actor. José Canseco, a Havana native whose family also relocated to southern Florida during his childhood was one of Major League Baseball's most feared power hitters during the 1980s and 1990s, and helped the Oakland Athletics reach three consecutive World Series from 1988 to 1990. Prominent Cuban American actresses of recent years include Eva Mendes, Cameron Diaz, and Rosario Dawson. Dawson has been active in voter registration efforts designed to increase Latinos' participation in the electoral process.

and the airlift that followed it. On November 2, 1966, President Lyndon Johnson signed the bill that granted special status to Cuban immigrants, authorizing the attorney general to grant permanent resident status to any Cuban who had been granted admission or parole into the United States after January 1, 1959, when Fidel Castro forced the resignation and flight of Cuban dictator Fulgencio Batista. Persons being granted permanent resident status must also have been physically present in the United States for two years. The law removed the necessity for Cubans who had entered the United States after Castro's victory to apply for political asylum in order to remain legally in the United States. This special status for Cuban immigrants remained unchanged until another crisis in 1994 pushed the administration of President Bill Clinton to adjust U.S. policy.

Castro, in effect, extended an invitation to Cubans in the United States to transport family members still in Cuba to the United States in 1965 when he opened the port of Camarioca in northern Cuba to boats arriving to evacuate relatives. The port remained open from October 10 to November 15. During the five weeks the boatlift lasted, 5,000 Cubans made the trip. In December, the so-called Freedom Flights began. Over the next eight years, about 250,000 Cubans arrived in the United States on these flights. It was in the context of these events that the Cuban Adjustment Act of 1966 was enacted.

The Cuban refugees who had entered the United States via the boatlift or the airlift were not automatically granted lawful permanent residence under the Immigration and Nationality Act. Applying for permanent residence required an immigrant to leave the United States to secure an immigrant visa at a U.S. consular office abroad and then reenter as a permanent resident. Clearly such a practice was impractical for the enormous numbers of Cuban refugees. In addition to providing refuge to Cubans who were oppressed in their own country, the Cuban Adjustment Act (CAA) eased the administrative burden for both the immigrants and immigration offices and allowed for the integration of the Cuban exiles into the American workforce. Although not part of the public rationale for adopting the legislation, the CAA was also an important move in the ideological war against communism. For almost

30 years, the CAA offered open-ended permanent residence to all Cubans who made it to the United States.

In summer 1994, Castro once again gave Cubans unrestricted leave to immigrate to the United States. The sudden influx of 25,000 Cubans arriving on rafts of all descriptions brought the total of Cuban immigrants for the year to 40,000. The Clinton administration responded by prohibiting the entrance of the raft refugees until an agreement could be reached with the Cuban government. In the interim, they were housed at Guantanamo Bay along with refugees from Haiti.

On September 9, 1994, Cuba and the United States signed a joint communiqué in which the two countries agreed that the United States would not allow Cubans rescued at sea to enter the United States, that the open-door policy of the ACC granting parole to all Cubans who reached the United States would end, and that the United States would issue a minimum of 20,000 immigrant visas annually through the Interest Section in Havana. Less than a year later, the Clinton administration issued the U.S.-Cuba Joint Statement on Migration. Among other provisions, it allowed for the parole of most of the Cubans detained at Guantanamo Bay into the United States.

Cuisine and Ethnic Diversity

Ethnicity comprises group cultural factors such as nationality, ancestry, language, traditions, and beliefs. Ethnic groups across America use their cultural foods to maintain their identity within the larger culture. “Cuisine” refers to a style of cooking that reflects ethnic or regional influences. Most foods and cooking techniques considered “American” had their origin with the Native American cuisines and those brought by immigrants, beginning with the first European colonists. Multicultural America continues to offer a diversity of ethnic cuisines from around the world.

Different cultures developed within various ecological environments and used foods locally available. Cooking techniques were developed that allowed the local ingredients to be combined into edible forms. As populations moved, they adapted and adjusted their traditional recipes to use indigenous ingredients. And as ethnic groups immigrated, many began to share and incorporate other ethnic foods and cooking techniques into their own diets. For example, pizza first appeared in the United States with Italian immigrants in the 19th century.

Different ethnic groups continued to prepare their foods, but sometimes the original ingredients were not available in their new settings. And, just as the immigrant groups became Americanized, so did ethnic foods prepared with American ingredients. In many circumstances, ethnic neighborhoods survived because of cultural institutions such as churches and food suppliers. With the advent of the Internet and modern food storage and transportation, original ingredients for ethnic foods, previously not available beyond the country of origin, can be found in any part of the world. In neighborhoods with large ethnic populations, even “American” stores carry products to meet the needs of local groups. For example, a grocery chain might stock spices and foods from the Middle East in its New York stores, while its Miami stores carry items for Cuban cuisine. American recipes from their earliest history represent “fusion” cuisine, combining elements of many different culinary traditions.

Religion is also an element of culture and many religious groups have certain dietary laws. Observant Jews (kosher) and Muslims (halal) follow dietary regulations from scripture. Some Buddhists and Hindus are vegetarians, following religious principles of nonviolence toward animals. Other religious groups have certain food requirements for certain holidays or observances, such as Catholics not eating fish on Fridays. For many years, public schools throughout the United States served fish sticks for lunch on that day. As various religious groups entered the United States, they brought their food needs with them, influencing public institutions such as schools, prisons, and hospitals. As with other ethnic groups, they have developed some unique fusion cuisines, such as kosher Chinese, prepared without pork or shellfish, staples in traditional Chinese cooking.

Native American Cuisine

Before the arrival of colonists from European nations, the Native American population of North America represented multiple and diverse cultures that used locally available plants and animals in their diets. Using various fishing methods and gathering techniques, they utilized the multitude of saltwater and freshwater fish, mollusks, and shellfish available in the oceans, lakes, and rivers.

Early Native Americans commonly used grilling and spit roasting for local bird and wildlife meats. In the northwestern United States, whale, seal, and walrus also provided food sources. Root vegetables were often placed in the fire next to hot rocks to cook. Since Native American pottery could not be placed over a fire, heated rocks were placed in pots filled with water to boil vegetables and meats. In the southwestern United States, they created adobe ovens to bake breads, while in other parts of the country pits were dug into which were placed heated rocks to bake or steam foods. Seaweed or cornhusks could be placed on top to insulate and maintain the heat. This method of pit cooking is found worldwide and forms the basis of the traditional clambake in the United States. Drying techniques were also developed to preserve foods, and cooking techniques such as stewing were developed to prepare the dried ingredients.

Colonial American Cuisine

When the colonists arrived in America, they attempted to prepare their traditional European foods while combining traditional Native American recipes, cooking methods, and ingredients. The settlers brought livestock (cattle, sheep, pigs, goats, and fowl) from Europe to provide meat, eggs, and milk for dairy products. The colonists planted crops using seeds they brought, some of which survived in the American climate and soil. They also began to hunt native animals (deer, bear, buffalo, rabbit, and wild turkey) while cultivating native plants such as corn to incorporate into their European and hybrid Native American recipes. Iron pots, brought from Europe, allowed traditional stewing techniques.

European wheat did not do well in the cold New England colonies and was replaced by native corn as a grain to produce bread-like products and porridge. In the southern colonies, the growing season was longer in the more temperate climate and a wider variety of produce was available. Rice, cabbage, string beans, and potatoes became dietary standards. Rice may have arrived in America by way of Dutch merchants sailing from Madagascar and arriving in South Carolina, where the grain grew well.

Later, French dishes further influenced the development of ethnic cuisine in the United States. Cajun cuisine emerged through French-speaking immigrants, who were deported by the British from Canada to Louisiana territories. A Cajun meal, using locally available ingredients, typically consists of a three-pot meal containing the main dish, a second with rice and spicy sausage or fish, and a third of vegetables.

Creole cuisine, also indigenous to Louisiana, is a blend of French, Spanish, Portuguese, Italian, Native American, and African influences, as well as general southern cuisine. The term *Creole* was used by the early French settlers to identify individuals of French and Spanish descent born in Louisiana, as opposed to those born in the Old World. While similar in some ways to Cajun cooking, Creole cuisine used more traditional European cooking techniques and adapted them to the locally available foods. Cajun cooking is more rustic, whereas Creole cuisine evolved in the homes of well-to-do aristocrats like the plantation owners of the southern colonies and

Caribbean islands or those who imitated their lifestyles.

Immigration and Ethnic Cuisine

The patterns of immigration to the United States have increased the ethnic diversity of American cuisine. Each period brought distinct national groups, races, and ethnicities to the United States. The first wave of immigrants came primarily from Great Britain and northern Europe. The early 20th century brought individuals from southern and eastern Europe, and after 1965 immigrants arrived from Asia and Latin America. While the Jewish population in the United States dates back to the early colonies, large-scale immigration of Jews from Germany occurred in the 19th century. At the beginning of the 20th century, eastern European Jews immigrated and established their community in New York City. Many other Jewish refugees arrived from Europe after World War II, and others arrived from the Soviet Union after 1970. These waves of immigration brought more ethnic cuisines to the U.S. menu.

Many of the foods and cooking styles brought by these immigrants have become part of the American cuisine. It would be impossible to identify all of the foods brought to the United States by immigrant populations. While some might be enjoyed across the country and are presumed “American,” others may be identified with regional cuisines. Hamburgers and hot dogs, originally foods eaten by German immigrants, have become identified as American foods. Apple pies had been eaten in Europe long before the colonization of the Americas, yet “as American as apple pie” is a saying in the United States, meaning “typically American.” And while we identify spaghetti and meatballs with Italian cuisine, it is uniquely American, as it is more likely that Italians would serve a meat sauce with other types of pasta. While many cultures have a variety of fermented milk products, yogurt is identified primarily with Greek cuisine and millions of Americans eat it every day. Kielbasa, identified by most as Polish, is marketed throughout the United States by major food companies, while the Polish origin

Soul food can be traced back to Africa—rice, sorghum, and okra were all common elements of west African cuisine. A plate filled with soul food that is now considered mainstream American, such as fried chicken and macaroni and cheese. Also on the plate are collard greens and deep-fried okra, part of a group of foods that remain uniquely “soul food” and include chitterlings, hoppin’ john, butter beans, mustard greens, hoe cakes, fried catfish, and custard pie.

of kasha (buckwheat groats), a popular cereal, is probably unknown to most Americans.

Some types of ethnic cuisine in the United States are related to historic events. The first significant immigration of Chinese individuals began with the California Gold Rush and continued with the building of the transcontinental railroad. The Chinese were tolerated as a cheap source of labor. Following the Civil War, many blamed them for the depressed economy, resulting in the Chinese Exclusion Act, which placed a ban on Chinese immigration to the United States and denied citizenship to those already in the United States. Since they were no longer able to come to the United States, many Chinese men went to Cuba to work in the sugar fields. After the Cuban revolution, many Chinese Cubans immigrated to the United States, bringing with them their unique fusion Cuban-Chinese cuisine. Knowing history explains the development of this particular ethnic cuisine.

Regional Cuisine

In the United States, there are many regional cuisines, which developed based on the availability of different foods, trade routes, varying climates, cooking traditions, and cultural differences. The same foods can be cooked in different ways depending on regional preferences. Salmon is available in both the Atlantic northeast and Pacific northwest regions of the United States. In the northwest it may be smoked in an oven on a cedar plank, similar to how it was cooked by the Native Americans of the region, while in the northeast it is more likely to be grilled or poached, a technique dating back to the Romans. Another method of preparing salmon uses traditional Scandinavian pickling techniques, with a solution of salts, spices, and sugar. The result is *lox*, a uniquely ethnic Jewish dish in the United States often served on a bagel with cream cheese. Other popular brined fish such as sable, sturgeon, whitefish, and herring are available in delicatessens and fish stores throughout New York City. Today, modern food packaging and refrigeration make such fish specialties available throughout the United States.

There is much regional diversity in cooking across the United States. Regional styles are influenced by Native American and immigrant patterns, naturally available foods, and traditions. Regional cooking in the United States is identified

by the part of the country (southern, southwestern, New England, etc.) or by major cities (Philadelphia cheese steak, Chicago-style pizza, Boston baked beans, Manhattan clam chowder, etc.). For example, in the United States there is southern cooking, which, while available throughout the United States, encompasses the traditional dishes of the southern states. A southern meal might consist of fried chicken, field (or black-eyed) peas, greens (such as collard or mustard), mashed potatoes, cornbread or corn pone, sweet tea, and a dessert, usually a pie or a cobbler. Southern cuisine also favors a full breakfast as compared to a light or continental breakfast.

Barbeque is uniquely identified as American, but truly represents an amalgam of cultures as they arrived in America and integrated the local foodstuffs with dishes of immigrants' countries of origin. Barbeque in regional southern cooking does not refer to hot dogs and hamburgers on the grill but rather to slow-cooked and smoked meat. Its earliest history dates to the slow drying of sliced, spiced meat over a low, smoky fire, a widespread practice in the Caribbean at the time of the first Spanish explorers. Early European colonists, observing Native American grilling, started basting the meat with liquids to keep it from drying while cooking.

African slaves from the Caribbean brought New World peppers, especially red peppers, when they were sold to southern plantation owners. The basting recipes began to combine butter, vinegar, peppers, and spices, resulting in the invention of barbeque sauce. German and French immigrants brought mustard, which became incorporated into the sauces. At the end of the 19th century, German-style coleslaw was added to the meal. Tomatoes, thought poisonous by early colonists, were later eaten and included in barbeque. By the 1800s, recipes for tomato ketchup appeared in American cookbooks. In Texas, German settlers developed barbecue sausage and brisket. Today, American barbeque reflects many regional preferences in the selections of sauces, rubs, smoking techniques, and meats.

Ethnic Foods and Ethnic Identity

The term *ethnic food* is ambiguous. We tend to have a good idea of the foods considered "American" versus those labeled "ethnic." Yet these

are not two discrete categories but are instead a continuum of food selections. As already noted, many American favorite foods have their origins in other cultures or represent fusions of different ethnic foods into the American diet. The newer a cultural group is to the United States, the more likely its food will retain its traditional roots and be considered “ethnic” by others.

Traditional ethnic recipes not only remind people how to cook but also pass on the history and culture that food can represent. Many traditional ethnic dishes are associated with rituals, holidays, or celebrations, which provide the opportunity to maintain ethnic identity. Holidays allow younger members of the cultural group to learn and practice their cultural heritage. Traditional recipes also allow food to develop into a complex cultural product in harmony with unique climates and traditions. Despite the cultural origins of many of our favorite foods, some of them are now American. Foods associated with exotic locales like Thailand or Ethiopia are clearly ethnic to many Americans. Americanized versions of ethnic cuisines may not resemble traditional ethnic cooking. For example, frogs’ legs are a very popular ingredient in some regions of China but are unlikely to be offered in an American Chinese restaurant.

Is Soul Food Ethnic?

Another type of American cuisine that has distinctly regional and ethnic roots is “soul food,” which has its origins in American slavery. African American slaves were farmers, cattle raisers, and fishermen who introduced several foods such as black-eyed peas, okra, sweet sorghum, turnips, and melons. Often these homeland foods were cultivated and used only by the slaves, eventually finding their way into the American diet. Slaves created their own recipes utilizing the leftovers and scraps of the undesired meats from their masters’ kitchens with some of their African crops grown for their own use. The recipes were shared among families and passed down through generations from memory.

After the emancipation of the slaves, many, who were excellent cooks, began working in homes, restaurants, and cafés throughout the United States, bringing this Afro-American cuisine to other regions of the country. In the 1960s this southern style of cooking by African American

cooks was renamed “soul food” to honor those who created and maintained this uniquely American cuisine. Today, some dishes that originally were part of this tradition have crossed into mainstream American cooking, such as macaroni and cheese, fried chicken, mashed potatoes, and meatloaf. Others remain uniquely soul food, such as chitterlings, hoppin’ john, butter beans, collard or mustard greens, hoe cakes, fried catfish, and custard pie. Many African Americans still eat soul food today, although it is generally reserved for holiday meals and special occasions.

Unfortunately, traditional soul food recipes are not healthy as a dietary mainstay because of the high levels of fats, sugars, and starches. Obesity combined with heart disease, high blood pressure, and diabetes is a serious health risk within the African American community. Modern efforts have focused on creating heart-healthy versions of traditional recipes. The risks of southern and soul food cooking were highlighted by the news that Paula Dean, the “Queen of Southern Cooking,” has type 2 diabetes. She teamed up with a company making the diabetes drug that she takes to create healthier versions of traditional recipes.

Conclusion

American cuisine reflects the history and multicultural composition of the people who immigrated to and settled this country. Beginning with Native Americans, Americans have adapted local foods and cooking techniques with those brought from other parts of the world. Some indigenous North American foods, such as sweet potatoes, were carried by Spanish and Portuguese traders to the Philippines, the East Indies, and then on to India and China. This process continues today with fusions of new cuisines with more traditional ones. Modern refrigeration and food packaging allows ethnic cuisines to be transported around the globe. An emphasis on healthy eating has challenged cooks to create newer, healthier versions of traditional foods.

Cultural Competence

The U.S. Department of Health and Human Services, Office of Minority Health, defines cultural competence as a set of "congruent behaviors, attitudes, and policies that come together in a system, agency, or among professionals that enables effective work in cross-cultural situations." Culture may refer to a shared pattern of human behavior that includes things such as language, customs, and religious affiliation among a group of people that is passed down from one generation to the next. Competence may be conceptualized as the ability to function effectively and optimally as an individual or organization within the cultural context of the target population. Cultural competence, therefore, refers to the capacity of an individual or organization to communicate and interact effectively with people of similar and dissimilar cultures.

Cultural competence is a critical component in ensuring quality and sufficient care for people of diverse ethnic/racial backgrounds. As society becomes more diverse, contact with individuals of differing cultural backgrounds is increasingly common. Developing ways to gain cultural competence has become an important goal for a wide range of industries, including human resources, nonprofit organizations, and government agencies whose employees work

with individuals from diverse cultural or ethnic backgrounds. A lack of cultural competence may result in an increase in conflict and a failure to deliver services. Although cultural competence is important across a wide variety of contexts, health care agencies, businesses, and educational institutions have been particularly interested in developing and applying the principles of cultural competence.

Culture and the Need for Cultural Competence

Cultures vary significantly from each other in terms of customs, beliefs, and lifestyles. These cultural differences affect people's expectations and behaviors when interacting with each other. For instance, perceptions of constructs such as time differ greatly between cultures. People from cultures with a sequential view of time prefer to have detailed agendas that are followed throughout the day. Being late to appointments may be considered unprofessional and disrespectful. People from cultures with a synchronic view of time tend to have a more flexible perception of time. They believe that rigid deadlines are unnecessary and that showing up after an agreed-upon time is acceptable. A culturally competent individual or organization would recognize these different orientations toward time and may institute policies and protocols that prevent conflicts from emerging. In addition, effective and culturally sensitive programs for handling conflict would be developed using cultural competence as its theoretical framework.

To systematically identify factors that differ across cultures, researcher Geert Hofstede conducted a study of over 40 countries with the assistance of the IBM company. He identified five dimensions that vary across cultures: (1) relations between people, namely whether people emphasize the group (collectivist) versus the individual (individualistic); (2) power distance, which is the extent to which people accept that power and influence is distributed equally among members of the society; (3) uncertainty avoidance, which is the extent to which people feel comfortable or uncomfortable in unstructured situations; (4) masculinity versus femininity, or the extent to which gender roles are highly distinct from each other, in that men are expected to be tough, assertive,

and focused on material success, whereas women are expected to be more tender, modest, and caring about quality of life—in contrast, more egalitarian societies may have more overlap between gender roles; and (5) short-term versus long-term orientation, which refers to the extent to which people expect immediate rewards for their efforts versus accepting delayed gratification.

Creating Cultural Competence

How do we measure if a person or organization demonstrates cultural competence? How do we improve cultural competence? Tools for measuring cultural competence have varied according to the specific context. One example is taken from Diversity Training University International, where four key components were identified to achieving cultural competence. The components are as follows:

1. **Awareness:** A general cognizance of one's own beliefs or biases toward people from diverse backgrounds.
2. **Attitudes:** The positive or negative ways in which a person perceives people of diverse backgrounds.
3. **Knowledge:** The amount of informational facts one has regarding other cultures, including customs, norms, religion, beliefs, and habits.
4. **Skills:** How well a person deals with people coming from a different culture, and whether he or she will treat that person with an understanding attitude or express biases or even prejudice.

Training programs in educational settings may assist teachers in enhancing the way they interact with students from diverse cultural backgrounds. Teachers may become more sensitive to students who were raised with different expectations regarding the appropriateness of talking during class, disagreeing with arguments made by other students, and what constitutes appropriate deference to authority. Corporations and small businesses may train employees to become more sensitive and aware of ways in which culture can shape attitudes about teamwork, who should receive credit for projects, and the importance of team versus individual goals. The health care

industry represents one of the most substantial areas where cultural competence has become a point of emphasis.

Cultural Competence and Health Care

Medical professionals and organizations serve patients from all walks of life, routinely interacting with people from all socioeconomic brackets, with differing languages and cultures. One major concern for health care practitioners may be the potential barriers people face in receiving care because of their cultural background. The National Center for Cultural Competence at Georgetown University has provided several examples of how a lack of cultural competence may disrupt care, beginning with interactions with receptionists in medical facilities. Patients may feel stigmatized, which may reduce willingness to interact with the medical community and can make receiving care more difficult. The following are some examples of how cultural incompetence may affect the quality of health care one receives:

1. Ms. Z is an African American mother of a child with special health care needs. Cultural stereotypes may portray Ms. Z as impoverished and influence a receptionist to immediately ask for her Medicaid card. In contrast, Ms. T is a middle-class white woman, but has a child on Medicaid because of a state waiver program. She may face challenges in receiving adequate care, such as the staff changing their attitudes and becoming cold and rude once she takes out her Medicaid card.
2. Ms. Y speaks little English and finds it very difficult to locate and communicate with staff to make appointments or to understand doctor instructions.
3. Ms. X is an immigrant from Sri Lanka. Ms. X has an Anglo name, Grace Williams. She is surprised when she is told to sit back down and wait her turn after the clerk at the front desk calls out "Grace Williams." The clerk assumed that a woman with an ethnically Sri Lankan appearance could not have an Anglo name. Ms. X may now feel alienated and marginalized as a result.

There are several different types of barriers that may arise when a health care organization is not culturally competent. These barrier types may be categorized as organizational barriers, structural barriers, and clinical barriers.

Organizational barriers include a lack of culturally diverse personnel in the workforce and leadership of health care organizations. For example, African Americans, Latinos, and Native Americans make up 28 percent of the U.S. population, but only 16 percent of public health faculty, 17 percent of city and county health officers, and 2 percent of individuals with senior leadership roles in health care management. Only 5 percent of U.S. physicians are African American and only 4 percent are Hispanic. One concern with the lack of representation in the health care industry is that policies, procedures, and delivery systems may not be appropriate for underrepresented populations because caregivers who are members of underrepresented populations are more likely than their Euro-American counterparts to organize health delivery systems to meet the needs of minority populations. For example, Spanish-speaking patients tend to report more satisfaction with health care when their health care provider is Spanish-speaking. African American patients report more satisfaction with care when their physician employs a participatory and inclusive style of decision making.

Structural barriers refer to bureaucratic or systemic challenges in properly accessing health care. These problems are exacerbated for members of underrepresented groups, who may not have access to proper interpreter services or culturally sensitive or linguistically appropriate health education materials. For example, compared to English-speaking patients, Spanish-speaking patients discharged from the emergency room are less likely to understand their diagnoses, prescribed medications, special instructions, or plans for follow-up care.

They may also be less willing to return if they have a problem and are less satisfied with their provider-patient relationship. Patients who are members of underrepresented groups are two to three times more likely than Euro-American patients to report major problems accessing specialty care, and are one and a half to two times more likely to not have a regular doctor.

Clinical barriers arise from the interactions between health care providers and the patient or the patient's family. Providers may receive medical training that conflicts with the belief systems of the patients. Some patients may have significantly different beliefs than providers. Provider/patient beliefs may differ in regard to the use of home remedies or treatments that are common in other cultures, the link between body and mind, and levels of trust in doctors and the health care system. People from diverse cultures may also use different metaphors or examples to communicate their symptoms. This may lead to misdiagnosis or confusion over the proper diagnosis.

For example, a Chinese patient may say that he has "fire going on" when he gets inflammation in his mouth. The Western doctor may prescribe medication, but the Chinese patient may expect a traditional herbal medicine to "put out the fire." Additionally, there are various conditions that are known as "culture-bound conditions" because they only seem to appear in specific cultures. *Susto* is a condition found specifically within Latin America, where people have the frightening experience of feeling as though their soul is attempting to escape from their body, leading to a wide range of psychological or physiological symptoms. Health professionals need to have knowledge about these conditions and try to solve them in a way that is acceptable to both the patient's original culture and the host culture. Enhancing cultural competence in communication between patient and provider may decrease the likelihood that individuals experience discrimination and may increase the likelihood that patients receive the proper treatment for their symptoms.

Many researchers, professionals, and patients have addressed these barriers in asking for the development of culturally competent treatment. This includes reducing organizational barriers by increasing the number of members of underrepresented groups in the health professional workforce and leadership. Structural barriers can be reduced by introducing innovations in health care systems designed to facilitate communication between providers and patients and making health promotion materials more accessible to individuals from diverse backgrounds. Interventions to clinical barriers can include promoting

education initiatives that equip health care professionals with knowledge and skills to serve diverse populations.

Culturally Responsive Pedagogy/Culturally Relevant Teaching

An enduring problem confronting the American educational system is how to ensure that all students, particularly racial/ethnic minority students, achieve academic success. Culturally responsive pedagogy (CRP) is an approach whereby teachers acknowledge the home, community, and culture of each student and integrate

those values and experiences into curricular content and school environment. CRP recognizes that the "lived experiences" of marginalized groups are significant and are what allows them to make meaning of the world. The approach also acknowledges deficiencies in many traditional curricula that primarily convey the ideology of the dominant culture. CRP's goals are for every student to achieve academic success, cultural competence, and sociopolitical consciousness, and for every student to become empowered to create and construct meaning in order to succeed in the larger community.

Although the 2010 census documents that 74.8 percent of adults are white, racial/ethnic minority children from birth to age 17 comprise nearly 45 percent of the population. In the 20 largest U.S. school districts, students of color range between 53 percent and 97 percent of the public school population. Given that more than 80 percent of today's K–12 educators are white, adopting culturally responsive pedagogy is a vital praxis toward bridging cultural differences.

Culturally responsive pedagogy includes a curriculum organized around sharing ideas, active student involvement, high expectations, community collaboration, and questioning "truth" in society and in long-established methodologies. This academically rigorous student-centered curriculum has its roots in established educational methods termed equity pedagogy, sociocultural teaching and multicultural or social justice education. This model of nonjudgmental, inclusive teaching, borrows from many multicultural, antiracist education scholars of the past 30 years. James A. Banks has traditionally advocated transformative teaching that includes a movement away from a Eurocentric curriculum, with a goal of equity pedagogy.

In Geneva Gay's *Culturally Responsive Teaching*, she passionately calls for teachers to recognize, honor, and incorporate students' personal experiences into lessons and teaching strategies. Gay, through her instructive style of storytelling, explains culturally responsive teaching as a dynamic and interactive process. Through narratives, educators learn to become more engaged with their students' cultural connections as they model ways to incorporate what is significant in students' lives into academic achievement.

Educator Sonia Nieto defines education in a sociopolitical context with multicultural social justice principles infused throughout the curriculum. Pedagogical theorist and teacher Gloria Ladson-Billings, however, coined the terms *culturally relevant teaching* in 1987 and *culturally relevant pedagogy* in 1994 to delineate when the three interrelated tenets of student success, cultural competence, and critical sociopolitical consciousness are achieved through teaching that honors connections between home, community, and school cultures that are committed to collective as well as individual empowerment.

Culturally relevant teaching ensures that ethnically diverse students' learning is relevant to them. Gay, however, acknowledges a preference for the term *culturally responsive pedagogy* because it represents a compilation of ideas from a larger variety of scholars. The term is often used to describe the collective philosophy practiced in culturally relevant teaching. It is aligned with the goal of reversing the achievement trends of students of color through an intentional pedagogy of power-sharing through teaching modes that cultivate both academic success and cultural identity through student empowerment. Students' experiences are a core element of the curriculum within a shared teacher/student practice. Culturally relevant teaching describes the praxis, or the doing and living of the lessons of culturally responsive pedagogy.

Bridging the Achievement Gap

A major concern of educators has been how to address the achievement gap between white and black/ethnic students. The National Assessment of Educational Progress (NAEP), the largest nationally representative and continuing assessment of what America's students know and can do in various subject areas, has repeatedly reported notable academic differences between white students and their black and Hispanic counterparts. Black students lag significantly behind whites on national assessments of mathematics and reading in grades four, eight, and 12 and are three times as likely to drop out of school as white children. Asian/Pacific Islanders score at or above white averages, and Hispanic and American Indian students trail white students in the most recent NAEP data.

The Comprehensive School Reform program began in 1998 and was signed into law in 2002

under Title I, Part F of the Elementary and Secondary Education Act. This produced the national No Child Left Behind (NCLB) initiative that mandates that schools show evidence of meeting the needs of all students. Particularly, the political lens has focused on children labeled "at risk" and minority. This restructuring process has predominantly authorized two different but equally authoritarian curricular models to improve scores. Each method has a teacher-directed, scripted, standardized curriculum, and test-based concentration. It is externally administered and essentially follows a business model of school reform. The implication is that schools with scores that do not rise, analogous to businesses that show losses, are subject to closing. Although schools have questioned how this prescribed curriculum demonstrates relevance for their diverse student populations, they nonetheless have complied with the required programs and testing.

NAEP scores of performance by race have been studied for decades. The achievement gap originally narrowed during the 1970s. Many educators believe that improvements by students of color were directly connected to schools initiating multicultural programs, bilingual education, and acknowledgment of diverse students' needs. But the political tides of subsequent years favored standards-based reforms, eventually resulting in NCLB mandates in most districts.

Researchers were pleased with early NCLB data but discovered that slight increases in reading and math scores for minority students quickly declined under rigorous investigation. Traditional rote teaching of a curriculum having no connection to the cultural and linguistic needs of students has not proven to meet the intended objectives of No Child Left Behind, as evidenced by recent NAEP results. Problems such as poverty, disproportionate placement of students of color in special education classes, and low teacher expectations of minority students obviously added to the achievement gap. Critics maintain that while implementation of NCLB has focused attention on the principle that every child deserves the best education, it questions whether standardized curricula, emphasizing low-level knowledge and skills easily measured on norm-referenced tests, do more than mask continuing inequities in the education of minority students.

Culturally responsive pedagogy addresses these factors by shifting focus from students' underperformance to how schools and curricula fail students. Intentional inclusion of students' backgrounds, home, and culture in a CRP curriculum becomes a direct demonstration of the distinction between difference and deficiency. Numerous studies have illustrated the success of culturally responsive pedagogy, although most report qualitative findings. Advocates recognize that quantitative research must increase and be more definitive. School districts, however, have witnessed benefits of CRP that cannot be measured by looking exclusively at students' test-score performance. Rather, the outcomes of culturally relevant pedagogy extend far beyond what might be measured on a standardized exam and show promise as a gap-narrowing alternative.

Principal Themes

The literature on CRP by such scholars as Gloria Ladson-Billings, Geneva Gay, Jacqueline Jordan Irvine, Sonia Nieto, Gary Howard, and others demonstrates parallels among their approaches to culturally responsive pedagogy. In 2008, 45 classroom-based studies of CRP practice denoted 12 specific actions that differentiate culturally responsive pedagogy from traditional models, while other education scholars have delineated more than 30 essential components derived from the aforementioned sociocultural approaches.

Fundamentally, culturally responsive pedagogy is distinguishable by five significant principles: (1) whole child teaching emphasis, (2) excellence through equity, (3) acknowledgment of students' and teachers' identities, (4) importance of student-teacher relationships, and (5) the integral connections of home, school, and community.

"Whole child emphasis" underscores that the cultural knowledge students bring to school must also be acknowledged, explored, and integrated into the curriculum. It observes developmental appropriateness of lessons for students of color that may differ from the majority population due to previous educational experiences or lack thereof. Influences from initial cultural socialization within the family and community affect how students receive and respond to what is meaningful to them. Teachers' knowledge and translation of different cultural communications styles can

avert misinterpretations of behavior or perceived demonstrations of disrespect. Although teachers maintain standards and practice within the requirements of the prescribed curriculum, they teach to and through strengths of their students. By incorporating students' interests, cultural information, and learning preferences, teachers validate and affirm students as they connect learning to their lives and environment.

The second CRP theme of "equity" is different from equality in that it acknowledges that students have specific needs requiring differentiation from "one size fits all" models. Color-blindness is antithetical to equity. Treating students equitably, teachers note their differences and affirm them as cultural assets. Teachers learn to realize that race is a significant factor and to address various disparities through differentiated instruction that honors individual talents and needs. Excellence is expected, as culturally relevant teachers provide scaffolds between what students already know and what they need to learn. Relevant teaching requires knowledge about how people learn and how different people learn differently. Teachers employ counter-storytelling as a critique of the mainstream master narrative, actively implement multiple ways of constructing knowledge, and ensure that content is inclusive of all cultures represented in their classrooms. Rigorous standards and high expectations of each student are embedded in their attitudes and lessons.

The third theme asks that culturally relevant teachers be attuned to their students' identities and to critically examine their own sociocultural identities. Such self-acknowledgment creates a cultural consciousness that helps teachers form authentic relationships with students. Success of CRP is often related to how willing teachers are to acknowledge their culture, which shapes their values, beliefs, ideas about family, historical perspectives, and communication styles, and to understand their own identity's impact on their practices in the classroom. Teachers' cognizance of themselves as political beings is important because schools are social systems that often afford greater status to some and dissimilar access to power to others. This is resolved by consistent efforts to reduce the gap between the cultures of students and the unexamined norms of non-CRP teachers and curricula. Culturally relevant teachers realize

that many racial/ethnic minority students view themselves and the world differently than white students, which requires teaching strategies that enable students to appreciate the significance of their identities, voices, and histories.

Theme four, the student–teacher relationship, is critical in promoting student learning. Although typically beneficial when the ethnicity, race, or culture of the teacher matches that of the students, current demographics deem this pairing improbable. Culturally relevant teachers, regardless of race, are successful facilitators of student learning through authentic relationships, community involvement, and creation of a positive classroom atmosphere. They envision their teaching as art rather than a set of skills, consider themselves an important part of their students’ lives, demonstrate deep respect for students as intellectuals and full human beings, and provide caring interpersonal relationships that are fluid, equitable, and extend beyond the classroom.

Culturally relevant teachers maintain reciprocal teacher-student relationships where student knowledge is continuously re-created and shared in the classroom and students are partly responsible for each other’s academic success. Teachers have a repertoire of differing representations for given concepts or procedures, discuss their pedagogical choices with their students, and essentially implement multiple ways of constructing knowledge.

The fifth principle recognizes that the home and community cultivate all students before they enter school. Culturally relevant teachers are aware of the integral connections and importance of home-school-community collaborations with regard to learning outcomes and enlisting support. They know that the world exists within relationships and that it is contingent upon relationships. Because influences from early cultural experiences in the family shape students’ perceptions and expectations, teachers expand their classrooms through outreach to the family and entire community. Home visitations and involvement in activities beyond classroom walls demonstrate that the teachers value family and community as vital partners in the education process.

Current Outlook

The U.S. education system is in flux. Many educators believe that adopting practices of culturally

responsive pedagogy can assuage inequities in the education of diverse students, compared to externally mandated, standardized curricula. Administrators find themselves weighing pressures to raise test scores through standardized measurements or incorporate multiple forms of evaluations of excellence.

More than a set of principles involving equity, community, and student-centered curriculum, CRP involves a mind-set that permeates teachers’ every decision regarding integration of the whole child and education for each child. For widespread implementation, culturally responsive pedagogy requires proof of rigorous assessment and ongoing published research that systematically documents its impact on student learning and verifies success of its principal goal of academic success and cultural competency for ethnically diverse students.

Culture

The notion of culture as a term of reference or explanatory medium is and has been a developmental concept “always in the making.” In American anthropology, two major early figures—Franz Boas from Columbia University and Alfred Kroeber from Berkeley—were significant in its early reiteration: Boas for his work on “configurations” and outlines of ideas, practices, and features, not the least of which was language, which a society maintained in “traditional” practices, and Kroeber for the idea that culture was superorganic and had little to do with individuals but determined the practices and behaviors of groups. The difference between the two was that Boas’s ideas were largely framed as timeless entities while Kroeber’s ideas paid great attention to history and change of the “super-organic” features over time and context.

Both stressed that culture was associated with discrete groups, each bounded by the outlines of ideas and meanings and practices that made each group different. Thus whole identities were associated with specific groups, which made cross-cultural comparisons possible. This concept influenced generations of anthropologists, and public discourse through the 1950s with few exceptions basically followed a type of Boasian or Kroeberian design. Thus discreteness of whole peoples was emphasized with different traits, languages, practices, rituals, ways of making a living, and political rules and interests. This point of view became very pervasive and in different variations of the same premise—even without the use of the label “culture”—came to be used (for example, in Africa, India, Latin America, Asia, and the Middle East) as the *raison d’être* for colonial rule and maintaining categories of persons in place with very particular group designations like “tribe,” the Maya, or the Kwakiutl.

Such separateness made for easy stereotypes and, in a nutshell, populations—in spite of their internal variability, differences, and complexity—were often turned into nonconnected, isolated, bounded, and timeless “cultures” or “societies.” In addition, a major emphasis of these early concepts was that these were integrated and functioned like clockwork with politics, social relations, ideological systems, economy, ritual,

and religion all contributing in some manner to sustaining traditional values and meanings over historical time. At the same time, these were interlocking, providing the platforms from whence future generations were enculturated to take their defined places and spaces.

But in the fifties and through the present, the recognition that human populations were not isolated wholes but were in reality, even in antiquity, interdependent and connected resulted in the shifting of premises of “culture” to “cultures” in which many populations—certainly from the ancient past to the present—in reality were connected by economy, trade, invasions, polities of various sizes, migrations, and population movements due to natural disasters like earthquakes and floods.

Thus these much more complex renditions of “cultures” in which economic, political, cultural, and social links and connections from regional to transnational to world systems of relations were emphasized became more normative, especially in the period following Vietnam. Thus new studies often included ecological changes that affected where humans lived and how they managed daily survival culturally by adopting new ways of thinking and meaning as well as by adapting to changing physical circumstances and relating to different populations that they encountered.

Postmodern Approaches

Two other important influences also added to new ways of considering “cultural systems” and complexity of human beings, not only about how they organized meanings, but also about how these meanings were distributed among individuals and the central questions involved. But how do we know what others think when they are thinking culturally? This provided impetus for the second influence from sociology, psychology, and economics—greater attention to more rigorous techniques and methods in addition to observations and interviews so that more attention was paid to the technical means by which people think and do in order to elicit information without the ever-present influence of the anthropologist.

However, such tasks, although scientifically cast, were heavily criticized as being narrowly uncreative. So an opposite position was developed of what could be termed “postmodern approaches” and the “political economy” view in which persons

were unbounded by experience. Moreover, in these approaches, the transnational and global world did not permit viewing cultural systems of human populations as somehow only “local” so those of a postmodern bent and political economy assumptions emphasized the local in the global network of links of meaning, identity, and “place” in a much broader cultural perspective. Scholars who were more economically and historically oriented sought to find links of articulation between the way in which power relations were distributed in complex webs of connections between local cultural systems and global and transnational processes of production, distribution, and accumulation whose meanings were often accepted but also often reconfigured by groups and individuals. Thus, from the kind of superdeterminism of early cultural studies arose a different sort of cultural analysis in which persons were agents and movers and made changes to the impositions of meaning as well as the aftermath of inequality.

At the same time, however, there has continued to be some interest in the manner in which such diversity is organized and/or shared so that human beings cannot simply be looked upon as using their cultural repertoires in a random and unpredictable manner. Yet, this position is itself a problem, particularly concerning those urban and migratory situations in which populations are forced to move in myriad cultural contexts having little to do with their original cultural upbringing about what is normative, “usual,” and expected. It may be the case, however, that human beings are so malleable in their ability to learn quickly, adapt and innovate, and create approaches, responses, and techniques of cultural meanings and behaviors that there may be little to limit the development of layers of cultural understandings used at will, discarded when no longer functioning, and that serve as the template of a process in which persons “learn to learn.” That is, each time a new, unfamiliar, or non-normative situation arises, new and seemingly more complex understandings emerge with an increased capacity to deal with greater complexity of understandings. Thus a multiplicity of cultural capacities are emphasized rather than single cultural identities based on the nation or religion, or participation only in local versions of culture without considering the interaction with transborder and transnational processes.

There are two other themes that are strongly emphasized in the present: first, the role of gender and class in the manner in which meanings, identity, and behavior are “distributed”; and second, and as important, that cultural systems are seldom frozen or cemented in one place. For the former, one of the major issues is the expectations regarding a host of cultural issues, including confusing biology for gender identity and behavior, with the former functioning as a human reproductive capacity and with the latter defined by power relations in political and economic settings and cultural scripts inherited or promulgated in different settings.

These are influenced by local, national, and transnational attitudes, expectations, and values repeated and emphasized in religious, educational, and political institutions. Gender, from a contemporary cultural perspective, is not a “given” based on biology or sexuality but strongly influenced by prevailing contexts and cultural scripts promulgated by institutional means and, certainly, class positions and relations of power.

The thematic arising from understanding that globalization, migration, transborder economic processes, and different populations meeting physically in the same space and place cannot but introduce new processes of interaction, learning, and adaptation so that cultural systems over time can hardly be considered “original” or defined by specific cultural behaviors that “belong” only to one group or another. While there are great pressures from national states to adhere to cultural scripts of “citizenship,” these are only one important but not singular script of learning, and when diverse cultural populations interact, then “cultural bumping” will be the norm rather than the exception. Thus a young female Ph.D.—one of whose parents is Irish and the other Colombian but who was raised in Mexican-influenced San Antonio, Texas, and who visits her Colombian relatives in Colombia while simultaneously being married to a non-Latino professional—provides us a glimpse into the complexity of cultural layers into which their own child will be exposed.

Thus, in the present, the notion of “culture” cannot be regarded as a singular type of concept but, rather, itself has emerged and evolved to encompass the great diversity of human expectations, global and local interactions, the meeting

of already diverse populations with other diverse populations in the same place and space, and, last but not least, an understanding of the almost inexhaustible malleability of the human capacity to make, develop, and create new versions of cultures, nonnormative expectations, and, as creative agents, to introduce layered and learned experiences, values, and beliefs of what we have traditionally considered as “culture.”

Culture Shock

Culture shock is a sense of loss and disorientation that occurs when our deeper values are challenged by a new culture where adaptation is required. This conflict in values frequently generates feelings of tension and anxiety due to the loss of familiar cultural cues, and a sense of inefficacy when we cannot succeed at tasks we once mastered. Symptoms of culture shock may be both physical and psychological, resembling typical stress responses we may have had before, in our own culture.

It is significant to recognize that culture shock relates not only to the loss of the frame of reference we have comfortably used but also to the defensiveness that this loss stimulates. It is not only not knowing what to do, but also a case of being unable to do what we have always done well before. This cognitive inconsistency often propels us to defend the worldview that has previously been so effective, only intensifying the sense of alienation.

Culture shock is a term that has been bandied about for decades in many sectors of cultural interaction, including international education, the military, business, nongovernmental organizations, refugee and immigrant services, and even in domestic diversity contexts. In its most basic sense, it refers to the experience we have when we encounter unexpected differences, and when we find ourselves perplexed or even intimidated by unusual expectations. This occurs most obviously when we enter a new country, a new region, or a new community, whether as a sojourner, a traveler, an immigrant, a refugee, or a minority. Any place that presents us with a powerful new worldview, that requires us to adapt, in which our sense of “how things are” is challenged, can foster a culture shock—sometimes called transition shock—reaction.

The “Dis-ease” of Culture Shock

At one time, culture shock was considered a negative consequence of culture contact, with some suggesting that it was a sign of mental instability. That orientation to culture shock was debunked in the late 1960s when large groups of certifiably sane young Peace Corps volunteers arrived in villages throughout the world and promptly experienced the stress of something they were told was culture shock. The fact that volunteers were carefully screened, substantially assessed, and still seemed to react to their new cultural isolation suggested to many observers that it was not merely the hopelessly neurotic voyager who found sojourning challenging. While culture shock may be dis-ease, it is not a disease.

Stage Models of Culture Shock

During the 1960s and 1970s, many writers attempted to develop stage theories about culture shock, describing various symptoms and attitude transformations that occurred sequentially.

A number of them described a U-curve model, moving from the high point of arrival through the low point of culture shock and ascending in anticipation of the return home. A few authors added a second curve, sometimes called the W-curve, creating a similar dip upon arrival home, when the individual may experience reentry shock, often described as the more distressing of the two reactions.

Most of the stage theories described the early phase after arrival to a new culture as a pleasant state of curiosity and anticipation when hosts require little of the visitor, and the visitor in turn knows little of the culture. As an outsider, the individual may not even recognize problems as they occur and therefore feels no need to resolve them. People may experience “culture surprise,” which occurs when they first arrive in an unfamiliar culture and begin observing superficial differences. The surprise relates to what they see, such as observing religious rituals, touching behaviors, or even different toilets.

When individuals finally try to accomplish a task in the new culture, “culture stress” may occur, a case of stimulus overload as they recognize their own limits in the new environment. Examples of typical cultural stresses include hearing comments about themselves, trying to get their shoes repaired, or even doing grocery shopping. As sojourners watch five-year-olds accomplish what they themselves can’t, confidence plummets, identity is questioned, and the setting is ripe for the in-depth culture shock experience.

As people make an effort to integrate into the host culture, they may discover that at the deepest value level, serious conflicts exist between the new environment and their home culture. These may involve religious values, social justice issues, privacy concerns, or whatever the person holds most dear. It is this level of conflict that engenders the more potent culture shock reaction, sometimes called the bottom of the U-curve. Not only is there a sense of loss and disorientation, but the context often requires an adaptation that challenges the sojourner’s strongest values.

Eventually, through building intercultural competence and reframing their worldview, efforts at integration often lead to a state of satisfaction in the new culture, sometimes called “adaptation” or returning to the top of the U-curve.

Not all researchers have supported stage theories of culture shock due to the limited empirical evidence for this rather elusive construct. For instance, some writers suggest that far from a pleasant arrival, many visitors enter a stage of discomfort immediately upon disembarking. While the U-curve concept offers a tidy model for thinking about the transition process, culture contact is rarely that clear-cut. However, U- or W-curve models have survived because they are often intuitively attractive to many travelers who read their own responses into the model.

Causes of Culture Shock

While all transition experiences are fraught with the potential for stress and anxiety, culture shock is particularly well suited to challenge the sojourner’s sense of well-being. There are numerous conceptual frameworks for examining the causes of culture shock.

First, the grief literature on loss and change suggests that during a time of loss, people fall back to a conservative impulse, seeking to protect that which they value from the impact of the new circumstance. For instance, the roles people play in their own cultures may be drastically altered in the new environment. A mother may be away from her children; an executive may be powerless; a friend may leave her social network behind. Each must adapt to their new roles rather than attempt to cling to their old roles in the new context, and this is difficult.

Second, situational and personal variables affect the intensity of the intercultural experience. Michael Paige notes 10 factors that increase the psychological impact of intercultural experience: cultural differences, ethnocentrism, language differences, cultural immersion, cultural isolation, prior intercultural experience, expectations, visibility and invisibility, status differences, and power and control.

Third, stimulus overload or underload may contribute to the culture shock response. Many actions that could be taken for granted in the home country, whether brushing one’s teeth or reading the daily paper online, become challenging in the new environment. It seems that everything is alien and represents a new approach to formerly familiar routines, which can become exhausting.

Symptoms of Culture Shock

Symptoms of culture shock can be both physical and psychological. Physical symptoms may include headaches, stomach aches, dizziness, rashes, nausea, irritability, insomnia, or excessive sleepiness; psychological symptoms may include mild depression, uneasiness, loneliness, withdrawal, mistrust, irritability, aggression, resentment, fear, crying, and complaining. Worries develop about aspects of the new environment: “Is the food safe?” “Are they cheating me?” “Is this prejudice against my group?” Not understanding whether to flee or flex, the sojourner may develop negative attitudes toward the new community and retreat to a more familiar group.

Managing Culture Shock

Many writers suggest the obvious: that knowing it is normal to experience culture shock, and what it feels like, provide an excellent start for managing it. Practicing familiar stress reduction techniques also helps. However, there are several less intuitive approaches to lessening the impact of culture shock. First, developing intercultural competence is the core to successful adaptation. Intercultural competence is a set of cognitive, affective, and behavioral characteristics and skills that support effective and appropriate interactions in a variety of intercultural contexts. The personal attributes of empathy, tolerance of ambiguity, curiosity, cognitive complexity, and nonevaluativeness have been recognized as central to intercultural competence.

Second, in the face of massive life changes, the transition literature cautions that the person should hold something steady. If the sojourner is changing language, culture, environment, job, and relationships, it is useful to maintain a thread from the past to achieve some continuity as the individual weaves a future in a new culture. Whether that thread is a hobby, a relationship, or something else the person values, research has suggested that maintaining that interest in the new culture increases satisfaction. Sometimes selecting a new interest can serve the same function.

Third, Mick Vande Berg’s recent research has noted that there may be optimal amounts of time to spend with members of the host culture (from 51 to 75 percent) and appropriate amounts to spend with fellow sojourners. It is not as simple as

total immersion; it is not as elementary as avoiding your own group. A balance of time with the person’s cultural cohort can allow for processing learning about the new culture and reestablishing a support network.

Fourth, sojourners who have an opportunity to help recently arrived outsiders learn how to function in the new culture may be surprised to recognize how much they have already learned. The experience can help restore a sense of agency that may have been lost in their own transition.

Finally, it is important to view the onset of culture shock as the onset of a learning edge, knowing that something is profoundly different and that this represents a challenging and rewarding learning opportunity.

Curandero

A *curandero* is a male shaman or healer who practices Latino folk medicine, *curanderismo*. (A

female practitioner is called *curandera*; for the purposes of this article the two terms are interchanged.) Hispanic cultures in the United States and elsewhere have a strong tradition of folk medicine. Curanderos and other practitioners of folk healing are respected, influential members of Latino communities and have a variety of skills.

In many traditional cultures, including Hispanic American cultures, there is a general belief that many illnesses are caused by not only physical factors but also spiritual ones. A range of ideas contribute to this belief system, including the idea that physical roots of a health problem such as an infection can be tied to spiritual and supernatural forces.

For example, a physical infection might be influenced by God or evil forces, including witchcraft (*brujeria*) or even Satan. Curanderas are, in a sense, intervening in spiritual matters between spiritual forces and their patients and assisting the patients in healing themselves.

Curanderos are equipped to handle both the physical and spiritual aspects of health issues and therefore are very important to some Latino communities.

The presence of botanicas, stores where herbal and religious healing elements are sold, is one good indicator that the local culture holds traditional healing beliefs and curanderas in high regard. (This is not to say that, for example, Western pharmacies would not also play an important role in the community; rather, in communities that use curanderos a multitiered approach to illness and health, including both Western and traditional methods, is often adopted.) The details of a community's curanderismo are closely tied to the specific region of Latin or South America from which the community members originate.

Certain symptoms within a culture are special signifiers and perceived in unique ways; these are culture-bound syndromes. An example of this is the "evil eye," *mal ojo*. A successful healer of the evil eye, whether she is a curandera or an M.D., will recognize both the cultural implications of the malady (in which children exhibit fever, crying, and vomiting as a result of spiritual issues) and the physical ones.

In other words, the healer will address the main danger—dehydration—and also the spiritual needs of the patient and family. Most curanderas

are well aware of their limits and many refer patients to Western medical professionals as needed. And, along these lines, the wise M.D. who treats people from more traditional Hispanic communities will endeavor to be sensitive to the role of folk medicine in the lives of her patients and will ask them what they feel the causes of the malady might be and what they have done to treat it. Furthermore, families might consult both an M.D. and a curandero, and pick, choose, and combine which methods they use from each consultation. This exchange of healing methods should highlight the ways curanderos impact American society as a whole. The research area of cultural influences on medical issues is steadily growing in our culture; see, for example, studies on the influence of folk medicine on pain management in cancer patients.

A curandero is known for his knowledge of a broad range of folk medical cures and his spiritual power; he works on each of the material, spiritual, and mental levels. The knowledge and skill of the curandero not only is seen by the community as something acquired with practice but also is a blessing that only some receive. There is therefore very little conflict between church practices and the work of curanderas as the two are seen to be connected and symbiotic.

The curandero may focus on herbal remedies, food-based cures, or other areas. As in more traditional Western practices of medicine, curanderas often have specialties. A curandera who is more of a midwife might be called a *partera*, although she is still a healer, a curandera. The curandero who specializes in massage is called a *sobadoro*. And the curandero who focuses on herbal cures is called a *yerbero*. Each of these specialties shares the holistic approach of the curandero and avoids treating a specific symptom, instead looking at the person as a whole and trying to discern what changes that person might need to effect to experience both greater health and happiness. The curandera's practice is usually handed down in part and mentoring is extremely important to the survival of the healing practice.

Without question, Latino folk medicine and the role of the curandero remain an important part of Hispanic American culture as well as American culture as a whole. Especially as we move forward in implementing public health

systems in the United States, the cultural impact of curanderismo will need to be assessed and the lessons of the healing practice of the curandero implemented to achieve full buy-in from Latino communities.

subsequent standards movement, which became prominent in the 1990s, slowed much of this work. However, as the U.S. population continues to diversify, the need for a well-planned and well-taught integrated curriculum is increasingly important.

Historical Context

Roots of today's efforts to integrate content by and about historically marginalized groups can be traced back at least a century. Early work in ethnic studies, led primarily by African American scholars such as W. E. B. Du Bois, began in the latter part of the 1800s. Their writings about historical experiences of African Americans were used in schools that African American communities established for their own children. Throughout the first half of the 20th century, scholars such as Carter G. Woodson actively promoted study of African American history and life through venues such as research, establishment of publications like the *Journal of Negro History*, and establishment of Negro History Week (which later became African American History Month).

Intergroup education was developed after World War II, primarily by white progressive educators and social scientists to improve relationships among diverse racial/ethnic and religious groups. Activities in schools focused on cultivation of democratic attitudes, prejudice reduction by teaching about diverse groups, development of cross-racial relationships and communication, and work in communities to address social problems.

In the wake of the civil rights movement and school desegregation in the 1960s and 1970s, students, educators, and parents drew on these historical antecedents in their demands for curriculum change. African American parents and educators, joined later by Mexican American, Puerto Rican, American Indian, and Asian American parents and educators, were deeply concerned that their children were being sent to schools that taught an all-white curriculum and in which the teachers and white students were ignorant of communities of color. Community members and students began to pressure schools and universities to create curriculum that teaches ethnic minority group histories and cultures. Beginning with San Francisco State University in 1968, ethnic studies

Curricular Integration

Curricular integration refers to integration of knowledge about and by historically marginalized groups into the school or university curriculum. Although there has been a long history of efforts to integrate African Americans, in particular, into curriculum, work on curricular integration became most visible during the decades following the civil rights movement. The

An elementary school class studies botanical specimens at the United States Indian School, Carlisle, Pennsylvania, in 1901. By the 1970s and 1980s, textbooks were published for elementary and secondary schools drew on scholarship about ethnicity and involved local communities in helping create curriculum drawing on community knowledge and history. This curricular integration also included African American literature text in high schools.

spread rapidly across the country. Although student demands were most pronounced at the university level, there were also demands by secondary school students for a relevant curriculum, such as the Chicano student walkouts in Los Angeles in 1968.

Ethnic studies and women's studies at the university level became very important to curricular integration by providing a vibrant context for ethnic and women's studies research. Many scholars became involved in archival work of piecing together histories of marginalized groups, and reinterpreting the disciplines from specific groups' perspectives. For example, African American literary theorists compiled literature written by African Americans, then began to theorize about literature from the vantage point of this body of work. Women scientists began to compile biographies of

women in math and science, as well as analyses of how traditional math and science curricula fail to encourage girls.

In elementary and secondary schools, textbooks became a flash point of concern, as numerous analyses documented omissions and stereotypes of racial and ethnic minorities, as well as of women. During the 1970s and early 1980s, textbook publishers attempted to address these concerns, mainly by adding pictures of and references to previously omitted groups, and removing stereotypic and offensive material.

Also during the 1970s and 1980s, many teaching resources by and about racial and ethnic minority groups, and women and sexism, were created and made available to teachers nationwide. Some of these compiled activities teachers could use in the classroom to promote integration

of students and prompt discussion about cross-group differences and similarities. Children's literature by and about racial and ethnic minority groups flourished as parents, teachers and school librarians sought out material that reflected a wider array of experiences and voices. Magazines and journals for educators were launched, such as *Winds of Change*, published by the American Indian Science and Engineering Society, that features indigenous science.

A few textbooks were published for elementary and secondary schools based on ethnic studies scholarship, such as an African American literature text for use in high schools. In addition, projects involved local communities in helping create curriculum drawing on community knowledge and history, such as in American Indian schools. Establishment of disability studies and lesbian, gay, bisexual, transgender, and queer (LGBTQ) studies broadened the work in curricular integration.

In schools, however, while teachers attempted to integrate knowledge about marginalized groups into their curriculum, they often did so fairly superficially, adding heroes, holidays, or a few cultural contributions. It requires some study of the scholarship of a group to know what is missing and worth adding, and to identify key concepts that do not immediately fit into traditional curriculum.

For example, colonization is a key concept to understanding the historical experiences and current issues of Filipino Americans. But since mainstream curricula do not examine the United States as a colonial power in any depth, it may not occur to a teacher to examine the impact of U.S. colonization of the Philippines without studying Filipino American history.

Curricular Integration

Beginning in the 1990s, as national concern shifted toward establishing curriculum standards and systems of accountability, with few exceptions, efforts to make texts and other curricula multicultural gradually subsided. Many educators, particularly those who were white, assumed that publishers had taken care of most forms of bias. Professional development in schools shifted from helping teachers work with diverse student populations (including integrating the curriculum) to

introducing teachers to standardized curriculum packages they were expected to follow.

At the same time, rapid diversification of student populations, chronic underachievement of racial and ethnic minority students, and ongoing work of many teachers, teacher educators, and professional organizations, such as the National Association for Multicultural Education, continued to draw attention to gaps between standardized curricula and the intellectual knowledge of historically marginalized groups.

Systematic analyses of textbooks continued to find that, while content related to African Americans, Latinos, and Native Americans had been added, deeper patterns and narratives that reflect Euro-American experiences and worldviews, and that have traditionally structured K–12 textbooks, particularly in history and social studies, remained intact.

For example, while most U.S. history texts begin African American history with slavery, African American scholars argued that starting with pre-Columbian African civilizations provides a much richer basis for understanding African American history and culture and for analyzing the devastating impact of slavery. While most U.S. history texts added a few pages about pre-Columbian American Indians, American Indian scholars and educators pointed out that Indians tended to disappear as the texts unfolded—replicating the idea of vanishing Indians while ignoring important historical and current issues such as treaties and land rights.

Many scholars and teachers pointed out that as racial and ethnic minority children proceed through school, their growing awareness of the irrelevance of the curriculum to their backgrounds disengages them, and they increasingly find school “boring.” When tested on mastery of a curriculum that students experience as boring and irrelevant, they achieve below their potential.

By the 1990s and 2000s, a body of evidence showed that subject matter curriculum designed and taught from an ethnic studies perspective engages racial and ethnic minority students, who then learn more and achieve at higher levels. For example, in Alaska, math educators, anthropologists, and elders from Yup'ik Native communities collaborated in developing a course called Math in a Cultural Context.

Curriculum units for elementary schools connect National Standards for the Teaching of Mathematics with historic and contemporary Yup'ik cultural knowledge. A unit on geometry works with Yup'ik textile and clothing designs that make use of geometric patterns; a unit on counting and measuring works with collection of local berries. Studies that assessed student learning according to the Alaska math achievement tests found that Native students in classrooms using knowledge learned from Math in a Cultural Context made more progress than students in classrooms not using it.

How to integrate multiple groups into curriculum is even more challenging than designing curriculum from the vantage of one historically marginalized group. A useful process is to begin with a core concept in one's subject matter curriculum, then research that concept through the scholarship in ethnic studies, disability studies, and/or women's studies, focusing on one or two groups. By delving deeply into this knowledge in relationship to one's own curriculum, teachers can then see how to rework that core concept in a way that reflects multiple perspectives and experiences.

For example, a teacher trying to integrate a literature unit on fantasy might become familiar with magical realism in Latin American literature, which is related but not identical to fantasy. The teacher can then make well-chosen selections from both related genres, creating a unit that allows students to explore literature from different cultural traditions. Or, consider a teacher figuring out how to teach about colonization of American Indians in a way that represents perspectives of both the European colonizers and Americans Indians.

To address this challenge, one teacher constructed a unit in which American Indians brought Europeans to trial for misusing natural resources, using the Haudenosaunee Great Law of Peace of the Iroquis Indians. By playing different roles in the trial, students explored contrasting perspectives about the issue. An intellectual benefit of a curriculum that integrates multiple perspectives is that it promotes cognitive growth. Students who experience such a curriculum have been found to develop higher levels of critical thinking and better communication skills

than students who experience curricula designed around one perspective.

Into the Future

The continued demographic diversification of the United States, and particularly that of the school-age population, suggests the need for curricular integration will continue to grow. Despite hindrances, such as the standardization of curricula, lack of teacher preparation, and political challenges, students will demand a relevant curriculum as they have in the past. Additionally, it is important that young people learn to grapple with issues of racism, poverty, and exclusion, and that they learn to work with those who differ from themselves. Evidence from research in higher education shows that students' attitudes about diversity improve and they develop more complex thinking when they engage in ethnic studies or women's studies curricula that teach directly about systems of oppression and human difference, particularly when this learning is coupled with cross-group interaction. Ultimately, this is kind of learning benefits everyone.

Custer Died for Your Sins: An Indian Manifesto

Custer Died for Your Sins: An Indian Manifesto was written by Standing Rock Sioux activist, scholar, and attorney Vine Deloria, Jr. Prior to publication, Deloria served as the executive director of the National Congress of American Indians (1964–67), which he left to study law at the University of Colorado at Boulder.

Vine Deloria

Experienced and knowledgeable about the radically changing world of post–World War II American Indians, Deloria writes insightfully in his book about popular American Indian stereotypes, the anthropologists who “studied” them, and the Bureau of Indian Affairs (BIA) that inadequately served their needs. He also took on the challenging topics of Indian humor and the exigencies of Indian leadership. There was even a chapter comparing the Red Power and civil rights movements, explaining why most Indians chose to not participate in the latter.

In *Custer*, Deloria organizes his critiques around institutions that he claims have done the most to oppress and misrepresent American Indians, despite their own claims to the contrary. Specifically, Deloria focuses on religion (such as Christian missionaries), higher learning (including university-trained anthropologists), and the federal government (particularly the Bureau of Indian Affairs).

Deloria furthered his analyses of these and other related institutions in *The Metaphysics of Modern Existence* (1979), deepening his reflections on religion in America; and in *American Indians, American Justice* (1983), which he coauthored with Clifford M. Lytle and which focused on American Indians’ troubling relationship with the U.S. Supreme Court.

Custer initiates its discourse with an account of the supposed “transparency” of “Indian people.” “People can tell just by looking at us what we want, what should be done to help us, how we feel, and what a ‘real’ Indian is really like.” The pervasiveness of these assumptions, Deloria avers,

Vine Deloria, Jr., (1933–2005) was one of the most recognized and respected Native American leaders. Deloria wrote or edited more than 20 books.

has even informed the development of federal Indian law and policy. Stereotypes of primitive, savage Indians abound in laws and treaties passed and ratified by the United States. He gives special attention to the BIA’s harmful and misguided policy of termination, which sought to end the federal government’s responsibilities to American Indians. While initially limited to a handful of tribes, the early 1950s policy measure generated an uproar across the nation.

Anthropologists and Missionaries

One of the most cited and influential chapters in *Custer* is devoted to “Anthropologists and Other Friends.” Deloria recounts summers when an annual migration “heads into Indian country.” Emerging from every nook and cranny, “they” appear “as if responding to some primeval fertility rite, and flock to the reservations.” The “they” about whom Deloria speaks are all manner of anthropologists, be they social, historical, political, or economic, who in Deloria’s estimation care more about corroborating their theories and publishing in peer-reviewed journals, not to mention obtaining tenure and grants, than helping the people they are supposedly “studying.”

Christian missionaries and BIA employees do not fare much better, as Deloria demonstrates the presumptuousness with which church and state

have taken turns at violating their own stated principles in the name of “Christianizing” and “civilizing” the people who are ostensibly under their care. Deloria even takes time to reflect on the relationship between American Indians and the hippie and corporate communities, both of which are sources for insightful and surprising comparisons. *Custer* concludes with chapters on Indian leadership and a new vision for the BIA.

W. Roger Buffalohead lauded the book as a “witty, provocative, and sometimes crotchety interpretation of the past and current state of affairs of American Indians.” James E. Officer, referring to himself as a “friend,” appreciated Deloria’s humor in otherwise serious topics: “Many of Deloria’s comments about anthropologists are laced with sarcasm and a Twain-like flair for burlesque.” Alfonso Ortiz offered an even more enthusiastic review, proclaiming *Custer* as “the most ambitious and most successful overview of contemporary American Indian affairs and aspirations” he “had ever read.”

Critics and Admirers

Custer was not without its critics, some of whom were also admirers. Officer, for example, while appreciating Deloria’s witty critique of anthropology, observed: “[Deloria’s] humor, which often creeps unexpectedly into otherwise serious passages, may leave the reader uncertain as to whether the author means what he is saying or only ‘funning.’” Buffalohead, in turn, anticipated backlash: “Those on whom Deloria has ‘counted coup’ will label the charges unfair, intemperate, irrational, and, perhaps, even ‘racist.’” Generating both outrage and enthusiasm, *Custer* asserted its place as a milestone in American Indian thought. More specifically, Deloria was a prominent figure in an impressive lineage of Lakota/Dakota writers and activists, including Charles A. Eastman, Zitkala-Sa, George Sword, Luther Standing Bear, and Ella Deloria. Deloria’s work has also done much to shape the political and philosophical agenda of American Indian/Native American studies.

In addition to *We Talk, You Listen* (1970), *God Is Red* (1973), and *Behind the Trail of Broken Treaties* (1974), Deloria created a tetralogy that has formed the foundation for much of the critical discourse in American Indian scholarly and activists circles.

Legacy

Deloria’s most lasting legacy is the meaningful role he played in shaping the dialogue on self-determination, which was later articulated in the 1975 Indian Self-Determination and Education Assistance Act and the 1978 statement on American Indian Religious Freedom. More recently, *Custer* can be credited with inaugurating a vital discourse on American Indian politics that is being furthered by scholars following in Deloria’s footsteps, namely David E Wilkins, Robert Williams, and Taiaiake Alfred.

Customs and Border Protection, U.S.

United States Customs and Border Protection (CBP) is a federal law enforcement agency within the Department of Homeland Security (DHS), created in 2003 as part of the reorganization

U.S. Border Patrol Agents of the Sector Response Team (SRT) search an apartment building room by room in downtown New Orleans, September 19, 2005. SRT is the Border Patrol version of a SWAT Team and operates at the sector level. Legislation enacted after 9/11 substantially increased the border patrol's budget and manpower, making it one of the largest law enforcement agencies in the country.

of federal agencies after DHS's creation in November 2002. Headquartered in the Ronald Reagan Building and International Trade Center in Washington, D.C., a federal building housing both public- and private-sector offices for the purposes of advancing trade, it is responsible for preventing entrance into the United States of terrorist individuals, groups, or resources.

CBP is in charge of formulating and enforcing regulations on international trade, customs, and immigration; it also carries out border-security duties, such as those pertaining to the international trade of narcotics or stolen or otherwise illegal goods, and the threat to American agriculture posed by foreign biological elements, including invasive species, plant and animal diseases, and crop-destroying pests. Many of its duties complement those of U.S. Immigration and Customs Enforcement (ICE), a DHS agency formed at the same time. The key distinction is that while both agencies are charged

with immigration and customs enforcement, CBP's highest priority is terrorism prevention, and its immigration concerns are aimed mainly at the security of the nation's physical borders, whereas ICE's purview is broader.

CBP absorbed much of the U.S. Customs Service (Customs) when it was created, with the remaining elements transferred to ICE. Customs was one of the oldest federal agencies, established on July 31, 1789, as the fifth act of the brand-new Congress, for the purposes of collecting the duties on imported goods authorized by the July 4, 1789, Tariff Act. Customs agents were originally called customs collectors and were assigned to a particular port of entry or other geographic jurisdiction. Apart from a number of minor excise taxes—notably on whiskey and rum, tobacco and snuff, and refined sugar—most federal revenue until the Civil War was provided by the tariffs collected by Customs. Sources such as federal income, estate, and gift tax were not added until

the 20th century, when the expanded duties of the government necessitated expanded revenues.

Though primarily a revenue collection agency, Customs's need to inspect arriving goods in order to correctly assess a tariff made it the most logical agency to be assigned further duties of preventing the introduction into the country of illegal goods, whether as freight or carried by passengers entering the country. Such goods included inherently illegal goods such as drugs, stolen or counterfeit or pirated goods, and illegal forms of pornography; goods that were not declared as required by law, such as weapons or large sums of cash; and goods rendered illegal because of special conditions, such as those produced in countries against which the United States was enforcing an embargo, for example, Cuba. Once assigned this duty, Customs transitioned into a more active law enforcement agency, pursuing investigations in conjunction with the Border Patrol and other federal agencies.

Agency Formation

Unlike Customs, the U.S. Border Patrol was not disestablished upon the creation of CBP but rather was assumed into it. It was formed in 1924, originally as an agency of the Labor Department, in order to patrol the United States' land borders with Mexico and Canada to prevent illegal entry. (Sea patrols in the Gulf of Mexico were added in 1927.) The Border Patrol had been preceded by several earlier attempts at manned border security in the 20th century, which had been aimed mainly at preventing the entrance of Chinese immigrants, who had been banned from the country by the Chinese Exclusion Act in 1882. It is notable that, despite the presence of a patrol on the U.S.-Canada border, border patrols originated from the desire to restrict immigration according to race and ethnicity.

The Border Patrol doubled in size in 1940 and was transferred to the Department of Justice as an agency of the Immigration and Naturalization Service, and again expanded its operations after the Cuban Revolution led in the early 1960s to one of the United States' nearest neighbors becoming one of the countries with which it had the most hostile relations. Around the same time, the importance of the country's land borders in preventing illegal immigration began to diminish,

and the Border Patrol engaged more often in "interior enforcement" (immigration enforcement and investigation in the country's interior rather than at its borders). Air travel became cheaper, global prosperity increased, and the world population became more mobile, increasing the number of ways in which the country became permeable.

While 1960s legislation liberalized immigration law and removed country-of-origin restrictions, the use of significant resources to patrol the border, especially when most of those resources are devoted to the southern border shared with Mexico, has the effect of targeting undocumented immigrants approaching from the south, which includes not only Mexicans but Central and South Americans passing through Mexico en route to the United States. This in turn has contributed to the perception of the "illegal immigration problem" as a "Mexican immigration problem," especially in states with large Mexican American communities and histories of friction between the Hispanic and Anglo communities, such as Texas, California, and Arizona. It is in these states that immigration is so frequently a politicized and hotly debated topic.

In the 1980s, the national illegal immigration strategy shifted toward the idea that American prosperity provided the motivation for illegal immigration and that efforts to control it needed to be formulated accordingly. The 1986 Immigration Reform and Control Act targeted employers who hired undocumented immigrants, leading to increases of the Border Patrol's interior enforcement and greater resources at its interior checkpoints, as well as its involvement in the employer sanction program, which conducted I-9 audits of businesses to ensure no undocumented immigrants were employed.

The 1994 ballot initiative Proposition 187 in the state of California greatly increased immigration enforcement in that state, as 21st-century legislation later did in Arizona. In what was intended to be a blueprint for federal legislation but was later found unconstitutional by a federal court, Proposition 187 denied benefits to undocumented immigrants—again driven by the idea of American prosperity as the motive behind illegal immigration—while enhancing screening and profiling procedures in order to catch

undocumented immigrants, and increasing the criminal penalties of crimes associated with illegal immigration, such as the forging of identification and immigration documents.

Twentieth-First-Century Shifts

As the 20th century came to a close, the Border Patrol's focus was shifted away from the interior again, and the terrorist attacks of September 11, 2001, and resulting creation of the Department of Homeland Security re-established border security as the Border Patrol's—and more generally, CBP's—primary concern. Border Patrol agents retain federal arrest authority nationwide, however.

While the Border Patrol consisted of less than 5,000 agents in the 1990s, and attrition spiked after 9/11 as agents requested transfers to the Federal Air Marshals, subsequent legislation substantially increased the Border Patrol's budget and manpower, making CBP one of the largest law enforcement agencies in the country. (In comparison, the Federal Bureau of Investigation (FBI) in 2012 employed 13,913 special agents, while the DEA employed fewer than 5,000.)

Today, the Border Patrol employs over 20,000 agents, about 80 percent of whom are tasked with patrolling the U.S.-Mexico border, with most of the remainder patrolling the U.S.-Canada border and several hundred tasked with coastal patrols of Florida and Puerto Rico. The Border Patrol is concerned mainly with the entrance of undocumented immigrants, but it is also responsible for the prevention of terrorists entering the country and has become very active in efforts aimed at illegal drug trafficking, especially as the Mexican drug war involves so much of the U.S. border region. The current national strategy of the Border Patrol was defined in 2005 as consisting of five primary objectives: the apprehension of terrorists and terrorist resources upon their entrance into the United States; illegal immigration enforcement measures that deter illegal immigration attempts; the apprehension and deterrence of drug trafficking, human trafficking, and the smuggling of contraband; electronic surveillance of the country's borders, and other "smart border" technologies; and crime reduction and harm mitigation in border communities.

The Border Patrol's duties are organized into 20 sectors: the Ramney Sector consisting of the

Caribbean territories outside the continental United States; the Blaine (Washington, Oregon, Alaska), Spokane (Washington, Idaho, Montana), Havre (Montana), Grand Forks (North Dakota), Detroit (Michigan), Buffalo (New York), Swanton (Vermont), and Houlton (Maine) sectors along the U.S.-Canada border; and the San Diego (California), El Centro (California), Yuma (Arizona), Tucson (Arizona), El Paso (Texas and New Mexico), Marfa (Texas), Del Rio (Texas), Rio Grande Valley (Texas), Laredo (Texas), New Orleans (Louisiana, Mississippi, Alabama, and Florida), and Miami (Florida) sectors along the southern border. Each sector is headed by a sector chief.

In addition to physically patrolling the border, the Border Patrol maintains electronic surveillance of strategic border locations, some fixed and others changing in accordance with current strategy and needs. Human resources are allocated according to the Border Patrol's three-layer strategy of line watch, roving patrols, and checkpoints. Line-watch operations consist of the monitoring of the border by electronic and human means, not only for the entrance of humans and vehicles, but for signs of changes to the natural terrain, which indicate the presence or recent passage thereof. Line-watch activities include traffic checks; transportation checks of commercial and charter passenger vehicles like buses, trains, and aircraft; city patrols; and the Border Patrol's intelligence and antismuggling activities.

Roving patrols consist of units of Border Patrol agents who patrol a given area of the border much like a police officer assigned to a beat. Some of these agents are mounted on horseback, as was the original Border Patrol, while others patrol in vehicles. Horse, bicycle, and snowmobile patrols continue to be relied upon because they can patrol areas difficult or impossible for vehicles to access, which represent strategic points of ingress for undocumented immigrants and drug traffickers. Marine patrols include both coastal and inland waterways, drawing on a fleet of 130 vehicles dispatched to 16 marine sectors. Patrol agents are usually equipped with night vision goggles, binoculars, and other means of detecting movement and activity. Surveillance drones are used for air patrols.

Checkpoints are stations, about half of which are permanent, set up on major highways within

100 miles of the border, at which Border Patrol agents inspect vehicles for signs of immigration or smuggling violations. Checkpoints are especially useful in that the Supreme Court has held that agents working at checkpoints have greater discretion than roving patrols have, including the authority to stop vehicles for questioning without the presence of any suspicion and to select such vehicles for more thorough inspection if suspicious activity is detected. Roving patrols, in contrast, have to have a reasonable suspicion of the presence of undocumented immigrants or contraband in order to stop a vehicle. In addition to the 33 permanent checkpoints that operate at specific locations, the Border Patrol operates between 30 and 40 tactical checkpoints, which consist of temporary facilities set up to operate in a given location for one to 14 days (legally, they must relocate after 14 days). Tactical checkpoints are often migrated through a circuit of specific locations, due to the finite number of strategically

significant highway locations that have sufficient shoulder space to operate a checkpoint without building a permanent structure.

When the Border Patrol was reorganized as part of CBP, former interior checkpoints, some of them significant, were closed. Other facilities were closed or turned over to other agencies, usually ICE. The entire Livermore Sector, consisting of Border Patrol stations in northern California, was also closed, in 2004.

The 2006 Secure Fence Act (SFA) was a major piece of immigration legislation, succeeding the Illegal Immigration Reform and Immigrant Responsibility Act of 1996. Much of the advanced infrastructure the Border Patrol relies upon for electronic surveillance of the border was authorized by the SFA. The SFA also authorized the construction of 700 miles of physical fence, wall, or other barrier along the U.S.-Mexico border, representing about 35 percent of the total length of the border but concentrated in the

southwest portion of the border where the most illegal immigration traffic occurs. The fence has been constructed in stages, though its expansion was halted by order of President Barack Obama in 2010 and funding used instead to improve existing border infrastructure.

The SFA has been subject to numerous controversies, including the incursion of the fence onto tribal lands and the waiving of more than 30 environmental laws and regulations in regard to the fence's construction, which leads to significant impacts on local wildlife habitats.

Cypriot Americans

Cypriots are perhaps one of the smallest ethnic immigrant groups to settle in the United States. Today Cypriot Americans comprise both Greek- and Turkish-speaking communities. Both groups take extensive pride in their American identity as well as their respective Greek and Turkish ancestries. Most common languages spoken by Cypriot Americans are English, Cypriot-Greek, Cypriot-Turkish, Arabic, and Armenian. Today nearly 80 percent of the people of Cyprus identify as Greek Cypriots. The second-largest ethnic group is comprised of Turkish Cypriots. Most Cypriot Americans live in large metropolitan areas. In 2010, 118 Cypriots became American citizens. The largest Cypriot American community currently lives in New York City. Other cities with significant concentrations of Cypriot Americans include Boston, Chicago, Detroit,

Baltimore, and Tarpon Springs. New York State is home to the largest Cypriot American community with more than 2,500 Cypriot Americans. According to the 2000 U.S. census, there are nearly 7,700 Cypriot Americans living in the United States.

Cypriot immigration to the United States was a result of political and economic instability in Cyprus. Cyprus, an island country in the eastern Mediterranean, had been historically settled and/or occupied by Phoenicians, Greeks, Venetians, Ottomans, and the British Empire. According to some sources, Cypriots began immigrating to the United States as early as the 19th century when the island of Cyprus was under Ottoman rule. Although official census on Cypriot immigration to the United States does not begin until 1955, Cyprus reports that significant immigration to the United States occurred as early as the 1930s.

According to the U.S. census, a large numbers of Cypriots immigrated to the United States between 1955 and 1979. These were times of major political and economic uncertainty in Cyprus. The late 1950s marked the end of colonial rule in Cyprus and the establishment of an independent Cypriot government. The decade that followed brought about a major economic recession in Cyprus. In the late 1970s there was a final surge of Cypriot immigration resulting from geopolitical tensions between Greece and Turkey, which ultimately divided the island between the Turkish Republic of Northern Cyprus and the Republic of Cyprus. During these years, many Cypriots emigrated to Greece, the United Kingdom, Australia, Turkey, and the United States.

After immigrating to the United States many Cypriot Americans integrated within the dominant Greek- or Turkish-speaking communities. Thus, many Cypriot Americans today identify as being Greek Americans or Turkish Americans rather than Cypriot Americans. This phenomenon, as well as early government classifications of Cypriots as Greek, Turkish, or Middle Eastern, skewed official U.S. records on immigration from Cyprus.

Customs and Religious Beliefs

Many Greek Cypriots and Turkish Cypriots follow similar customs. However, most Greek-Cypriot Americans are members of the Cypriot Orthodox

Church, while Turkish-Cypriot Americans tend to be followers of Sunni Islam. Some Cypriot Americans identify as being Greek Orthodox, Maronite Christians, and Armenian Christian. Orthodox Cypriots practice similar religious traditions observed by other Orthodox Christians. These include observing Christian holidays, celebrating saint's days, and fasting during Lent. Muslim Cypriots, although not strict Muslims, practice many of the same religious traditions followed by other Muslims around the world. These include Eid, Ashura Day, and fasting during Ramadan.

Cypriot Organizations

Today several religious as well as secular Cypriot American organizations are active in promoting a Cypriot American identity as well as in building relations between Cyprus and the United States. Some of these organizations include Cyprus-U.S. Chamber of Commerce; Cyprians of New Jersey; the Cyprus Trade Center (CTC); United Cypriots of Southern California, Los Angeles, and San Diego; and the Cyprus Society of Greater Philadelphia. The State University of New York, Albany, is also the home of the Institute of Cypriot Studies, which deals with topics ranging from ancient Cypriot archaeology to contemporary topics such as political and economic development in Cyprus.

Notable Cypriot Americans

Through hard work and a strong belief in education and family, many Cypriot Americans have gained prominence in the United States in business, education, entertainments, government, and philanthropy. Some famous Cypriot Americans are Philip Christopher, business executive and community activist; C. L. Max Nikias, president of the University of Southern California; Symeon C. Symeonides, dean of Willamette University School of Law; Hal Ozsan, actor; Charlie Crist, 44th governor of Florida; and Eugene Rossides, government official and community activist.

Czech Americans

Czechs are a Slavic ethnic group, descended from tribes who inhabited Bohemia, Moravia, and Silesia—the historic Czech lands that today are part of the Czech Republic. Many Czechs have partial German ancestry due to widespread German immigration in the Middle Ages. Part of the Austro-Hungarian Empire until 1918, the Czech lands then became part of the independent nation of Czechoslovakia. One of many central European nations to become a Communist country in the aftermath of World War II (except during the Prague Spring, a brief period of democracy in the late 1960s), Czechoslovakia peacefully split into the separate states of Slovakia and the Czech Republic in 1993, after the fall of European Communism in the early 1990s.

Czech Americans include many of those whose ancestors identified as Bohemian, Silesian, or Moravian Americans, as well as many who were classified simply as Slavic, or less commonly Austrian or Austro-Hungarian, by immigration officials. Czech immigration to the United States was extensive in the 19th century, and by century's end, Chicago had the world's third-largest Czech

population (after Prague and Vienna in the Austro-Hungarian Empire). Much of this period of immigration coincided, perhaps paradoxically, with the rise of romantic nationalism among the Czech people. A century-long quest to restore the historic rights of the Czech lands under Habsburg (Austrian) rule had failed; even the minor concessions granted in the late 18th century were rescinded. Czech language and culture suffered a dilution under the Germanization of the Austrian Empire, and the rise of romantic nationalism inspired many Czechs to reclaim their heritage; abroad in the New World, they could more freely celebrate that heritage and language, in a country becoming known for the opportunities it offered to immigrants.

Though it was sparse until 1848, Czech immigration began much earlier than the 19th century. In fact, the first English colonists in the New World included Joachim Gans, a metallurgist and mining expert whom Sir Walter Raleigh recruited to settle in the ill-fated colony of Roanoke, Virginia, in 1585. Gans was also the first Jewish person in North America. He was not the last Czech among the pre-Revolutionary

settlers; Bohemians were prominent in the colonial days, including the wealthy Philipse family of New Amsterdam and the 17th-century explorer Augustine Herman, first lord of Bohemia Manor, who created the first maps of the Delaware Bay and Chesapeake Bay regions. Herman's descendants have included Richard Bassett, a signer of the U.S. Constitution, and four Delaware senators: James Asheton Bayard, Richard Henry Bayard, Thomas Francis Bayard, Sr., and Thomas Francis Bayard, Jr. Bayard Sr. also served as secretary of state.

Sustained Czech immigration began in 1848 after a failed revolution, and even those Czechs who returned home after a few years when it was safer to do so spread the word of America, and attracted further immigration. While many immigrant groups settled primarily in New York City or nearby northeast cities because of the proximity to their arrival point at Ellis Island, Czechs clustered around Chicago, which in the 19th century was the hub of American railways.

By the end of the 1850s there were 10,000 Czech Americans. Most had arrived in family groups, unlike the common trend of young men immigrating alone to secure work and sending for their families later or marrying local girls. By the turn of the century, American-born Czech Americans outnumbered first-generation Czech immigrants, 199,939 to 156,640. New immigration restrictions exacerbated this. In the 20th century, many of the Czechs admitted to the United States were professionals, journalists, or students—refugees first from Nazi persecution in the 1930s and 1940s, and later from the Communist regime in Czechoslovakia. Many Czech immigrants Americanized their names, either choosing a new name that was phonemically similar or translating the meaning of their surname into English.

Prominent Czech Americans

Famous Czech Americans include Ray Kroc, the son of Bohemian immigrants, who turned McDonald's into a nationwide franchise; the Moravian-born Charles Louis Fleischmann, who popularized packaged yeast and founded the Fleischmann Yeast Company; Henry and Richard Bloch, founders of the H&R Bloch tax preparation company; former Secretary of State

Madeleine Albright; President George W. Bush (who has Czech ancestry on his mother's side) and his 2004 election opponent U.S. Senator John Kerry; former Secretary of Defense Caspar Weinberger; and three justices of the Supreme Court: Louis Brandeis, Felix Frankfurter, and current Chief Justice John Roberts.

Composer Jerome Kern, who wrote "The Way You Look Tonight," was Czech American, as is film and *Miami Vice* theme music composer Jan Hammer. Major Czech American filmmakers include movie stars Kim Novak, Karl Malden, and Sissy Spacek; directors Milos Forman and Jim Jarmusch; and the Karate Kid's William Zabka. In the sciences, two of the Apollo astronauts, Jim Lovell and Eugene Cernan, were Czech American, as were Karl Landsteiner, the physician who developed the modern system of blood type classification, Institute of Advanced Study founder Abraham Flexner, economist Joseph Schumpeter,

and Nobel laureates Thomas Cech, Carl Cori, and Gerty Cori.

Dance and Ethnic Diversity

Dance, which involves the rhythmic movement of the body, exists in nearly every culture on Earth. Whether performed with music or not, dance is utilized as a form of communication, self-expression, ritual, competition, or artistic performance. Some forms of dance comprise movements without any specific significance assigned to them; others involve a complex symbology of movements and gestures, relating ideas and information or interpreting events and emotions. A hallmark of dance in the United States has been the intermingling of multiple cultural traditions.

Ballet

Originating in the 15th-century European royal courts, ballet only became widely popular in the United States in the early 20th century, when Michel Folkiné of the Ballets Russes brought his unique, historically accurate, and expressively dramatic form of classical dance to New York City. As with classical music and theater, dancers of color were grossly underrepresented in the earliest decades of American ballet.

Since the 1950s, ballet has diversified considerably. Sono Osato, of Japanese and European descent, began dancing with the Ballets Russes

and the American Ballet Theatre in the 1930s before moving on to an award-winning career on Broadway, television, and film in the 1940s and 1950s. Early in Osato's career, she faced so much racism that she was unable to perform in most of the western parts of the United States. Maria Tallchief, whose father was a chief in the Osage Nation, became the first prima ballerina of the New York City Ballet in 1947. Janet Collins was one of the first black ballerinas of note, becoming the first African American performer hired full-time by the Metropolitan Opera in 1951.

As a teenager, she had been hired by the Ballet Russe de Monte Carlo in 1932, but their desire for her to perform in whiteface caused her to resign before ever setting foot on stage. In 1955's *Western Symphony*, Arthur Mitchell became the first African American dancer in the New York City Ballet; the following year, he became a principal dancer with the company. He founded the nation's first African American classical ballet company and training school, the Dance Theatre of Harlem, in 1969.

In 1990, Lauren Anderson became the first black woman to become a principal dancer at a major ballet company, the Houston Ballet. Misty Copeland, who became the first African American woman soloist at the American Ballet Theatre in 2007, often has been described as the Jackie Robinson of classical dance. Fernando Bujones,

It formed a cultural expression in open spaces such as parks, schoolyards, raves, and, of course, the streets.

Angel Correia, Michael DePrince, Goh Choo San, Jermel Johnson, Alex Ko, Zack Tang, Danny Tidwell, and Rodney Yee all have had noteworthy careers in ballet.

African American Dance

African American dance first emerged in the mid-Atlantic region of Virginia, North Carolina, and Maryland during the early years of chattel slavery. Cultural exchange in America among slaves from different geographic regions of west and central Africa produced a syncretic dance vocabulary. African choreographic elements, including improvisation, isolation, and individualism, were interpolated into 17th- and 18th-century European dances practiced in America. Friendly competition among dancers always has been an aspect of African American dance.

Katherine Dunham was a pioneer in the field of ethnochoreology, or anthropological research in dance, whose scholarship and choreography led to increased interest in African diasporic dance. Trinidadian American choreographer Pearl Primus, who studied at Hunter College and New York University, worked to legitimize the study and presentation of African and Afro-Caribbean dance among American audiences in the 1940s, 1950s, and 1960s. Her work was a seamless melding of African diasporic, balletic, and modern dance techniques.

Alvin Ailey, the African American dancer and choreographer credited with popularizing concert dance among the black community, developed a choreographic style that borrowed from a wide range of dance forms, according to whichever one suited the emotional moment. He allowed his dancers—whether trained in ballet, modern dance, or jazz—to interpret his choreography according to their personal styles. *Revelations* (1960), his signature choreographic work that interpreted the African American experience through spirituals and jazz music, is believed to be the best-known modern performance.

An amalgam of the Juba dance, Irish step dancing, and English Lancashire clog dancing, tap dance has been a staple African American dance form since at least the middle of the 19th century. Tap also is considered to be a form of music, in that the dance involves making syncopated, percussive sounds with metal slabs on the bottom of the dancers' shoes. There are two arms of tap dance: rhythm, or jazz tap, which highlights the more musical elements of the dance form; and show tap, the flashy dance style that is associated with big-budget Broadway musicals, like *42nd Street*, *Jelly's Last Jam*, and *Anything Goes*. Influential tappers include Steve Condos, Gregory Hines, Savion Glover, Chloe Arnold, Brenda Bufalino, and Sutton Foster.

Modern Dance

Modern dance emerged in the early 20th century as something of an apostasy from what some American practitioners viewed as the formality, punctiliousness, and affection of classical ballet. At that time, modern dance was performed in bare feet and without the customary costumes of tulle and tights. Early pioneers were influenced in their

choreography and technique by Native American dance, jazz, and other early-20th-century popular music, south and east Asian culture and religion, nature, Classical Greek art and mythology, and the choreography of Japanese dancer Sada Yacco.

In his distinguished career, modern dance pioneer Michio Ito choreographed for motion pictures, Broadway revues, and major opera houses. Trained in both opera and dance, he collaborated with a wide array of influential artists, including William Butler Yeats, Ezra Pound, and Isamu Noguchi. In 1943, Ito chose to repatriate to Japan rather than be sent to an internment camp. He was later hired to choreograph for the American Occupation administration in Japan.

Radical Dance

From modern dance came the radical dance movement of the 1930s and 1940s. Impelled by the rise of fascism in Europe, as well as the worldwide Depression, dancers and choreographers sought to raise awareness of social issues through dance. American choreographer José Limón, who was born in Culiacán, Mexico, and raised in southern California, was a central figure in the radical dance movement, and his choreographic techniques remain broadly influential. In 1946, he founded the José Limón Dance Company, which toured internationally and inaugurated the New York Shakespeare Festival in 1962. He developed his signature work, *The Moor's Pavane*, inspired by William Shakespeare's *Othello*, in 1949.

Jazz Dance

Jazz dance, which dates back to New Orleans in World War I, used to refer to any of the popular social dances of African Americans, as its moves were based on African and Afro-Caribbean forms. As with jazz music, jazz-inspired dances, including tap and swing dance, have prominent improvisational characteristics. After World War II, a new form of jazz, called modern jazz dance, emerged. Developed by choreographers like Bob Fosse, Jerome Robbins, Michael Kidd, and Jack Cole, and utilizing specially trained dancers, this style revolutionized Broadway dance. A wide array of performers, including pop star Michael Jackson, jazz choreographer Gus Giordano, and Jennifer Lisette López, innovator of the Caribbean-fusion

form known as Afrogroove, have shaped this style of dance.

Swing dance first appeared during the 1920s and remained hugely popular through the 1950s. It is a social dance that emerged from the swing variant of jazz music; its syncopated rhythms have their roots in west African music. The most common versions of swing dance include the Lindy hop, push-and-whip, boogie-woogie, Balboa, St. Louis shag, imperial swing, and jive, which have been played by big bands like Cab Calloway and His Orchestra, Chick Webb and His Orchestra, the Toshiko Akiyoshi-Lew Tabackin Big Band, and Brian Setzer Orchestra. Swing dancers of note include Nathalie Gomez, Yuval Hod, and Frankie Manning.

Latin Dance

Tango has been popular in the United States since the 1910s, after it was imported from the Río de la Plata region of the Uruguay-Argentine border. Its basic positions based on an embrace, tango always has had a romantic association. It has its roots in southern European partner dance and *candombe* religious ceremonies from the Bantu peoples of central, eastern, and southern Africa. The influence of tango can be seen in choreography for pairs figure skating, gymnastics, and synchronized swimming.

Salsa dates back to Cuba in the 1920s, and has its roots in the Afro-Cuban rumba. By the last few decades of the 20th century, salsa was danced throughout North and South America, Europe, Africa, and Asia. An informal dance, it is commonly practiced in nightclubs, restaurants, and parties, with other types of dance moves incorporated frequently. Traditional salsa music is sustained by a simple five-note rhythm by the clave. Upon its arrival in New York, salsa was influenced by other Latin dances, especially rumba and mambo.

Merengue, a close partner dance with a quick tempo, is an import from the Dominican Republic. It was the national dance of the island during the Rafael Trujillo era. Although it was brought to the United States in the early 1900s, it did not become widely popular until the 1960s. Cultural exchange between Dominican Americans, African Americans, and Puerto Ricans in New York City has caused the merengue to be associated with

hip-hop, rhythm and blues (R&B), reggaeton, and mambo music, rather than the accordion-based combos with which it was connected originally. Along with several other Latin dances, such as salsa, mambo, cha-cha-cha, and rumba, merengue is common in competitive ballroom dance.

Street Dance

Street dance refers to any number of informal dances that are regular parts of cultural expression among various groups; in many ways, street dance can be considered a contemporary folk dance. People engage in street dance in a variety of public and private spaces, including homes, nightclubs, parties, and raves. Commercialized versions of street dance are a regular part of music videos and televised dance shows, such as *The Grind*, *Soul Train*, *American Bandstand*, and *Hullabaloo*. Among the best-known street dances are dancehall, reggaeton, soca, the Bankhead Bounce, the Dougie, krumping, the Percolator, waacking, air guitar, headbanging, moshing, lambada, glowsticking, industrial dance, jumpstyle, and punta.

Voguing, a stylized dance form that first appeared in elaborate competitions attended by gay and transgendered black and Latino men in 1960s Harlem, went mainstream after being featured in Madonna's popular 1990 song, "Vogue." The dance takes its name from the high fashion magazine *Vogue*; dancers assume quick sequences of model-like poses, showcasing their creativity, dexterity, flexibility, precision, and grace. Willi Ninja, widely considered to be the most influential practitioner, integrated Asian-influenced choreography into voguing in the 1980s and 1990s.

B-boying, more commonly known as breakdancing, is an umbrella term for a number of street dances, including breaking, popping, locking, the robot, and the electric boogaloo, that evolved conterminously with hip-hop music and graffiti. B-boying dates back to the New York City neighborhood of the South Bronx in the 1970s; its earliest practitioners were black and Latino teenagers who created the dances by creatively merging Brazilian *capoeira*, Arabic street dance, kung fu moves, and James Brown's choreography. Although most of its earliest innovators were b-boys, b-girls have also had a strong presence in the dance form.

Other Dance Forms

Hula is a traditional Hawai'ian dance with its roots in Polynesian folk dances brought to the island by the original Polynesian settlers who arrived sometime between 300 and 800 C.E. The dance dramatizes the lyrics of the song or chant that it accompanies. While there are numerous hand motions, there is a much smaller suite of movements for the lower body. Upon contact with Westerners in the 19th century, the hula changed considerably, including the addition of Christian content, and a change in instrumentation from gourd drums and split bamboo sticks to ukuleles and steel guitars. Belly dance originated in western Asian and the Middle East. Despite its name, belly dance most prominently features movements of the hips. Belly dance was brought to the United States in the late 19th century, where it created a frenzy for its unseemliness at the 1893 World's Fair in Chicago, the World's Columbian Exposition.

Bhangra is a diasporic Punjabi dance brought to the United States by Indian immigrants in the 1990s. It typically is danced to various genres of popular music and is comprised of Punjabi and Western dance styles, including R&B, hip-hop, and rock. Since the 2000s, it has been especially popular as a competition among college dance teams. The Persian dance practiced by Iranian immigrants to the United States represents a wide range of diasporic dances. Known as *raghs* or *gher dadan* in Persian, it is typically performed in a compound meter, with high levels of improvisation, and a distinctive combination of hip undulations, facial expressions, and hand motions. Samoan dance is practiced primarily in the enclaves of Samoan immigration in the United States, specifically, Hawai'i and California. Tauluga, which means "to jump" in Samoan, and sasa, a synchronized slap-dance performed by groups, combine with hip-hop dance to comprise contemporary Samoan dance in America.

Dances With Wolves

Dances With Wolves is a 1990 film about European American encounters with American Indians. First Lieutenant John Dunbar, a young Union army officer in the U.S. Civil War, requests a post on the frontier, befriends the Lakota Sioux, and becomes one of their group. Reprising America's Manifest Destiny foundation story, the film is significant for revising the Hollywood western, advancing the subgenre of the revisionist western, and influencing Indian self-representation.

The film won seven Academy Awards: Best Picture, Director, Adapted Screenplay, Film Editing, Cinematography, Sound, and Original Score. In 2007, the Library of Congress added it to the National Film Registry. Coproducer, director, and star Kevin Costner adapted the film from Michael Blake's 1988 novel and screenplay of the same name. Its budget was almost \$22 million, and it grossed \$424 million in U.S. and foreign sales.

Reviving the Western

The first western to win Best Picture since *Cimarron* in 1931, *Dances With Wolves* revived the genre by using its conventions innovatively. To evoke the frontier's lost grandeur, thousands of buffalo on South Dakota's vast plains preface a spectacular (unprecedented in film) buffalo hunt. Using a domestic herd and foam and fiberglass buffalo, Indians from 10 tribes learned to shoot bows and (rubber-tipped) arrows, while galloping bareback among fast-moving buffalo, to capture the likes of a buffalo hunt not seen since the 19th century.

Adhering to Eurocentric assumptions that whites would reject an Indian protagonist and all audiences could identify with a white male,

the film also reemploys the white male protagonist convention to update the western with late-20th-century ideas. The army sends Dunbar to the 1863 Dakota frontier under the mistaken assumption that he wants to be an Indian fighter. Instead, he wants to see the wilderness before it is gone, and he rejects the policy that Indians need to be eliminated. Rather than represent the attitudes of a Civil War officer, Dunbar is an environmentalist, he respects animals (interacting with and naming a wolf Two Socks as the Lakota rename him Dances With Wolves), and he considers the Lakota a nature-loving, oppressed minority.

The white hero out-Indians the Indians. Dunbar rescues the Lakota-adopted white woman, discovers buffalo to hunt, is successful in his first hunt, rescues a youth from a charging buffalo, and saves the Lakota by supplying rifles against a Pawnee attack. Seeming to embody the idea of white male superiority, far from being superior, Dunbar is often the butt of humor. After encountering the Lakota medicine man Kicking Bird (Graham Greene), Dunbar faints. Trying to stop the Lakota from stealing his horse, Dunbar instead knocks himself out by running into his doorjamb. As he pantomimes a buffalo and grinds coffee, the Lakota see him as ridiculous. And Dunbar himself decides—while witnessing fields of buffalo carcasses left to rot by white hunters who only wanted tongues and hides—against the supposed superiority of the white man.

The film reuses the Hostile Savage Indian stereotype (of merciless, motiveless killers of innocent white settlers). Pawnee first kill Timmons (who brings Dunbar to the frontier). In flashback, Pawnee kill Euro-American settlers, including the parents of Christine/Stand With a Fist (Mary McDonnell). To problematize the stereotype, the film gives the Pawnee motives, showing them reluctantly following a leader (Wes Studi) who kills Timmons as yet another white man blatantly intruding on Indian land. At film's end, Pawnee scouts help soldiers track Dunbar, reduced to serving Manifest Destiny to survive.

Revising the Noble Savage stereotype (of white-friendly primitives in harmony with nature but doomed by Euro-American civilization) is the major means by which the film revives the

western. Rather than primitives, the Lakota are like Dunbar. He and Kicking Bird are eager to know and make peace with each other, and he and Wind in His Hair (Rodney Grant) each think the other inferior, until they become friends. Cultural exchanges—including Wind in His Hair trading his bone breastplate for Dunbar's army jacket, and Dunbar and Kicking Bird conversing in each other's language—envision lives of peaceful accommodation. The film includes an intertitle of the vanishing “noble savage”:

. . . their homes destroyed, their buffalo gone, the last band of free Sioux submitted to white authority at Fort Robinson, Nebraska. The great horse culture of the Plains was gone and the American frontier was soon to pass into history.

But rather than end with a sense of vanishing Indians as the inevitable result of encroaching civilization, Dunbar and Christine leave the Lakota to convince the nation that Manifest Destiny is a badly mistaken and certainly not inevitable policy.

A Revisionist Western

Dances With Wolves crosses into and advances the evolution of the Revisionist western as Dunbar adopts Lakota culture as superior to his own and the film depicts the Lakota as fully realized human beings. Kicking Bird and his wife Black Shawl (Tantoo Cardinal) converse as equals and, as Kicking Bird startles himself in bed by rolling onto a child's misplaced toy, the film reveals everyday Lakota life as familiar family life.

The film dismisses staples of the western. Rather than actors in redface, only Indians play Indians. Rather than English, the Lakota characters speak Lakota and the Pawnee speak Pawnee. Subtitles confirm English as dominant, but as only one of the country's functioning languages. Rather than the U.S. Cavalry saving Dunbar, soldiers attack him for turning Indian and the Lakota save him. As soldiers kill Dunbar's horse, kill Two Socks in target practice, use Dunbar's journal as toilet paper, taunt and beat him, and arrest him for treason, the film challenges the frontier as the supposed defining line between Euro-American civilization and Indian savagery.

Indian Response

In Chris Eyre's 1998 film *Smoke Signals*, its two contemporary West Coast (Coeur d'Alene) Indian protagonists discuss *Dances With Wolves* to emphasize that American Indians have not vanished and are as culturally diverse as America itself.

Danish Americans

Denmark's colonization of the Americas began with the arrival of the Danish West Indies Company to the Virgin Islands in the 1660s. A small trickle of Danes continued their migration to the North American continent, where the Dutch colony of New Netherlands and the religious haven of Pennsylvania also housed early Danish contingents. The onset of Danish mass migration to the United States dates to the middle of the 19th century, however. With over 4,000 arrivals, 1869 constituted an early peak year, but it was not until 1882 that the 10,000 immigrant mark was passed for the first time. Immigration stabilized at a somewhat lower level during the following decades, until World War I and the subsequent immigration restrictions, which ultimately curtailed the Danish yearly quota to 1,181, brought the era of large-scale immigration from Denmark to an end.

Altogether, 340,000 Danes were registered as immigrants to the United States in the period from 1820 to 1950. While this number puts Denmark in the top 20 countries of origin for the period, it lies far below its Norwegian and Swedish equivalents. As the Scandinavian country situated closest to the European center, Denmark industrialized earlier than its northern neighbors, and its fertile plains offered better agricultural conditions than the Scandinavian peninsula. As a consequence, the country was able to absorb a larger percentage of its population growth. Return migration was low, by contrast, even if the 9 percent rate calculated for 1908 to 1914 is not considered fully representative for the overall period.

Economic Motivations

The vast majority of Danes left their country for economic reasons. In the earlier phases it was primarily the allure of affordable farmland, but toward the end of the 1800s, migration shifted to the cities. Yet from the very beginning there were also political and religious influences. In the late 1800s, German-ruled Schleswig experienced a substantial emigration of discontented Danish-speakers. At the same time, Mormon proselytization was uncommonly successful in Denmark, and the almost 17,000 Danes who left for Utah between 1850 and 1904 made Denmark the second-largest country of origin for Mormon immigrants.

Once they had arrived in their new country, Danish immigrants dispersed more evenly than their Scandinavian neighbors. With almost 18,000 Danish-born residents out of a national total of 182,000, Iowa contained the largest contingent of Danish immigrants in 1910, but Illinois, Minnesota, Wisconsin, and Nebraska followed closely after, as did larger coastal states such as California and New York. Danes seldom reached the critical mass necessary to exercise decisive influence on entire states or at least larger regions. Only in individual settlements, most commonly located in western Iowa but spreading as far as California's Santa Ynez Valley, were Danish immigrants able to establish themselves as local majorities.

These settlement patterns furthered integration into American society. As early as 1910, 43 percent of second-generation Danish Americans had one non-Danish parent, among them primarily native-born Americans, Germans, and other

Scandinavians. Today, only 6 percent of Danish Americans report having a spouse from the same ancestry group. In respect to language, the assimilation process progressed just as rapidly, with the number of Danish-speakers declining from a high of 187,000 in 1920 to 85,000 in 1960 and below 30,000 in 2005. The once far-spread Danish ecclesiastical infrastructure, primarily rooted in the Lutheran tradition, has largely merged into larger American entities. The over 100 secular ethnic associations have survived to a greater extent, with fraternal orders such as the Danish Brotherhood dating back to 1882 and newer organizations such as the Danish American Chamber of Commerce and the Danish American Heritage Association still being founded in the 1970s.

On a more modest level, Danish immigration continued beyond World War II, with approximately 1,000 yearly arrivals throughout much of the 1950s and 1960s. These totals further declined thereafter, so that only 16,885 Danes were admitted as legal immigrants to the United States between 1971 and 2002. The destination of these immigrants had shifted as well: among the Danish citizens receiving permanent resident permits in the United States between 2005 and 2007, more than a fifth lived in California, distantly followed by New York and Florida. Even more important for the changing regional distribution of Danish Americans, however, were internal migration and demographic divergences. With 200,000 Californians reporting Danish ancestry in 2000, their home state now contains the largest absolute number of Danish Americans, whereas Utah has the highest relative share with more than 6 percent of the state's overall population.

Because of their small numbers, Danish Americans had to succeed as individuals rather than as representatives of an ethnic constituency. This was true for early Danish American politicians such as Nebraska Governor Frederick V. Peterson as well as Danish descendants such as Texas Senator Lloyd Bentsen. It was equally true for journalist Jacob Riis and sculptor Gutzon Borglum, the creator of the Mount Rushmore monument. Yet even today, individual Danish immigrants and their children continue to carve out successful careers in the United States, as exemplified by musician Lars Ulrich as well as actresses Scarlett Johansson and Connie Nielsen.

In the 2010 U.S. Census, almost 1.4 million Americans list full or partial Danish ancestry. Like most Americans, they now live predominantly in metropolitan areas, even if their rural component still exceeds the national average. More than 95 percent are born in the United States and speak only English in their homes. With superior high school and college graduation rates, it is not surprising that their median household income of \$60,734 exceeds the national average by approximately 20 percent. By whatever standard applied, the descendants of Danish immigrants have fully arrived in the United States.

disparate groups tended to have in common was a set of culturally based assumptions about property—how it should be held, what should be done with it—and about the nature of civilized society. Whether friends of the Indian or foes, the act benefited the non-Indian population by forcing Native individuals into a restricted form of private land ownership, while freeing up millions of acres of once collectively (tribally) controlled lands to non-Indian settlement.

From 1883 to 1916, Indian rights advocates and reformers were invited to meet annually at the Mohonk Mountain House resort hotel of Indian Commissioner Albert Smiley (and his twin brother Alfred) on the shores of Lake Mohonk, New York. The annual proceedings of this multi-day event, Lake Mohonk Conference of Friends of the Indian and Other Dependent Peoples, provide an inside look into an array of Euro-American concerns over what was widely referred to as “the Indian problem.” With some notable exceptions, white Americans accepted the Eurocentric position that American Indians would be better off if they adopted “white ways,” marked particularly by modes of dress, language (English), religion (Christian), and ownership of private property.

The Dawes Act’s underlying purpose—touted by President Theodore Roosevelt some years after its passage—was to destroy tribal governance and the collectivist nature of Native societies. In his first annual message to Congress as president, Roosevelt referred to the act as “a mighty pulverizing engine to break up the tribal mass.” Although for many decades the General Allotment Act was considered a benign but failed form of paternalism, there is now wide consensus among scholars—especially those guided by the 2007 passage of the United Nations Declaration on the Rights of Indigenous Peoples—that the act perpetrated cultural genocide among indigenous Americans.

In the decades prior to passage of the Dawes Act, thousands of acres had already been allotted to citizens of indigenous American nations, often under specific treaty provisions. However, between 1887 and 1934 (when the allotting provision of the Dawes Act was repealed under the Indian Reorganization Act), millions of acres of indigenous homelands—lands already identified as such in hundreds of treaties with the United States—were surveyed and allotted in 40-, 80-, and

Dawes Act (1887)

The centerpiece of the Dawes, or General Allotment, Act of 1887 was its provision to allot lands “in severalty”—that is, under individual ownership—to American Indians, and eventually to impose U.S. citizenship on them. The act met with widespread approval among Euro-Americans and widespread disapproval among the indigenous peoples upon whom it was imposed. Named after its author, Senator Henry Dawes of Massachusetts, the act was the culmination of various groups’ efforts to advocate both for and against an Indian rights agenda. What these

160-acre parcels to individual “allottees,” and the tens of millions of acres of “surplus lands” ceded or sold to make way for white homesteaders.

Federal Trust Provision

Adding to the perception that the Dawes Act was a form of benign paternalism was its original imposition of a 25-year period during which individually owned Indian lands, and any money earned from them, would be held in trust by the U.S. secretary of the interior. The federal trust provision also rendered allotted lands untaxable by state and federal governments, and inalienable (unsellable) by the allottee. This trust period was supposed to allow its Indian beneficiaries time to learn how to farm, ranch, or otherwise turn their labor into money, and thus to be able to fend for themselves in modern, capitalist society. Instead, most allotments that remained in

Native ownership were eventually leased out to whites, undermining the original “civilizing” purpose of the act and creating a massive administrative apparatus within the U.S. Bureau of Indian Affairs devoted to the management of the Federal Indian Trust (both land and money). Many other allotments passed out of indigenous ownership altogether as often economically desperate allottees sold their lands or lost them through the intended and unintended consequences of the act and its amendments. Because of the rapid land loss, the trust provision of the act was extended indefinitely and remains today a central feature of the federal-Indian/tribal relationship.

Amendments to the Act

Apart from wholesale and deliberate destruction of indigenous collectivist forms of land tenure and governance, amendments to the act further undermined Native Americans’ ability to hold onto their lands once allotted. For instance, the Act of May 27, 1902—also known as the Dead Indian Act—and the Burke Act of 1906 each created pathways by which indigenous homelands could pass smoothly into nonindigenous ownership. The Dead Indian Act made it easier for heirs of deceased allottees to sell their inheritance. The Burke Act authorized the U.S. secretary of the interior to determine the “competency” of Native individuals to manage their own affairs. Once they were determined competent, the secretary could remove the trust restrictions on the individual’s allotment—with or without the allottee’s knowledge—thus rendering the land taxable and able to be sold. Having little cultural knowledge of such transactions, many Native people lost their allotments through tax foreclosure, or sold them under conditions of economic desperation and despair.

Consequences of the Act

All told, the Dawes Act and its amendments facilitated the passing of more than 90 million acres out of indigenous ownership and tenure and enabled what is considered the largest legalized land grab in American history. In many ways, the act and its structural and cultural legacies help account for the ongoing economic problems faced by the citizens and governments of American indigenous nations. Greater than 60 percent of American Indian landholdings in 1887 went out of Native ownership

in fewer than two generations; and greater than 80 percent of the land's value was lost, as much of what remains in Native ownership is arid and (with some exceptions) of little agricultural value. Although the act's central allotting provision was repealed in 1934, the problems it engendered persist, including jurisdictional issues created by non-Indian ownership of lands inside reservations, and political and economic challenges associated with inheritance provisions that re-create a version of the tragedy of the commons among heirs of the original allottees.

Declaration of Independence

As an iconic emblem of liberty, the Declaration of Independence has stood for nearly a quarter-century as an exemplar of the rights of people to elect self-governance in the face of tyranny. The

document has also perplexed and puzzled those who wonder at how a group could espouse “that all men are created equal, that they are endowed by their creator with certain unalienable rights, that among these are life, liberty, and the pursuit of happiness,” while not only ignoring the issue of slavery, but owning enslaved people themselves. Serving as an inspiration for many who advocated the rights of the oppressed, the Declaration of Independence continues to motivate and encourage those who work for the rights of marginalized people.

Background

In July 1776, the 13 colonies had been at war with Great Britain for over a year. Since the conclusion of the French and Indian War in 1763, Britain had been looking for ways to reduce debts incurred as a result of that war and the other ancillary costs associated with governing the colonies. As a result, the British parliament had passed a series of statutes designed to increase revenue, including the Stamp Act of 1765 and the Townshend Acts of 1767. Whereas the Stamp Act, which required printed materials to be produced on stamped paper, had proven unpopular, the Townshend Acts were especially unpopular. The Townshend Acts were intended in part to be punitive, as a way of punishing New York for failure to comply with the earlier Quartering Act (that outlined locations and conditions in which British soldiers were to find room and board in the American colonies), and asserted that Britain had the right to tax the colonies. A great many acts of resistance occurred as a result of taxes imposed by Townshend Acts, including actions that led to the Boston Massacre and the Boston Tea Party. The British held that because Parliament was the supreme authority in the nation, anything that body did was constitutional. This included the right to assess taxes, especially those used to cover expenses generated by the individuals being taxed.

Members of the Continental Congress who met in Philadelphia in July 1776 had different views regarding taxation. Since the colonists did not have the ability to elect members of Parliament, some argued that this body had no authority over the colonies. American political theorists, such as Samuel Adams and Thomas Jefferson, maintained that Parliament served only as the legislative body

of Great Britain, and that the colonies, with their own legislatures, had the right to self-governance, which the British were trying to abrogate. Patriots such as John Adams had argued for independence from Britain as early as February 1776. Problems existed for those favoring independence insofar as the delegations to the Continental Congress only possessed authority consistent with their instructions from each colony's legislature—as advocates for independence grew more vocal, they had these instructions revised to give the Congress increased authority. John Adams had drafted a “preamble” advocating suppression of authority of the Crown. On June 11, 1776, Congress appointed a Committee of Five, comprised of John Adams, Benjamin Franklin, Robert R. Livingston, Roger Sherman, and Thomas Jefferson, to draft a declaration of the colonies' independence from Britain. At Adams's urging, Jefferson agreed to draft the document.

Drafting and Ratification

Over the course of 17 days, Jefferson drafted the Declaration, received comments from others, and presented it to the Congress on Friday, June 28, 1776. Debate began and continued over the weekend. On July 1, a preliminary vote was taken on whether to declare independence, a vote that passed 9–2 with two abstentions. Congress declared the colonies' sovereign status on July 2, and a second reading of the Declaration was conducted. Two passages of Jefferson's draft were rejected after a third reading the following day. The first rejected passage involved language critical of the English people. The second involved a repudiation of the slave trade and of slavery itself. The debate regarding the efficacy and moral impropriety of slavery was probably necessary to ensure the votes for passage for the Declaration, but dramatically changed its tenor and tone.

In his initial draft, Jefferson had included a paragraph in the Declaration asserting that Britain had forced slavery on the American colonies. This language was removed during the course of a two-day revision process, both to curry favor with British residents friendly to the revolution and to placate the southern colonies. During this period of revision, approximately 25 percent of the Declaration was deleted and numerous wording changes were made. These changes were

completed by the adjournment of Congress on July 3, 1776, and a formal vote was conducted the following morning. The document was then returned to the Committee of Five, which made the required edits and handed the Declaration over to John Dunlap, a printer. By July 5, he had printed approximately 200 copies, known as “Dunlap broadsides,” which were dispatched across the colonies for public dissemination.

Influence

The Declaration of Independence proved to be powerful and influential, both in an immediate sense to those involved in the Revolutionary War and historically to others interested in the rights of individuals. John Hancock, who served as president of the Continental Congress, had a Dunlap broadside delivered to George Washington, commander-in-chief of the Continental Army. Washington had the Declaration read aloud to his troops on July 9, 1776. Washington believed the Declaration was useful in motivating his troops and a useful recruiting tool to inspire others to join the army. Around the colonies, readings of the Declaration of Independence inspired crowds to destroy statues of King George III, deface signs indicating British authority, and to become more passionate regarding the patriots' cause. When copies of the Declaration were transported to Europe, its dissemination proved equally galvanizing. In Britain the Declaration was published in the newspapers, and in France, Switzerland, and Bavaria it was translated into French and German. Although Spanish authorities banned circulation of the Declaration, it was soon available in Spain and many of its colonies, including Colombia, Mexico, and Venezuela.

Those opposed to slavery also used the Declaration of Independence to challenge that institution. Writing on behalf of the British, pamphleteers, Thomas Hutchinson and John Lind denounced the Declaration's signers for failing to extend “life, liberty, and the pursuit of happiness” to enslaved people, and the “all men are created equal” language was used to suggest patriots' hypocrisy. The Declaration also inspired many enslaved blacks, thousands of whom left plantations and farms to cross the British lines. During the closing days of the Revolutionary War, the British evacuated thousands of African American troops, who had

fought with the Crown, to England, Jamaica, or Nova Scotia. Additionally, approximately 5,000 black troops, or 5 percent, of the Continental army consisted of African Americans.

After the Revolutionary War ended, interest in the Declaration of Independence waned in the United States, but the document remained influential abroad and was referenced during the French Revolution that began in 1789. Other former colonies copied parts of the Declaration in their own declarations of independence, including Argentina, Bolivia, Chile, Czechoslovakia, the Dominican Republic, Haiti, Hungary, Mexico, New Zealand, Nicaragua, and Peru. After having fallen out of fashion, interest in the Declaration of Independence experienced a revival in the United States in the 1820s, and biographies of many Founding fathers were issued. Abolitionists found the Declaration's language supported their opposition to slavery. During discussions leading up to the Missouri Compromise, questions often arose regarding whether newly admitted states should allow slavery. Abolitionists often quoted portions of the Declaration to support their assertion that the founding fathers opposed slavery. Those in favor of slavery, however, asserted that since the Declaration of Independence was not referenced in the U.S. Constitution, it had no bearing on the matter.

The Declaration helped shape Abraham Lincoln's views toward slavery, as evidenced by shifts that occurred in his beliefs that are demonstrated by speeches he gave in the early 1850s and during the Lincoln-Douglas senatorial debates of 1858. Lincoln believed the Declaration represented beliefs of the patriots at their most eloquent and altruistic, and he believed they expected slavery to fade away over time. Lincoln asserted that expansions of slavery, such as those allowed by the Kansas-Nebraska Act, served as a refutation of the principles undergirding the Revolution. Stephen Douglas, Lincoln's opponent during the 1858 debates, believed that "all men" as referenced in the Declaration referred only to whites. While some observers believe Douglas's interpretation to have been more historically correct, Lincoln made the Declaration of Independence a living document, one that changed over time to meet changing understandings of equality, liberty, and freedom. During his Gettysburg Address, Lincoln paid homage to the Declaration through his statement that "Four score and seven

years ago our fathers brought forth on this continent a new nation, conceived in liberty, and dedicated to the proposition that all men are created equal." Early supporters of women's suffrage also referenced the Declaration of Independence, with Elizabeth Cady Stanton, Lucretia Mott, Martha White, and others titling their demands for equality a Declaration of Sentiments when presented at the inaugural Women's Rights Convention held in Seneca Falls, New York, in 1848. The Declaration of Independence has continued to influence the thoughts and actions of those speaking for multicultural groups that have frequently been marginalized or dispossessed.

Deer Hunter, The

The Deer Hunter is a Hollywood film directed by the Italian American director Michael Cimino. It received the Academy Award for Best Picture after its release in 1978. Along with *Coming Home* (1978) and *Apocalypse Now* (1979), *The Deer Hunter* was one of three major films pertaining

to the Vietnam War and released in the aftermath of U.S. involvement in the conflict. It was made at the end of the 1970s period of the “New Hollywood” cinema, during which filmmakers challenged the classical storytelling principles of moviemaking.

Rusyn Americans During the Vietnam War

The Deer Hunter dramatizes the life of a small Rusyn American community from Clairton, Pennsylvania, as it struggles to cope with the effects of the Vietnam War. The film begins by introducing a group of male friends who work at a steel factory outside Pittsburgh. The film’s protagonist is Michael (Robert De Niro), a Western-type hero who combines great inner strength with a controlling personality. An avid hunter, Michael discloses his tendency to play God through his “one-shot” philosophy for killing deer. Nick (Christopher Walken) presents a counterbalancing force by reminding his best friend of his domineering ways. At the start of the film, the two men prepare for their departure for Vietnam along with Steven (John Savage), a younger friend who is to be married in a farewell celebration.

The Deer Hunter intertwines the war front and the home front through an alternating ABABA format (where A is Clairton and B is Vietnam). The vitality of the working-class community revolves around the steel mill, a Russian Orthodox church, a bar where the male characters bond, the mom-and-pop market that employs Nick’s girlfriend Linda (Meryl Streep), and the mountains where the men go deer hunting. In scenes depicting Steven’s wedding celebration, the *mise-en-scène* highlights regional immigrant traditions while also attesting to the characters’ assimilation into the U.S. mainstream. Although the men and women sing and dance in accordance with eastern European traditions, a giant banner stating “Serving God and Country Proudly” honors the three men set to fight for their country. Nick professes his unconditional love for this Clairton enclave by making Michael promise never to leave him behind in Vietnam.

Cimino depicts a tight-knit ethnic community but also points to systemic problems within it. For instance, Linda’s alcoholic father beats her at the start of the film. Steven’s wife-to-be is pregnant with another man’s child. The chaos of

the wedding party at the American Legion hall brings to light chronic problems of homophobia, machismo, infidelity, spousal abuse, and alcoholism. During a hunting trip, Michael nearly comes to blows with his friend Stan (John Cazale) over a pair of boots.

The Deer Hunter mostly omits the dramatic battle sequences that were a staple of the Hollywood war film. In Vietnam, the men are immediately pitted against their North Vietnamese captors inside a POW camp. To pass the time, the Vietcong compel prisoners to play Russian roulette while the men gamble on the outcome. The scene combines gritty sets, intense close-ups, shot/reverse shot eyeline match editing, and disruptive sound effects to create what is the best-known part of the film. Given its cruel Asian villains, some critics have called Cimino’s unvaried depiction racist. The film remains concerned with the effects of Vietnam on the national psyche, seeing the Vietnamese as props rather than reflecting the complexity of the struggle itself.

Against all odds, Michael and Nick blast their way out of captivity during a head-to-head matchup. As U.S. helicopters come to rescue the three men, however, Steven breaks his legs and the friends get separated. The sound of gunfire at a Russian roulette ring soon seduces Nick, who is visibly shell-shocked and unable to find fulfillment by sleeping with a Vietnamese prostitute. The film then returns to the home front, as Michael comes back a war hero but feels a deep gulf between himself and his community. Linda’s attempts to connect with him—as a friend and, later, as a lover—prove futile. Lonely and distraught, Michael almost kills Stan, and himself, with a loaded revolver during a second hunting trip. Michael then seeks out Steven and brings him back home after he finds out that his friend (now a wheelchair-bound amputee) is living in isolation in a U.S. veterans’ hospital. Michael also discovers that Nick has gone AWOL and that he is likely sustaining himself by competing in a Russian roulette ring in Saigon.

Michael returns to Vietnam just as Saigon is falling. In the hope of saving Nick from self-destruction, he pays a French go-between to secure a match between himself and his friend. Nick, who is traumatized and in a drug haze, does not remember him. In a final recognition, Nick

repeats the phrase “one shot” and shoots himself in the head before dying in Michael’s arms.

The film enacts a final homecoming. *The Deer Hunter* begins with a wedding and ends with a wake. The scene takes place in a bar in which the community gathers for a final meal to remember Nick. The men and women sing “God Bless America” as a defense mechanism to cope with their loss and/or as a genuine statement—however complex—of heartland patriotism.

Defiant Ones, The

The Defiant Ones, a film directed by Stanley Kramer and released in 1958, is the story of two convicts who have escaped a southern chain gang and face physical challenges. This fast-paced, suspenseful film was made at a critical time in the civil rights movement, and what would otherwise be a straightforward action-adventure is complicated by the fact that one convict is white—John “Joker” Jackson (actor Tony Curtis)—and the other is black—Noah Cullen (Sidney Poitier).

From the outset, Kramer throws down the gauntlet to those who believe they can rule by fear and discrimination. Although the recent Red Scare years had resulted in the blacklisting of several hundred Hollywood personnel, in *The Defiant Ones*, Kramer himself was defiant. In the opening credits, two men playing small parts as truck drivers have their faces appear directly

above the names of screenwriters Nedrick Young and Harold Jacob Smith. These were the men’s own names, with one twist: Nedrick Young was the blacklisted Nathan E. Douglas, but he and Smith received the 1958 Academy Award for best screenplay written directly for the screen.

This theme of resistance is taken forward through the film’s technique and narrative. Beginning on a rainy night as a truck comes into view, the soundtrack plays a voice singing the lament, “Long gone. Twenty long years on a chain gang.” As the drivers complain of the noise, viewers realize the song is coming from the truck, and cutting to its interior, viewers see that the prisoners, all white except one, are being transported. It is the African American prisoner Cullen who is singing, and his shackled partner Joker retorts, “You heard what the man said, nigger, now shut up.” But Cullen is practicing the only form of resistance at that moment available to him; just like slaves controlling the working day by slowing down their singing in the fields, he is using his voice to retain freedom within his captivity.

Soon after, the truck crashes and Cullen and Joker escape. From then on the film intersperses chase scenes with quieter moments that explore not just the current impacts of volatile race relations within the United States but, more profoundly, the economic and cultural structures that created and perpetuate racism and class inequalities.

As they try to break their chains, each man has a particular goal. For Joker, it is to become Charlie Potatoes, a big shot who drives a Cadillac, wears expensive clothes, and has a beautiful woman on his arm. When he tires of trying to break the chains with a rock, he tells Cullen to take over. Cullen channels his sarcastic “yessir” into his own desperate quest for “no more ‘yessir boss.’” Each man is seeking not just to break his metal chains but also the chains society places on the disadvantaged: race for Cullen but, equally, his economic position for Joker.

Joker hates the word *thanks*. It reminds him of his years parking cars for hotel patrons when the louder he said “thanks,” the bigger the tip he received. He dreams now of being a patron himself. But when Cullen asks if he, too, could go in that hotel and is told, “yes, through the back door, so long as you’ve got a pail and mop,” Cullen retorts that Joker could go “through the front door just

long enough to collect your tip,” thus underscoring Joker’s lowly place in the class hierarchy.

If it is economics that creates inequality, *The Defiant Ones* explores the cultural forces that effect its perpetuation. Cullen objects to being called “boy,” and especially “nigger.” Joker tells him, “That’s the way it is and you’re stuck with it,” even likening their situation in society to “them swamp animals.” But Joker recognizes race and class inequalities are constructed and then naturalized through structures such as language: “You breathe it in when you’re born and you spit it out from then on.” Religion also plays its part in the naturalization of constructed inequalities as Cullen remembers going to church with no shoes but having to say “thank you, Lord” nonetheless. Evidently, he also hates to say “thanks.”

Through these discussions, and the loyalty they must practice to survive, the two men work through their prejudices. At the backwoods farm house of a lonely abandoned young wife, they break their shackles and each has a chance to escape, Joker with the woman and Cullen by train going north. But each sacrifices this opportunity to stay with their new friend, and surely the most powerful image of the film is when their hands momentarily meet as Cullen tries to pull Joker aboard the train. In the closing frames, Joker rues that they are both now “mashed potatoes,” but reflecting on their emotional journey, Cullen tells him they are “doing all right.” Despite their imminent recapture, their triumph over prejudice is their real escape.

In 1986, the film was remade for television starring Robert Urich and Carl Weathers.

Deliverance

Deliverance is a 1972 Hollywood film by British director John Boorman. Southern author James Dickey adapted his own best-selling 1970 novel into the screenplay. To convey a gritty realism, *Deliverance* was shot on location in Georgia’s Appalachia and was filmed in sequence using color desaturation. The film stems from the 1970s period of the “New Hollywood” cinema, during which filmmakers challenged the classical techniques of studio moviemaking. Its depiction of the south remains one of the most important in film history.

The Plot

The action/adventure plotline of *Deliverance* pits civilized man against an endangered, but savage, nature. The film begins by introducing four male friends from Atlanta. At a backwoods gas station, the men inquire about hiring some locals to drive their vehicles to Aintry at the end of the Cahulawassee River, which the friends plan to navigate during a weekend canoeing retreat. The film’s main protagonists are Lewis (Burt Reynolds), a muscle-bound survivalist who suggests the trip and seeks deliverance from the city to get back in touch with his primal side, and the cerebral Ed (Jon Voight), who is attracted to Lewis’s frontier spirit despite his own comfortable suburban lifestyle. Bobby (Ned Beatty), an overweight jokester, and Drew (Ronnie Cox), a cultured man who plays the guitar, round out the quartet. As a frame for the principal narrative, Boorman includes several shots of the damming of the Cahulawassee, which is being done to provide electrical power to Atlanta. Lewis condemns this modernization of Appalachia as a “rape” of nature.

At first, the men experience tension with the locals, who suspect the strangers of being in cahoots with the electrical company. In turn, the urban dwellers display condescension toward the poor farming community, particularly Bobby, who

makes fun of one person and scoffs at the “genetic deficiencies” of another. In an episode that sets the tone for urban versus rural, Drew plays a bluegrass tune with a mentally disabled boy sitting on a porch strumming a banjo. Created as a shot/reverse-shot sequence that alternates between the players trying to outdo each other, this “dueling banjos” competition—which the boy wins—is one of the film’s most iconic scenes.

Culture Clash

The action in *Deliverance* extends over four days. On day one, the friends navigate a series of rapids and encounter an immense and unspoiled wilderness that makes them feel like the early explorers of America. On day two, however, they experience the more malevolent side of nature. As Ed and Bobby paddle on ahead, they come upon two mountain men whose inbred appearance conforms to southern “redneck” stereotypes. The encounter quickly turns violent. At gunpoint, the locals tie Ed to a tree and force Bobby to remove his clothing. In the most infamous scene of the film, one of the men savagely sodomizes Bobby while beating him and forcing him to “squeal like a pig.” Through a combination of rapid editing cuts, close-ups, and the sound of faux hog squeals, Boorman depicts the mountain man raping Bobby as if to punish him for his earlier indiscretions and for his complicity in the city’s own “rape” of nature.

As the second perpetrator prepares to sexually assault Ed, Lewis surprises Bobby’s rapist by shooting him through the back with his bow and arrow. His companion escapes and the four men quickly begin discussing what to do with the corpse. A standoff ensues between Lewis (who wants to bury the dead) and Drew (who wants to abide by the law). The men eventually agree to conceal the body illegally. While fleeing the scene, a distraught Drew becomes dizzy and falls into the river just as the two canoes get caught up in a waterfall and collapse into a gorge. After gathering their senses, the men look in vain for Drew, who they believe was shot from a cliff by the escaped perpetrator. In addition, Lewis has suffered a broken leg and the mild-mannered Ed must now transform himself into the lead survivalist of the group. He scales a rock wall in search of Drew’s killer, who he fears has surrounded them and will hunt the men like animals.

On day three, Ed awakens to find an armed man hovering near the cliff’s edge. Overcoming his inability to slay a deer earlier in the film, Ed shoots and kills his target with a bow and arrow. He transports the body back down the gorge for further inspection, but the men remain unsure if it belongs to the assailant from the day before. After finding Drew’s mangled corpse downriver and sinking it with rocks (the same as the body of Ed’s victim), the men paddle successfully into Ainttry, where they fabricate an official story about their ordeal.

The film ends on day four as the police challenge the inconsistencies in the survivors’ account (and in connection with a local missing person). With no hard evidence to detain them, the county sheriff instructs the men to leave and never return. The final scene shows Ed at home with his wife and son. That night, he awakens from a nightmare in which a bloated hand resurfaces from the Cahulawassee. While reinstated into civilization, Ed is marked indelibly with a traumatic awareness of the underlying conflict between culture and nature.

Public Afterlife

Deliverance has greatly impacted the public image of Appalachia. While the film criticizes urban development, its depiction of the Georgia community as dirty, poor, backward, ignorant, and animal-like nevertheless has cemented the “redneck” stereotype in popular culture. Unflattering references to Appalachians abound in *Deliverance* and have become part of an American cultural lexicon that remains largely unquestioned: They include mental retardation, incestuous relations (a kinship that supersedes civilized law), and the subhuman existence of survivalists in the wild. This depiction has led to subsequent—and mostly less complex—representations that have reinforced the image of the degenerate “hillbilly” in the cinema.

Among these films are those belonging to the horror subgenre known as “hixploitation.” Following the pattern of culture shock established in film history by *Deliverance*, these movies feature urban protagonists who go on vacation only to be abducted by rural whites who rape, torture, and/or murder them (especially beautiful modern women). The filmmakers’ sympathies are most

always with city dwellers who, having left civilization behind, now struggle against a barbarian clan of “rednecks.” The acclaimed U.S. director Quentin Tarantino even references the rape scene in *Deliverance*, and hixploitation more generally, in his 1994 film *Pulp Fiction*. More recently, reality television shows that put the wild antics of southern families on display—from the making of moonshine to mudwrestling—are carrying the clichés into the 21st century.

Deportation (Repatriation)

Deportation is the involuntary relocation of an individual to their country of origin and citizenship. The United States expresses its sovereignty through decisions about citizenship and residency. It exercises a federal right to deport noncitizens, even long-term permanent residents.

Historically, deportation began as a method of external border control through ejection of those who did not legally enter and pass inspection. The development of numerical quotas to limit immigration and the use of deportation has been primarily politically and economically motivated. For example, the United States has viewed communism and other dissident political beliefs as threatening and potential grounds for removal. The American economy is characterized by economic fluctuations associated with scapegoating and targeting of immigrants for deportation.

History

Since the United States was formed in 1776, the nation has been through 40 economic recessions/panics, including two major depressions: the Depression of 1920 to 1921 and the Great Depression of 1929 to 1937. Economic problems do not directly drive the formation and refinement of immigration law, but negative public opinion and immigrant scapegoating in times of economic duress have made deportation a putative means of addressing the “immigration problem.” Historically, deportation has been used to control the race and nationality, political beliefs, criminality, and possible public welfare consequences of accepting individuals and groups. In the 20th century, in response to social pressures, the U.S. deportation bureaucracy has developed an additional purpose, which law professor Daniel Kanstroom views as a mechanism of post-entry social control of immigration. In the 21st century, the immigration status of undocumented aliens, including permanent resident aliens, has been increasingly subject to criminalization. Beyond the civil offense of unlawful first-time entry, the commission of specified criminal offenses is becoming a major ground for deportation.

In North America, the use of deportation to shape a colonial population began with a mid-18th-century British political decision to deport Acadians, a French population, after they took control of Nova Scotia. Many Acadians came to the United States, among other destinations. The decade of the 1790s was marked by a three-year economic downturn (the Panic of 1797–99). Responding to public concern about the economy and allowing more people to immigrate, including Acadians, the U.S. Congress passed the Alien Enemies Act in 1798, which specified that “all natives, citizens, denizens or subjects of a hostile nation . . . shall be liable to be apprehended, restrained, secured, and removed, as alien enemies.” The 1798 Alien Friends Act broadened the president’s authority to expel noncitizens perceived to endanger peace and safety or to have engaged in treasonable activity in the United States. The Alien Enemies Act and the Alien Friends Act established many of the basic principles of deportation.

There was no requirement that an order of removal be based on a specific finding; any burden of proof, including that of citizenship, was

Part of a group of 171 illegal aliens wave good-bye to the Statue of Liberty from the U.S. Coast Guard cutter that took them from Ellis Island in New York to the Home Lines ship Argentina in Hoboken, New Jersey, for deportation. At the early part of the Cold War between the United States and the Soviet Union, the 1951 Internal Security Act allowed for retroactive deportation of noncitizens politically affiliated with organizations that were considered a threat to public security, including the Communist Party.

the alien's responsibility upon receiving a removal order. All aliens were required to have a government permit. Anyone returning to the United States after removal was subject to criminal prosecution and permanent exclusion from attaining U.S. citizenship. Subsequent to passage of these laws, many French left the United States, some returning to postrevolutionary France.

Chinese Exclusion Act: The "Undesirables"

In the mid-19th century, the arrival of Chinese laborers willing to work for low wages on the West Coast produced social tension with native-born workers. The national economic stress

of the Panic of 1873 and the Long Depression prompted passage of the 1875 Page Act, which banned "undesirables" from entering the country. The law classified as "undesirable" people coming from Asia as forced laborers, women engaging in prostitution, and those considered convicts in their own countries. Next came the recession of 1882 to 1885, prompting passage of the Chinese Exclusion Act in 1882. It barred Chinese immigration for 10 years and authorized deportation of convicts, "idiots," "lunatics," and individuals who were considered unable to support themselves. This was the first federal immigration law and it established precedent for federal control

of immigration. The disposition to deport people after years of presence in the country was a move beyond border control to one of post-entry social control through deportation.

At this time, the concept of race became a criterion for structuring the deportation system. Nativistic hostility and scapegoating of Chinese laborers led to the 1882 Geary (Chinese Exclusion) Act. All Chinese immigration was banned for 10 years and deportation of Chinese immigrants present without permission was authorized. Chinese noncitizen laborers were required to register or face removal. A challenge to the Geary Act resulted in a Supreme Court decision that equated the right of a nation to prevent entry of a foreign population with a nation's right to remove foreigners from its interior.

From 1893 to 1897, recession was coupled with concerns that immigrants were connected to crime. In the early 20th century this concern began to be expressed in federal legislation. In 1907, a statute was passed to deport alien women engaged in acts of prostitution within three years of entry. In 1910, this statute was amended to remove the time limit, making it a form of post-entry social control through deportation. The recession of 1913 to 1914 was followed by federal efforts to contain immigrant crime.

The 1917 Immigration Act authorized post-entry deportation of individuals who had committed a crime of moral turpitude within five years of arrival. This law created a list of legal permanent resident aliens subject to deportation, and removed time limits for deportation in certain cases. Criminal criteria for deportation included (1) length of sentence (a sign of a crime's severity), (2) the vaguely defined "moral turpitude" criteria, and (3) the time limit of five years after entry except for the most serious crimes. Individuals sentenced for more than two crimes were subject to deportation regardless of how long they had been in the United States. The 1917 immigration law provided for recognition of pardons as a defense against removal and allowed immigration judges to override sentencing with a recommendation against deportation. Later, deportation came to be connected with the 1919 National Prohibition Enforcement Act and was used as a method of containing liquor-related crime. In addition, the 1922 Narcotics Deportation Act required

removal of any immigrant convicted of importing opium or cocaine.

Concern about political dissidence ran parallel to concerns about a connection between immigrants and crime. A 1903 law prohibited entry of persons individually opposed to organized governments or any member of an organization opposed to organized government. This law, used to target anarchists and labor union leaders, provided the basis for ideological post-entry social control.

The 1917 Espionage Act and the 1918 Sedition Act expanded the categories of political dissidents to be excluded or deported. With the onset of World War I, in 1917, "enemy aliens" were interned for acts of political disloyalty.

Postwar economic fluctuation, including increased unemployment, inflation, strikes by a radicalized labor movement, and the emerging threat of a Bolshevik Russia led to a Red Scare. A series of bombings included a 1919 explosion at the home of Attorney General Mitchell Palmer. J. Edgar Hoover, then head of the General Intelligence Division of the Bureau of Investigation, sought to identify radicals and claimed that the majority were aliens. In the so-called Palmer Raids of 1919, a mass roundup of radicals based on 6,000 warrants resulted in an estimated 4,000 arrests. The Red Scare of 1919 was a mass deportation effort in which raids were used to round up, detain, and deport political activists and labor organizers deemed to be communist sympathizers. Russian immigrants and labor sympathizers Emma Goldman and Alexander Berkman were both deported in an effort to break labor unions. These raids continued into the 1920s, and, in many cases, deportation occurred without legal counsel or the overview of a federal court.

Emergency Quotas

A post-World War I recession and the depression of 1920 to 1921 was followed by the 1921 Emergency Quota Act, which began to limit immigrant entry based on quotas from the 1910 U.S. Census, restricting entry from southern and southeastern Europe. Soon after came the 1923 to 1924 recession, followed by the 1924 Immigration Act, which renewed quotas on the southern and southeastern European populations. A numerical quota was not placed on Western Hemisphere countries

or on Mexican immigrants and sojourners. The 1924 Immigration Act eliminated statutes of limitations for overstayers and illegal entrants, making them permanently subject to removal.

A deportation bureaucracy began to develop for deportation of aliens lacking proper documents. Immigration control became a matter of enforcing the borders and finding undocumented individuals in the interior. Use of deportation laws, previously very limited, began to grow. For example, in 1920, 2,762 illegal aliens were deported; in 1925, the number rose to 9,495, and in 1929, 38,796. The head tax—a literacy test and fee for a visa—were ignored by many Western Hemisphere entrants, making them subject to deportation. By 1929, immigration criteria began to have disparate impact on Mexicans, who, according to experts, became the “iconic illegal aliens.”

Great Depression and Mexican Deportation

The Great Depression began in a climate of a war on crime related to the failure of Prohibition, nativism, and the availability of enforcement instruments, such as the Bureau of Immigration and Border Patrol. The federal government sought to “repatriate” Mexicans to their country of origin, distinguishing this removal from standard deportation practice. During this time, the repatriation action targeted Mexicans in the southwestern United States for removal, and the resultant sweep forced many individuals, families, and even citizen children back to Mexico. An estimated 415,000 Mexicans were sent back to their homeland during these years. America’s economic troubles and lack of employment discouraged Mexican nationals from coming to the United States. The rationale for deportation Mexicans was the fear that if they stayed they might become a public charge. Chief sweeps were made primarily in Texas, California, Arizona, Colorado, and in midwestern communities in Illinois, Michigan, Ohio, and Indiana.

Mexicans were under pressure to repatriate themselves voluntarily by welfare officials. Many were deported for lack of a visa. In turn, the Mexican federal and state governments were said to be offering land to returnees.

The Mexican repatriation was greatly facilitated by the participation of local governments

eager to ease school budgets and reduce the welfare rolls. In the case of Los Angeles, federal agents cooperated with police and local authorities, eventually deporting seven Mexicans out of every 10 removed. Los Angeles had a county repatriation program with repatriation trains. This was initially paid for with federal funds, but after Franklin D. Roosevelt’s election and change in funding for relief, the necessity to use county funds reduced departures sponsored by county welfare officials.

The 1940s Recession and Communist Threat

The recession of 1948 to 1949 occurred at the beginning of the Cold War between the United States and the Soviet Union. The 1951 Internal Security Act provided for retroactive deportation of noncitizen members of the Communist Party and those politically affiliated with organizations considered to threaten public security. The 1952 Immigration and Nationality Act again reduced the criteria for and degree of judicial review necessary before deportation, while establishing statutes of limitation. The recession of 1960–61 preceded the Immigration and Nationality Act of 1965, which eliminated national origin quotas but restricted Western Hemisphere immigration to quotas for the first time, increasing the potential for unauthorized entry.

The 1950s and Operation Wetback

Agricultural grower demand for Mexican workers during the postwar 1940s led to unauthorized crossings in an attempt to be part of the U.S.-Mexico Bracero program, which imported Mexican fieldworkers. A targeted deportation in the 1950s, however, was unrelated to economic cycles of boom and bust.

Although the United States continued to enjoy postwar prosperity in the 1950s, ethnic antagonism toward the increased presence of undocumented Mexican immigrants led to the U.S. Border Patrol’s 1954 “Operation Wetback” program. Concentrated in the southwest, including California, Arizona, and Texas, over 1,000 Border Patrol officers seized tens of thousands of undocumented Mexican workers from agricultural fields and Mexican neighborhoods, which led to allegations of ethnic harassment of citizens. Additional thousands of Mexicans returned voluntarily to avoid deportation.

Illegal Immigrants in the 1980s

The 1986 Immigration Reform and Control Act ended pressures on eligible undocumented immigrants subject to deportation through a legalization program. Nevertheless, this period marked an increased criminalization of illegal (undocumented) immigration. From 1988 to 1992, a recessionary period marked the beginning of adoption of more specific criminal offense criteria for deportation. The 1988 Anti-Drug Abuse Act designated drug trafficking and nonviolent drug offenses, such as possession, aggravated felonies for which permanent resident aliens could be deported after serving time in prison.

The 1990 to 1991 recession was marked by the passage of the 1990 Immigration Act, which expanded aggravated felonies to include violent offenses and money laundering. Relief from deportation was withheld if individuals were of “poor moral character.” The 1994 Violent Crime and Law Enforcement Act increased penalties for unauthorized reentry after deportation, while the 1994 Immigration and Technical Correction Act made property crimes of fraud, burglary, and theft aggravated felonies. Criminalization continued with the 1996 Anti-Terrorism and Death Penalty Act. It expanded the legal category of aggravated felonies, requiring deportation of legal permanent residents. The 1996 Illegal Immigration Reform and Immigrant Responsibility Act provided for both expansion of criminal criteria for removal and retroactivity.

Aftermath of 9/11

The September 11, 2001, terrorist attack on the World Trade Center in New York brought on a recession and social control measures, which had a major impact on both citizens and non-citizens. The USA PATRIOT Act of 2001 greatly expanded the powers of the attorney general and restructured the Immigration and Naturalization Service and the U.S. Border Patrol. They became subunits of the new Department of Homeland Security (DHS). The major DHS organizational components responsible for removal and deportation are the Immigration and Customs Enforcement (ICE) division, active in the interior, and the U.S. Customs and Border Protection (USCBP) division. After September 11, 2001, the U.S. War on Terror conducted an unprecedented

roundup of individuals targeted on the basis of nationality, ethnicity, and religion. Many immigrants with Middle Eastern and Islamic backgrounds who had overstayed visas or violated other aspects of immigration law were detained and deported.

President Barack Obama was elected after the start of the so-called Great Recession in 2008, which has been characterized by a slow economic recovery. During Obama’s first term in office, ICE has detained and deported record numbers of undocumented and permanent resident alien immigrants. By comparison, in 2003, 211,098 persons were deported. After ICE was formed, those figures jumped to 319,382 in 2007, 359,795 in 2008, 395,165 in 2009, 387,242 in 2010, and 396,906 in 2011.

Criticism of the USCBP and ICE has focused on removal of noncitizens for visa violations rather than criminal activity. From 2001 to 2011, there was a progressive increase in deportations, but visa violators with no criminal record were the main category of individuals removed. In fiscal 2011, ICE indicated that 55 percent (216,698 deportees) had committed felonies or misdemeanors. The total included 1,119 noncitizens convicted of homicide; 5,848 convicted of sexual offenses; 35,927 noncitizens convicted of driving while intoxicated; and 44,653 convicted of drug-related crimes. The vast majority of deportees have not had access to legal representation, received limited judicial review, and were given expedited removal without consideration of extenuating circumstances, such as minor children.

This unprecedented wave of deportation was reduced after 2011, when Obama authorized low-priority immigration offenders be allowed to remain in the United States and be given a work permit.

Desegregation/Integration

During much of the history of the United States, Caucasians and members descended from other ethnic groups, such as African Americans, Asians, Latinos, and Native Americans/Indians, were segregated, either by law or custom. This often caused these individuals to live in separate neighborhoods, attend different schools, use distinct commercial and professional services, and stay apart from the other groups in many ways. Beginning during the first half of the 20th century, desegregation and integration became important and related goals of the American civil rights movement. A variety of court decisions, coupled with legislative action, have worked to level barriers to association, thereby creating more equal opportunities regardless of race.

Desegregation is sometimes referred to as chiefly legal in context, while integration is largely a social matter. The term *desegregation* generally is used to refer to the disestablishment of laws and regulations forcing the separation of two or more races. The term *integration* includes desegregation, but also consists of actions undertaken toward leveling barriers to association, including steps to create equal opportunities and a more inclusive culture drawing on diverse traditions. As

the multicultural population of the United States has grown, dealing with the legacy of segregation by creating more opportunities for individuals from all backgrounds to connect, collaborate, and cooperate has become a priority for politicians, lawmakers, and policy specialists.

Background

In the aftermath of the American Civil War, Congress proposed, and the states ratified, three amendments to the Constitution to remedy some of the underlying inequities that had not been resolved by the military conflict. The Thirteenth, Fourteenth, and Fifteenth Amendments to the Constitution, sometimes referred to as the “Reconstruction amendments,” sought to rebut some of the discrimination that had been acknowledged since the decision in *Dred Scott v. Sandford*, 60 U.S. 393 (1857), which held that people of African descent who had been brought to the United States in slavery, and their descendents, were not citizens and were not protected by the Constitution.

The Thirteenth Amendment, which was proposed and ratified in 1865, abolished slavery and involuntary servitude. The Fourteenth Amendment, proposed in 1866 and ratified in 1868, contained a citizenship clause that overturned the *Dred Scott* decision, extending citizenship to all born in the United States, and also included equal protection and due process clauses that required all states to provide equal protection under law to all citizens and defined safeguards necessary to protect these rights. The Fifteenth Amendment, proposed in 1869 and ratified in 1870, prohibited any governmental entity from denying citizens the right to vote based on their race, color, or previous condition of servitude. While these constitutional amendments in theory extended equal rights to all citizens, including African Americans, in practice this was not the case, with the situation being especially difficult in the former slave states.

Despite the protections and rights afforded all citizens by the Reconstruction amendments, authorities in the southern states soon began to pass legislation and to enact policies and procedures that segregated blacks and whites. The U.S. Supreme Court, in the matter of *Plessy v. Ferguson*, 163 U.S. 537 (1896), held that state laws requiring separate but equal accommodations for African Americans and Caucasians on trains

via different railroad cars were constitutional. In *Berea College v. Kentucky*, 211 U.S. 45 (1908), the Supreme Court upheld a statute that barred a private institution from teaching black and white students in an integrated setting. The combination of the *Dred Scott* and *Berea College* rulings emboldened many legislatures, especially those in the south, to pass a variety of laws that restricted African Americans from a variety of activities.

Legislation that mandated segregation was generally known as “Jim Crow laws,” named after a blackface character made popular by Thomas Dartmouth Rice in the 19th century. Segregation of the races occurred in schools, restaurants, hospitals, the military, public transportation, and in public facilities. Segregation also existed in the northern states, but unlike that imposed by the southern Jim Crow laws, it was more frequently the result of custom and private agreements. For example, in the northern states real estate covenants often restricted sellers from contracting with buyers from certain racial and ethnic groups, and bank lending practices and discriminatory employment meant de facto segregation for practices of many African Americans.

Issues of desegregation and integration also affected Asians, Latinos, and American Indian tribes. During the 19th century, for example, Chinese workers were used to help build the transcontinental railroad, but they were not permitted to become naturalized citizens. Indeed, the Chinese Exclusion Act of 1882 banned all Chinese immigration into the United States for a decade. Severe restrictions on Asians’ freedom to come to the United States existed through the 1960s. Latinos also faced immigration restrictions for much of the United States’ history, especially after the passage of the Immigration Act of 1924, which limited the number of Latino immigrants to a proportion similar to that present in the nation at that time. Discrimination in housing, whether de jure or de facto, led many Latino children to be educated in segregated schools. American Indian tribes were faced with the taking of their land, which occurred throughout the 19th and 20th centuries, but especially as a consequence of the Indian Appropriations Acts of 1851 and 1871. After having their land taken, many American Indians were forced to live on reservations that were far from other resources and facilities.

Economic and Educational Consequences

Segregation caused tremendous harm to members of multicultural groups beyond the exclusion from equal participation in public life. Faced with few options for economic betterment in the south, millions of African Americans began what is now known as the Great Migration. Beginning in 1910, a 20-year period saw 1.6 million African Americans move from the rural south to manufacturing regions in the northeast and midwest. This is sometimes referred to as the First Great Migration in areas that saw cities, such as Baltimore, Chicago, Cleveland, Detroit, Kansas City, New York, Omaha, Philadelphia, Pittsburgh, and St. Louis, experience a dramatic increase in their African American populations. The north offered blacks better schools, economic opportunities, and less segregation than were possible in the south. Despite this, African Americans still faced discrimination, often from European immigrants

*Dred Scott was an African American slave who unsuccessfully sued for his freedom in *Dred Scott v. Sandford* (1857), which was based on his status as a slave who was a resident in free states. The U.S. Supreme Court ruled against him based on his inability to claim citizenship—and therefore bring suit in a federal court—because his African ancestry disqualified him.*

and other groups that felt economically insecure. Although laws seldom dictated this, most African Americans lived in neighborhoods that were segregated from other groups. This led to the growth in newspapers, shops, professional services, churches, and other activities aimed at and controlled by blacks. These endeavors often created a group of economic, political, social, and spiritual leaders from within the African American community.

Education was important to many African Americans, and normal schools and colleges worked to prepare teachers to work with the black community. In the 50 years after the end of the Civil War, most African Americans became literate, and black teachers often inspired students to obtain additional education. After the passage of the Chinese Exclusion Act and the Indian Appropriations Acts, many Asians and Native Americans faced grave consequences. Many Asians already living lawfully in the United States were deported, although for a while they enjoyed some success in appealing such actions in federal court. After 1894, however, Congress passed a law forbidding such relief. Many American Indians were taken from their families and enrolled in boarding schools, where they did receive schooling, although this action focused largely on forcing Native American children to renounce their language and culture.

Segregation also affected Hispanic Americans. Discrimination and xenophobia worked to create a situation where Latinos frequently felt unwelcome and occasionally were victims of acts of hatred and racial animosity. Though many Latinos had lived in what is now the southwestern United States before the Mexican-American War of 1848, many immigrated to Arizona, California, New Mexico, Texas, and other states after that date. By the 1930s, over three million Americans of Hispanic descent lived in the United States. Economic difficulties caused by the Great Depression, however, caused problems for many Latinos. Forced to live in segregated communities, Latinos often had to live in substandard housing and were offered only poverty-level wages. More than 12,000 Latinos were deported from Los Angeles to Mexico during the 1930s, despite many of them being U.S. citizens. "Redlining," a term devised by sociologist John McKnight, was

also used to prevent those living in particular, often racially determined neighborhoods from obtaining certain products and services. Banks, real estate agencies, insurance companies, and others refused to provide their services to individuals living in certain neighborhoods. These neighborhoods were overwhelmingly comprised of African Americans, Asians, Latinos, and other multicultural groups.

Early Initiatives to End Segregation

Defenders of segregation often claimed that members of various multicultural groups needed to be excluded from Caucasian society for their own protection, the theory being that this practice spared blacks from feelings of adverse sentiments and negative opinions. Such conditions continued until the advent of World War II. A. Philip Randolph, who had founded the Brotherhood of Sleeping Car Porters, the first predominantly African American union, pressed the federal government to take a leadership role in combating segregation. As a result of Randolph's efforts, in 1941 President Franklin D. Roosevelt signed an executive order prohibiting racial discrimination by companies in the defense industry supplying weapons and other materiel to the armed forces. This was the first federal action to promote equal opportunity and to forbid employment discrimination. During World War II, many African Americans, Latinos, Native Americans, and others were drafted into the armed forces, and served honorably in a variety of sites around the globe. Upon these veterans' return to the United States, many were unwilling to once again accept the restrictions of discriminatory laws. As a result, many veterans began to press for changes that would reduce segregation. In response to lobbying by Randolph and others, in 1948 President Harry S. Truman issued another executive order abolishing racial segregation in the armed forces. This action resulted in the dismantling of all-black units in the armed services, and integration of the troops was essentially complete by 1954.

Efforts to end segregation and to promote integration were not limited to the military. In 1943, singer and actor Paul Robeson addressed the Major League Baseball team owners at their annual winter meeting. Robeson beseeched the owners to end segregation and stated that they

had an obligation as stewards of the national pastime to promote integration. On April 15, 1947, African American Jackie Robinson broke the color barrier, starting a game for the Brooklyn Dodgers at first base. Robinson had a stellar season and was named Rookie of the Year. This opened the door for other players of color, and most other teams soon integrated. Robinson proved to be an iconic figure for many African Americans and starred in films, comic books, and advertisements. Before 1948, restrictive covenants permitted sellers to refuse to convey real estate unless the buyer pledged not to sell to certain groups. Restrictive covenants were used in many areas of the United States to prevent Jews, Italians, Latinos, African Americans, Asians, and other multicultural groups from moving into certain neighborhoods. Although the U.S. Supreme Court determined in 1948 that the courts could not enforce such covenants, their use persisted for decades afterward.

Civil Rights Movement

Based upon the gains seen in the military and Major League Baseball, certain organizations, such as the National Association for the Advancement of Colored People (NAACP), used the judicial system to make attacks on the Jim Crow system, racial discrimination, and segregation. After the Scottsboro Boys had been arrested for fighting with some white men on a train, they were convicted of raping two white women on the same train. Partnering with the International Labor Defense (ILD), the NAACP gained a reputation as a defender of the civil rights of African Americans. During the 1930s, the NAACP also became a leading opponent of lynching, which was still common in the south. As a result of these activities, the NAACP's membership soared in the early 1940s, growing from 50,000 to 450,000. This increase in membership permitted the expansion of the NAACP's legal department, which began to consider ways to attack laws mandating segregation.

Led by Thurgood Marshall, the NAACP legal department became involved in a campaign to reverse the separate but equal principle reached in *Plessy v. Ferguson*. Despairing at obtaining relief in state legislatures, the NAACP decided to challenge segregation on the grounds that segregated facilities were separate but not equal. In

1950, Marshall and the NAACP took up a series of cases that challenged school segregation. Two types of segregation exist: de jure and de facto. De jure segregation represents that which is mandated by law, while de facto segregation occurs as a result of human behavior and custom. In the case that ultimately became known as *Brown v. Board of Education*, 347 U.S. 483 (1954), the U.S. Supreme Court held in a unanimous opinion that state laws establishing separate schools for African American children violated the Constitution. *Brown v. Board of Education* abolished de jure segregation and paved the way for integration. While the ruling eliminated the legal justification for segregation, many state and local governments resisted the ramifications of the *Brown* case.

Although resistance to the *Brown* decision was strong, momentum grew to end segregation. Building on the success in *Brown*, many leaders from a variety of traditionally underrepresented groups continued to campaign against segregation in a variety of other settings, such as in commercial establishments, on public transportation, or as it pertained to the use of public facilities. Reverend Martin Luther King, Jr., for example, was the leader of the Montgomery Improvement Association. The Montgomery Improvement Association was a consortium of African American ministers and community leaders who sought to end segregation in that Alabama city. After Rosa Parks was arrested for refusing to yield her seat to a white passenger, King helped organize the Montgomery Bus Boycott. The Montgomery Bus Boycott lasted for over a year and resulted in the near bankruptcy of the municipal bus company. The boycott continued until segregation on Alabama's mass transit systems was ended by the U.S. district court decision in *Browder v. Gayle*, 142 F. Supp. 707 (1956). At the conclusion of the boycott, King, Parks, and others involved, such as Ralph Abernathy, formed the Southern Christian Leadership Conference (SCLC) to continue efforts at desegregation on a national basis.

In California, the Community Service Organization (CSO) was formed to address racism directed against Latinos and the discrimination they experienced. Although many immigrants from Mexico and other Spanish-speaking countries had worked in the southwestern United

States for decades, they had often faced segregation and other consequences from racism. The CSO worked during the 1950s to file lawsuits halting desegregation, increase voter registration among Latinos, offer citizenship classes, and push for political change. CSO initiatives launched the careers of many influential Latino activists, including César Chávez (founder of the United Farm Workers union), Congressman Edward Roybal (first Latino elected to Congress), and Hector Tarango (attorney who won the first U.S. desegregation case).

This change in attitudes culminated in the passage of the Civil Rights Act of 1964, which outlawed major forms of discrimination based on race, ethnicity, gender, religion, or national origin. The act also ended disparate voting registration requirements. The passage of this legislation, coupled with the Fair Housing Act of 1968, effectively meant desegregation was a reality, as those who objected to behavior that resulted in segregation could challenge it in court. As the number of Latinos in the United States increased after 1965, some school districts attempted to exclude the children of undocumented workers. Although popular with certain segments of the population, such actions were ultimately challenged in the courts. The U.S. Supreme Court in *Plyler v. Doe*, 457 U.S. 202 (1982), declared a Texas statute that prohibited state aid being used to educate the children of undocumented workers unconstitutional on grounds that it constituted discrimination based on immigration status. Despite this ruling, however, during the 1990s many state and local governments prohibited undocumented college students the right to use in-state tuition rates or other forms of financial assistance granted other residents.

Integration

While desegregation was the legal remedy to segregation, integration was and is a more amorphous concept that refers to the elimination of barriers between groups, the availability of equal opportunity, and the creation of a culture that draws upon a variety of diverse traditions. Because integration is a social concept, consensus as to what constitutes this is more difficult to obtain. Integration can occur only after desegregation happens, and a variety of American

institutions have struggled to become integrated since the passage of the Civil Rights Act.

In a nation such as the United States, with a long history of de jure segregation, the mere ending of laws and practices that mandated separation of different races was not enough to ensure integration. Most children in the United States attend neighborhood schools, that is, the school that is located the nearest to their place of residence. Because many Americans live in neighborhoods that, as a result of laws or custom, are segregated, this results in segregated schools regardless of laws mandating desegregation. As a result, a variety of ways have been explored to better integrate schools and other organizations, albeit with mixed results.

Private and public schools, colleges, and universities that draw students from a broader geographic area can use affirmative action policies, scholarships, and other tools to recruit a more diverse and integrated student body. Affirmative action policies are those that take a variety of factors into account in order to obtain a student body, workforce, or other group that better reflects the diverse nature of the general population. Affirmative action is usually warranted as a result of past segregation. Although often effective, affirmative action is often unpopular with members of the majority population, who sometimes challenge affirmative action policies in court, alleging reverse discrimination. Another response to a lack of integration in public schools has been the use of forced busing, although this was more popular during the 1970s and 1980s than it is today. Some forced busing programs are initiated by a school district's administrators who are seeking to create a more diverse student body than that which would exist if schools relied on neighborhood children only. Other busing plans have been ordered by courts as a way to remedy past segregation.

In *Swann v. Charlotte-Mecklenburg Board of Education*, 402 U.S. 1 (1972), the U.S. Supreme Court considered whether busing was a remedy to deal with the effects of segregation. Charlotte-Mecklenburg, a school district in North Carolina, had segregated students by race until desegregation was ordered by a court in 1963. In the years following desegregation, the Charlotte-Mecklenburg schools failed to become integrated

because housing patterns in the region resulted in segregated schools if children were left in their neighborhood establishment. After a challenge from the NAACP, the U.S. District Court for the Western District of North Carolina determined that a desegregation plan was necessary to obtain integration.

To that end, the district court ordered that elementary schools serving predominantly black and white students be paired and grouped, and a number of students would be bused so that individual schools' racial composition more accurately mirrored that of the district as a whole. Although busing was used in many regions, it proved highly unpopular, with many white parents withdrawing their children from public schools or moving to avoid it.

Desilu Productions

Desilu Productions was a television and film production studio cofounded in 1950 by husband-and-wife team Desi Arnaz and Lucille Ball. The studio is best known for hit television productions like *I Love Lucy*, *The Untouchables*, *Star Trek*, and *Mission Impossible*. Arnaz's business acumen, vision, and innovation built the couple's Desilu empire. They owned Desilu until their divorce in 1960 when Arnaz sold his shares to Ball, who became the first female president of a major studio. Ball sold Desilu in 1967, which still operates today as CBS Television.

Desilu Productions is closely connected to and reflective of the careers, marriage, and divorce of Desi Arnaz and Lucille Ball. The couple met while filming *Too Many Girls* in 1940 and were married on November 30, 1940. Ball was an established movie actor in Hollywood known as the “queen of B-movies,” while Arnaz was an established musician, band leader, and actor, whose acting career was hindered by his Cuban accent. During the first year of their marriage, they were apart with busy careers, which led them to form Desilu Productions to handle their business affairs and appearances on stage, screen, and radio.

I Love Lucy

It is impossible to separate Desilu Productions from the success of *I Love Lucy*. Desilu and *I Love Lucy* finally gave the Arnazes the opportunity to work together, which they longed to do. *I Love Lucy* debuted on October 15, 1951. American audiences and the new genre of television embraced the comedy of *I Love Lucy*—her hijinks and how they played off her on-camera Cuban husband, Ricky Ricardo, and their neighbors Fred and Ethel Mertz. Arnaz's exaggerated

Cuban accent, which had been a detriment in his earlier acting career, delighted audiences in his role as Lucy's long-suffering foil.

The production performed like a play, filmed once and capturing live audience reaction. Other innovations included mirroring the changing American middle-class landscape, such as depicting a Cuban husband with an accent, the baby boom, post-World War II consumerism, and the great suburban migration. In particular, the show depicted Lucy's real-life pregnancy on-camera, which was previously considered a television taboo. With more Americans owning television sets, audiences identified with and shared in the on-camera lives of the Ricardos, which mirrored to a great extent the Arnazes' real-life personas.

Desilu Productions created several key technical innovations during the *I Love Lucy* production that are still used today. They include using a three-camera technique (with wide, middle, and close-up shots), filming before a live studio audience, creating lighting for multiple cameras, and usually completing a scene in one take.

Tapping Into the American Dream

Off screen, Arnaz proved to be a savvy businessman and negotiated with CBS for the rights of the show and its films in exchange for a \$1,000 weekly salary to pay for production costs and ensure high-quality tapings of the show. CBS agreed, believing it was a bargain. However, the rights to the films proved wildly lucrative, and as a result, Arnaz is credited to giving birth to television reruns and syndication. Arnaz sold 179 *I Love Lucy* episodes to CBS for \$4.5 million. CBS also paid Arnaz and Ball \$1 million for exclusivity as CBS performers for 10 years following the sale.

In 1954, the Arnazes bought Motion Picture Center Studios in Hollywood for \$750,000. Three years later, they bought RKO Studios for \$6.15 million, which included RKO's film production lots in Hollywood and Culver City, with 26 soundstages. With their acquisitions, Desilu Productions totaled 35 soundstages, four more than MGM and 11 more than Twentieth Century Fox. The Arnazes renamed the studios Desilu Gower, Desilu Culver, and Desilu Cahuenga. Desilu operations produced their own films, as well as making films for other producers and providing rental studio space. On December 3, 1958, the company

held an initial public offering and used the proceeds to pay off a portion of the RKO acquisitions. By 1959, 26 television series were produced and filmed at Desilu Productions.

Desilu was a publicity machine and encouraged the image and familiarity with the Arnazes of real life and the Ricardos of TV. All employees were a part of the "Desilu family" and were celebrated during the annual company picnics. Desilu started with seven employees and grew to nearly 1,000 in over five years. Family and friends said that Arnaz and Ball were the happiest when they were working together on *I Love Lucy* or dealing with business at Desilu.

Desilu Playhouse was the company's most ambitious series that included a package of 48 episodes from 1958 to 1960. Notably, it included the pilot for *The Twilight Zone* and several episodes of *The Lucille Ball-Desi Arnaz Show*, later called *The Lucy-Desi Comedy Hour*, in which they reprised America's favorite family, the Ricardos. This new *Lucy* show format went from *I Love Lucy*'s 30-minute episodes to a one-hour special that featured guest stars. At its peak, Desilu was the leader in the industry for television and film production, followed by Revue and Screen Gems. Ball always credited her husband as the business mastermind behind building their Desilu empire.

End of an Era

The success of Desilu Productions translated into professional pressures and marriage problems for the Arnazes. The more successful they became professionally, the more their marriage deteriorated. The last *Lucy* episode was filmed on March 2, 1960, on Arnaz's 43rd birthday; the very next day, Ball filed for divorce. In 1962, Arnaz resigned as president of Desilu Productions and Ball bought out his shares, becoming the first woman president of a major studio. Ball continued to run Desilu successfully until 1967, when she sold it to Gulf+Western, who renamed it Paramount Television (now CBS Television Studios).

Día de los Muertos

Día de los Muertos (Day of the Dead) is a national holiday in Mexico that is celebrated by many Hispanics in the United States and by many others throughout the Americas and other parts of the world. This time set aside for honoring the dead is now celebrated on the same date that Catholics celebrate All Saints Day (November 1) and All Souls Day (November 2). The celebration is thought to have originated in indigenous celebrations in Mexico that existed prior to European influences.

Origins of Día de los Muertos

Before the arrival of Europeans the Aztecs had a monthlong celebration at the end of summer, at the time of the corn harvest, related to their goddess Mictecacihuatl, who was considered closely related to death. She was thought to guard the bones of the dead. The celebration sought to recognize the continuity between those living and those who had died. It was seen as a time to celebrate the lives of those who had died. The lives of deceased children were observed first, followed by deceased adults. Skulls were used in the festival.

Ancient Mesoamericans were agrarian and depended upon the fertility of the soil. Their belief system, as well as that of many other groups, held that departed souls were partially responsible for crop production. The festival to honor the dead, held during harvest time, was at least one effort to ensure the continued production of crops. Generous offerings of food were given to departed people as a way to prepare for a bountiful harvest. As is the case with today's celebration, the ancient people of Mexico did not view death as a finality.

The interaction of the living and the dead was symbolized in the carrying out of this celebration.

When the Spanish conquerors entered Mexico, Catholic priests accompanied them to seek to make Christians of the indigenous peoples. They sought to eliminate practices that were contrary to Catholic teachings. The monthlong celebration devoted to a goddess of death and offering sacrifices to the dead were seen as practices that had to be stamped out. However, Catholics found the practices deeply ingrained in the culture and were not able to wipe them out. But there were enough parallels between this indigenous celebration and the Catholic All Saints Day and All Souls Day to enable the church to Christianize the pagan practices and fit them within the celebration of these two Christian holidays. Both Catholic holidays had to do with the dead. All Saints Day involved praying to saints, and All Souls Day was a time for praying for the deceased in purgatory.

Practices of Día de los Muertos

The celebration is based on the belief that the dead are able to visit the world of the living for a 24-hour period during this time. Children are thought to visit on November 1 and adults on November 2. During this period, death is conceived less grimly and there is an effort to joyfully celebrate the temporary return of the spirits of the deceased. In Mexico public observances, like parades and street parties where people dress as skeletons, have been encouraged to promote tourism. Private celebrations have needed no encouragement.

In Mexico the practices of Día de los Muertos vary from place to place. Also, the customs in other Latin American countries are not uniform. However, there are common characteristics of the celebrations. There are public and private celebrations. Families will often clean and decorate the graves of the deceased. Food and drink that the dead person enjoyed will often be made available at the grave site. Food will be shared among those in the graveyard, and there is fellowship among the families gathered there. Candles are placed on the grave to guide the spirits back to their proper places. Marigolds are often used to decorate, as these flowers have special significance for the dead. Incense is burned. Photos are also placed around the grave. The symbol of the skull is

In Mexican folk culture, the catarina symbol, a skeleton of a high-society woman, is one of the most popular figures in the Día de los Muertos (Day of the Dead) celebration, which focuses on prayer and remembrance for dead friends and family members. It is a Mexican national holiday, with many communities in the United States holding similar celebrations.

closely associated with the celebration. Candy in the shape of skulls is seen throughout the festival. The name of deceased persons is often written on the candy before it is consumed. *Pan de muerto*, or bread of the dead, is commonly seen during the celebration. This bread has decorations that resemble bones and is eaten in memory of the deceased. The bread is often seen in the period leading up to the celebration.

Home altars are a part of the festival. Families are generous in providing their altars with food, drink, and objects meaningful to the deceased members of the family. Copal is a resin from a tree that grows in Mexico; this is the incense that is burned on altars. The dead spirits are said to be drawn to the altar by the smell. Salt for purification and water for quenching the thirst of spirits are provided on the altar. Water basins are available for the spirits to use for cleaning themselves.

Día de los Muertos in the United States

In the United States, the practice of the Day of the Dead was given prominence in California as the Chicano movement sought to instill pride in Hispanics in California and in other locations. Art and festivals were important to the growth of the practice in the United States. As more Hispanic immigrants moved to the United States, the practice of Day of the Dead followed these newcomers to various parts of the country.

As more cities boast a large Hispanic population, Day of the Dead celebrations have spread. In San Francisco, the large Latino and strong arts communities stage a major event on November 2. Artists and others build altars to put on display. A candlelight procession is joined by those wishing to honor the dead. One of the largest events takes place in Los Angeles' Hollywood Forever Cemetery. This event, for which there is an entry fee, truly takes the form of a festival.

Día de los Muertos celebrations provide a source of cohesiveness for Hispanics from diverse backgrounds who have made their home in the United States. While the customs might be different from the ones they were accustomed to in their homelands, there is enough familiarity for people to join in. For many, the event can turn out to be more about fellowship with the living than with the dead.

Día de los Reyes Magos

The Epiphany of the Wise Men—or Día de los Reyes Magos, as it is known in Spanish—is celebrated on January 6 of each year as one of the three epiphanies narrated in biblical scripture. The most celebrated epiphany is that of the Wise Men (formerly known as the Three Magi), as narrated in Matthew 2:1-12. Matthew is the only one of the four Gospels to mention the three wise men, identifying them as foreign individuals arriving from the east. The use of the appellation magi to name them appears to have started in Italy during the Middle Ages.

The Story

Upon receiving the good tidings of the birth of Jesus, Gaspar, Melchior, and Balthazar traveled from the east to offer three symbolic gifts: gold, incense, and myrrh. It is probable that the number and richness of gifts led in time to the assumption that they had been three in number, as well as kings. According to tradition, when Jesus was born in Judah, in the days of King Herod, three Wise Men arrived from the east, guided by a star. On their way to Bethlehem, the Wise Men were warned by a dream that King Herod wanted to kill the child. Upon arriving in Bethlehem, they discovered the child with Mary, his mother, and they rendered homage unto him. Later traditions have established the Wise Men's number at more than three. In time, more symbolism became attached to the legend; for example, the Wise Men became represented in art by different races and ages, to encompass all the ethnicities and ages of men.

Latin America Observance

Día de los Reyes traditions were established early in many main colonial cities built by Spanish

conquerors. There are historical chronicles and art depicting the Adoration of the Magi from South America to Mexico. Although the celebration was popular for centuries, the traditions have given way in importance to others in most Spanish American regions and institutions that preserve the holiday rituals. Ring-shaped cakes known as *rosca de reyes* (Kings' Cake) are baked with a figurine of the child Jesus and eaten on this day. The person who finds the figurine is crowned or blessed.

United States Celebration

Epiphany, also known in different communities as Twelfth Night, Three Kings' Day, or Día de Reyes, has also found expression in the United States, where it is celebrated in Mexican American and some Caribbean communities, as well as in the former French colony of Louisiana and in some Protestant communities.

Inevitably, the Epiphany celebration would adopt local customs and mores across the United States and today still plays a significant role in intercultural community celebrations. In the U.S. Virgin Islands, the day is commemorated as a public holiday, where it maintains a Latin American flavor. It is celebrated expansively in the island of St. Croix, where lively processions and parades take place. In Louisiana, a former French Catholic colony, Three Kings' Day starts the Mardi Gras season, and a version of Kings' Cake, similar to the one enjoyed in Mexico during this holiday, is baked from Epiphany Day until Mardi Gras. In Puerto Rico, children and adults participate in the celebration of the Feast of Kings, which includes live music on the feast day, and children open gifts that are placed under their bed on the eve of the holiday. For many Protestant churches, a holiday is celebrated as a period of time rather than as a single holy day. Thus, in some Protestant traditions, Epiphany extends from Twelfth Night until Ash Wednesday, which marks the beginning of Lent.

Diaspora

From the Greek verb *diaspeirein*, “to spread about,” the word *diaspora* means dispersion or scattering. Classically, the term referred specifically to the scattering of Jewish populations from various countries that nevertheless maintained an attachment to their homeland. Beginning in the 20th century, however, the definition has shifted: It has come to mean compulsory expulsion of numerous populations, whether for economic, social, political, or other reasons. Some scholars also use it to simply communicate migration, without any sense of force or duress. In the last 15 years or so, it has become more popular to use this concept as a lens of analysis in literary studies and other fields within the humanities and social sciences. Discussions of diaspora now call forth such terms as *hybridity*, *creolization*, *syncretism*, *fragmentation*, *fluidity*, and *transnationalism*, among others. The Americas have been the destination of many diaspora groups.

Jewish Diaspora

The dispersal of Jewish populations throughout history has often been cited as a classic example of diaspora. Its origins in recorded history begin with the destruction of the Temple in Jerusalem and the Babylonian conquest of the kingdom of Judah in the 6th century B.C.E. by Nebuchadnezzar and his military forces. For decades, Jewish communities existed outside Judah, in the Babylonian Empire and Egypt; though there was a return to the capital of Jerusalem under the leadership of Persian ruler Cyrus the Great, who allowed the reconstruction of the Temple, “Babylon” became

a metaphor for exile within Jewish religious and secular texts, and the exilic experience has been recorded in the Hebrew Bible. Despite the opportunity to return, many Jews remained in the settlements that had been established outside Judah; with the ability to retain their language and culture, these populations thrived in what is today Iraq. Centuries later, the Temple was destroyed for a second time in the 1st century C.E., when Jerusalem was under the Roman Empire. In the following century, Roman soldiers crushed Jewish independence movements and the name of the state was changed from Judea (what had formerly been Judah as well as Samaria) to Syria-Palestine.

In subsequent centuries, the rise of Jewish communities throughout the Asian, African, and European continents under various powers (first empires and later nations) meant populations that acclimated to the cultures that surrounded them; they therefore developed different ethnic identifications, such as Sephardi, Ashkenazi, and Mizrahi. Nevertheless, there remained identification with a Jewish homeland, the capital of which was Jerusalem.

Jewish migration to the Americas began at the conclusion of the 17th century. Fleeing the persecutions of the Spanish Inquisition that began in the 15th century, many were forced to convert to Catholicism (*conversos*) or migrate to other European nations such as Britain, France, and the Netherlands. Some moved to Spanish and French holdings in the Western Hemisphere; there remain small communities throughout the region, including in Curaçao, Cuba, the Dominican Republic, and Jamaica, among other islands.

In the 19th and 20th centuries, there was large-scale migration to the United States, Argentina, and Brazil. As a result of pogroms in the Russian Empire, more than two million fled to the United States in the late 19th and early 20th centuries. In the same time period, Argentina encouraged Jewish immigration as a means to increase the general population and cultivate large swaths of land, resulting in the creation of the largest Jewish community in Latin America. In the aftermath of the Holocaust, hundreds of thousands of survivors migrated to North America. Today there are more than five and a half million men, women, and children who claim Jewish heritage throughout the Americas.

African Diaspora

The dispersal of peoples from the African continent to Europe, Asia, and the Americas has occurred for millennia, due primarily to trade and warfare. The most common usage of the term *diaspora* in relation to the Americas refers to the Middle Passage, the sale and transport of enslaved Africans and their descendants that began in 1501, shortly after Spanish colonization efforts in Hispaniola. Although the transport of enslaved men and women from western Africa to the Americas ended in the 1860s, slavery itself ended in 1888 in Brazil, only a few short years before the start of the 20th century. In the 400-year history of the slave trade, it is estimated that 1 million to 2 million people died, and over 12 million Africans survived the transport to the Americas, only 5 percent of whom (600,000) landed in the United States, in ports such as Newport, Boston, New York, and Charleston. The remainder of these men and women, almost 12 million, were transported to the French, Spanish, and Portuguese holdings south of the 13 colonies. They passed through important ports such as Galveston, New Orleans, St. Augustine, Havana, Port-au-Prince, Cartagena, Salvador da Bahia, and Buenos Aires.

Throughout the Americas, there was a strong demand for labor; as the indigenous populations died as a result of warfare and disease, there remained the mandate for cheap labor. While the great majority of the enslaved worked on sugar plantations throughout the Caribbean and South America, they also worked in the harvest of cotton, coffee, tobacco, and cacao. They were also integral in the mining of gold and silver. Living conditions were devastating, and tens of thousands died annually, resulting in the continued refreshment of the inventory of the enslaved. The United States was the only country in the hemisphere to succeed in developing a system whereby the domestic population was successfully reproduced, thereby allowing for the maintenance of slavery even after the British ended the transport of slaves in 1808. Other countries such as Cuba and Brazil continued to import enslaved men and women, in the case of Brazil, well into the 1860s.

After the slave revolts and subsequent independence of Haiti, tens of thousands of landowners and their enslaved workers moved to Louisiana, itself a former French colony. The Haitian

Revolution impacted the hemisphere remarkably, as the cultivation of sugar moved from that island to Cuba and Brazil, most notably. In the same period, the Spanish colonies of the South American continent rebelled against their Mother Country; enslaved men were granted opportunities for freedom should they fight in the rebel armies, which they did in the first two decades of the 19th century.

The abolition of slavery occurred in stages in the Americas: the British Empire ended this practice throughout its colonies in 1833, and the French followed suit in 1845. The United States formally ended slavery in 1865 following its Civil War with the passage of the Thirteenth Amendment to the Constitution. Slavery ended in Puerto Rico in 1873 and in Cuba in 1886; the end of slavery in these last two colonies of Spain was an element of the fight for independence from Spain, which was not gained until 1898. Brazil was the last country in the Americas to end slavery, in 1888; the recipient of the greatest number of enslaved African men and women, Brazil remains the site of the greatest number of people of African descent outside Nigeria, the most populous African country.

In the years following the formal end of slavery, millions faced racist discriminatory practices as they fought to gain all that had been promised them as citizens of these nations of the Americas. Today, over 200 million people self-identify as being of African descent throughout the Americas; tens of millions more deny such a claim, a testimony to the legacy of racial discrimination and prejudice that continue to affect employment, education, law enforcement, citizenship, housing, and health services.

Irish Diaspora

While there were hundreds of thousands of men and women of Irish heritage in the 13 colonies in the 18th century, this population was mainly comprised of the Scots-Irish of Ulster, Presbyterians, and other Protestants who had little trouble assimilating in the Protestant colonies of the British Crown. More often, references to the Irish diaspora apply to subsequent migrations that occurred a century later, resulting in great part from the potato famines of the 1840s. This movement in the middle of the 19th century resulted

in the flight of millions of Irish men and women to the Americas, as more than 1 million died in Ireland itself. More than 5 million migrated to the United States alone between 1820 and 1920.

Whereas the earlier Irish immigrants were Protestant, this group was largely Catholic, arriving in a predominantly Protestant United States. In comparison with other groups, the Irish were the greatest in number to arrive in the United States in the 1840s. Destitute and faced with rampant anti-Irish, anti-Catholic sentiment, many came to find work in canal building, construction, and mining.

Unlike the Irish settlers of the 18th century, who put down roots in the frontier lands of Pennsylvania and Virginia, those of the 19th century lived in urban centers: Boston, New York, Chicago, among other cities. In the Irish, business owners found a relatively inexpensive source of labor, in comparison to the enslaved population of African Americans. This opinion was shared throughout the Americas, as the Irish immigrated not only to the United States but also to all of the Americas, including Canada, Argentina, Cuba, Puerto Rico, Uruguay, and Brazil, among other places. In these Spanish- and Portuguese-speaking nations, Argentina attracted the largest number of Irish immigrants, with 45,000–50,000 arrived there from 1829 to 1929. It is estimated that at least half of that number went on to settle in other countries, including the United States; nevertheless, today up to half a million Latin Americans are of Irish heritage, whereas in the United States, approximately 40 million are of Irish descent.

South Asian Diaspora

In the aftermath of the abolition of slavery throughout the British Empire in 1833, the British established a new source of cheap labor for all of their holdings: men from one of the empire's largest colonies, the Indian subcontinent. One destination for these workers was the English- and French-speaking Caribbean, where they were meant to replace the newly freed African laborers on sugarcane plantations. Though theoretically more humane than slavery, indentured servitude often replicated poor living conditions experienced previously by the enslaved. Contractually obligated to work for five years (the one critical difference between indentured labor and African

slavery), these men were barred from leaving the premises and paid a shilling a day, with sums withheld for the provision of food and other supplies. Between the arrival of the first ship carrying these laborers to Guyana in 1838 and the end of the indentured labor system in 1916, more than half a million men traveled to the Caribbean. At the end of the contract, rather than sign on for another five-year term or return to India, many decided to remain on the islands, recipients of land grants offered by the colonial governments. Known as "coolies," they continued to contribute to the economies of these islands, becoming an integral part of a middle class, as shopkeepers and owners of other businesses. Today, their descendants make up a significant part of the populations of many Caribbean islands such as Trinidad and Tobago, Guyana, and Jamaica.

Indians migrated to the North American continent at the turn of the 20th century, often to replace Chinese labor, first in Canada (a part of the British Empire) and then in the United States. Immigration was kept at low numbers in the United States for much of the 20th century because of anti-Asian sentiment, especially on the West Coast. With the Immigration Act of 1965, more Indians were allowed into the country, as the United States sought skilled labor: doctors, engineers, and scientists. As previously established restrictions were eased, these immigrants were allowed to bring their families with them and establish residency in the country. In addition, workers of Indian heritage from the Caribbean and east Africa also arrived in the United States in larger numbers. With the creation of the new H1-B visa in 1990 allowing for the temporary hiring of non-U.S. laborers in such occupations as engineering, science, and information technology, more highly skilled workers continue to arrive in the country. After multiple waves of migration throughout the 20th century, today there are almost three million men, women, and children of Indian descent in the United States.

Chinese Diaspora

Beginning in the 1840s and 1850s, Chinese laborers were recruited to work throughout the Americas; tens of thousands of contract workers left China with visions of beginning new lives. Between 1849 and 1874, more than 125,000 men arrived in Cuba, the majority of them from Fukien

Province. Also known as “coolies,” these men were meant to supplement the labor provided by enslaved Africans on sugarcane plantations. They were contracted to work for eight-year terms, paid one peso a week, and provided with food, shelter, and medical attention, with holidays free. While they were legally distinct from their enslaved counterparts, in reality, they suffered much of the same mistreatment, with many dying from malnutrition, beatings, or suicide. In the same period, more than 100,000 Chinese laborers arrived in Peru to work the guano fields, as well as the cotton and sugar plantations, as a means by which to end the labor shortage there. They worked alongside Africans, indigenous, and mestizo workers in severe conditions similar to those faced by their countrymen in Cuba. In Panama, laborers worked on the Panama Railroad, linking the Atlantic and Pacific Oceans and completed in 1855. Afterward, they settled there, opening businesses across the country.

Chinese laborers traveled to California in large numbers after the discovery of gold there in 1848s; they worked as miners, suppliers, and performed unskilled labor. They also worked on the railroad in the United States; hired by the Central Pacific Railroad Company, they made up more than 90 percent of the workers. Charged with laying the tracks, they blasted mountains and excavated tunnels through the Sierra Nevada. By 1880, over 100,000 Chinese men lived in the United States, involved in a number of industries, including agriculture, fishing, and manufacturing, among others. Today there are more than seven million men, women, and children of Chinese descent throughout the Americas.

Caribbean Diaspora

Throughout the 20th century, there were a number of migrations to the continental Americas from the Caribbean. Between 1900 and 1930, almost 1 million laborers from the British and French West Indies (Jamaica, Barbados, Guadeloupe, and Martinique) as well as Haiti migrated to the Spanish-speaking Americas. Cuba, Venezuela, and Panama received the highest number of workers. In Cuba, there was work to be found on the sugar plantations, a large contributor to the national economies of these countries. In Venezuela, newly discovered oil fields provided an opportunity for employment;

then, as now, oil was a natural resource that called for a steady stream of manual labor. In Panama, men found work in the construction of the largest infrastructure project of the era, the building of the Panama Canal connecting the Pacific and Atlantic Oceans. The canal would facilitate the faster transportation of goods in this hemisphere, thereby cutting the costs for trade.

On the Caribbean coasts of Panama, Costa Rica, Nicaragua, and Honduras, West Indians found work on the banana plantations as well as in railroad construction. During the same time period, there was a great migration within the island of Hispaniola as sugar plantations expanded at the end of the 19th century, leading to greater demand for workers. By 1935, more than 200,000 Haitians had crossed the border dividing the island. In all of these countries, migration was spurred by a need for cheap labor in diverse industries, many of which were dominated by U.S. firms such as United Fruit Company in the banana industry, Standard Oil in the oil industry, and the Panama Canal Company.

Whereas Central America and the Spanish-speaking islands saw an expansion of the banana and sugar industries, the British and French West Indies saw a collapse in their own, and so the supply of workers increased dramatically toward the end of the 19th and the beginning of the 20th centuries. During this time, between 1899 and 1935, more than 140,000 West Indians emigrated to the United States, settling in Florida, New York, and Massachusetts; in contrast to many of their countrymen emigrating to Spanish-speaking countries of South America and the Caribbean, these men and women were often better educated than their counterparts and even better educated than the U.S. native-born population. They contributed greatly to the growth of a black middle class in the United States, as a good number were doctors, lawyers, writers, activists, and other professionals. This generation of migrants gave birth to public figures such as Cicely Tyson, Malcolm X, Shirley Chisholm, Audre Lorde, and Colin Powell.

As the century rolled on, various Caribbean islands saw great economic and political instability, which was a leading contributor to continued migration. Though Puerto Ricans had lived in the continental United States since the late 19th century, when they and their Cuban brethren had

organized independence efforts against the Spanish Empire, it was not until the 1940s that the United States, New York especially, saw tens of thousands of Puerto Ricans arrive in search of work. This immigration peaked in the 1950s and 1960s, when more than 500,000 Puerto Ricans left the island. Industrialization efforts on the island in the form of Operation Bootstrap had left agricultural workers without work. This migration was facilitated by the fact that since 1917, Puerto Ricans were U.S. citizens, and so there was relative ease in making the move.

In the aftermath of the Cuban Revolution of 1959, tens of thousands of upper- and upper-middle-class Cubans fled to the United States; over 20 years later, in a five-month span, from April to September 1980, more than 125,000 Cubans arrived in Florida from the Cuban port of Mariel, in the Mariel boatlift. Dominican migration to the United States peaked in the decades following the assassination of Rafael Trujillo, the dictator who ruled the island for over 30 years, in 1961. In the aftermath, hundreds of thousands of men, women, and children, migrated primarily to the northeastern United States in the 1960s, 1970s, and 1980s. During the same period, Haitians fleeing the dictatorships of the Duvaliers (François “Papa Doc” [1957–71] and Jean-Claude “Baby Doc” [1971–86]) made their homes in the United States, Canada, the Dominican Republic, and the Bahamas. Today there are more than 10 million men and women of Caribbean heritage residing in the United States alone.

Different Mirror, A

First published in 1993, *A Different Mirror: A History of Multicultural America* represents one of the earliest attempts at a comprehensive history of the United States that spotlights the sociohistorical experiences of Native Americans, African Americans, Asian Americans, Latinos, Jews, and other ethnic minority groups. Written by Ronald Takaki (1939–2009), a renowned Japanese American scholar, this classic work aims to counter the traditional white-Anglo-Protestant bias that characterizes most textbooks' narrative of U.S. history and the "American experience."

A Different Mirror earned an American Book Award in 1994 for outstanding literary achievement. A second edition, which briefly mentions in the final chapter President Barack Obama's diverse heritage and its influence on discourses of race in American society, was released in 2008.

Ronald Takaki: Life and Legacy

The grandson of Japanese immigrants, Ronald T. Takaki was born in Honolulu, Hawai'i, on April 12, 1939. Takaki's grandfather ventured to Hawai'i in 1886 seeking employment in the local sugarcane fields. Takaki's father died when Ronald was 7 years old; afterward, his mother and Chinese stepfather raised him. An avid surfer, Takaki expressed little interest in academics until a high school teacher encouraged him to attend

college. Takaki enrolled at the College of Wooster in Ohio, graduating with a bachelor's degree in history in 1961.

As one of only two Asian American students at Wooster, Takaki immediately realized others' perception of him as an "outsider" on the American mainland. One of the most profound experiences that fostered Takaki's interest in ethnic studies occurred when one of his professors asked him how long he had lived in the United States and where he had learned to speak English. After informing his professor that he was from Hawai'i, his professor continued to question Takaki on how long he had lived in the United States. Takaki understood that his name and physical appearance marked him as "not American" to mainstream society, which lacks an awareness of the existence and experiences of marginalized groups.

Ronald Takaki authored *A Different Mirror: A History of Multicultural America*, which examines minority perspectives in the United States. The work highlights various ethnic groups, incorporating quotes, folk songs, letters, photographs, and telegrams. The theme of "us against them" is woven throughout.

Takaki went on to earn a master's degree in history at the University of California, Berkeley in 1962 and a Ph.D. in history (also at Berkeley) in 1967. His dissertation focused on the history of U.S. slavery. The University of California, Los Angeles (UCLA), hired Takaki in 1967 to teach the university's first African American history class. After leaving UCLA, Takaki joined UC Berkeley and taught in its recently established Ethnic Studies program. He chaired Berkeley's Ethnic Studies department from 1975 to 1977 and was instrumental in designing the nation's first Ph.D. program in Comparative Ethnic Studies during the early 1980s. Takaki also played a critical role in the establishment of the "American cultures" general education requirement, which required all students to take a course focusing on ethnic and cultural diversity. This is now a standard requirement at many colleges and universities nationwide.

A prolific writer, Takaki authored more than 20 books and journal articles throughout his career. The White House asked Takaki to advise President William Jefferson Clinton on his major initiative on race in 1997. A major proponent of multicultural education, Takaki garnered numerous awards throughout his career, including honorary doctorates from seven institutions and the Lifetime Achievement Award from the Association for Asian American Studies in 2009.

A Different Mirror

Takaki begins *A Different Mirror* with a vignette that reveals his rationale for writing the book, discussing an experience that occurred on a flight from San Francisco to Norfolk, Virginia. After hailing a taxi en route to a conference on multicultural education, the white cabbie complimented Takaki for speaking "excellent" English and asked him, "How long have you been in this country?" Takaki's response, informing the driver that he was a third-generation American, left the cabbie speechless, revealing to Takaki that his Asian physical features and heritage led others to automatically preclude him from the bounds of what is considered "American."

Takaki's overarching theme in *A Different Mirror* is to offer an alternative paradigm of U.S. history from the customary "master narrative." This master narrative, from which U.S. history has long been taught and is reified in most history

textbooks, reflects a Eurocentric viewpoint on the nation's history told from the perspective of middle-class, Anglo-Saxon Americana. Takaki points out that the central problem with this hegemonic master narrative is that it marginalizes, or outright omits, the experiences and influences of racial and ethnic minority groups throughout the nation's history. The master narrative also produces a sanitized account of American history by glossing over the discomfiting dimensions of the nation's past, such as Native American genocide, slavery, Manifest Destiny, nativism, and the internment of Japanese Americans during World War II. The master narrative implies that white, particularly Anglo-Saxon, Americans are the "real Americans," that their ancestors alone built the nation, and that racial, ethnic, and religious diversity are phenomena that arose only in recent years. Such a limited understanding of the multiethnic dimensions of U.S. history have led many Americans to automatically presume Takaki and other Asian Americans are foreigners.

Takaki contrasts the master narrative by putting forth "a different mirror" from which the nation should view its past. Takaki documents that the nation has been a multiethnic and multicultural one since the colonial era. Beginning with a description of the North American continent's indigenous inhabitants before the arrival of Europeans, Takaki proceeds in chronological order over many chapters until the 21st century.

The major groups that Takaki includes in his comprehensive account of American history include Native Americans and African Americans, along with the migrations and incorporation of the Irish, Mexicans, Chinese, Japanese, and Jews. Takaki incorporates the major political and military events in the nation's history, such as the Civil War and World War II, but he expands the traditional focus of these events by discussing the experiences of various groups with regard to these events. His chapter on World War II, for example, addresses the internment of the Japanese, black soldiers' struggle with a segregated military, the high rate of enlistment among the Navajo, and the denial of entry to Jewish refugees fleeing the Nazis.

Digital Divide, The

The digital divide is the phenomenon of demographic disparities in both the access to, and the ability to use, information communication technologies (ICTs). The term stems from a perceived gap, or divide, between users and nonusers of ICTs who comprise different socioeconomic, linguistic, and geographical subgroups.

Theoretical Development

The theoretical origins of the digital divide can be traced to the knowledge gap hypothesis introduced in 1970 by Phillip Tichenor, George Donohue, and Clarice Olien at the University of Minnesota. The knowledge gap hypothesis explains that mass media and the underlying structure of society cause knowledge to be disproportionately appropriated by high socioeconomic groups, thus increasing the knowledge gap with low socioeconomic groups. The digital divide applies this reasoning to information models (such as ICTs or the Internet), rather than only to knowledge flow.

The term *digital divide* was used as early as 1996, when it sporadically began to appear in

the U.S. press, such as in the *New York Times*, and in political speeches, including some by Vice President Al Gore. The most popularly cited origin of the term is a 1999 report from the National Telecommunications and Information Administration (NTIA), which defined the digital divide as "the divide between those with access to new technologies and those without." In this context, "new technologies" referred to information and communication technologies (ICTs) generally, which included telephones and computers in addition to the Internet. As the Internet became popularly accessible through systems other than dial-up access, the nature of the Internet as a free-floating system disembodied from telephone lines became increasingly apparent. Then the term *digital divide* came to apply to the demographic disparities exclusively in Internet use and access.

At the beginning of the 21st century, the digital divide started to become recognized as a complex multidimensional phenomenon and thus not amenable to simple dichotomous analysis. Analysis now entails (1) an understanding of the criteria for the divide, including the definitions of being online or off-line, both in terms of Internet access and Internet use and (2) the context of the divide, which includes the extent to which economic, social, and political forces have shaped and continue to shape the divide.

The abundance of usage options permitted by the Internet, ranging from social networking and finding information to shopping and seeking entertainment, allows for various new conceptions of the Internet user. Hence, while the term *digital divide* intuitively delineates a gap between the two groups of users and nonusers, additional groups are now being compared. These groups can be delineated by temporality of use, for example, as early adopters, late adopters, continuing users, and dropouts—but not only. For example, as early as 2002, the idea that different Internet users hold different approaches to using the Internet gave rise to what Eszter Hargittai termed the "second-level digital divide." More recently, as collaborative online cultures have emerged, supported by technological developments such as Web 2.0 and legal developments such as Creative Commons copyright licensing, the idea of a gap between online content producers and online

content consumers, or a “production gap,” has also started to develop.

Thus, although the term *digital divide* has been used continually since the mid-1990s, it has not been used consistently, as conceptual developments have refined it from an intuitive binary concept to a less intuitive, but more intricate, multifaceted and culturally sensitive concept.

Historical and Contemporary Digital Divides

Race has historically been an important categorization for the digital divide as different cultural groups have struggled to access and use the Internet at a similar rate as whites. The U.S. Census Bureau’s 2012 Statistical Abstract indicates that only 71 percent of African Americans, as opposed to 80 percent of whites, occasionally accessed the Internet in 2010. The following year, though whites had slightly lower levels of Internet usage (79 percent), African Americans had considerably lower levels (67 percent). Nonetheless, while race has been an important component of divides in Internet access since 1995, these divides became less prominent from 2009.

However, general comparative figures of Internet access by race sometimes mask additional divides that exist within racial groups. For instance, while native and English-speaking Hispanics have generally maintained Internet access rates similar to those of whites, indeed sometimes surpassing them—as evidenced in U.S. census data for 1995, 2005, and from 2008 to 2010—the Pew Hispanic Center reports that foreign-born and Spanish-speaking Hispanics have lower Internet access and usage than other Hispanics. Similarly, based on 2003 data from the Current Population Survey, Robert Fairlie finds that Mexican Americans have lower rates of access than Cuban Americans and Puerto Ricans.

Therese Bissell evidenced in 2004 that Native American Internet use is strongly divided by cultural contexts such as whether individuals live in an urban area or a reservation, and whether or not they perceive the Internet as being detrimental to the preservation of their native cultures. African American Internet access is differentiated based on education and age. When considering national origin, income, language, and geography, the divide within races is in certain cases larger than the divide between races.

Income, age, and education are the strongest social markers of divisions in Internet access. The U.S. Census Bureau’s 2012 Statistical Abstract finds that in 2011, only 63 percent of adults from low-income households (earning under \$30,000 a year) were Internet users, as opposed to a near totality (96 percent) of adults from high-income households (earning over \$75,000 a year). This is a relative trend that has been continuous from as long as data on the digital divide has been collected. These low-income Americans access the Internet from libraries more often than do higher-income Americans, who access the Internet largely from home. This further erects barriers to usage due to limited library accessibility and capacity, as library computers are shared among numerous other groups, particularly by students. Accordingly, the 2010 Pew Home Broadband Survey found that one in five Internet non-users self-reported not using the Internet due to cost-related reasons.

Yet the main motivation for self-exclusion from the Internet is that many Internet non-users (48 percent) believe the Internet is not relevant to their lives. Self-exclusion is heterogeneously distributed by age, and there exists a “gray divide” of sorts as individuals over the age of 65 are much less likely (42 percent) to use the Internet than those between 18 and 29 years of age (95 percent).

Finally, educational attainment also marks important divides in both Internet access and use. In 2011, only 42 percent of adults without a high school education were Internet users, as opposed to 69 percent of those who had graduated from high school; and 94 percent of those with at least a college education were Internet users. Income, age, and education have been historically the most significant socioeconomic markers of the digital divide and continue to be so today.

Significance of the Digital Divide

The Internet mirrors its users and, in a multicultural society, presents a kaleidoscope of cultural and socially sensitive political and economic outlooks. It provides potential for alternative methods of fulfilling numerous existing societal functions, and, more profoundly, of introducing innovative alternatives to existing societal structures—from leveraging social media for health

care to increasing representation through participatory Internet democracy. However, the digital divide reflects underlying socioeconomic disparities within society, especially those related to income, education, and age. Current differential Internet access and use limits these possibilities by biasing social outcomes. Moreover, as the Internet continues to permeate everyday American life, and benefits Internet users, these underlying socioeconomic disparities will become increasingly exaggerated. The digital divide, then, has consequences on the sustainability, short-term development, and long-term outlook of multicultural society, rendering it increasingly important to assess and redress the digital divides within the United States.

Dillingham Commission (United States Immigration Commission)

The period from 1870 to 1914 marked a time of unprecedented growth in immigration. As arrivals increased, and as the origin of these people largely changed from nations located in northern and western Europe to the regions of southern and eastern Europe, nativist sentiments led to increasing calls for legislation to limit both the number of new immigrants and the nations from which they were allowed to come. In 1888, the U.S. House of Representatives organized a select committee to investigate the effects of immigration. The committee held hearings in New York, Boston, Pittsburgh, and Detroit, publishing its findings as the Ford Committee Report in 1889.

This report, sustained by a similar U.S. Senate report, concluded that the time had come "to select the good from the bad, and to sift the wheat from the chaff." The time had come to restrict anarchists, paupers, and the influx of cheap foreign labor. It is apparent, the Ford Committee continued, "that this country cannot properly assimilate the immigration now coming to our shores."

The industrial depression of the early 1890s added urgency to the situation. By 1892 both the Democratic and Republican party platforms contained planks calling for further immigration restriction. The efforts of these movements crystallized around the proposal to add a literacy test to the immigration requirements, a concept championed by Senator Henry Cabot Lodge, the anti-Catholic American Protective Association, the American Federation of Labor, and others who supported immigration restriction. Lobbyists for the Immigration Restriction League and the American Federation of Labor renewed their efforts for a literacy test in 1906, appealing to Congress to preserve America's Anglo-Saxon civilization. Opponents of the 1906 literacy test hoped to postpone or prevent its passage by calling for the establishment of a commission to study the immigration question. Thus was born the U.S.

Immigration Commission, usually referred to as the Dillingham Commission.

Chaired by Senator William P. Dillingham of Vermont, the commission included nine members: three from the Senate, three from the House of Representatives, and three statisticians. In addition to Dillingham, the senators included Henry Cabot Lodge and Asbury Latimer (the latter replaced by LeRoy Percy in 1910). The House was represented by William S. Bennet, John L. Burnett, and Benjamin F. Howell. The statisticians were Charles P. Neill from the U.S. Department of Labor, Cornell University professor Jeremiah Jenks, and William R. Wheeler, the California commissioner of immigration. Five of the six politicians had made statements in favor of immigration restriction prior to their appointment to the commission, and the statisticians were also generally known to favor restriction; thus, the commission was hardly impartial.

The commission met from 1907 to 1911 and employed a staff of more than 300 people at a cost in excess of \$1 million, a very considerable sum in those days. During its investigations it accumulated a mass of data on a wide variety of topics such as employment, education, crime, unionization, living conditions, and a variety of other economic and social topics. Its data and reports were published in 41 volumes, the first of which contained conclusions reached by the commission as a result of the study. Not surprisingly, given the makeup of the commission, the findings supported the proponents of restriction, officially declaring for the first time that there was a distinct difference between what it labeled the “new” immigration—those from southern and eastern Europe—and the previous groups from northwestern Europe, which it termed the “old” immigration. Restriction of the former, it concluded, was “demanded by economic, moral, and social conditions” since these “races” were significantly different from those of northwestern Europe and could not be readily assimilated.

Although based upon faulty research and reasoning, as studies have shown, the Dillingham Commission reports extended the sanction of the U.S. government to the stereotyping of millions of Americans descended from the regions of southern and eastern Europe. The reports appeared to “legitimize” calls for restriction. The effects can

be seen in T. J. Woofter’s survey of popular literature between 1900 and 1930. Woofter found that during the period from 1907 to 1914, “there occurred a marked change in public sentiment toward immigration,” with the old restrictionist arguments based upon economics giving way to a rationale based upon “the undesirability of certain racial elements.” Italians, Poles, Greeks, Russians, and others from whence the “new” immigration derived were now typecast as undesirable races.

One of first results of the commission’s pronouncements was an increase in calls for further restriction, leading Congress to enact a new literacy bill in 1913, only to have it vetoed by President William Howard Taft. A similar bill for a literacy test adopted by Congress in 1915 was vetoed by President Woodrow Wilson with the comment that such a law would test opportunity, not intellect. Regardless of these setbacks, the restrictionists eventually succeeded. The commission’s findings provided the support required to ratify the Immigration Acts of 1921 and 1924.

First European Immigration Restrictions

On May 19, 1921, President Warren G. Harding signed into law the first federal legislation in American history designed specifically to limit European immigration. Between 1901 and 1920 an average of 625,629 people entered the United States each year. The First Quota Act of 1921 was designed both to limit total immigration to the United States and to alter the composition of that immigration in favor of people whose origins lay in the nations of northwestern Europe. To accomplish the first goal, the law imposed a maximum of 357,803 people allowed to legally enter the country from outside the Western Hemisphere in any single year, some 57.2 percent of the previous average number of arrivals. Additionally, each nationality group was given a separate quota based upon 3 percent of the number of people from that group residing in the United States in 1910. This provision addressed the second goal by discriminating directly against southern and eastern Europeans. It did so by using 1910 as a base year rather than 1920, thus eliminating from the formula by which the quotas were calculated the millions of people, approximately 75 percent of whom traced their origins to southern and

eastern Europe, who arrived during the decade between census enumerations.

In 1924, Congress made the quotas permanent with the National Origins Act, which also reduced the total number of immigrants per year from 357,803 to 164,667, only 26.3 percent of the previous average. To further guarantee the predominance of immigrants from northwestern Europe, the quota percentage of each nationality was reduced from 3 percent to 2 percent, and the base year was changed from 1910 to 1890. This was a clear attempt to diminish the impact, and therefore the quota, of immigrants from southern and eastern Europe who entered en masse after 1890.

The net result of the Dillingham Commission was therefore to seemingly legitimize the negative stereotyping of hundreds of thousands of Americans from southern and eastern Europe, to seriously reduce any future opportunity for immigration from these areas, and to justify racial discrimination based on the commission's faulty findings.

Kellerman's, a Catskills summer resort, and falls in love with a rough-edged, working-class dance instructor who introduces her to "dirty dancing." The story is set in 1963, the summer of Martin Luther King, Jr.'s "I Have a Dream" speech and the summer before John F. Kennedy was assassinated. The movie, propelled by the romantic appeal of a cross-class love story and a wildly popular sound track, was a smash hit. It was also, both on screen and behind the scenes, a reflection of America's diverse cultures.

The movie pulled in box-office receipts for the first 10 days that earned twice the movie's cost of less than \$5 million. Final worldwide sales topped \$170 million, and the original sound track was recertified platinum 11 times. A second album was quadruple platinum. The movie's theme song, "(I've Had) The Time of My Life," written by Franke Previte, John DeNicola, and Donald Markowitz, hit number one and earned both a Grammy and an Academy Award. The album also reached the top position, outranking both Michael Jackson and Bruce Springsteen to do so. It remained at number one for nine weeks and returned to the top spot for an additional nine weeks in 1988. A poster of Patrick Swayze as Johnny Castle sold out, and the most quoted line, "Nobody puts Baby in a corner," entered the lexicon of the American public. By August 1988, the *Dirty Dancing* enterprise—movie, sound track albums, video cassette, touring company, and television series—had grossed \$350 million.

Eleanor Bergstein wrote the screenplay, basing much of the story on her own life. Like Baby Houseman, Bergstein was the daughter of a Jewish doctor. She was called "Baby" until she reached adulthood, and she vacationed with her family in the Catskills. Bergstein based Kellerman's, the resort the fictional Houseman family visits, on Grossinger's, the Catskills resort where her family vacationed. The setting is Bergstein's tribute to the Borscht Belt. The name refers to soup made from beetroot, a popular eastern European dish; it alludes to the heritage of many of the Jewish inhabitants of New York's Lower East Side who invaded the Catskills resorts each summer.

The Museum of Jewish Heritage in New York considers *Dirty Dancing* a Jewish movie that captures an important slice of Jewish culture. The museum has a copy in its film archives. Bernstein

Dirty Dancing

Dirty Dancing, a movie that premiered on August 21, 1987, tells the story of Frances "Baby" Houseman, the privileged, idealistic younger daughter of a doctor who vacations with her family at

Johnny Castle's famous line from the film *Dirty Dancing*, "Nobody puts Baby in a corner," is scrawled on a San Francisco sidewalk. The 1987 film, set in 1963 about a cross-class love story between a privileged Jewish American girl and a working-class Irish American dancer, was a massive box-office hit.

herself has acknowledged deliberately evoking stereotypical elements of the Borscht Belt with its bad jokes, ill-conceived matchmaking, and liberal Democrat social values common among upper-middle-class Jews generally and Bergstein's family particularly. Bergstein was named for Eleanor Roosevelt. Her sister Frances, whose name Bergstein borrows for her heroine, was named for Frances Perkins, President Franklin Roosevelt's secretary of labor from 1933 to 1945. The future plans of Baby Houseman include studying the economies of the third world and joining the Peace Corps, and the Kellermans' grandson anticipates joining the Freedom Rides in the south after the summer season ends. Bergstein has described the time in which she sets the movie as "the last summer of liberalism."

Johnny Castle is separated from Baby Houseman by more than class. Baby's father disapproves of him for his privileged daughter not only because Johnny falls lower on the social scale but also because he is descended from Italian immigrants. Implicit in the contrast between the two characters are religious differences as well, as Italian immigrants were overwhelmingly Catholic. Part of Baby's coming of age, represented by her transformation into Frances, is her recognition of the shallowness of her father's liberal convictions. He can accept his daughter's studying third world economies but not her love affair with someone of a different class and culture.

The sound track heightened the cultural clash within the movie and mirrored the cultural differences in American society of the 1960s. Bergstein, who coproduced the movie, had far greater control over the production than she would have had as only the writer. She divided the musical selections into Latin mambo, with its Cuban and Mexican roots; teen pop, which Bergstein called the "clean music"; and sensual rock and roll, with its strong influences from black music, especially soul and gospel. Bergstein wanted the dance music to be something Baby Houseman would be unlikely to have heard, something that would connote the shockingly sexual in contrast to Baby's innocence.

The movie's creators comprised an ethnic and cultural mix even more diverse than that of the fictional world they created. Jennifer Gray, who played Baby, is a third-generation performer who had been rejected for other roles because she looked "too Jewish." Texan Patrick Swayze, the professionally trained dancer who played Johnny Castle, was an American mongrel who claimed Apache ancestors among his mostly Irish forebears. Jerry Orbach, who played Baby's father, was the son of a Jewish immigrant from Germany and a Polish American Catholic. Director Emile Ardolino was the openly gay son of Italian immigrants, and choreographer Kenny Ortega is the grandson of Spanish immigrants.

Disability and Ethnic Diversity

U.S. policy today recognizes that disability is an inevitable part of the human experience. Some people are born with disabilities, others develop disabilities through disease or injury, and many people will acquire disabilities, both mental and physical, as they age. Regardless of this prevalence, however, for several centuries after Europeans began colonizing the United States, people with disabilities were scorned, excluded, vilified, demonized, and institutionalized. They have been called malingerers, freaks, imbeciles, witches, lunatics, cripples, and many other offensive names.

Slowly, charitable views began to overtake these former ideas, including beliefs that the medical profession could prevent and heal some disabilities. But not until recent times have people with disabilities been guaranteed basic civil rights under federal law that is taken for granted by other Americans, regardless of race, nationality, gender, and religion.

Historical Perceptions of Disability

Prior to the 20th century, the term *disability* was not commonly used to describe a group of people with varying impairments. More common names were blind, deaf, mute, inferior, imbecile, idiot, cripple, midget, monster, and freak. In extreme cases, disabled people were put to death under law or murdered. More often, newborns with disfigurements or defects were killed or died from neglect or the denial of treatment within days or weeks of birth. Family members with impairments were frequently hidden from view to protect them from ridicule or the disabled member from harm.

Often children with disabilities were excluded from public school programs. A few private entities offered educational opportunities that only wealthy families could afford, such as the American Asylum for the Deaf and Dumb that opened in 1817. State educational institutions for the deaf began in 1823, and for the “feeble-minded” in 1852. Black children had no access to public education, regardless whether they had a disability.

Data on the prevalence of disabilities in the general population of enslaved people prior to U.S. independence from Great Britain do not

largely exist. The earliest data from the U.S. Census of 1830 found 5,363 whites and 743 free blacks and enslaved people identified as “deaf and dumb,” and 3,974 whites and 1,470 free blacks and enslaved people as “blind.” These persons accounted for less than 1 percent of the U.S. population at the time. In subsequent censuses, additional disability and racial data were collected, including for the categories of “deaf, dumb, idiotic, blind, insane, or pauper” in 1850; and differentiating between whites, “free mulattoes,” “free blacks,” and slaves in 1860; and adding mixed race, Chinese, and Indian, as well as multiple disabilities, in 1870.

Civil War to 1900

The U.S. Civil War created a cohort of veterans with disabilities; more than 850,000 Union army veterans, including nearly 200,000 African Americans, acquired a permanent disability. Over the next 50 years, Congress implemented and enhanced a pension scheme of medical care and monthly compensation for Civil War disabled veterans to offset their inability to work, under the General Law of 1862. The General Law created a comprehensive evaluation system for rating claimants in terms of their inability to work, based on impairment to specific physical functioning (such as one amputated leg or loss of vision in both eyes). Quantification of impairment in this manner shaped public understanding of disability for the next 100 years, whereby “disability” was defined and determined by the medical community based on the “incapacity to perform manual labor.” This medical model viewed having a disability as a “personal tragedy” that ensured the “victim’s” low productivity or inability to work, and condemned them to “the mercy and charity of society.”

The 1873 Consolidation Act extended pensions to veterans for “service-related conditions or diseases that later caused disabilities” (such as noise-induced hearing loss or chronic bronchitis). In 1879, the Pension Arrears Act offered back payments to veterans who previously were ineligible for or denied pensions. Thereafter, African American and immigrant veterans increasingly sought disability pensions. The 1890 Disability Pension Act extended pensions to veterans regardless whether their disabilities had arisen from military service. As pensions were extended to veterans

whose impairments were not linked to military service and to those with easily diagnosable conditions, outcomes of pension claims “reflected a stigma-based distinction between mental and physical impairments. . . .” Veterans who had sustained severe physical disabilities in service were viewed as worthy beneficiaries, while those with less obvious or invisible mental impairments often were thought to be malingerers scamming the system. Moreover, the race or ethnicity of veterans “was tied to views of deservingness and moral worth.” African American veterans were disproportionately denied disability pensions.

By 1880, the U.S. Census found that many more persons with disabilities were categorized as “insane” (157,589) and “idiotic” (149,783), compared to “deaf-mute” (64,385) and blind (89,527). Data for blacks were not collected; however, “Indians” (or Native Americans) and Asians (Chinese) combined accounted for more persons with disabilities in all four categories than whites. Moreover, rates of disabilities among Native Americans challenged those of whites (such as 40,599 blind Native Americans compared to 41,278 whites), although white populations had become the dominant group in the United States.

20th-Century Eugenics

An understanding of disability and ethnicity is incomplete without a discussion of the eugenic immigration, sterilization, and anti-miscegenation laws that permeated U.S. society into the early 20th century. English biologist Francis Galton introduced the term *eugenics* in 1883 and later defined it as the “study of the agencies under social control that improve or impair the racial qualities of future generations, either physically or mentally.” These laws prohibited specific ethnic and racial groups from entering the United States and/or reproducing based on their ethnic and/or disability status.

In 1882, for instance, Congress passed an immigration act that gave authorities the power to deny entry to “lunatics,” “idiots,” and “persons likely to become public charges.” The 1917 Immigration Act further denied immigration to “undesirables,” including “imbeciles, epileptics, alcoholics . . . criminals, beggars, any person suffering attacks of insanity, those with tuberculosis . . . those who have any form of dangerous

contagious disease, [and those] who have a physical disability that will restrict them from earning a living in the United States.” Through the Immigration Restriction Act of 1924, eugenicists sought to stop, in part, the immigration of those “who are making excessive contribution to our feeble-minded, insane, criminal and other socially inadequate classes.”

During this period, people with disabilities generally were considered incapable of work, undeserving of opportunities, or at best curable by medical experts if such charity were afforded. Large-scale institutionalization of people with disabilities became a common approach to caring for their unique needs by providing some with access to professional treatment, while separating many others from the sight and concern of the general public. In time, many of these institutions moved to a custodial model, in which people with disabilities were kept in overcrowded, unsanitary, and subhuman conditions.

In 1927, the U.S. Supreme Court upheld a Virginia state statute in *Buck v. Bell* requiring sterilization of persons with mental retardation “for the protection and health of the state.” Notably, during this period, Hitler’s Germany deemed a broad array of persons to be “socially defective,” including those with obvious physical or mental disabilities. An estimated 350,000 persons were sterilized pursuant to German Law for the Prevention of Defective Progeny. In 1934, an estimated 150 million people worldwide were living under laws requiring sterilization of certain individuals. In the United States, 33 states had sterilization statutes, which authorized the involuntary sterilization of more than 60,000 persons.

Most states implemented workers compensation laws by 1920 to recompense employees injured on the job. These laws adopted and perpetuated the categorization of physical dysfunctions for purposes of compensation. Similarly, the Social Security system instituted benefits systems that presumed people with disabilities were incapable of work and thus of earning an income. These attitudes toward people with disabilities naturally fed the arguments of the eugenics era.

Civil Rights Movement

The U.S. Supreme Court’s decision in *Brown v. Board of Education* marked the beginning of a

shift in both race and disability policies in the United States. This decision held that “in the field of public education the doctrine of ‘separate but equal’ has no place. Separate education facilities are inherently unequal.” Over the next decade, civil rights activists fought and won equal legal rights for people of color, as well as women, to work and earn a living, go to school, travel, shop, and otherwise participate in society on equal terms with other Americans. As the civil rights movement grew, people with disabilities began seeing themselves as a minority group and lobbied for their own civil rights. An independent living movement began in the 1960s with the goals that people with disabilities should have control over their own lives, make their own decisions, and minimize their reliance on others in performing everyday activities.

Almost two decades after *Brown*, federal courts invoked the reasoning that separate education was inherently unequal in ruling that children with disabilities could not be denied educational opportunities in the same schools as children without disabilities. Shortly afterward, Congress passed the Rehabilitation Act of 1973, prohibiting the exclusion of and discrimination against people with disabilities under any program that received federal funding, including those at many public schools. Congress then passed the Education of All Handicapped Children Act (EAHCA) in 1975, requiring public schools to provide all students with disabilities a free, appropriate public education.

Renamed the Individuals with Disabilities Education Act (IDEA), amendments to EAHCA acknowledged that children of color and non-native English speaking students were being disproportionately identified as having disabilities, and prohibited biased and inaccurate methods of determining eligibility. In 1990, Congress enacted the Americans With Disabilities Act (ADA), the first comprehensive civil rights law for people with disabilities, providing equal access to employment, government services, public accommodations, transportation, and telecommunications by prohibiting discrimination based on disability.

Modern Perceptions of Disability

Today, the concept of disability differs across U.S. cultural groups. Immigrant groups from all over

the world have brought many different perceptions of and experiences with disability to the American mosaic. The impacts of xenophobia and racism in America also are important to consider. For instance, throughout U.S. history, disability has been used as a tool to justify unequal treatment to nonwhites through racist and eugenic laws that imply nonwhites are biologically inferior. This creates an underlying tension between disability rights groups and ethnic groups, as some minorities have had to disprove the myths of their “inferiority” by distancing themselves from disability groups.

Recent population surveys have indicated different rates of disability among racial and ethnic populations in the United States. In 2010, the U.S. Census indicated that the overall disability rate was 18.7 percent. However, self-reported disability varied substantially by race. Asians (13 percent) and Latinos (13.2 percent) reported the lowest disability rates, while whites (18.5 percent) and blacks (20.3 percent) reported the highest rates. A 2008 report from the U.S. Department of Health and Human Services found a disability rate of 29.9 percent in the American Indian/Alaska Natives category.

Many Americans of western European origin view disability as a deficit that doctors, social workers, special educators, and other professionals are trained to remedy. Charitable approaches that pity and seek to help people with disabilities arise from Christianity. Many Americans of eastern European origin have a functional view of disability that has been influenced by the former Soviet Union’s emphasis on work capacity as the main factor in determining whether someone has a disability. The functional perspective is evident in eligibility determinations for social benefits, like Medicaid and Social Security disability insurance.

There is no single Asian perspective on disability; however, there are several themes, including shame and guilt, and disability being a private matter in Asian cultures. These perspectives might explain the lower rates of disability reported by Asian Americans. The traditional Chinese term for disability is *canfei*, meaning “handicap” and “useless,” or *canji*, meaning “handicap” and “illness.” Disability is viewed as a punishment for the parents of the person with a disability or for

past-life sins. Chinese people generally are more accepting and sympathetic toward acquired physical limitations than congenital physical or mental disorders.

Many Latinos place a high value on family. Family members with disabilities generally are included in and protected by the extended family. Strong religious beliefs may aid in acceptance of the family member with a disability. Similar to Asian cultures, Latino Americans are less likely to accept government support for their disabilities. This may explain the lower rate of reported disability in this population. Additionally, many Americans of Central American or Caribbean origin do not recognize mild intellectual disabilities, emotional disturbances, and speech and language impediments as disabilities. In these cultures social abilities may be more important than academic success, such that mild disabilities are viewed as learning differences.

The high rate of disability among Native Americans is attributed to an overwhelming lack of access to quality health care and the devastating impact on the Native American population and culture by U.S. colonialism. Most Native American tribal languages do not have a word for disability; rather Native Americans view disability as disharmony of spirit. Tribes have different cultural and traditional beliefs, unique religious doctrines, and taboos. “Unwellness” may be caused by the violation of a tribal taboo or by witchcraft.

African American perceptions of disability are linked to the history of discrimination including the institution of slavery, segregation, and overrepresentation in special education. African American students disproportionately are identified as having a disability (a special education label), prompting distrust for disability labels among black families. For example, a 2001 study suggested that African American parents are less likely to accept the attention deficit hyperactivity disorder diagnosis and to use stimulant medication for its treatment. A 2003 study suggested that African Americans are less willing to use psychiatric medications themselves or to administer them to a child for whom they are responsible.

Disability Culture

Many people with disabilities view disability as part of their cultural identity, similar to the

way some view ethnicity as part of their cultural identity, rather than a physiological impairment. They view disability through a social model that rejects the idea that there is a “normal” range of human functioning. The social model of disability argues that society creates barriers to access and participation by people with disabilities through inaccessible social, attitudinal, and physical infrastructures. The social model is commonly associated with a human or civil rights orientation toward disability and focuses on removing social, attitudinal, and physical barriers. The mantra of the disability rights culture is “Nothing about us without us,” meaning that experts on disability are people with disabilities, and that they should have the strongest voice and most active role in the outcome of their own lives.

The most established disability-based cultural identity is deaf culture. A recent census report found that 7.6 million people (3.1 percent) experienced a hearing difficulty, including 1.1 million people who had severe difficulty. Many members of the deaf community see themselves as a cultural minority with a unique language, American Sign Language (ASL), and traditions, rather than as a group bound together by a common disability. These traditions include deaf clubs, deaf sports, deaf residential schools and universities, deaf art, and deaf political organizations, such as the National Association of the Deaf (NAD). The deaf community helped spark a nationwide disability civil rights movement with protests at Gallaudet University in March 1988. During a weeklong protest known as Deaf President Now (DPN), deaf protesters demanded that the board of trustees appoint a deaf president to the university instead of the selected hearing candidate. They wanted a president who would represent the deaf community’s interests. Eight days later, they got their wish. This political mobilization of the deaf community helped put disability rights in the mainstream political media and increased support for the enactment of the ADA in 1990.

Another example of disability culture comes from the autistic community. A 2008 study estimated that about one in 88 children have an autism spectrum disorder (ASD). Some members of the autistic community do not consider autism to be a disease but rather a neurological variation that ought to be respected as a difference, like

race or sexual orientation. This concept is often referred to as neurodiversity.

The Autistic Self Advocacy Network (ASAN) was founded in 2006 as a nonprofit run by and for autistic people to provide support and services to individuals on the autism spectrum, while working to educate communities and improve public perceptions of autism. Members of ASAN and other autistic cultural groups have criticized the federal government for allotting the majority of autism funding for preventative or curative research rather than for policies to help improve the community integration and participation of autistics in society.

These two examples of disability culture are by no means exhaustive but serve to illustrate cultural disability as an identity rather than a medically based categorization. Scholars have recently criticized disability rights groups for not being more representative of ethnic differences among people with disabilities in their leadership and respective agendas, and for failing to acknowledge nonwhite perceptions of disability. For example, critics would suggest that the deaf community should not be characterized as a monolithic cultural group when there are ethnic differences among deaf people. A study from the National Center on Health Statistics from 1990 reported that 9.4 percent of the white population, 4.2 percent of the black population, and 4.2 of the Hispanic population reported being deaf or hard of hearing. There are also reported geographical differences in ASL, and black ASL has been recognized for years as a distinct form of sign language.

Discourse

Discourse is language (spoken, written, visual, and body language) people use in social contexts in order to convey meanings, communicate with each other, and interact with the world. It is an integral part of the beliefs, identities, and values that are produced and enacted in society, illustrating the diverse positions that social actors or groups occupy; hence, "discourses" is the plural form that is often used. As "language in use," discourse represents, classifies, or performs various aspects of social life. A person may hold progressive or conservative views, which means that their understanding and representation of issues such as the welfare state originate and result in very different discourses. They may fall into the category of "citizens" of a state, enjoying full citizenship rights, or "asylum seekers" with limited rights. They may identify as "punk" or "emo" and act out these identities in dress code, talk, and music.

Discourses belong to and generate effects in particular social, political, economic, and cultural contexts. They pertain to domains of public activity, such as politics, media, research, and education, but also to everyday, private interactions. They are a site of negotiation of meaning, reproduction of existing practices and relations and, importantly, of social change. The relationship between discourse in general and social reality is a mutually constitutive one: discourse is shaped by and at the same time shapes social reality.

Nation, ethnicity, and race are not natural givens that exist in the world "out there" but instead are a product of socially embedded language. Two major social institutions that construct and are constructed by dominant discourses on

American national identity are immigration, naturalization, and citizenship policies, and census categories. Together, they classify and respond to public classifications of racial and ethnic identities, setting boundaries between, for example, black and white and Hispanic and non-Hispanic. The U.S. government and other institutions use systems of classification to regulate migrant flows and impart social justice, and in turn often (re)produce stereotypes and prejudice. Multicultural America is an outcome of the interplay between discursive self-identification and other identification, power relations in society, and institutional policies.

Discursive constructions of who Americans are have molded national identity over the centuries, by structuring how Americans both define national community, values, and spirit, and how they draw boundaries between themselves and others. Such discourses have multiple sources. They include political texts, such as the Declaration of Independence, the U.S. Constitution, the Bill of Rights, presidential addresses, texts produced by lobby groups and similar organizations, and policy documents; scientific texts, such as research about the origin of races; legal decisions; media articles and forums (either mainstream or alternative); educational textbooks; literary works; and popular culture products. Many of these sources reflect political ideologies (liberal-progressive, libertarian, or conservative) or frame topics and themes from a political perspective.

In the course of American history, struggles among social groups to project their own understanding of national identity and the recognition attributed to racial and ethnic groups within its framework have generated distinct versions of the nation and place occupied by “cultural diversity” as one of its main components. Dominant discourses, understood as long-standing discourses that articulate the ideological visions of groups in positions of power in society, are the ones most often materialized and institutionalized by means of policy making. Far from being confined to the level of discourse, prevailing interpretations have been implemented and made part of existing institutions, often distorting or overlooking the self-assigned identities of the culturally diverse groups in American society. Changes in the sociopolitical and cultural circumstances, power dynamics,

major historical events, and economic developments have brought about changes in the meanings and definitions of the national “we” and its multicultural and racial diversity. On the backdrop of social transformation and often engaged in it, ethnic and other minority groups have succeeded in achieving recognition. Their counter-narratives—self-representations of the histories, traditions, and values of their communities—have gained visibility and have been included in the official narrative of the American nation.

From the Melting Pot to the Salad Bowl

The metaphors of the “melting pot” and the “salad bowl” frame the two dominant American political standpoints regarding cultural diversity. Coined by British writer Israel Zangwill in 1909, the former may be interpreted either as assimilation and conformity to traditional norms of “Americanness.” Less commonly, it is interpreted as cultural pluralism accommodating ethnic and racial differences under the umbrella of a common civic identity, a concept proposed by philosopher Horace Kallen in the early 1900s. The “salad bowl” metaphor stems from multiculturalism, a vision of ethnic and racial groups that participate in society as unique cultural entities. This approach gained centrality in the 1970s and 1980s.

These two divergent views—the culturally homogenizing trend and the preservation of ethnic and racial distinctness—incorporated into two main opposing discourses and still clash in the debates surrounding the place of cultural diversity in the nation. The prominence of one or the other over the decades has created discursive and social categories of desirables and undesirables, targets of persecution and discrimination, and special recipients of reparation in affirmative action programs. Culturally and linguistically, discrimination finds expression in stereotypes and clichés, predominantly negative, but also positive, such as the “model minority” label attached to Asian Americans in the late 20th century.

The construction of American identity in the discourse of the founding documents established the nation around an ideal of unity, captured in the motto *E pluribus unum* (out of many, one), Enlightenment reason, and the rights to equality, freedom, and opportunities for advancement,

political independence, constitutionality, economic self-reliance, and the values of individualism. The discourses that surround the theme of American exceptionalism, America's special mission to spread democracy and freedom to the world, and the discourses that construe the American Dream thus derive from the civic virtues of Americanness at the dawn of the nation. The category of "man" was, however, originally limited to white, propertied male citizens; the union excluded from the very beginning American Indians and enslaved African Americans. The United States emerged and consolidated into what would become known as a white, Anglo-Saxon, Protestant (WASP) nation, after the groups that retained dominance and enjoyed privilege in society. Until World War II, dominant society's main tendency was to absorb into this construct immigrants and other categories, such as Native Americans, and allow them access and citizenship on the basis of their perceived potential to assimilate.

Taking National to the Extreme

An extreme version of American nationalism is the nativist discourse that was built around anti-Catholic, antiradical, and racist attitudes, occasioned by feelings of aversion and suspicion toward those identified as foreigners. At present, the nativist discourse puts forward economic, demographic, and environmental arguments, but many of its claims are of a social and cultural nature. It often supports restrictionist positions and immigration reform. Bouts of nativism are responsible for some of the most discriminatory and constraining immigration and naturalization acts in American history.

For example, the representation of Asian immigrants as unassimilable because of their skin color and non-Christian religion led to policies of exclusion and bans on citizenship against the Chinese and Japanese at the turn of the 20th century. Nativism also found support in the discourse of scientific racism or eugenics, catalyzed

A group of Japanese American girls stands in formation during a calisthenics exercise at the Manzanar War Relocation Center, Inyo County, California, 1943. Nativist discourse, an extreme form of American nationalism built on feelings of aversion and suspicion toward foreigners, has been compounded by threats from the subversive "other" during various wartimes. In February 1942, Executive Order 9066 authorized the secretary of war to remove anyone from designated military areas considered a threat to the war effort. Without due process, the government relocated everyone of Japanese ancestry on the West Coast to internment camps during the war.

in the United States by Madison Grant, author of *The Passing of the Great Race* (1916), which scientifically legitimized Nordics (those considered to originate in northern Europe and declared ancestors of native-born Americans) as a superior, pure, white race. These claims lay behind the Immigration Act of 1924, which introduced national origin quotas to curtail immigration from southern and eastern Europe and exclude Asian immigration.

Fears of the subversive “other,” the foreign enemy who would plot against the nation from within, compounded nativist fears that foreign “others” would spoil national values and pose a threat to social cohesion and Western civilization in the United States. This categorization, also bearing the name of “fifth columnist,” affected German Americans during World War I, Japanese Americans during World War II, Mexican and other Latino youths during the Zoot Suit riots in Los Angeles in 1943, and Arab Americans during the Persian Gulf War and especially after 9/11 and the War on Terror. More extreme reactions have included arrests, internments, bombings, and hate crimes. Manifestations of contemporary nativism can be associated with organizations such as Save Our State and magazines such as *The American Conservative*, cofounded by Patrick Buchanan, their main concern focusing on the massive immigration of Hispanics.

A shift in perspective on cultural diversity and the configuration of political, media, education, legal, and popular discourses that construct diversity took place in 1965, when multiculturalism started to gain ground. The Immigration and Naturalization Act of 1965 eliminated the national origins quotas and coincided with civil rights legislation and the affirmative action programs initiated by President Lyndon B. Johnson for the purpose of preventing racial discrimination and inequality, offering reparation through preferential treatment. These programs benefited both African Americans and immigrants. Despite more liberal immigration and citizenship policies in the 1980s and 1990s, the constant and dramatic growth in immigration, especially from Latin America but also from Asia, has resulted in new categories of threatening “others.” Such are the figures of the Mexican or Latino immigrants or of the illegal alien, the two often conflated in

popular discourse, or of the concept of the “welfare sponge,” often applied to immigrants.

Racial Discourse in American Census Categories

The U.S. Census provides one of the best examples of the historical developments in racial discourse and the transformations of race categories in the United States. It both expresses the social meanings attributed to race in American society and institutionalizes race and ethnicity according to political, economic, and civil rights imperatives. The racial category that has registered no descriptive changes over the years is “white,” while many other categories have been created in response to increases in and diversification of immigration, racial laws, and affirmative action policies. If between 1790 and 1840 the census categories chiefly addressed the need for representational reapportionment, the following period (1850–1920) also witnessed the use of the national census for testing and sustaining scientific racism theories. The term *mulatto* appeared in the 1850 census to measure degrees between “pure white” and “pure black” and to gather data about a hybrid population believed to be predisposed to bodily weakness and impossible to culturally integrate. In 1890, two more refined categories were introduced, “quadroon” and “octoroon,” subsequently removed because of the unreliability of data, left to the estimate of enumerators. The American Indian population (blood quantum included) was carefully recorded to verify hypotheses about their assimilation and eventual disappearance.

A new era in the classification of race and ethnicity began in the 1960s and impacted the 1970 through 1990 census categories through Directive 15 of the Office of Management and Budget (OMB) for the purpose of monitoring the implementation of civil rights legislation and equal access programs. Four racial categories—American Indian or Alaska Native, Asian or Pacific Islander, black, and white—and one ethnicity category, Hispanic, constituted the new racial and ethnic configuration of American diversity in accordance with the tenets of multiculturalism. The 2000 and 2010 census forms offered respondents the possibility to acknowledge more than one racial background. Initially, this aroused suspicions among civil rights and ethnic

organizations that group rights would be targeted if the neoconservative discourse of a colorblind society could be borne out by census data.

Mainstream discourses, or discourses that rise to mainstream acceptance, are the chief generators of institutional change, in turn structuring new discourses. Dominant worldviews coexist and engage in permanent clashes with more marginal voices, which come to the fore in particular socio-political, economic, or cultural circumstances. The discourses of African American self-identification, leading to the civil rights movement in the 1950s and 1960s, challenged and overturned the racial categories that denied African Americans basic rights and liberties. The self-identification of Americans who consider themselves multiracial put pressure on census officials to provide a “mark one or more boxes” option for race in the 2000 and 2010 census forms, but pressure is still on for a separate multiracial category. In the 2010 census, 97 percent of all respondents in the “some other race” category were of Hispanic origin. In the long run, this might challenge the white race majority in American society.

Multiculturalism has eased the trajectory to the center of previously marginal discourses in culturally diverse America, but it has also caused concern for the dissolution of the traditional white, Anglo-Saxon, Protestant core of American identity. At present, the United States is searching for a “more perfect union” formula that would reflect the nation’s cultural diversity without eliminating a set of commonly accepted American identity traits and without compromising social justice and equality.

Displaced Persons Act (1948)

By the end of World War II, an estimated 17 million people had been forced to leave their homes. Some were murdered in German concentration camps, but others survived. Among the latter were people who had been taken from their homes against their will to serve as forced labor in German wartime industries, those who fled war zones as refugees seeking safety from the fighting, and still others who either could not or would not return home because of the takeover of their countries by postwar Communist regimes. Some seven million of these “displaced persons” resided in Germany and Austria in May 1945.

With the end of the war in Europe, the Western Allies and the United Nations Relief and Rehabilitation Administration (UNRRA) established what were supposed to be temporary camps for people who were classified as refugees and displaced persons. Within about five months, some six million people were repatriated, but that left nearly a million people to be cared for in the “temporary” camps, some for several years. When the UNRRA ceased operations in 1947, its activities

were taken over by the International Refugee Organization (IRO). It was estimated that there were then still 370 camps in operation in Germany, 120 in Austria, and 25 in Italy containing a total of more than 800,000 people. About 55 percent of these were Roman Catholics, 27 percent Protestants and various Eastern Orthodox denominations, and 18 percent Jewish.

According to research by Edward B. Rooney, estimates are that within a year England accepted 17,000 people from the displaced persons camps and another 250,000 former members of the Polish armed forces and their families. Belgium ranked second on the list of receiving nations with almost 20,000, followed by Brazil (7,000), Argentina (5,000), Venezuela (4,000), Canada (2,000), and the Netherlands (2,000). The United States, because of its restrictive immigration laws of 1921 and 1924, had accepted no one. In 1947, a bill proposed to allow refugees into the country in excess of the quota numbers, but it required each to have a U.S. sponsor. Largely because of this restriction, in June of the following year Congress enacted the Displaced Persons Act.

Under the new law, people who suffered persecution under the Nazi regime, those escaping persecution, and those who could not return to their home country because of the fear of persecution based on race, religion, or political views could apply for admission to the United States as a permanent resident. Spouses and children were also eligible for permanent resident status. However, the law distinguished between those who were “forcibly” displaced and those who “voluntarily” left their homelands. By definition, those who were displaced between the beginning

of the European war on September 1, 1939, and December 22, 1945, were to be considered “forcibly” displaced and thus eligible for U.S. entry. Those designated as “voluntarily” displaced were not eligible for entry under this law. The date parameters excluded those who had migrated to Germany for higher wages before the beginning of the war and those who fled later Communist takeovers such as in Czechoslovakia.

The act provided 220,000 nonquota visas over a two-year period and an additional 3,000 nonquota visas for orphans. Although President Harry Truman signed the Displaced Persons Act into law, he had serious reservations, calling the legislation “flagrantly discriminatory” because the date restrictions excluded approximately 90 percent of the Jewish refugees who arrived in the displaced persons camps after December 22, 1945. It also tended, Truman argued, to discriminate against Catholics who fled from persecution under Communist regimes only after that date. In fairness, he maintained, the closing date ought to have been established as April 21, 1947, when the camps were closed to any further admissions. Though voicing these concerns, he signed the legislation in the belief that to veto

The original Displaced Persons Act was amended in June 1950 to increase the number of visas by an additional 121,000 and to raise the number of orphan visas to a total of 5,000. A separate provision added 5,000 nonquota visas for children under the age of 10 who were going to live with close relatives or be adopted through a recognized agency. A year later, a second amendment extended the time limit for visa issuance to the end of 1951 for displaced persons and June 1952 for orphans. The Final Report of the U.S. Displaced Persons Commission identified people admitted under the act by year and by country of birth, as seen in Tables 1 and 2.

Approximately 900,000 immigrants were admitted to the United States between 1949 and 1952, with almost one-half of them gaining entrance through the Displaced Persons Act. Over 78 percent were from eastern Europe, a region previously severely restricted under the immigration laws of 1921 and 1924. About 63,000, or 16 percent, were Jewish. Almost three-quarters arrived as part of family units. The result was a broadening of the mosaic of ethnic groups comprising the nation.

The Displaced Persons Act was the first time in U.S. history that immigration policy had been directly influenced by the circumstances of foreign refugees. As such, it set a precedent that later informed U.S. policy toward refugees from Communist nations during the Cold War. The admittance of so many displaced persons from eastern Europe also proved to be the first crack in the discriminatory quota system based on nationality, which was eventually eliminated in the Immigration Act of 1964.

Diversity

Diversity is a word, a challenge, a body of knowledge and practices, and a set of programs used in organizations, often in an employment context. The programs are sometimes referred to as Diversity and Inclusion or D+I. It has many definitions and meanings.

Defining Diversity

The first is a common dictionary definition, which is not used in the social justice, social equity, and multicultural fields. Any standard dictionary will use words such as “difference” and “unlikeness.” These are elements used in the social science sense of the word. However, “diversity” has become a more technical, if conflicted, term that dictionaries do not help define.

In regard to professional practice in the diversity and inclusion field, an emphasis on accepting, respecting, and valuing differences among people by recognizing that no one group is intrinsically superior to another underlies the current usage of the term. Diversity can include human qualities that are different from one’s own and from those groups to which one belongs. The intent is sometimes to include members of groups who have been marginalized in some way. Cultural diversity is the integrated pattern of human knowledge, belief, and behavior that depends upon the human capacity for learning and transmitting knowledge to succeeding generations.

In terms of organizational culture, implementation of diversity concepts can create an organizational and managerial process for developing an environment that maximizes the potential of all employees by valuing difference. Diversity training is often prescribed as a partial solution to intergroup differences within an organization. A diversity-competent organization would then be able to respond to the needs of many different

groups in ways that are appropriate for these groups in sociocultural terms.

A different meaning of diversity is used in the social sciences, especially around fair housing and segregation, as a measurement of levels of integration by race and ethnicity. The theory is that if all decisions were made randomly, there would be 100 percent diversity. Diversity is a condition; integration is an outcome.

History

Some diversity programs arose in the United States before the 1990s, becoming more popular with the partial dismantling of affirmative action programs as the result of several successful federal court challenges against them and a more conservative electorate in a few states, who expressed their opposition to affirmative action at the ballot box. While some viewed affirmative action as coercive, many people accepted diversity programs because they were voluntary. The impetus for diversity programs was prompted by the reality that many organizations did not reflect the population of the United States, and were overwhelmingly white and male. An institutional lack of diversity was a hallmark of the United States from its earliest history.

A current impetus to adjust to and prepare for the nation's new demographics is rapidly becoming much more urgent with the growth of Latino and Asian American/Pacific Islander populations. Growing acceptance of gays and lesbians, and the presence of more women in the workforce also create a need to learn to adjust to new realities. An advantage to organizations in approaching disparity problems through diversity programs is that they can often resolve issues without legal investigations or making admissions of wrongdoing. Diversity is often distinguished from civil rights.

Diversity as a concept, as in the diversity of student bodies, was introduced into the legal and organizational discourse in part as a justification for race-conscious remedies to racial inequality, such as affirmative action. Diversity arguments for affirmative action are a species of argument from social utility. The general idea is that group attributes can contribute to positive outcomes over and above the attributes of individuals. The diverse whole is greater than the sum of its

individual parts. Diversity programs have relatively few legal underpinnings, and are in general not required by statute.

The benefits of student diversity are used as an argument in favor of affirmative action in admissions to colleges and universities. In a number of important federal court cases, parties, such as the U.S. military and U.S. corporations, have argued in favor of affirmative action by noting that racial and ethnic diversity is beneficial for the student body as a whole.

In an international context, diversity can have different target groups. For example, Northern Ireland's equity policy covers most employees and targets inequality between Catholics and Protestants. India's policy targets the social class of *dalit*, formerly called untouchables. Malaysia has hiring quotas for public sector employment for native Malays, the majority community; and India has a hiring quota system for some government jobs and for access to higher education for disadvantaged castes and tribes. South Africa's legislation addresses discrimination in private and public sectors against women and racialized people (including African, colored, and Indian groups—local categories that constitute the majority of the population). In Norway, setting target figures for female representation is quite common.

Diversity as a Profession

Diversity programs are often carried out by consultants and trainers, and, if in-house, by chief diversity officers. Diversity management (DM) is the label given to a wide range of management practices that seek to promote the employment and career development of a range of specified groups. As of 2009, the term *DM* is no longer popular in the United States, as it implies that diversity is something to be manipulated.

A number of organizations have introduced certification for professionals in the diversity field. Such certification is already common in the human resources field and in a number of other professions. None of these certifications is universally accepted, and there is disagreement within the field concerning the value of certification. Currently, diversity as a profession is similar to the field of executive coaching, in that any interested person can practice it. Advocates of certification

feel that certification would help organizations determine the qualifications of consultants and ensure that they have a minimum standard of knowledge, experience, and practice. Diversity and inclusion have not achieved much consensus and community of practice as a field.

Coverage of Diversity Programs

Some of the most targeted diversity programs strive to recruit, hire, train, promote, and retain members of underrepresented, traditionally discriminated against groups in organizations. Typically, this practice would cover legally protected classes, such as racial and ethnic minorities, women, and people with disabilities. The other end of the diversity program spectrum would focus on veterans' status, language, the status of the lesbian, gay, bisexual, and transsexual (LGBT) community members, religion, culture, class, geography, learning styles, and modes of thought.

The most extreme interpretation is that almost any difference among people makes for diversity. This is sometimes called "deep diversity." In the view of many of those who see and practice diversity, such broad interpretations and practices dilute diversity programs into nonexistence and lack of meaning. This is in part because of a lack of focus, a lack of prioritization, and a problem with not addressing real social problems of underrepresentation of traditionally discriminated against groups in organizations.

Types of Diversity Training

There are at least four types of diversity training programs designed to try to repair and remedy harm done to traditionally discriminated-against groups of people by addressing underrepresentation and lack of inclusion in the workplace. These types of training include group dynamics orientation, antioppression and unearned benefit, positivistic, and legal compliance.

Diversity programs with a group dynamics orientation often emphasize diversity training of staff. Diversity training is any discrete program or set of programs that aims to influence participants to increase their positive—or decrease their negative—intergroup behaviors and interactions, with the objective that less prejudice or discrimination is displayed toward others perceived as

different in their group affiliation(s). The roots of diversity training extend back to the work of the psychologist. In the 1940s, psychologist Kurt Lewin tried to train leaders to better manage interpersonal tensions. Lewin developed methods of using small discussion groups to "unfreeze" the attitudes of the participants (coining the term *group dynamics*). Since then, diversity training has changed direction from the initial compliance-focused programs of the 1960s to early 1980s to ways of improving working relationships of the mid-1980s to the mid-1990s to the recent focus on leveraging a myriad of diversity dimensions to enhance business performance.

A second, now less prominent, form of diversity training involves exploration of antioppression and unearned benefits accruing to white men. Fundamental concepts considered by political progressives (such as those who work in "anti-racism") include group identity, power and privilege, and internalized oppression. This type of training is often unpopular among a target audience of white men. Diversity programs are often opposed by politically conservative groups, who feel the programs are coercive and indulge in political correctness.

In the 1990s, Congress went so far as to prohibit diversity training among Federal Aviation Administration staff, following a set of trainings that caused some white male employees to complain to their representatives in Congress. Terms such as "antiracism" and "antioppression" are not being transitioned out of mainstream applications of diversity work; rather, those initiatives are pursued independently of diversity and inclusion. While some diversity practitioners include tolerance of others as a goal, some social justice advocates object to the word as implying paternalism. Possibly replacing or displacing the internalized oppression and privilege approach is a newer method based on findings from neuroscience, based on unconscious and implicit bias. While these programs have great explanatory power, their effectiveness has yet to be proven.

A third type of diversity training and programs is softer and usually draws fewer objections. It emphasizes singing songs (characterized only somewhat facetiously as "Kumbayah," after a famous folk song celebrating good intergroup relations), ethnic food and costumes, speeches,

and celebratory days, weeks, and months. These are sometimes called “feel good” efforts, after the positivistic, self-improvement strain in late-20th-century American culture that emphasized “feeling good” about oneself. These efforts are sometimes called “celebrating diversity.”

A fourth type of diversity effort stems from equal employment opportunity and nondiscrimination laws and emphasizes social justice and social equity, with a legalistic emphasis. Major components of this effort include maintaining policies, procedures, practices, monitoring, and compliance. Complaint and grievance procedures, with following investigation, analysis, evaluation, findings, and resolution, figure prominently in these efforts. Many who work in the diversity field do not regard these as components of diversity, but others maintain that such legally oriented efforts have produced some of the few measurable gains in employment of underrepresented and traditionally discriminated-against group members.

Assessing Diversity

The success and failure of diversity efforts are often not measured. Thus, it can be hard to determine if they succeed or not, or if goals are met or not. Sometimes, no goals are set. Goals of diversity programs can include improving the organization’s global marketing, demographic marketing, and cultural competence. Other goals include keeping up to date with changing demographics in the organization’s service/client area, contributing to the organization’s corporate social responsibility efforts, and improving the climate of welcomeness in the workplace for employees of color, women, and people with disabilities. These issues can include how the organization is regarded in the community and among special interest and advocacy groups. Diversity programs can also be used to address problems found through administering organizational climate surveys when questions are asked and answers analyzed about diversity, equity, trust, fairness, accountability, and transparency. The type of assessment can be linked to the particular diversity goals of the organization.

The thorniest part of diversity and inclusion programs is defining and carrying out the inclusion prong. It has been said that achieving diversity

without inclusion is just numbers. Others say that numbers of traditionally discriminated-against employees are important, especially in achieving a critical mass within an organization.

Supplier diversity is used by companies and government agencies in procurement programs and initiatives to encourage business relationships, purchasing commitments, and provisions of equal access and opportunity to small and minority-owned businesses. Targeted businesses typically include small businesses, small disadvantaged businesses, woman-owned small businesses, veteran-owned small businesses, minority and women business enterprises, and businesses in historically underutilized business (HUB) zones to participate as partners and suppliers of goods and services within a corporate and agency supply chain.

Too often, diversity programs are afforded less credibility than other corporate endeavors. Probably the most telling indicator of lack of success of diversity programs is when staff increases of targeted groups simply match or are worse than natural demographic increases in the service or customer area. An organization’s diversity profile would include a consideration of the organization’s history, baseline disaggregated statistics, demographic situation, existing practices as an employer, relationship to local communities, as well as its clients, student body, and/or customers. In other words, any equality and diversity policies should function to provide “biographies” of organizations, as well as sectors in a full or descriptive sense.

Employment equity analysis compares representation and distribution in a workplace with availability of workers in relevant labor markets in order to investigate underrepresentation. Underutilization in workforce participation of fewer minorities or women in a particular job group then would reasonably be expected, given their availability.

Major arguments in favor of adopting diversity programs include the “business case for diversity,” which states that businesses will prosper globally if they employ a diverse staff. The usefulness of diversity is supported by research documenting the benefit of diverse people in diverse workplaces and by facilitating creative problem solving, attracting a larger client base, and

effectively operating within a global marketplace. However, the mere presence of coworkers from various backgrounds in a single workplace does not necessarily foster racial and ethnic harmony.

A lack of adequate assessment measurements and tools can make it difficult to show that diversity programs have contributed to an organization, and thereby contribute to a criticism of some diversity programs that they are pro forma and symbolic.

Diversity and Inclusion

Diversity existed in North America long before the first Europeans settled on the continent. Native populations included wide differences among Plains, mountain, and coastal nations. With the entry of Europeans, diversity continued in the form of religious, ethnic, gender, and other differences. Populations were segregated by differences, however, so that diversity and inclusion was only noticed, or considered, when someone violated the rules by trying to integrate a group to which they did not belong. It was not until the 20th century that integration and therefore diversity became something to consciously notice and attempt to include.

Early in the 20th century there was diversity in the workforce but it was still segregated: Women were generally relegated to clerical, nursing, and teaching jobs; people of color were relegated to service industries. Positions of authority and status and a wide range of options were still limited to white males. Women and minorities were also denied access to most educational systems.

Women gained a wider range of work experience during World War I and even greater options following World War II. Organizations like the Women's Bureau of the U.S. Department of Labor, created in 1920, and the National Council of Negro Women, begun in 1935, lobbied Congress against racism, sexism, and job discrimination.

President Harry S. Truman integrated the military in 1948. In 1961, President John F. Kennedy established affirmative action through an executive order. This order was followed by a plan for action that was a model for businesses to recruit and develop minority employees. In the same year, Kennedy established the Commission on the Status of Women. The Equal Pay Act was passed in 1963, and in 1964 President Lyndon B. Johnson signed the Civil Rights Act. All of these acts were intended to remedy past and present discrimination in employment, education, and housing. This legislation also created a legal environment for diverse populations to succeed and to be integrated throughout U.S. culture.

Backlash was quick, however, and one of the most visible signs was the lawsuit by Allan Bakke, a white male who in 1974 sued the University of California at Davis for denying him admission

A member of the Navy's diversity senior advisory group provides diversity training to officers and enlisted and civilian personnel at a three-day diversity symposium in Pearl Harbor, Hawaii, in 2008. Many leaders have the feeling they are exploring new territory when managing a team of individuals from different cultures. Originally aimed at white participants, diversity training has gradually adopted very broad definitions of diversity over time, including secondary differences such as communication, leadership, and thinking styles.

while applicants of color with lower scores were admitted. Affirmative action became synonymous in many peoples' minds with "reverse" discrimination, or with favoring applicants for jobs or education simply because they were minorities.

Expectations that diverse populations would be integrated into U.S. culture were not met, and following almost two decades of struggle to realize the dream of inclusion, people of color and women were still relegated to lower-status jobs, excluded from educational institutions, and struggled to attain economic equality. In addition, affirmative action efforts generally enabled white women to benefit substantially faster than women and men of color. Studies by Susan Reed indicated that in three separate years—1995, 2005 and 2009—Fortune 100 companies had gender diversity in their highest ranks but no minority diversity.

Enter Diversity Training

Largely in response to the failure of new laws to make substantial changes in work and educational achievements, many work environments began to offer diversity training in the 1980s. This training

largely endeavored to educate white populations about the challenges experienced by minorities and women, and to modify biased behaviors. The philosophy behind these programs was that if white people just understood minorities and women, they would change their behaviors. Training typically included a combination of information about marginalized populations, exercises to help participants identify and challenge their own biases, and attempts to change the work environment to be more accepting of women and people of color. The result, however, was not as hoped: Considerable white male backlash occurred and diversity training was often laced with accusations, leaving participants with negative reactions and often bolstering existing biases.

Slow shifts in training programs began to occur. Educators and trainers began to consider adult learning theory and created programs that reduced defensiveness and increased readiness for learning. Definitions of diversity became very broad, including differences as wide as primary dimensions (race/ethnicity, gender, sexual orientation, disabilities) and secondary differences (communication,

leadership, and thinking styles). This shift to a broader definition of diversity often had the impact of allowing Caucasians and men to feel included in the diversity field and to take ownership of their own biases and behaviors. It also often had the effect of diverting conversations away from legally protected groups and concern about reducing the impacts of historical discrimination.

Other diversity trainers and facilitators took a more cross-cultural, developmental approach using Milton Bennett's stages of cultural sensitivity. This allowed education programs to acknowledge differences as cultural in origin and to approach participants based on their developmental stage, thus decreasing defensiveness.

At about the same time, in the late 1980s, research began to identify specific business-related benefits of including a broader range of people in workforce populations. Diverse workforce demographics were shown to increase organizational resilience during market changes, as well as to produce higher profit margins and return on investment. The Diversity Inc. Foundation conducted studies that demonstrated the positive impact of diversity on profit margins. This shift became important to acceptance of diversity and inclusion in both employment and educational settings.

McKinsey & Company examined the performance of 180 publicly traded companies in the United States, Germany, France, and the United Kingdom from a wide range of industries from 2008 to 2010 (during which there was a strong economic downturn). They found that for companies ranking in the top quartile of executive-board diversity, return on investments was 53 percent higher, on average, than it was for those in the bottom quartile. At the same time, earnings before interest and taxes were 14 percent higher for the top quartile, on average, than those of the least diverse companies.

What has become clear is that when leadership supports diversity, it happens. Corporations with leadership support have more women and people of color in executive suites and boards of directors and appear to achieve better financial results.

Inclusion Trumps Diversity

Hiring diverse employees was not having the impact that organizations had hoped for: As they

hired more women and people of color, they also began to experience high rates of turnover. Hiring diverse candidates and expecting them to think, talk, and act like the white male norm was not working. Many people of color and women were not willing to leave their own cultural values and norms behind in order to succeed. What became clear was that it was not enough to hire people—organizational cultures needed to change in order to become attractive to nontraditional employees if they were to be retained, developed, and promoted into leadership.

Beyond diversity training, organizations began to examine how structural shifts could create a more inclusive environment. A range of structural changes included benefits for domestic partners, child care facilities or assistance, transportation benefits, and employee affinity groups. The number of employee groups, for example, doubled between 1995 and 2005. Those groups provided assistance to leadership in identifying policies, procedures, and practices that could be modified to achieve a more inclusive environment. They also frequently assisted in the recruitment and retention of employees from diverse populations.

And Then Came Globalization

As more organizations developed an international focus in the 1990s and into the 21st century, it became clear that they often needed assistance in how to be effective in non-U.S. environments. Consequently, they began hiring leaders from international locations in order to understand those populations and best serve them. While this was intended as a positive action to increase effectiveness and avoid a U.S. bias, there was a downside. Over one-third of minority officers in the Fortune 100 companies in 2009 were born outside the United States. These international hires are often counted in affirmative action numbers. This practice has the effect of masking the fact that those individuals are not the people affirmative action was initially intended to impact. Organizations that hire international employees who can be used in compliance data can look like they have considerable diversity—and they do—but they have not continued to hire, develop, and retain the U.S. minority populations that were the initial target of affirmative action.

The Case for Education

Education is often the key to being able to hire, develop, retain, and promote people of color and women. Most jobs in today's world require a minimum of high school graduation, with college graduation giving candidates a substantial advantage. Educational disparities and the low number of people completing both high school and college educations will be a challenge for the future of diversity and inclusion in the United States. Looking at 2010 graduation rates, 87.6 percent of white students graduated from high school but only 30.3 percent graduated from college; 84.2 percent of black students graduated from high school while 19.8 percent graduated from college; 88 percent of Asian and Pacific Islanders completed high school and 52.4 percent completed college.

Only 62 percent of Hispanic students graduated from high school, and 13.9 percent graduated from college. Female college graduation rates were 29.9 percent for whites, 21.4 percent for blacks, 49.5 percent for Asian/Pacific Islanders, and 14.9 percent for Hispanics. The significantly lower percentages of Hispanics graduating from both high school and college is important in view of the fact that these populations accounted for over 58 percent of the growth in the last decade and will continue to account for a large percentage of future growth.

These data suggest that those very populations needed for successful diversity and inclusion in employment are not receiving the basic education required to get hired, much less promoted into leadership roles.

In recognition of the importance of diversity and cultural competency for future generations of leaders, the National Association for Campus Activities has included the following in its 17 core competencies: meaningful interpersonal relationships, cultural competency, collaboration, interdependence, effective communication, and social responsibility.

Demographic Shifts

The 2010 U.S. Census data make it clear that the demographics of the United States are changing in a way that will impact diversity and inclusion in organizations. While Caucasians are still the majority of the population (72.4 percent), their

increase since the 2000 population was a mere 5.7 percent, while other ethnic groups grew far more rapidly, from a minimum of 12.3 percent of African Americans to a maximum of 43.3 percent of Asians. This means that organizations will need to attract people of color at a much higher rate—and will need to retain and promote these populations into leadership positions.

A significant shift in the census data is that of individuals who identify as having “two or more” ethnic identities. This category, while only 2.9 percent in 2010, increased by 32 percent since 2010. Biracial marriages have increased by over 30 percent in the past decade, resulting in an increasing number of biracial individuals who are no longer willing to identify with only one of their parental ethnic lines. This change will make data collection and census information gathering in the traditional method much more challenging, if not irrelevant to the real world of work, education, and community life.

The older population increased by 15.1 percent between 2000 and 2010, faster than the total U.S. population growth of 9.7 percent. These older individuals are working longer, leaving challenges for the younger population who is often looking at workplaces that cannot promote them into leadership—or will not utilize their creative skills—as quickly as they wish. This leaves many young people feeling disenfranchised.

Females outnumber males at virtually every age group in the United States. Similar to the numbers for nonwhite groups, if organizations cannot recruit, hire, develop, and retain women at leadership levels, there will be a loss of leadership as males in those positions retire.

Another major demographic shift is that of immigrants. Since the 1990s, immigration to the United States has been the highest it has been since the early 1900s. New immigrants and their children have contributed well over half the U.S. population increase. These immigrants have shifted from being native to Europe to being native to Latin America and Asia, changing both the voice and face of the United States. While these populations will contribute to a needed labor force, they also tend to have a lower educational level, which will make it difficult for them to be developed and retained into leadership roles in most organizations.

Future Implications

All of this information leads to a number of critical challenges to diversity and inclusion, including the following:

- It will become more difficult to recruit and retain younger workers who will be looking beyond compensation to company reputation, workplace culture, and promotional and entrepreneurial opportunities that may not be available if older workers stay in the workforce.
- Organizations will need to identify ways to retain older workers and encourage them to transfer their knowledge and skills to younger generations, especially in knowledge-based sectors.
- Organizations that invest in educational attainment for communities of color and for women will benefit in the recruitment and retention of those populations.
- Recruitment in immigrant communities, along with the development of language and other skills for those individuals, will likely pay great dividends in the ability to retain loyal employees.
- It will become increasingly important to identify ways to collect meaningful data regarding biracial and multiracial identities.
- Organizations will need to balance the need for international leaders as they become global with the need to hire, retain, and promote domestic populations of color.

More important, however, the country will need to identify ways to facilitate effective cross-cultural communication and cross-difference working and living relationships in order to avoid the potential violence and ineffectiveness that can occur when people fear, avoid, or reject those who are different from themselves.

Diversity Assessment Instruments

The assessment of cultural diversity competence grew out of the 1960s, a period characterized by the realization by culturally diverse groups that culture does matter. Culture has always occupied an important role in the lives of identifiable groups; the 1960s saw the emergence of cultural groups that openly embraced their differences. Culturally aware African Americans, Chicanos, and women led the way in voicing pride in who they were and ushered in a movement that led to a greater emphasis on inclusiveness and the need to train school and business personnel in respecting cultural differences. The importance of developing an understanding and respect for diversities

of all kinds began during this period and has impacted people and institutions globally.

Cultural diversity training and assessment is based on the notion that culture is an integral part of what it means to be a human being. People are made up of a diversity of cultures. Training programs and accompanying assessment instruments have therefore been developed to foster cultural understandings and measure the outcome of such training. Educational institutions at all levels, public and private schools, colleges, and universities have developed cultural diversity assessment instruments to assess the cultural competency of their students and the cultural inclusiveness of educational organizations and educational programs. Organizations are able to apply the assessment instruments in uncovering strengths and areas for improvement regarding diversity and personnel, recruitment and retention, promotion, accountability, policies, and procedures.

Assessment Tool Examples

As the world has become increasingly diverse, it has also become increasingly necessary for educators, health care workers, social agency personnel, and employees in businesses and corporations to develop cultural competence. The assessment of the cultural competence of individuals as well as organizations and institutions has become a natural by-product of cultural diversity training. Cultural diversity assessment instruments have been developed to address the perception and reflection of culture by individuals, institutions, organizations, and programs within organizations. Self-assessment instruments designed to be used by personnel in schools, businesses, and other human service organizations consist of a series of statements to which responses reveal positive or negative perceptions of diversity.

The Self-Assessment Checklist for Personnel Providing Services and Supports to Children and Their Families, developed by Tawara Goode from the Georgetown University Center for Child and Human Development, consists of 33 items designed to assess perceptions of educators regarding the importance of culture as reflected by the school learning environment through materials and resources, communication styles, and values and attitudes. Educators

respond to questions addressing whether the displays in their classroom reflect cultural diversity, how they respond to parents of limited English proficiency, or if they understand how religious beliefs may impact decisions regarding illness, medical treatment, or death. Respondents reflect cultural competence by choosing from the following responses to the 33 statements: (1) things I do frequently, (2) things I do occasionally, or (3) things I do rarely or never. There are no right or wrong responses; however, a majority response of “things I do rarely or never” may reveal a low level of cultural competence in working with children from diverse cultural backgrounds.

A similar cultural diversity assessment is the Culturally Responsive Learning Environment (CRLE) Rating Scale. This instrument consists of 28 statements descriptive of a culturally responsive learning environment. A Likert scale, consisting of strongly agree, agree, uncertain, disagree, and strongly disagree, is used to reflect the perceptions of educators regarding the curriculum, instruction, student involvement, or parent involvement of their school. Respondents indicate the extent of their perception regarding statements addressing whether their school has a gospel choir or a mariachi band; other statements address the involvement of African American or Hispanic students in honors and advanced placement courses.

Teachers indicating agreement with a majority of the statements have a more favorable perception of the cultural responsiveness of their school's learning environment. In contrast to the first instrument described, the CRLE Rating Scale assesses the perceptions of respondents toward the institution or, as in this case, toward the school. The instrument is therefore not only an assessment of the organization; as the respondents reveal their perceptions, an assessment of the respondent's cultural competence is uncovered.

Achieving a Culture of Inclusion: A Self-Assessment Tool, developed by Susan Lee, is another instrument labeled as a self-assessment tool, but the items of the instrument reflect an assessment of the organization. Six sections of the instrument address the perceptions of the respondent regarding cultural diversity in leadership, academic planning, resource allocation

and faculty rewards, faculty recruitment and retention, accountability, and typical behaviors and beliefs as manifested by the organization. Representative statements from this instrument address whether leadership openly and publicly communicates the importance of student body diversity and whether diversity is an integral part of planning, curriculum, and instruction. Lee's instrument also addresses the allocation of funding and research for diversity-related projects and whether the organization's value system is characterized by understanding and respect of diversities of all kinds. Each statement is rated along a continuum ranging from pre-awareness, characterized by homogeneity and an unawareness of bias, to a state of complete culture of inclusion, where cultural diversity, inclusiveness, and heterogeneity are norm.

McKendree University uses the Diversity Rubric: Awareness of Diverse Individuals and Cultures Competency (General Education), which is comprised of four performance factors to assess the cultural competency of McKendree University students. Students are rated along a four-point continuum designed to assess competency in the areas of knowledge and comprehension, application and demonstration of individual understanding, analysis and synthesis, and evaluation. The expectation is that students will develop a broader understanding of what diversity includes, demonstrate positive understanding of diversity, show creative displays of attitudes toward diversity personally and professionally, and evaluate the impact of the college experience on their attitudes toward cultural diversity.

The University of South Florida developed the Human and Cultural Diversity in a Global Context, Assessment Rubric to determine students' understanding of multicultural perspectives, local and global processes, and what can occur when students do not have this understanding. This rubric consists of four criteria detailing specific cultural understandings that are evaluated along a continuum ranging from 4 = outstanding, 3 = acceptable, 2 = developing, to 1 = unacceptable. A column is available for recording the score received by students for each criterion.

Various cultural diversity assessment instruments are being used by educational institutions, health care institutions, businesses, and other

organizations to determine the cultural competence of their personnel and the cultural responsiveness of their institution. Instruments have been found to be easily administered and can be used to uncover meaningful results.

Diversity Training

Long before the now-famous Hudson Report sent shock waves through corporate America in 1987, with its predictions about demographic changes impacting the workforce, diversity was on the radar screens of forward-thinking business leaders. Equal employment opportunity (EEO) laws of the 1960s and 1970s and affirmative action requirements were already putting attention on equity in the workplace, and immigration was bringing a wider range of cultures and languages to both the workforce and the marketplace. Finally, global business realities were highlighting the need for increased cultural understanding. Because of vision and necessity, companies began to understand that diversity was a business issue, and managing it effectively was a strategic imperative for survival and growth.

As organizations began to address these changes, one of the first responses was to implement training for staff at all levels. While varying in effectiveness in raising awareness and increasing sensitivity and understanding, what training did not and could not do was change organizational cultures. The ensuing disappointment led to many articles and studies decrying the “failure” of diversity training. What critics often failed to realize was that, while training is an essential element in building an inclusive climate, it alone is not sufficient. Effectively done, training can develop awareness, knowledge, and skills that can result in behavior change at individual and team levels. In addition, when leaders gain awareness and knowledge about diversity, they can institute policies and procedures leading to culture change.

Diversity training is a label that covers a broad spectrum of content and activities, from awareness and sensitivity about bias and prejudice to knowledge about different cultural norms and the skills to work effectively with others who are different. A more recent addition to this array has been a focus on the strategic business case for diversity and its relevance to the organization’s goals and objectives. The foundation of effective diversity training is a definition of diversity that is broad and inclusive. Diversity is at its core about inclusion and exclusion, and about helping staff understand the differences around which there is inclusion and exclusion. The model by Lee

Gardenswartz and Anita Rowe, the Four Layers of Diversity, is used in many organizations across the country to frame the issue and encourage discussion, involvement, and commitment to diversity and inclusion.

Diversity training conjures up a variety of images and expectations for employees, from “touchy feely” activities to confrontational sessions in which sensitive issues around prejudice are dealt with. Many participants arrive at training with fear and trepidation, expecting to have their deepest biases exposed, be accused of bigotry, or have their values challenged. Others may think training did not go deep enough if no tears were shed. Some will view training as punishment for problems they did not create, while a number of their coworkers may welcome a chance to address long festering issues of inequity. Effective diversity training should consider the aspects of content, method, and measurement to overcome resistance, engage trainees, and achieve the desired goals.

Content

The focus of the training needs to be framed around the objectives of the organization and the needs and realities of participants. For example, does an organization want training to raise awareness and increase sensitivity about differences and how they impact interactions, teamwork, and productivity? Does an organization expect training to give managers skills in building diverse teams, or to give employees skills in cross-cultural customer service? Training objectives need to be tied clearly to job responsibilities and issues faced by staff. Needs assessment through interviews and focus groups can help determine relevant objectives.

Once clear on expected outcomes, the content of training is designed to achieve them. The three following areas of content, built from the fields of psychology, sociology, and anthropology with an emphasis on intercultural communication and bias reduction, are essential to diversity training:

1. Defining the multiple dimensions of diversity and their impact on personal and organizational effectiveness;
2. increasing knowledge of culture and how it influences behavior and interactions on the job; and

- managing stereotypes and prejudice that interfere with relationships, teamwork, and service.

Method

Diversity training can be implemented through a variety of methods and formats. In-person training, usually in half- to full-day sessions, brown-bag workshops, or in-house diversity conferences with breakout sessions and keynoters are common formats. Some organizations also make use of online training as well as video-based content.

Most diversity training is not conducted through a didactic process. The objectives of training are best achieved through an inductive session that is interactive and experiential, using personal assessment, paired sharing, and small-group discussions. In this way the learning is pulled out of participants rather than given to them. Finally, the most effective training has a strong focus on practical application, giving participants awareness, knowledge, and skills they can use on the job.

Measurement

Assessing the results of diversity training has generally been the weakest element in most organizations. First, it is difficult to isolate the variables to identify the role training had in the results. Second, training has often been tied to results that it alone cannot achieve. For example, training alone cannot increase the number of underrepresented groups in management, though it can help leaders manage their biases and assumptions when making decisions about promotion and hiring.

The most effective methods do not focus only on process measures, such as how many people were trained and how they rated the training. Rather they focus on results by tying measures to organizational outcomes. Allstate Insurance, for example, compares the employee opinion survey scores of those who have and have not attended training to see if there is an impact. The company's findings show that those who attended training have higher levels of satisfaction and ability to solve problems and that they experienced less conflict on the job. Measures of customer satisfaction, productivity, retention, absenteeism, safety, and other organizational outcomes are also used.

Diversity training is an essential tool in helping organizations effectively manage diversity,

leverage its potential benefits, and create a culture of inclusion. However, to be effective it must be part of a larger strategy of culture change and tailored to meet the specific needs of employees and objectives of the organization.

Do the Right Thing

Some critics have called *Do the Right Thing* (1989) one of the most important films of the 20th century. It was immediately recognized with a nomination for an Academy Award for Best Original Screenplay, and some felt it should have received Best Picture. Part of a new wave of black-made auteur (author) films speaking about the reality and complexity of black life with black voices and perspectives, it created controversy even

before its official opening. Filmmaker Spike Lee exposes the structured racism and racial tensions simmering just below the surface of a Brooklyn working-class neighborhood comprised mostly of African American and Puerto Rican residents and Italian and Korean businesses. Defying the usual Hollywood linear style, with clear heroes and villains leading to closure and a clear message, Lee provides a realistic yet sympathetic portrait of a neighborhood that explodes in violence. There are few good or bad characters, and his refusal to provide easy answers led many viewers to experience the film through their own lenses and agendas, resulting in widely divergent interpretations usually based on race.

Lee's first feature in 1986 marked the beginning of a 21-year period in which African American filmmakers claimed the right to define and explore their own culture and community instead of allowing nonblack Hollywood to shape black characters, roles, and stories created for the mainstream market. *Do The Right Thing* expanded the focus from interpersonal relationships to the social conditions of poorer African American neighborhoods.

The Plot

Set in the Bedford-Stuyvesant section of Brooklyn, New York, Lee portrayed the daily life of his own neighborhood on the hottest day of the year, with warmth, humor, and music (including an original score by his father, Bill Lee). Shot entirely on location by a mostly black crew, the film particularizes the archetypal characters and small details of people's lives. Most cross-cultural interactions are depicted as confrontations and concessions of varying intensities, sometimes comical and increasingly threatening. They build at one point to a ritual round of racial epithets verbalized by each of the resident races, including a white policeman. Tensions also exist between women and men, focused primarily on the failure of black men to be strong and fulfill their responsibilities. Hopelessness is part of the landscape.

The action surrounds Sal's Famous Pizzeria. Formerly an Italian neighborhood, Sal and his sons continue their business long after others have moved away. Sal (Danny Aiello) and his sons are portrayed in a mainstream style of expository dialogue, enabling whites access to their feelings and motives. Mookie, the central black character

played by Spike Lee, and the other key black characters are revealed through a style of dialogue as almost musical interplay more accessible to black audiences.

Mookie works for Sal delivering pizzas and functions as a bridge between the Italians and African Americans as the central conflict builds: black demands for voice and representation challenging white Italian positional power. Radio Raheem's music (Public Enemy's "Fight the Power") and Buggin Out's pressure for black celebrities on Sal's Wall of Fame confront the power of Sal's ownership, and this time no one concedes. The seemingly inevitable violence leads to Radio Raheem's brutal death at the hands of the police.

Lee challenges audiences with the title, *Do the Right Thing*. The film sets up a polarity between nonviolence and violence and ends with quotes from Martin Luther King, Jr., and Malcolm X. After the death of Radio Raheem, Mookie throws a garbage can through the window of the pizzeria, initiating its destruction. Lee says he is not advocating violence, but the days of oppression need to end.

Spike Lee produced, wrote, directed, and starred in the film Do the Right Thing, a story about his own neighborhood's racial tensions that come to a head on the hottest day of summer. The controversial Lee has produced over 35 films examining political issues such as race relations, colorism, the role of media in contemporary life, and urban crime and poverty.

Praise and Criticism

Lee's grandmother helped bankroll his earliest films, but Lee wanted to make it in the mainstream industry, while insisting on artistic control. When Paramount wanted to change the ending, afraid it would incite riots, Lee went to Universal and successfully negotiated his aesthetic terms but felt frustrated with a reduced budget, despite two previous successes. Nevertheless, he used a union crew and hired as much black talent as possible, expressing that he was committed to putting his power and influence to good use.

While many of the new wave black films played primarily to black audiences, *Do the Right Thing* made such an impact at the Cannes Film Festival that it drew people from all backgrounds. It elicited drastically different responses from different audiences. Some black viewers lauded Lee for defying white power, while others found it lacking in real resistance to white power. Many black women found it another example of the dismissal of black women and their voices. Many white audiences forgot about the police brutality and missed Sal's racism, considering him the main character and his loss the tragedy. Some whites saw it as proof that you can't trust black people, and others accused Lee of antiwhite racism and inciting black hate. Audiences continue to polarize over the movie because it raises complex questions about daily racism, poverty, and hopelessness, and provides no clear answers.

Uncompromising Voice of Black Experience

This uncompromising film along with Lee's other films and Spike Lee as a personality have contributed enormously to the recognition of lived black experience, black voices and talent, and to the rise of black filmmaking as a successful industry. It has made a cross-cultural historical impact shared by few other films.

Dominican Americans

Individuals of Dominican descent constitute the fifth-largest Latino group in the United States, after Mexican Americans, Puerto Ricans, Cuban Americans, and Salvadoran Americans. According to the 2010 U.S. Census, there were 1,414,703 native or foreign-born people of Dominican descent in the United States, comprising approximately 0.4 percent of the population. The northeast has the highest concentration of Dominican Americans, with nearly 48 percent living in New York, followed by New Jersey (14 percent), Massachusetts (7 percent), and Pennsylvania (4 percent).

An additional 12 percent of Dominican Americans live in Florida. A thriving Dominican community has existed in the New York metropolitan area since the 1930s, particularly in the Washington Heights neighborhood in northern Manhattan. In addition, large numbers of Dominican immigrants settled in Boston, Providence, and Philadelphia.

Immigration to the United States

The Dominican Republic occupies the western third of the Greater Antillean island of Hispaniola. With an estimated 2010 population of 9,378,818, it is the second-largest Caribbean nation, after Cuba. Colonized by Spain in 1492, the nation first won its independence in 1821. Foreign powers, including Spain, Haiti, and the United States, occupied the Dominican Republic for intermittent periods through the 1920s. Years of political and economic instability, marked by assassinations and the brutal dictatorship of General Rafael Leonidas Trujillo Molina followed. Subsequently, the nation experienced military

rule, civil war, and a curtailing of civil liberties that continued through the 1970s.

Although there have been men and women of Dominican descent in the United States since the 18th century, immigration picked up significantly after the 1961 assassination of Trujillo. A second wave of immigration began in 1966, during an occupation by the U.S. military to end the civil war. The third period began in the early 1980s, due to high inflation and unemployment in the Dominican Republic, and the strong U.S. economy. Nearly half of all Dominican Americans have immigrated since the early 1990s, after Mexican immigration began to wane, thereby allowing Dominican applicants for legal residency to be approved.

Historically, most Dominicans immigrated to the United States from rural areas and lacked higher education. In contrast, a large percentage of second-generation Dominican Americans live in or around large metropolitan areas, and at 21 percent, the group possesses one of the highest rates for college completion among American-born Latinos.

Politics and Sports

Although some scholars have maintained that, historically, Dominican Americans have been more interested in Dominican politics than in U.S. affairs, they have served in government at the local, state, and national levels. William Lantigua, Alex D. Blaco, and Angel Taveras have served as mayors of major American cities. In Massachusetts (Marcos Devers), Rhode Island (Grace Diaz), Maryland (Joseline Peña-Melnyk), and New York (Adriano Espaillat), Dominican Americans have been elected to state government. From 2001 to 2006, Dr. Eduardo J. Sanchez served as Texas's commissioner for health. In New York, multiple Dominican Americans have served as secretary of state, including Lorraine Cortés-Vázquez and Cesar A. Perales. President Barack Obama nominated Julissa Reynoso as U.S. ambassador to Uruguay in October 2011.

Baseball's popularity in the Dominican Republic has resulted in a number of prominent players in the American major leagues, including Alex Rodriguez, Sammy Sosa, Manny Ramirez, and Albert Pujols. Although not as celebrated among Dominican Americans as baseball, basketball

has gained in popularity in tandem with the successful careers of professional players like Trevor Ariza and Charlie Villanueva. Other Americans of Dominican descent are well-known athletes in tennis (Mary Joe Fernández), mixed martial arts (Eddie Sanchez), track and field (Félix Sánchez), and football (Dante Rosario).

Dominican Americans and the Arts

Since at least the 1940s, Dominican American actors have made significant contributions in film, television, and stage roles. Maria Montez was a popular actress in adventure and western films in the 1940s. She paved the way for subsequent generations of Dominican American film actors, including Zoe Saldana (*Avatar*), Rick Gonzalez (*Coach Carter*), Michelle Rodríguez (*The Fast and the Furious*), and Victor Rasuk (*Raising Victor Vargas*).

Child actress Shannon Tavaréz (*The Lion King*) and Tony Award winners Karen Olivo (*West Side Story*) and Wilson Jermaine Heredia (*Rent*) have given acclaimed performances on Broadway in the 1990s and 2000s. Actors Dania Ramírez (*Heroes*), Judy Reyes (*Scrubs*), Merlin Santana (*The Cosby Show*), Carlos Pena, Jr. (*Big Time Rush*), and Tristan Wilds (*90210*) all have worked extensively in television.

Musicians of Dominican descent are present across genres, ranging from merengue (Johnny Ventura) to *bachata* (Aventura) to pop (Kat DeLuna) to R&B (Karina Pasian) to hip-hop (Trina) to house (Roger Sanchez) to salsa (Johnny Pacheco). Dominican American writers of note include Julia Alvarez and 2008 Pulitzer Prize-winner Junot Díaz. Oscar de la Renta has been an influential fashion designer since the 1960s. Dominican American life has been represented on stage in *In the Heights*, on screen in *Nueba Yol*, *Raising Victor Vargas*, and *Sugar*, and in the novels of Angie Cruz (*Soledad*), Nelly Rosario (*Song of the Water Saints*), and Loida Maritza Perez (*Geographies of Home*).

Dora the Explorer

Dora the Explorer is a Nick Jr. children's preschool series that began in 2000. Dora Marquez is a 7-year-old Latina heroine who travels the televisual landscape together with her anthropomorphic monkey companion Boots, her talking purple backpack, and a funny, bouncy map that lives inside the backpack's side pocket. The animated series aired on the Nickelodeon cable television network, including the associated Nick Jr. channel. Creators Chris Gifford, Valerie Walsh Valdes, and Eric Weiner created a character who epitomizes Latina/o culture, while becoming part of the intimacy of the viewers' home and everyday life. *Dora the Explorer* has gained global recognition, and Dora's popularity demonstrates how images from children's programming can be readily spread and consumed in countries other than the United States. A key element of *Dora the Explorer's* popularity has been the assertion and acceptance of Spanish in the program. For example, Spanish is taught through small phrases that are very accessible for non-Spanish speakers. This makes the programming a great tool for second language acquisition. The protagonist Dora is a bilingual Spanish- and English-speaking Latina.

Multifaceted Intelligences

In *Dora the Explorer's* first season, the audience becomes familiarized with Dora and her friends and also is introduced to the 30-minute show's format. The episodes focus on psychologist Howard Gardner's theory of multiple intelligences, which are: (1) linguistic, (2) logical-mathematical,

(3) musical, (4) bodily kinesthetic, (5) spatial, (6) interpersonal, and (7) intrapersonal.

Education is important to the producers and *Dora the Explorer* teaches children to be active by asking them to "Stand up! Stand up!" or "Wiggle, Now Wiggle!" or "Jump! Jump!" Repetition is key to learning math, colors, Spanish words, and active words throughout the episodes. Dora teaches children the need for direction and successful arrival. For example, in each episode there is a starting point and a destination at which one needs to arrive in order to win a race, rescue a princess, or arrive to a party. Dora is aided in her quests by Map, who lets the explorers know where to go and how to navigate themselves through jungles, forests, mountains, and, in one episode, outer space. Preschool educator James R. Carter notes that through *Dora the Explorer* preschoolers learn geography and how to use maps. Additionally, Carter argues that even though viewers may occasionally see stereotypical images of Latina/os, those images should be seen in comparison to the stereotypical images of life in other communities and countries, such as in Paris, a village in Tanzania, a winter in Russia, and children in China playing beside the Great Wall. As Dora facilitates a discussion of how to negotiate space within the televisual landscape, educators note, she is configured with a fair amount of power that has historically been denied Latina/os.

Exploring Different Cultures and Languages

In the second season of *Dora the Explorer* more episodes are introduced with Spanish titles. The producers' advocacy of bilingualism is evident in the naming of the episodes, as well as in the use of language within all the episodes.

Dora the Explorer's producers' advocacy of bilingualism is evident in the naming of the episodes in the development of the series as well as the use of language in the episodes. Dora's character develops the intention to educate children on various cultures, educational strategies, and communication skills through numerous episodes that enhance the understanding of different cultures and languages. For example, the fourth season of the series introduces more cultural markers and more relevance to bilingualism, as in how friendships are made, even when the characters are monolingual in their native languages.

In the fifth season, each episode introduces a new character from a different place in the world, including Guatemala, Denmark, Egypt, Australia, Peru, Mexico, Japan, China, Antarctica, and Russia. While these characters may appear in other episodes, they have a main role in their respective episodes, which is to assist Dora and her friends to figure something out. All of these characters are Dora's age or older. They all show respect to their elders by acknowledging what they have learned from them. These children survive, navigate, and solve problems through the knowledge they have gained from grandparents and parents, thus teaching children and adult viewers to acknowledge what their elders have to share with them.

Dora the Explorer embodies the notion of multiculturalism in the United States. The programming has opened the conversation to develop more culturally and linguistically sensitive pedagogy.

DREAM Act

The DREAM Act, which stands for Development, Relief, and Education of Alien Minors Act, was first introduced by Congress in 2001 as a means of providing a path to legal residency for undocumented students who came to the United States

with their parents as children and, hence, give them an opportunity to participate in the American Dream.

The bill would benefit students who meet the following requirements: entry into the United States before age 16, continuous presence in the United States for five years prior to the bill's enactment, receipt of a high school diploma or its equivalent (such as a GED), and demonstration of good moral character.

If passed, the DREAM Act would enable undocumented high school graduates to apply for conditional status, which would authorize them for up to six years of legal residence. During the six-year period, the student would be required to attend college and graduate, or serve in the U.S. military for at least two years. Students who meet these requirements would be granted permanent residency at the end of the six-year period.

The Problem

The undocumented population in the United States includes approximately 3.2 million children and young adults under the age of 24, about one-fourth of the total undocumented population, who were brought to this country by their parents when they were very young, often before school age. Before 1982, various school districts across the country tried to bar undocumented children from attending public schools.

Undocumented students initially received legal access to K–12 public education as a result of the 1982 Supreme Court case *Plyler v. Doe*. The court held that denying education to children who have no control over their parents' conduct or their own legal status would impose a lifetime hardship on them. The court also stated that educating children, regardless of their immigration status, is essential for creating individuals who can function in society and contribute to its development.

That court-mandated equal access to education, however, ends when undocumented students graduate from high school. Each year, between 65,000 and 80,000 undocumented students who have lived in the United States for at least five years become high school graduates, joining the ranks of an estimated 1.7 million undocumented young adults between the ages of 18 and 24. Upon graduating, and after extensive public educational

investment, higher education becomes an elusive dream for these young adults.

Under current law, undocumented students are not eligible to receive state or federal financial aid. Instead, in most states they are required to pay international student tuition rates, despite having had all their schooling and early education in the same state. International tuition fees to attend a state (public) university can be three to 10 times higher than resident tuition fees of U.S.-born high school graduates. In-state tuition charges have a significant impact on the ability of undocumented students to enroll in a postsecondary institution. A recent study of college attendance found that among all undocumented young adults between the ages of 18 and 24, only half (49 percent) are in or have attended college. The comparable figure for U.S.-born residents is 71 percent.

State Efforts

To address the lack of higher education access, a number of states have taken matters into their own hands. Starting in 2001, states that have passed in-state tuition policies are Texas, California, Illinois, Kansas, New Mexico, Nebraska, New York, Oklahoma, Utah, Washington, Wisconsin, Maryland, Rhode Island, and Connecticut. Four states—Texas, California, New Mexico, and Illinois—provide expanded access by offering students various grants under their state financial aid programs. Although undocumented immigrants in these states are allowed to attend public colleges and universities at in-state tuition rates, they are still not able to work because of their undocumented status, even if they earn a college degree.

Federal Legislation Efforts

The DREAM Act would immediately make 726,000 undocumented young adults eligible for conditional legal status, while another 934,000 would be potential future beneficiaries. Economic impact studies suggest that the act's passage would encourage more immigrants to graduate from high school and college and would also increase tax revenues and reduce government expenses. Furthermore, these studies conclude that the increased fiscal contribution would repay the required educational investment within a few years and thereafter provide a profit to taxpayers for several decades.

U.S. Secretary of Labor Hilda Solis talks with an immigrant graduating senior during a meeting on immigration reform at University of California, Los Angeles, in June 2012. The DREAM Act would provide conditional permanent residency to some undocumented U.S. high school graduates who arrived as minors and lived in the country for at least five continuous years.

The impact of the DREAM Act would not be limited to increased earnings, tax revenues, and social services savings. Under current law, most undocumented youth are unable to complete their education and are forced to work in the informal economy as domestic workers, day laborers, ambulatory sellers, and factory workers. Recent studies have also found high levels of civic engagement among undocumented college students. In particular, studies of young adults who lived most of their life undocumented but who were able to legalize their status as they entered adulthood find that their civic engagement increased after gaining legal status, thus suggesting that DREAM Act beneficiaries may follow a similar pattern. Despite a decade of efforts by advocates, as of 2012, the DREAM Act has not been passed into law.

Over the past five years, public opinion studies have consistently found that at least two-thirds of Americans support passage of the DREAM Act. There has also been an increase in the number of advocacy organizations, corporations, religious organizations, educational institutions, and state governments that have expressed their official

support. Despite these trends of increasing support, passage of the bill remains elusive.

Dred Scott v. Sandford (1857)

The institution of slavery, long a source of discord, came increasingly to dominate the national political debates during the 1850s as the north and south argued over whether new states admitted to the Union would be "free" or "slave" and abolitionist and proslavery oratory grew to increasingly belligerent rhetorical heights. One of the key events in the years immediately prior to the outbreak of the Civil War was the *Dred Scott v. Sandford* case in 1857, a defining moment when the Supreme Court finally rendered a decision on the issue of slavery.

Dred Scott was born into slavery. In 1832, he was living in Missouri when his owner died, as a result of which he was sold the following year to John Emerson, an army surgeon. When Emerson was assigned to Fort Armstrong in Illinois, he took Scott with him, even though the Northwest Ordinance of 1787 required that the land north of the Ohio River and east of the Mississippi River be maintained as free territory and the Illinois constitution of 1819 prohibited slavery. In 1836, Emerson was reassigned to Fort Snelling in what was then the Wisconsin Territory, which was likewise required to be "free" under the Northwest Ordinance. When Emerson joined the army in the field for service in the Seminole War, his wife, Eliza Sanford, settled in St. Louis, Missouri, with Scott and his wife Harriet. Emerson survived the war but died soon thereafter in the Iowa Territory in 1843. Three years later, Scott attempted to purchase his and his wife's freedom, but Eliza Emerson refused the proposition. Failing to gain his freedom, Scott, with the assistance of antislavery attorneys, sued for his freedom, his wife's, and his daughter's in 1846.

The Legal Argument

Scott's legal argument was that his owner had freely taken him to reside for several years in a state and a territory where slavery was illegal, thus making him free. When the case finally came to trial in Missouri, a jury found in Scott's favor, declaring him and his family (by then increased by the arrival of a second daughter) free. Emerson, who in the meantime had moved to Massachusetts, appealed the verdict to the Missouri Supreme Court with her brother, John Sanford (misspelled as Sandford in court records), acting as executor of John Emerson's estate on her behalf. In 1852, the state's highest court reversed the earlier decision based on the fact that Scott was a resident of a slave state and had not attempted to gain his freedom while resident in a free state. Scott appealed the new verdict to the federal courts where he again lost, eventually appealing this decision to the U.S. Supreme Court.

Chief Justice Roger B. Taney, a native of Virginia, delivered the *Dred Scott* decision on behalf of the court on March 6, 1857. There were three major issues in the case: Was Scott a citizen entitled to sue in federal court? Was residence on free

soil a valid claim to freedom? Was the Missouri Compromise constitutional? Of the nine justices, seven were Democrats and two were Republicans, and each justice rendered his own opinion. Regarding the first question, Taney found that Scott was not a citizen and thus not entitled to sue in federal court, because people of African descent were never intended to be citizens. Three justices agreed, while two dissented. With this finding the case should have been over, since Scott was not eligible to sue in federal court, but the justices went on to determine the merits of the case anyway. Taney found that Scott should not be free because he resided in Missouri at the time of the suit and Missouri allowed slavery. Six justices agreed with this position; three dissented. By a similar majority of 6–3, the court also found that the Missouri Compromise was unconstitutional because slaves were considered property and the Fifth Amendment prohibited Congress from depriving people of their property without due process. In part, the Fifth Amendment reads: “No person shall be . . . deprived of property, without due process of law; nor shall private property be taken for public use, without just compensation.” Because the majority of justices considered slaves to be property, Scott could not be freed against the wishes of his owner.

Southerners were jubilant. The Supreme Court had validated their position. Slaves were property and the right of people to own property was protected by the Constitution. The long disagreement over the expansion of slavery into the territories appeared to have been finally decided in favor of southern expansionism.

Northerners were outraged. “Surely,” wrote New York politician Roscoe Conkling, “there can be fewer great monstrosities than the proposition that one race has the right to enslave another.” His hometown newspaper, the *Utica, New York, Herald*, editorialized the following:

A new code of political ethics is pronounced: a new theory of Government has been discovered. It is not a Republic, but a Despotism we are living under. The Constitution is not a chart of freedom, but an instrument of Bondage. The object of the Government is not to protect the liberties of the People, but to further the interests of Slavery. It is not Freedom that is national, but Slavery.

If slavery was protected by the Constitution, then what was there to prevent a slave owner from bringing slaves into New York, or Ohio, or Indiana, or any other free state? If the Constitution protected the right to own slaves in Missouri, then it also protected that right in every other state.

Northerners who had heretofore been ambiguous or disinterested in the slavery issue began to join the antislavery ranks, fearing that slavery might spread nationwide, forcing them to compete with slave labor. The Democratic Party split over the issue, while membership in the new antislavery Republican Party grew quickly from an influx of disenchanting Democrats. The decision became a focus of the Lincoln-Douglas debates in the 1858 campaign for the U.S. Senate seat from Illinois and served to mobilize northerners against slavery as much as did abolitionist rhetoric. The rapid emotional response by northerners to the decision made any further compromise on the issue less likely, propelling the nation toward civil war.

Dual Citizenship

The United States does not formally recognize dual citizenship; however, neither does it act against it. Currently, the United States tolerates the millions of Americans who have dual citizenship. Unlike in the past, the courts maintain that actions that symbolize dual, split, or even

the abandonment of American allegiance are not sufficient for compulsory expatriation or any other legal action. Since 1907, Americans who acquired another citizenship have faced the risk of losing their U.S. citizenship. Today the legal standard has changed, and in order to revoke U.S. citizenship, the state has to prove that taking the second citizenship was performed voluntarily and with the intention to relinquish U.S. citizenship. Nevertheless, it is questionable whether Americans have really adopted a political philosophy that embraces multiple national loyalties.

Dual citizenship is the consequence of two phenomena. The first is the movement of people across national borders (and to a lesser extent, the realignment of geographical borders by agreements or wars). The second is the fact that different countries have different policies regarding naturalization—some countries grant citizenship only to those who are born in the state territory (*jus soli*), others grant citizenship according to descent (*jus sanguinis*), or according to a combination of the two policies. Therefore, children born in the United States to immigrant parents automatically receive U.S. citizenship regardless of the legal status of their parents and can usually also keep their parents' citizenship. A child who is born to one parent who is a U.S. citizen and one who is not may get both citizenships; immigrants (from one of the 92 countries that allow dual citizenship) can acquire dual citizenship by naturalization in the United States without voluntarily renouncing their former citizenship; and even immigrants who do lose their former citizenship upon naturalization in the United States may regain it while retaining their U.S. citizenship.

Having dual citizenship can be extremely important for establishing a multicultural society. Benefits include the facilitation of remittances, encouragement of immigration and naturalization, and the development of a sense of civic solidarity. In fact, for those strategic reasons many countries, such as India and Australia, began to permit multiple national allegiances. In March 1998, Mexico departed from its historic hostility to dual citizenship, explicitly in order to foster ongoing nationality links with Mexican emigrants who naturalize in the United States.

Marriage as a Metaphor

Multiple national allegiances were not always tolerated in the United States. In the past, having multiple citizenships was considered illegitimate and even immoral. In an unpublished essay cited by Gerhard Casper and Stephen Krasner, Alexander Hamilton, the first U.S. secretary of the treasury, himself an immigrant, used marriage as a metaphor for citizenship as follows:

A dispassionate and virtuous citizen . . . will regard his own country as a wife to whom he is bound to be exclusively faithful and affectionate. And he will watch with a jealous attention every propensity of his heart to wander toward a foreign country, which he will regard as a mistress that may pervert his fidelity and mar his happiness.

The ideal citizen, Hamilton asserted, owed allegiance to only one state. Over the years many other politicians and public figures have expressed the same conviction. For example, President Theodore Roosevelt maintained that citizenship, like identity, cannot be divided. The common position for most of American history up to the middle of the 20th century was that dual citizenship should be eradicated. In order to be a "true" American, one ought to have complete and undivided loyalty to the state. Dual citizenship was perceived as an imminent threat to the continuation of the national world order that supposes a one-on-one relationship between the individual and the state.

This belief was not limited to speeches, and the U.S. Congress enacted many laws that not only prohibited the holding of dual citizenship but also forbade many actions that might be perceived as indicative of divided national allegiance. During most of the 20th century, Americans who performed acts that represented dual national allegiance—such as establishing residence abroad, taking an oath to a foreign country, voting for another country's parliament or serving in its army, accepting foreign public office, or even women marrying foreign nationals—could have their citizenship revoked. Those provisions were legislated as part of the Expatriation Act of 1907, the Nationality Act of 1940, the Immigration and Nationality Act of 1952, and many amendments to these laws. Voluntary renunciation of

citizenship was encouraged and forced expatriation was recommended in order to reduce dual citizenship. In other words, once individuals gained a second citizenship, they were expected to voluntarily renounce their first citizenship; if they were not willing to do so, the state would take it from them.

This well-established and accepted belief, that dual citizenship should be eliminated, is also apparent in U.S. international relations. The War of 1812 arose partly over dual citizenship, when the British tried to repatriate American citizens at sea, maintaining that citizenship could not be transferred or divided. From 1868 to 1937, the same period in which most expatriation laws were legislated, the United States entered into 25 treaties in regard to nationality transformation. The goal of these treaties, named after the historian and diplomat George Bancroft (1800–91), was to regulate the citizenship of those persons who emigrate from one country to another. Dual citizenship was construed as an undesirable outcome and the treaties were intended to make sure that nationality was acquired in one country at the expense of the other. For Bancroft, dual allegiance was to be rejected as vehemently as polygamy. In 1930, the Convention on Certain Questions Relating to the Conflict of Nationality Laws explicitly stated that “it is the general interest of the international community to secure that all its members should recognize that every person should have a nationality and should have one nationality only.”

Changing Views

Scholars have debated the reasons the United States took such a negative view of dual citizenship and thus instituted the policy of forced expatriation. The most common justification is related to the incomprehensibility of the idea of dual citizenship at the time, which was likened to political bigamy. The need for an international regulatory mechanism that eradicates dual nationality is connected to issues of diplomatic protection. Another difficulty was the need to regulate military service and other acts that supposedly require undivided allegiance. These considerations should be seen as part of a whole and not viewed separately. Practical needs of state (such as issuing protections to citizens abroad or ensuring the loyalty of the army) are always intimately linked with the

broader perceptions of citizenship at that particular moment (that national allegiance cannot be divided or multiple). In addition, policies are rooted in the hegemonic cultural perception of the time. Thus, while considering actual cases of dual citizenship, the consular and diplomatic officers of the United States abroad who were charged with implementing these notions also included assumptions regarding gender, religion, capitalism, and race.

Today, there is a consolidation of a new stage in the history of citizenship whereby dual citizenship is becoming implicitly accepted. Most scholars, such as David Martin, Alexander Aleinikoff, and Peter Spiro, embrace this change, although others, such as Stanley Renshon, believe that it may degrade American national identity. Nevertheless, the 1958 U.S. Supreme Court ruling in *Trop v. Dulles* and subsequent rulings, the following repeals of many of the legislative measures regarding expatriation, and the 1990 written acknowledgment of the Department of State that acquiring another citizenship should not be taken as an indication of the intent to relinquish citizenship all suggest that in the United States divided and multiple national loyalties are now acceptable.

Whereas in the past dual nationality was not merely unacceptable—it was an abomination—today it is not unusual, problematic, or freakish to hold more than one citizenship. The United States tolerates dual citizenship and it is improbable that this trend will change in the future. The current conditions of globalization, peace, complex identities, an effective human rights regime, and expanding democratization all make dual citizenship more common and more acceptable. The empirical data gathered by most of the recent studies suggest that acceptance of dual citizenship has been rising steadily since World War II. The trend is toward an expansive and nonexclusive notion of citizenship. While many scholars indicate that there is a growing acceptance of dual citizenship, there is still evidence that in the United States this transformation is neither wholehearted nor complete.

Although today dual citizenship is allowed by law, socially, many view it as an indication of un-American behavior. Michele Bachmann, a Republican member of the U.S. House of Representatives from Minnesota, became a Swiss citizen in

March 2012, a month after her husband Marcus, the son of Swiss immigrants, registered with the Swiss consulate. After being censured in conservative circles for her dual allegiance, she immediately renounced her Swiss citizenship. Bachmann claimed that her withdrawal from dual citizenship showed her commitment to the United States and to its Constitution.

The ambivalence in U.S. policy can be seen in the most defining document of citizenship—the passport. The United States passport explicitly states that possessing another nationality might result in loss of American citizenship (section 13). However, in the next section, it is acknowledged that many Americans have dual citizenship and that they might encounter problems abroad—but not in the United States (section 14). This document represents the fact that although dual citizenship by itself cannot be a reason for denaturalization, there are still laws that maintain that dual nationality is prohibited if the state can prove that the act of acquiring it was undertaken with the intent to renounce American citizenship.

The naturalization oath symbolically exemplifies that the United States still has not embraced the multicultural ideal of multiple nationalities. One of the foundational elements of naturalization in the United States is the Oath of Allegiance. Since it was introduced in 1795, in order to become a citizen of the United States, the immigrant has had to forswear forever former national loyalties. In the first line of the oath the immigrant declares that he or she does “absolutely and entirely renounce and abjure all allegiance and fidelity to any foreign prince, potentate, state, or sovereignty of whom or which I have heretofore been a subject or citizen.” Although compliance with the oath has never been enforced by American authorities, this text is still a mandatory oath for almost all naturalized citizens.

Irene Bloemraad analyzed immigration and naturalization patterns in the United States and Canada and concluded that the public embrace of dual citizenship in Canada has promoted immigration to that country. In contrast to the United States, which does not explicitly allow dual national allegiances, Canada removed the restriction on multiple citizenships in 1977. That is, even if the United States de facto accepts dual citizenship, the symbolic embracing of multiple national

allegiances in Canada illustrates its multicultural commitment, which in turn has real consequences regarding the absorption of immigrants.

Dual (Two-Way) Immersion Education

Dual language education is generally well regarded in the United States and is seen as an ideal model for all students, both English speakers

and English-language learners (ELLs), to participate with each other in authentic bilingual, biliterate, and bicultural education. This model promotes positive attitudes toward each language and culture and fosters full bilingual and biliterate proficiencies.

Dual language education is neither a new concept nor limited to the United States. Canada, Switzerland, Spain, and China, among many other countries, have successfully practiced and encouraged this form of bilingual and multilingual education. In the United States, the success of bilingual education programs established in Florida after the Cuban Revolution inspired the implementation of dual language programs across the nation. Coral Way Elementary, a dual language English-Spanish school established in 1963 by Cuban exiles in Dade County, Florida, continued to operate in 2012.

Bilingual education in the United States is generally designed for English-language learners in prekindergarten through 12th grade schools who are not yet proficient in English, offering different amounts of native language instruction (such as Spanish or Chinese) as well as English as a Second Language (ESL). The goal of all bilingual education programs, regardless of model, is to assist ELLs to reach full proficiency in English and achieve at grade level academically. However, bilingual education in the United States follows several types of models that fall under either additive or subtractive language paradigms. Subtractive models, such as transitional bilingual education, use students' native language typically for a period of three to four years as students develop proficiency in English through ESL or sheltered English instruction. Once students have become proficient, as determined by language proficiency standardized evaluation, students exit into the general English medium classrooms.

Subtractive programs add a second language, in this case English, and subtract the native language. Additive language programs, on the other hand, promote the continual development of the native language and maintenance of the home culture while adding a second language and culture. Additive models, such as maintenance, developmental, and dual language, do not drop the students after they become proficient in English. Rather, students in additive programs

continue to develop their academic native language as well as academic English. Unlike subtractive programs, the goal in additive programs is for students to reach full biliterate and bilingual proficiencies.

Effectiveness of Dual Language Education

Two critical longitudinal studies, in addition to an increased body of research, have documented the effectiveness of dual language education in the United States. In their 2009 book, Virginia Collier and Wayne Thomas report that ELLs who participated in dual language education outperformed comparable monolingual-schooled students in academic achievement after four to seven years in the program. Students who received dual language instruction for at least five to six years reached the 50th percentile on the reading standardized tests by fifth or sixth grade and maintained this level of performance in subsequent grades. Their results also indicate that native English speakers in dual language programs maintained their English, acquired as a second language, and achieved well above the 50th percentile in all subject areas on norm-reference tests in English.

In research published in 2001, Kathryn Lindholm-Leary reported that native English speakers developed high levels of proficiency in their first language regardless whether they participated in total (90-10) or partial (50-50) dual language immersion programs. Students from both language groups developed high levels of second language proficiency in both total and partial immersion models, though their proficiency was higher in total immersion programs.

Lindholm-Leary found that English- and Spanish-speaking students made significant growth in reading and academic achievement in both the native and second language across grade levels, and scored on a par with their peers using standardized norms for English and Spanish speakers, although results varied somewhat according to program type, grade level, and language background. The results showed that higher levels of bilingual proficiency are associated with higher levels of reading achievement, corresponding with other research findings that point to higher levels of bilingual proficiency leading to increased academic and cognitive functioning. Spanish- and English-dominant students in dual language

programs outperformed their peers across California in English reading and academic achievement tests.

One-Way and Two-Way Programs

Dual language is an additive model that falls under the broader umbrella of bilingual education and is also known by several other names: two-way immersion as well as one-way or two-way bilingual education. Dual language programs consistently use two languages for instruction for teaching and learning literacy as well as all content subjects that include math, science, and social studies. There are two program types: one-way and two-way. Two-way dual language programs have equal or near equal numbers of students from two language groups, English native speakers and native speakers of another language who are typically ELLs, such as Navajo, Korean, or Spanish. Students from the two language groups are integrated for instruction for all or at least half of the school day to achieve bilingual, biliterate, academic, and cross-cultural competencies.

In one-way dual language instruction, the goals and language use are the same as in the two-way program, with the difference that all the students in the program are ELLs, and there are no native English speakers. While both types of programs are effective and desirable, the two-way program has the advantage of having students who are native speakers of English and represent more diversity in the classroom demographic makeup.

In addition to the one-way and two-way variations that are based on the language backgrounds of student population, there are also two types of models that are based on the amount that each language is used for instruction: partial immersion (or 50-50) or total immersion (90-10 or 80-20). The primary distinction between these two models is the amount of time allocated to each language for instruction at each grade level. In the total immersion model, the amount of instruction in the language other than English is initially greater than in English, usually 80 percent of the time in the primary grades, with English instruction increasing by each grade level until students receive equal amounts of English and the other language instruction by the intermediate grades. In the partial immersion model, on the other

hand, both languages are used equally for instruction in all grade levels.

Dual language education, an additive form of bilingual education that provides enriched language education both for ELLs and native English-speaking students, has been recognized by policy makers, educators, researchers, and parents as a desirable alternative to monolingual English education in the United States.

Dutch Americans

The Netherlands is a western European country on the shores of the North Sea. As of the most recent census information, there are 5,023,846 Dutch Americans, or 1.6 percent of the population. The Dutch were not only a significant immigrant population in American history, they were the original settlers of some of the territory that eventually became the United States. Dutch Americans should not be confused with “Pennsylvania Dutch,” whose name is a corruption of the word *Deutsch*, meaning German.

The Dutch established New Netherland in the early 17th century, consisting of lands from the

Delmarva Peninsula to Cape Cod, a region now occupied by parts of Delaware, Connecticut, New Jersey, Pennsylvania, Rhode Island, and New York. New Netherland (the capital of which was New Amsterdam, which became New York under English rule) was settled more slowly than its neighbors, New England to the north and New Sweden to the south, and the colony was also less homogenous than its neighbors, consisting not only of Dutch settlers but of Flemish and Walloons from modern-day Belgium, French Huguenots, Scandinavians, and Portuguese. New Netherland, like the Dutch Republic, was a bastion of religious and cultural tolerance, perhaps the first American civilization who could be considered multicultural. Some of the colony's principles were adopted into the U.S. Constitution, and they also provided the legal tradition for the New York

area—notably, the Articles of Capitulation, which transferred control of the colony from the Dutch to the English in 1664, guaranteed the right to religious freedom. As a pragmatic matter, this was to ensure the safety of New Netherland's existing citizens, but it also preserved religious freedom as what became an American ideal.

Nassau County, Coney Island, Block Island, Long Island, Rikers Island, Staten Island, Batavia, Dunkirk, Rensselaer, Yonkers, Brooklyn, the Bronx, Bedford-Stuyvesant, Harlem, Dutch Kills, Flushing, and Manhattan in New York; Bergen County and Brielle in New Jersey; Cape Henlopen in Delaware; and Rhode Island all bear names from the New Netherland period. Though the Hudson River is named for the Englishman Henry Hudson, he was working in the service of the Dutch. The families of three presidents—Martin Van Buren, Theodore Roosevelt, and Franklin Delano Roosevelt—are descended from Dutch colonists in New Netherland.

A late-17th- to early-18th-century Dutch gable home in Albany, New York, is typical of the Dutch architectural influence in the United States, with its Flemish brick bond and fleur-de-lis wall tiles. From the first Dutch settlements in the Americas in 1613, many villages were established by Dutch immigrants, including New Amsterdam, which eventually became New York City.

Population Growth and Assimilation

After New Netherland was transferred to British control, Dutch immigration stopped almost completely until the 19th century, though very few Dutch left the colony, so the Dutch American population continued to grow through natural means. The key exception was the founding of Germantown in Pennsylvania—since absorbed into Philadelphia—by Dutch Quakers in 1683. Germantown soon became the birthplace of the abolitionist movement. Dutch immigration resumed in the early 1800s as Dutch farmers left the economic mire of the Netherlands for new opportunities in the United States, settling mainly in the midwest, where ample agricultural land was available. Western Michigan and the city of Holland have become an epicenter of Dutch American culture and the Dutch Reformed Church in the region. Dutch Catholics settled in Wisconsin in response to the same economic pressures and growing anti-Catholic sentiment in the Netherlands. Over the course of the 19th century, 340,000 Dutch immigrated to the United States.

After World War II, an unknown number—probably around 50,000—of Indies Dutchmen immigrated to the United States from Indonesia, formerly known as the Dutch East Indies.

Typically Christians raised with the Dutch language and culture, they were predominantly children, and even grandchildren, of Dutchmen and indigenous Asian women and were categorized in a variety of ways by immigration officials and subsequent census reports. A wave of Dutch immigrants arrived directly from the Netherlands as well, where the war had left the country with a flailing economy and a significant housing shortage. Provisions of relief acts passed beginning in 1950 permitted more Dutch and Dutch Indonesians to immigrate than immigration quotas would have allowed, part of the exceptions granted to postwar refugees.

Dutch immigrants, especially prior to the 20th century, assimilated quickly and decisively. While celebrations of Dutch culture were retained, the English language was adopted almost universally. The spread of public education in the 19th century helped with this, as the children of immigrants were taught English and other American practices for free. Almost none of the Dutch restaurants, bakeries, or stores operating today were opened before the mid-20th century. Dutch culture has been influential in America's melting pot, notably contributing to modern depictions of Santa Claus (*Sinterklaas*, in Dutch).

Many areas with large Dutch populations celebrate a Dutch heritage festival, typically scheduled to coincide with the blooming of tulips, a popular symbol of the Netherlands. The largest is believed to be in Holland, Michigan—the Tulip Time Festival, which has been held since 1929 and runs for a week beginning the first Saturday in May. Tulip gardens throughout the town are displayed, and tulips line the major streets. There are three separate parades, traditional dancing and music, fireworks, and a Dutch Market selling Dutch goods and memorabilia. Holland also holds a Dutch Winterfest to celebrate *Sinterklaas* in early December. Other Dutch American communities celebrate *Kermis*, a Dutch festival that originated as the anniversary of the founding

of a given church but has developed into a harvest festival held in October to celebrate Dutch culture.

Some of the most famous Dutch Americans include the abstract expressionist painter Willem de Kooning, actors Dick Van Dyke and Rebecca Romijn, Simpsons creator Matt Groening, musicians Alex and Eddie Van Halen, baseball player Bert Blyleven, and Nobel Prize-winners Nicolaas Bloembergen and Tjalling Koopmans.

E

E Pluribus Unum

Within any group, no matter how homogeneous, diversity exists. This has been the reality within the United States from the very beginning. The Latin phrase *E Pluribus Unum* (out of many, one) found on American coinage illustrates the recognition and balance of plurality and unity. Throughout the history of the United States, the motto *E Pluribus Unum* has been interpreted in numerous and sometimes even contradictory ways. This ideal is based on the hope that one nation can be simultaneously supportive of diversity and sufficiently unified.

Attempts at balancing these conflicting values have been seen in various political and cultural debates, with each side wrestling for domination. In a unitary system, like that with which the colonists were familiar in England, government entities strive for national unity and in the process suppress individual or regional identities, resulting in a *unum*, or totalizing, government. In a confederated system such as the one established by the Articles of Confederation, local government agencies dominate, thus emphasizing the *pluribus*, or many. By contrast, the federal system as established in the Constitution is designed to balance the needs of the states with the needs of the country by balancing the many and the one.

Historical Background

The Continental Congress of 1776 appointed Benjamin Franklin, John Adams, and Thomas Jefferson to draft the design of the Great Seal of the United States. These Founding Fathers employed three Latin phrases within the design: *Annuit Coeptis* (God has favored our undertaking), *Novus Ordo Seclorum* (a new order of the ages), and *E Pluribus Unum* (out of many, one). All three Latin phrases possess both a religious and a political connotation that significantly are blended together.

There is some debate on the literary source of *E Pluribus Unum*. Some attribute the phrase on the Great Seal, *E Pluribus Unum*, to a poem, *Moretum*, attributed to Virgil, in which a farmer mixes various ingredients together to form a relish. A more likely candidate for the origin of the phrase is Saint Augustine. The phrase, “out of many, one,” is a classical Catholic ecclesiological principle stressing the universal nature of the Catholic faith. It is used by Saint Augustine to describe the ties of brotherly love and friendship in book IV of his *Confessions* (397 c.E.). By just examining the three Latin phrases of the Great Seal, in both their likely sources and intended meanings, one finds a high degree of religious reference and significance. The case is made only stronger when one considers the multiple religious symbols incorporated into the design of the Great Seal (such as the Eye of God, cloud of God’s glory, and olive branch).

A fresco by Constantino Brumidi pronouncing *E Pluribus Unum*, which is Latin for “out of many, one,” graces the rotunda at the U.S. Capitol in Washington, D.C. The central idea was that out of many colonies emerged a single nation.

Ethnicity

The response to the 19th-century influx of immigrants was called Americanization, made famous by the “melting pot” analogy, whereby the cultural ingredients of religion and ethnicity would melt newcomers into one national character of a “true” American. To be American was to speak English, be white, and be Protestant. The government, schools, and churches participated in this effort to form a unified, patriotic national identity.

In the late 19th and early 20th centuries, European immigration to the United States began to increase substantially. Beginning in the 1880s, large numbers of Catholic immigrants from southern and eastern Europe, such as Italians, Russians, and Poles, arrived. These immigrants were met with intense hostility. The dominant white, Anglo-Saxon Protestant (WASP) culture forced them into ethnic “ghettos” in the larger cities.

Adopting a social Darwinism perspective, nativists felt too many “undesirables”—in their view, culturally inferior immigrants from southern and eastern Europe—had already arrived. Nativists wanted to severely restrict foreign influence on the

culture of the United States. A series of immigration laws in the 1920s followed, establishing the principle that the number of new arrivals should be small and, apart from family reunification, the inflow of new immigrants should match the ethnic profile of the nation as it existed at that time. Already-established national quotas discouraged immigration from Poland, Italy, and Russia and encouraged immigration from Britain, Ireland, and Germany.

The sociological pendulum has swung in the opposite direction as modern struggles with immigration reject such complete assimilation, and instead minimize characteristics required to identify one as an American. Some argue today that there is no single American identity but rather each ethnicity should be equally valued. Instead of a melting pot, America is more often compared to a tossed salad wherein each component is distinct.

Religion

To what degree was the United States founded as a religious nation? The answer to this question involves the interpretation of history and has become central to the modern culture wars. Scholars who argue that the United States was founded as an experiment in limited government in pursuit of the freedom of religious expression point to numerous examples of government support of religious ideas, symbols, and expressions. Even prior to the American Revolutionary War, evidence indicates there was a high degree of religious consciousness within the society. By popular demand the inscription “In God We Trust,” was formally adopted as the official national motto on July 30, 1956.

Advocates of a secularized American history describe the Founding Fathers as varying in their attitudes toward religion from merely suspicious to openly hostile. They contend that America was founded as a secular or religion-free society but incrementally over time religion was injected or forced into our culture. Advocates of secularity prefer the phrase *E Pluribus Unum* to the national motto “In God We Trust,” applauding the prior phrase’s absence of reference to the divine and envisioning an America made up of distinct cultures. As national secularity and sensitivity to multiculturalism continue to increase, the phrase

E Pluribus Unum will likely supersede “In God We Trust” as the national motto.

Ebony

On November 1, 1945, America got its first look at *Ebony*, a monthly pictorial magazine modeled after *Look* and *Life* but whose goals, in the words of its founder John H. Johnson, were to focus on the achievements of blacks from “Harlem to Hollywood” and to “offer positive images of blacks in a world of negative images.”

Prior to *Ebony*, no black magazine had taken such an optimistic view of black life in America. Magazines such as *Crisis* and *Opportunity* daily catalogued the harshly circumscribed world of racism, violence, federal apathy, and black oppression after World War II. In *Ebony*, Johnson sought to introduce both black and white readers to African America’s good life, and black readers expressed relief and satisfaction at *Ebony*’s approach. It showed that African American life was as good as any American’s life in this world. Johnson found success in his policy that *Ebony* “reflect the Negro’s everyday life on Main Street from coast to coast, to present him to both white and Negro readers as an ordinary mortal human

being—not a freak or a stereotype, not a debate or a resolution.” While its presentation of the 1950s American good life was not new—magazines such as *Life* and *Look* showcased similar formulas and themes—*Ebony* championed an optimistic black identity for the first time.

Founding a Black Publishing Empire

John H. Johnson was born in Arkansas City, Arkansas, in January 1918, the grandson of enslaved people. His mother worked hard to save enough money to buy a train ticket for the family to the north because there was no high school for black students in Arkansas City. Johnson graduated as class president and with academic honors from Wendell Phillips Academy High School on the south side of Chicago and attended the University of Chicago and Northwestern University.

In 1942, after putting up his mother’s furniture as collateral for a \$500 loan, Johnson began his publishing career with *Negro Digest* and *Black World*, and, with his wife, took the first steps toward establishing what would become one of the most successful black-owned businesses in the world, Johnson Publishing Company.

Ebony’s Birth and Popularity

Three years later, Johnson launched *Ebony* (a name suggested by his wife Eunice); the first issue sold a meager 25,000 copies. With the help of Benjamin Burns, *Ebony*’s white and Jewish coeditor, the second issue sold 200,000 copies. To capitalize on what historian Adam Green called “the market turn in African American life” and to emphasize the broader complexities of the black political and consumer culture of the postwar era, the magazine’s initial success relied on several stock features. The magazine regularly ran features on exemplary individuals from the sporting world, Hollywood, and literary world, such as world heavyweight champion Joe Louis, author Richard Wright, and poet Gwendolyn Brooks. Fame became a celebrated virtue in the magazine.

Ebony also had an appetite for racially evocative culture and arts. It regularly posted stories on fashion, dancing, and performance pieces that were more than a mere catalog of the week’s best box-office hits. Headlines such as “African Influences on Fashion” (July 1948), “Dred Scott’s

Children” (April 1954), and “Female Impersonators” (March 1948) always pushed the envelope, showing a commitment to showcasing the “zesty” (February 1946) side of African American cultural production. *Ebony* also evidenced a commitment to interracial dialogue and fellowship. Coverage such as “Famous Negroes Who Married White” (1949) and “Whites Who Sing Like Negroes” (1951) captured these topics and showed that the cultural meaning of blackness and interracial dialogue were ever-evolving phenomenon.

Setting and Breaking Precedent

As much as *Ebony* strove to break with the protest precedent of the black press, the magazine devoted much space to voices of dissent. It stands as a rich historical archive of political protest and the politics of black struggle worldwide. During the late 1950s, it ran Dr. Martin Luther King, Jr.’s, column, “Advice for Living By,” and by the 1960s, it was covering substantive and consistent news of the civil rights movement. Photographers captured the Montgomery Bus Boycott, King’s Nobel Peace Prize, and the march from Selma to Montgomery. *Ebony* photographer Moneta Sleet became the first African American photographer to win a Pulitzer Prize for his photograph of Coretta Scott King and daughter Bernice that appeared in *Ebony*’s May 1968 issue. *Ebony* was also the first magazine to get an interview and photo shoot with President Barack Obama after his 2008 election.

Johnson and his wife built an empire in Chicago that included not only magazines *Ebony* and *Jet*, but a cosmetic line, as well, called Fashion Fair Cosmetics. Johnson’s magazine ventures achieved and continue to achieve high accolades; *Negro Digest* and *Ebony* were so successful that in 1972 the Magazine Publishers Association named Johnson Magazine Publisher of the Year. Today, *Ebony* and *Jet* are the mainstays of Johnson Publishing Company and hold the number one and number three spots, respectively, in readership of black American magazines with over 20 million readers. The company’s current chairwoman is Johnson’s daughter Linda Johnson Rice.

Ecuadorian Americans

Ecuador is a South American country on the Pacific Coast, bordered by Colombia and Peru. Like many countries of the former Spanish colonial empire, its population is predominantly mestizo (a mix of European and indigenous heritages) with a large indigenous population and Afro-Ecuadorian and white minorities.

Recent Immigrants

Ecuadorian Americans come from many backgrounds, including the aforementioned groups, Lebanese Ecuadorians, Italian Ecuadorians, Chinese Ecuadorians, and Japanese Ecuadorians. There are 696,500 Ecuadorian Americans and an unknown number of undocumented immigrants.

As with many American groups of South American descent, one reason for the diverse heritage of these immigrants is that most of them have arrived relatively recently, having immigrated from a country that itself had become its own melting pot of diverse ethnic heritages. Not that this diversity is always egalitarian; even in the 21st century, the indigenous population is predominantly poor, and in most of rural Ecuador, indigenous Ecuadorians are expected to defer to whites and mestizos, their social superiors. However, racial identity is in some ways more social than biological; Ecuadorian Indians typically still wear their traditional clothing, and abandoning that clothing in favor of modern garb and acquiring sufficient Spanish fluency is enough to present oneself as mestizo and rise in the social ranks.

Sustained Ecuadorian immigration in significant numbers did not begin until the 1960s, in response to both the liberalization of American immigration restrictions and the 1964 Ecuador Land Reform, Idle Lands, and Settlement Act, which redistributed land in a belated effort to dismantle the feudal system that had been outmoded even at the nation's birth. Though the reforms gave ownership of the land to the peasantry who had worked it, these new landowners lacked the experience to know how to manage a farm, rather than simply do farm work, and in most cases had no credit with which to pay for expenses. Without the ability to earn revenue from the land, many of them were forced to sell it, and in doing so put themselves out of work. While some simply took jobs working on other farms, others took their sudden access to cash—a rarity for a farming family—and used it as an opportunity to relocate. Some moved to Ecuadorian cities; others immigrated to the United States, Canada, and Venezuela. Many of those who left Ecuador continued to support their families back home through remittances. Others sent for their families to join them.

Some of the Ecuadorians living in the United States, and a group that rarely naturalizes, are Otavaleños, an indigenous group in northern Ecuador. The Otavaleños were textile weavers whose forced labor was ended by the 1960s reforms, and as they took control of their own businesses, they sent itinerant sales forces abroad

to sell their clothes and blankets. At any given time there are several hundred Otavaleño sellers in New York City and a scattering in other parts of the country, working as street vendors of their traditional clothing. The Otavaleño community has gradually become prosperous, its young men and women more likely with each decade to attend and complete college, and to enter into a professional career.

Chinese Ecuadorians are also among the Ecuadorians who immigrated to New York City, in part to escape discrimination in Ecuador, where they occupied no defined position in the racially based social hierarchy, and in part for the same economic reasons as other Ecuadorians. Despite New York's having a well-established Chinese American community, Chinese Ecuadorians are more likely to settle in Spanish-speaking Hispanic neighborhoods.

Illegal Immigration and Human Trafficking

A 1990s study found that Ecuadorians were one of the three largest groups of illegal immigrants in New York City; the typical tactic was to fly to New York with a tourist visa and simply not return. This group included those who were staying in the country illegally while waiting for paperwork to be processed that would allow them to become legal residents—a process that could mean spending years on the waiting list. Not all such illegal immigrants intended to be, or knew they were, immigrating illegally; numerous businesses arranged passage to the United States from Ecuador, making claims that the Ecuadorians had no means of checking, especially before access to the Internet became widespread. Such businesses might guarantee a green card, for instance, without the immigrant realizing no such guarantee could be made; others promised to secure both a work visa and work for the immigrant, but such promises either proved to be false or the jobs paid well below minimum wage and were themselves undocumented.

Of course, human trafficking of prospective sex workers is always a factor where illegal immigration is concerned, with young women told a job has been lined up for them, only to go into debt to the company providing their passage and discover too late that the job is prostitution and they are without documentation or money in a

foreign country. However, this is not to suggest that human trafficking accounts for a significant share of Ecuadorian immigration.

Even aside from undocumented immigrants, only a fifth of the Ecuadorian immigrants today who are eligible to become citizens choose to do so. Still, Ecuadorians do assimilate in a fashion—but the culture they assimilate into is the under-recognized culture of the Hispanic United States, the growing culture common to many Latin American communities within the country. The *quinceañera* celebration for 15-year-old girls, for instance, is a Mexican tradition celebrated by Mexican Americans but has become adopted by many Latin Americans, including Ecuadorian Americans, in the United States, who have no such celebration in their home countries.

The majority of the Ecuadorian American population live in the New York City area, the port to which most of them first immigrated. New York Ecuadorian Americans comprise more than half of Ecuadorian Americans, and the 25 cities and towns with the highest percentages of Ecuadorian Americans or Ecuador-born residents are all in New York or nearby New Jersey. The second-largest community, in the Los Angeles area, is only 10 percent of the Ecuadorian American population.

Educational Achievement

By 1852, states began establishing compulsory attendance laws requiring children within specific age ranges to attend school. All states had established compulsory attendance laws by 1929. Although all children were required to attend school, the schools were racially segregated. It was during this time that educators began noting disparities in academic achievement among different racial-ethnic groups.

The most glaring disparity was the significantly lower achievement of black students compared to white students. Educators argued that having racially segregated schools contributed to this disparity because the schools that black students attended were inferior (in buildings and textbooks) to the schools that white students attended. Given this concern, the landmark ruling in *Brown v. Board of Education of Topeka* (1954, 1955) required all schools to desegregate with all deliberate speed. Despite integration efforts, disparities in achievement between white and black students not only persisted, but similar disparities between other racial-ethnic groups also emerged.

While academic performance in all content areas is important, educators and scholars have prioritized student performance in reading and math because they are foundational skills that all students need to be successful in schools. Given the importance of reading and math skills, identifying and addressing the differences in performance across racial/ethnic groups became a major priority. Therefore, to better understand the academic performance of all students, the U.S. Department of Education's National Center for Education Statistics (NCES) began conducting a National Assessment of Educational Progress (NAEP) during the 1970s.

The purpose of the NAEP is to assess the academic performance of a nationally representative sample of students in 4th, 8th, and 12th grade across a range of subject areas to obtain a national picture of academic performance.

NCES reports the performance data for each of five racial-ethnic groups: black, white, Asian/Pacific Islander, American Indian/Alaska Native,

and Hispanic. To provide a historical context for reading and math achievement across these five racial/ethnic groups, the achievement data is organized approximately by decade depending on the years of testing. It is important to note that NCES did not collect data for all racial/ethnic groups for all years of the assessment. Hence, reading results are available for white and African American students since 1971 and for Hispanic students since 1975. Results for the remaining racial-ethnic groups are available beginning in 1980. Math results are available for all groups since 1978 with the exception of American Indian or Alaska Native; this is again due to insufficient sample sizes that do not permit reliable results.

Reading Performance Across Racial/Ethnic Groups: 1970 to 2011

Since the NAEP in reading began during the 1970s, the reading performance of black and Hispanic students has lagged behind that of white students. Specifically, in 1971, African American students performed approximately 40 points below their white counterparts. From this time to 1988, the performance gap decreased significantly across all grades, such that African Americans remained approximately 20 points behind white students (25, 18, and 17 points behind for 4th, 8th, and 12th grade students, respectively). Hispanic students also performed well below their white peers during this time. Performance among Hispanic students in 1975 was markedly worse, falling approximately 30 points below white students across grades. During the period from 1975 to 1988, however, the gap decreased somewhat, with Hispanic students 20, 21, and 20 points below white students across 4th, 8th, and 12th grades, respectively.

This disparity in reading performance was concerning because it was occurring after the *Brown* ruling to integrate schools, which was established in part to address academic performance gaps. However, many have argued that *Brown* did not achieve its purpose because schools did not racially integrate, and when integration did occur, it was tremendously arduous, especially for racial/ethnic minorities. Therefore, many racial/ethnic minorities continued to attend either under-resourced schools or racially integrated schools with more

resources, but with often racially charged school environments.

Also during this time, it was hypothesized that racial/ethnic minorities were culturally disadvantaged by living in poverty or having parents with lower achievement levels. Advocates of the cultural-disadvantage hypothesis argued that racial/ethnic minority students needed compensatory programming to address their inherent disadvantages and allow them to perform better in schools. There were several scholars who disagreed with the cultural-disadvantage hypothesis, explaining that it was a deficit-based approach to understanding racial/ethnic minorities that perpetuated stereotypes, prejudice, and marginalization of these students in academic settings, which contributed in part to their academic underperformance.

On the other hand, when NAEP data was first collected for Asian American/Pacific Islander students, the data indicated that white and Asian American/Pacific Islander students had similarly high performance across grades throughout the 1970s and 1980s. Demonstrating steady growth since their respective start points (1971 for white students and 1980 for Asian/Pacific Islander students), in 1988 Asian/Pacific Islander students outperformed white students in 4th and 8th grades, while white students outperformed their Asian/Pacific Islander counterparts in 12th grade. Asian Americans/Pacific Islanders were the only racial/ethnic minority group to outperform their white peers in reading during this decade.

By 1990, there was more variability in reading performance across the different ethnic groups. Specifically, there were periods when the reading performance gap narrowed; however, overall, the gap persisted. For example, Asian American/Pacific Islander 4th graders initially outperformed white students by 16 points, but by 1999, white students outperformed Asian American students by 3 points. In 8th grade the trend was similar, with Asian American/Pacific Islander students initially outperforming white students by 12 points, but by 1999, white students outperformed Asian American and Pacific Islander students by 9 points. For 12th grade students, there was a similar gap, with white students outperforming by 6 points in 1988 and by 5 points in 1999. It is unclear what accounted for these trends in performance; however, both of these groups continued

to outperform black and Hispanic students. The white-Hispanic achievement gap generally increased from 1988 to 1994 and then decreased from 1994 to 1999.

Overall, the gap generally widened slightly, increasing from 24 to 28 points among 4th grade students and 21 to 23 points among 8th grade students, and remaining unchanged for 12th grade students (24 points). With the generally erratic change in scores among African American students throughout this time period, the achievement gaps predominantly worsened. The gap shifted by 4 points among 4th grade students (from 29 to 25 points), by 11 points among 8th graders (from 18 to 29 points), and by 10 points among 12th graders (from 21 to 31 points).

While the 1970s through the 1990s generally saw the black-white and Hispanic-white reading achievement gap increase, by 2000 those trends were starting to reverse. From 2000 to 2011, Asian American/Pacific Islander students surpassed or equalized the performance of white students across all grade levels. That being said, scores remained comparable, with white students performing 4 points below in 4th grade, 1 point below in 8th grade, and equal in 12th grade. For both Hispanic and African American students the achievement gaps with white students remained approximately the same or improved throughout this decade across grades (with 12th grade Hispanic students being an exception). Among African American students, the gap decreased by 9 points in 4th grade (35 to 26), by 4 points in 8th grade (29 to 25), and by 2 points in 12th grade (31 to 29). Among Hispanic 4th, 8th, and 12th grade students, gaps decreased by 3 points, decreased by 1 point, and increased by 2 points, respectively (the latter as the lone exception). Comparing American Indian/Alaska Native students to their white counterparts, the gaps shifted throughout this decade, from 7 to 17 points and from 29 to 22 points (4th and 8th grade, respectively).

Although the reading achievement gaps remain quite substantial, the decreases in the gaps are noteworthy. It is unclear what factors have contributed to the decreases because of the myriad changes that constantly occur in education. Identifying the factors that help reduce the achievement gap is a major focus of educators so they can further reduce the achievement gap in reading.

Math Performance Across Racial/Ethnic Groups: 1970 to 2011

The performance of racial/ethnic minorities in math has also been a concern among educators for several decades. For example, during the 1970s, white and Asian American/Pacific Islander students performed notably higher than Hispanic and African American students. While the growth pattern differs across grade levels among Asian American/Pacific Islanders, they actually outperformed their white counterparts in 1978 and continued to do so in 1990; during 8th grade this gap actually increased throughout this time period, but for 4th and 12th graders the gap decreased. The gap between Hispanic and white students varied by grade level. In 4th grade, the gap remained unchanged (21 points in 1978 and 1990). In 8th grade, however, the gap closed considerably, from 34 points in 1978 to 21 points in 1990. The 12th grade gap was between these two relative extremes, from 30 to 25 points (1978 and 1990, respectively). The gap between African American students and their white counterparts closed steadily across grade levels. In this time frame, the gap decreased from 32 to 27 points in 4th grade, from 42 to 27 points in 8th grade, and from 38 to 20 points in 12th grade.

A fluctuating black-white and Hispanic-white achievement gap was also observed in the area of math achievement. The disparities were consistently above 20 points, which was slightly larger than the reading achievement gap between the same groups.

Again Asian American/Pacific Islander and white students performed significantly higher than Hispanic and African American students during the 1990s. Gaps between Asian American/Pacific Islander and white students were rather minimal and only increased slightly, with Asian American/Pacific Islander students demonstrating slightly greater growth (within 2 points in 1990 and 5 points in 1999). For both Hispanic and African American students, the achievement gaps with white students remained approximately the same or worsened throughout the 1990s across grades (with 12th-grade Hispanic students being an exception). Among African American students, the gap widened by 1 point in 4th grade (27 to 28), by 5 points in 8th grade (27 to 32), and by 10 points in 12th grade (21 to 31). Among Hispanic

4th, 8th, and 12th grade students, respectively, gaps increased by 5 points, increased by 2 points, and decreased by 4 points (the latter being the lone exception with gap closure). Throughout the 1990s, the math achievement gap remained quite substantial.

By 2000, Asian American/Pacific Islander students continued to outperform their white counterparts across all grade levels and even extended this gap. It remains comparatively minimal (as of 2011), with white students performing 7 points below in 4th grade, 10 points below in 8th grade, and 7 points below in 12th grade. Among African American students, the gap decreased across all grade levels, from 28, 32, and 32 points to 25, 31, and 27 points (4th, 8th, and 12th grade, respectively). A similar trend held true for Hispanics, with gaps decreasing from 26 to 20 points in 4th grade, 24 to 21 in 8th grade, and 22 to 21 in 12th grade. Finally, American Indian/Alaska Native students decreased the gap in 4th grade, from 31 to 24 points, but the gap increased among 8th-grade students from 24 to 28 points.

As with the reading achievement gap, the math achievement gap remains large; however, there is also a decreasing trend in the math achievement gap. It is unclear what factors are contributing to this trend; however, educators and researchers have put great effort into improving educational programming to improve reading and math performance. However, across the United States, there are several different curricula and other programming supports that are being used to improve math performance, especially among racial/ethnic minorities. The variability in programming makes it very difficult to identify programs that reduce the gap in order to extend those programs to other schools across the country.

Based on all of the data reviewed since 1970, the central challenges regarding ethnic group achievement have been and continue to be the relatively lower reading and math scores among black, American Indian/Alaska Native, and Hispanic compared to white and Asian/Pacific Islanders. Given the persistence of these achievement gaps among the ethnic groups, reducing the

achievement gap in reading and math has become a major goal of the U.S. Department of Education as well as several other national, state, and local education agencies. To reduce these gaps, researchers have studied these data for decades to identify factors that are causing and/or contributing to these achievement gaps, especially the black-white and Hispanic-white gaps in reading and math.

Causes/Contributors to Differences in Ethnic Group Achievement

One of the longest-standing explanations for the differential achievement of ethnic groups has been that blacks, Hispanics, and American Indian/Alaska Natives are minority groups that have experienced discrimination and oppression in educational institutions. It is suggested that discriminatory practices have contributed to the high number of these ethnic minority students attending poorer-quality schools that have fewer qualified teachers, lower-quality curriculum, and less financial support. Therefore, these students demonstrate lower academic performance due to having a lower-quality education. While racial integration has occurred with the *Brown* decision, the implementation has been uneven and racial segregation in educational institutions continues to manifest in new ways.

Another proposed reason for the ethnic group achievement is differences in socioeconomic status across groups. Given that a disproportionate number of black, Hispanic, American Indian/Alaska Native families live in the low-income range, these students are more likely to experience poor-quality prenatal care, inadequate nutrition, unsafe/inadequate housing, and poorer quality schooling. When these students experience these risks, it can adversely influence their academic and/or psychological functioning. Therefore, it is suggested that these students are more likely to demonstrate poorer academic performance. However, data also indicate that not all students who have family income in the low-income range experience these adverse events or effects. Thus, low-income status alone does not explain the lower academic performance of these ethnic groups.

The instructional and educational practices used within schools have also been suggested as

factors contributing to the uneven performance among ethnic groups. To explain, there has been limited research examining how students who are members of different racial/ethnic groups learn. Moreover, educators have had limited training in teaching students from different ethnic backgrounds. Therefore, it is unclear whether instructional environments should be restructured, whether teachers should use different instructional strategies/styles, or whether curriculum content should be modified to better reflect the learning needs/styles of ethnic minorities.

For these reasons, there has been increased interest in trying to better understand the components of an optimal learning environment for students who are members of different ethnic groups in order to improve their academic performance.

Finally, factors such as acculturation and English language proficiency are important considerations for students who immigrate to the United States because students may feel stress as a result of the acculturation process or learning a new language. However, the data remains limited on how these factors influence learning as well as how to optimally teach students who are learning English or who have recently immigrated to the United States.

Conclusions

Current data suggests that while the academic performance of black, Hispanic, and American Indian/Alaska Native ethnic groups is improving at some grade levels, their performance (on average) continues to lag behind their white and Asian/Pacific Islander peers. The lower academic performance of these groups, particularly in reading and math, has contributed to increased rates of retention and dropout. Uneven achievement across these ethnic groups has garnered significant attention, yet the challenge persists. It is unclear how the achievement gap will be reduced in the near future; however, efforts to address the myriad factors that contribute to the achievement gap will continue.

Egyptian Americans

Egyptian Americans are Americans of direct Egyptian descent. Egyptians began to immigrate to the United States in large numbers in the second half of the 20th century. However, unlike other Arab Americans, such as the Lebanese and Syrians, there are no official records to indicate the precise number of immigrants who came from Egypt to the United States in the 19th century.

In 2000, 1.2 million people living in the United States reported an Arab ancestry. A little over one-fourth of those were Lebanese, 29 percent. The next largest specific groups were Egyptian, 14.5 percent, and Syrian, 8.9 percent (U.S. Census Bureau, 2000). In 2009, the U.S. Census Bureau reported the number of Egyptians had reached 197,000, maintaining its second-place rank of Arab populations in the United States after Lebanese Americans. Egyptian Americans reside mostly in New York, New Jersey, Philadelphia, Virginia, Michigan, Florida, Texas, and California. According to the 2009 census figures,

the distribution of Egyptian Americans by region is northeast, 36 percent; midwest, 12 percent; south, 25 percent; and west, 27 percent.

Demographics

Egyptian immigrants are predominantly male, concentrated in young age groups, with a high educational attainment. In the 20th century, the first wave of Egyptian immigrants to the United States were highly educated, mostly university graduates, some of whom were seeking further graduate studies. They have been working as physicians, engineers, lawyers, professors, teachers, accountants, brokers, and entrepreneurs.

Within the American multicultural context, most Egyptian Americans are bilingual, speaking English and Arabic, often with an Egyptian dialect. While all of the Arab American subgroups show educational levels above that of the total U.S. population, Egyptians in particular have a high degree of educational achievement, with over 63 percent having earned at least a college degree. However, some Egyptian Americans who hold degrees from Egyptian universities are engaged in blue-color occupations, such as car maintenance workers, taxicab or truck drivers, and restaurant waiters.

Growth of U.S. Immigration

Before 1965, migration to the United States was limited from both the Egyptian and American sides. Egypt, under Nasser's regime, did not have good relations with the United States, which had a restricted immigration policy, restraining certain countries from entering its land. However, in 1965 the United States issued the Immigration and Nationality Act allowing selective entry of certain professionals, especially scientists, from other countries including Egypt.

Furthermore, the deterioration of economic conditions, triggered by the political instability in Egypt following the 1967 Arab-Israeli war, pushed thousands of Egyptians to emigrate to the United States. After Nasser's death in 1970 and the improvement of American-Egyptian relations during Anwar Sadat's presidency, emigration to the United States rose dramatically.

By 1990, Egypt, more so than other Arab countries, had participated in the Diversity Visa (lottery) Program, allowing them to immigrate to the United States. Since the 1980s, the Egyptian

government has been working to strengthen ties with the United States by encouraging wealthy Egyptian Americans to help its economy through remittances sent to their families, as well as by investing their money in the homeland.

In 1999, Egyptian Americans' income was among the highest per family at \$57,246, per the 2000 U. S. Census. In 2000, 61 percent of the foreign-born population in the United States participated in the labor force, a figure slightly below the national average. Labor force participation among Egyptian immigrants in particular, however, was slightly higher than the average, at 65 percent.

Daily Life and Religion

Traditional Egyptian culinary dishes include bread ('*aysh*, which also means "life"), *ful* (fava beans), *falafel* (a mixture of ground fava beans and other spices served fried), *mullkhia* (a thick green soup made of mallow leaves), *kufta* (ground meat mixed with ground rice and other spices served, after being fried, in tomato sauce), and stuffed cabbage (*mahshi*). Egyptian Muslims prefer to eat *halal* food (food that is prepared according to Islamic law or regulation).

Egyptian Americans' religions include Christian Copts, who migrated earlier, and predominantly Sunni Muslims. Mosques and churches have been built in Muslim and Christian communities, respectively. Western-style clothing is common among Egyptian Americans, though some Muslim women wear traditional Islamic dress and veils. For religious services, Muslim and Christian leaders wear traditional clothes. Muslim leaders, for example, wear a long gown (*jilbab*), robe or cloak ('*abaya*), and turban. Both Muslims and Copts participate together in social and religious occasions. Egyptian Copts sometimes share in the celebrations of the Muslim holy month of Ramadan, while Muslim Egyptians participate in certain aspects of Easter (comparable to the Shamel-Nessim, or celebration of spring tradition of serving egg and salted fish), Christmas, and the New Year.

Egyptian Americans are concerned not only with the religious and daily activities of the living, but also with the burial of their dead. Families collect money and buy several burial lots to reserve for their members. Graves of Muslim Egyptians are built facing the Qiblah or the Ka'ba in Mecca.

While marriage between Egyptian Sunni and Shi'i Muslims is uncommon in Egypt, there are cases in the United States in which Sunnis, mostly men, are married to Shi'i women. Similarly, as marriage between Muslims and Christians is rare in Egypt, various marriages between Egyptian Muslim men and Christian or Jewish women have occurred in the United States. Still, a Muslim woman would only be able to marry a non-Muslim man on the condition that he converted to Islam. Some Christian and Jewish men have actually converted to Islam to marry Egyptian Muslim women.

Egyptian Americans have established social and cultural societies such as the Egyptian American Organization (EAO) and the American Egyptian Strategic Alliance (AESAs), among others. They participate in activities of Arab American and Islamic societies, such as the Arab American Institute (AAI), the Arab American Association (AAA), and the Council on American-Islamic Relations (CAIR). Most Egyptian Americans give their votes to the Republican Party, but recently there has been a shift, especially among educators and workers, to support the Democratic Party. Some, however, cast their votes as Independents. Egyptian Americans supported the January 25, 2011 revolution in Egypt and celebrated the fall of President Hosni Mubarak's regime. They also willingly participated in the first democratic presidential election in Egypt.

El Norte

El Norte (The North), is an independent film released in 1983, directed by Gregory Nava along with writing partner and producer Anna Thomas, which received an Academy Award nomination. The film captures the journey of siblings Enrique and Rosa Xuncax from the battlefields of Guatemala during the 1980s, through the borders of Mexico and the United States, and to the final destination of Los Angeles. *El Norte* is a border-crossing epic that tells the story from the perspective of the protagonists Enrique and Rosa, of the violence propagated by an authoritative regime that took control of Guatemala and of the civil war (1960–96) that followed.

The film parallels their journey from the violence of their homeland with their journey north to another type of violence. At the film's end, a dying Rosa observes that in Guatemala, the regime wanted to murder them; in poverty-stricken Mexico there is no room; and in the United States, they are not accepted. Disheartened, she asks her brother, "When will we find our place?"

This question resonates with the current status of Guatemalan immigrants, primarily the indigenous Indians, who migrated en masse during the 1980s, seeking refuge in the United States only to be greeted with hostility and massive deportations. More broadly, the story questions the current place of indigenous communities in the Americas. The film captures the cross-border experience in three parts: "Arturo Xuncax," "El Coyote," and "The North."

Seeking a Better Life

The film opens with the circumstances that force the siblings to flee their homeland. Arturo Xuncax, the father of Rosa and Enrique, is ambushed

and brutally murdered, along with several coffee pickers, for attempting to organize. Upon the burial of the murdered men, the military troops return in search of surviving family members. Rosa's and Enrique's mother is picked up and "disappeared," a common practice during the repressive regime. Enrique and Rosa escape the death squad and are faced with the only option available: to head north. El Norte—America—is not only a place of refuge but, as told in old issues of *Good Housekeeping*, also a place of abundance, where they will make a lot of money. "In the north, we won't be treated this way," Enrique asserts optimistically upon the decision to migrate.

Part two projects the travels of Rosa and Enrique through Mexico and across the U.S.-Mexico border at Tijuana. While in Mexico, the siblings experience the racial hierarchies established in a country where Indians continue to be at the bottom, even in impoverished circumstances. At the same time, they encounter strangers willing to help them through their journey, including Raimundo, a retired *coyote* (smuggler) who agrees to guide them through the border. Rosa and Enrique cross underneath the U.S.-Mexico border through an abandoned sewer tunnel. As they crawl through the narrow space, they are attacked by hundreds of rats, a haunting moment that exemplifies the dehumanization of immigrants as they seek refuge in *el norte*. As they reach the end of the tunnel, mesmerized by the shining lights of San Diego, they pause for a moment to relish their arrival in the promised land.

Part three captures their arrival in the north. The film depicts Los Angeles as it is transformed by the shifting migrations of the 1980s, including the exodus of Central Americans. Rosa finds employment in a sweatshop that produces high-fashion clothing, and after escaping an immigration raid with the help of her new friend, Nacha, the women find work cleaning houses in high-class neighborhoods.

Meanwhile Enrique finds employment in an exclusive restaurant where his hard work ethic quickly wins him a job as a waiter's assistant. This promotion is the envy of a coworker who calls immigration, and, like Rosa, Enrique also escapes arrest, paralleling his escape from the death squads in Guatemala.

The Harsh Realities of Illegal Immigrants

These places of employment manifest the echelons of American society, where luxury and abundance are reserved for the elite, and unattainable for the nonwhite laborers. Similarly, the film parallels the life of the siblings in Guatemala, where commodities, such as coffee, were inaccessible because they were destined for U.S. consumption. The film captures the position of impoverished and oppressed indigenous populations in the Americas, chased by government officials, subjected to racism and discrimination, and serving as chattel for a global economy. The film closes with a scene of Enrique working with a shovel as the foreman oversees the labor, and thus paralleling the beginning of the film that opens up with a scene of indigenous workers picking coffee as a *ladino* foreman oversees them.

In addition to illustrating the cross-border experiences, *El Norte* is central to the development of Latino filmmaking. While Latina/os had been represented in films, often with negative stereotypes, it was during the 1970s that Latinas/Latinos began portraying and telling their own stories through film. It is in this context that *El Norte* emerges as a film that captures the “face and the heart in the shadows that prevailed in Los Angeles,” as Gregory Nava states. “By offering the human side of immigration, *El Norte* countered the anti-immigrant arguments of the time that portrayed the U.S.-Mexico border as being raided.”

These arguments have prevailed and intensified at the turn of the 21st century. The effect and power of *El Norte* has endured as evidenced in the re-release of the film on DVD on the 25th anniversary of its production.

El Paso Salt War

The El Paso Salt War was a series of armed conflicts toward the end of 1877 over the right of the Mexican American population near El Paso to gather salt from land previously held in common by the location population, yet claimed under private ownership laws by prominent Anglo leaders in the region.

Background

When the area surrounding El Paso, Texas, was part of the Spanish New World empire, the Spanish king had granted villagers the right to collect salt from the salt lakes in the region. In essence, the salt lakes became communally owned. When the region became part of Mexico, the Mexican government continued to grant this right, and it should have continued even after ownership of the region transferred to the United States because of provisions in the Treaty of Guadalupe Hidalgo, which ended the U.S.-Mexican War in 1848. However, in 1866, the new Texas state constitution allowed individuals to make claims on mineral rights, which included the salt in the El Paso salt lakes. Beginning in 1866, various prominent Anglo figures began to assert ownership over the salt lakes, sometimes in cooperation and sometimes in conflict with one another. By 1877, a Virginia-transplant and local political leader named Charles Howard claimed ownership, and he intended to enforce it.

The Salt War

On September 29, 1887, two local Mexican American men, Jose Maria Juarez and Macedonia Gandara, announced their plan to collect salt from the salt lakes, in contradiction of Howard's ownership claims. In response, Howard had the local sheriff arrest the men, then pursued a restraining order against them. Outraged by Howard's actions, Mexican Americans in the region organized several citizens' committees (*juntas*) to determine a response. Eventually, the

juntas “arrested” two judges who refused to issue warrants for Howard’s arrest, then finally took Howard himself captive. After three days as a hostage, Howard signed a piece of paper agreeing to relinquish his rights to the salt lakes, allowing the courts to decide the true ownership. He also agreed to pay the juntas a \$12,000 bond and promise never to return to the El Paso area. After signing the document and paying the bond, he was released on October 3.

However, Howard returned to the area on October 10 to murder a political rival, Louis Cardis. It was an act of revenge, because Cardis had encouraged the local Mexican American population to defy Howard’s claims of ownership in the first place. After killing Cardis, Howard fled to New Mexico. The Mexican American population of the area was outraged by the death of Cardis, and the juntas threatened to effectively shut down local government. The governor dispatched Texas Ranger Major John B. Jones to El Paso. Jones restored order with the juntas and arranged for Howard’s return to the area to face charges. He also recruited a new Texas Ranger company to stay in the area and placed it under the command of Lieutenant John B. Tays.

Howard would never face trial. Under the escort of 20 Texas Rangers, including Tays, Howard was ambushed by a mob of local citizens.

The Guadalupe Mountains in 1899. The El Paso Salt War was a complex political, social, and military conflict between Mexican American citizens and the Texas Rangers over ownership and control of huge salt lakes here toward the end of 1877.

After a two-day siege of the building in which the group had taken refuge, Howard agreed to surrender to the mob, and Tays and the other Texas Rangers agreed to lay down their arms. Howard, along with two other men, were immediately executed. The rest were allowed to leave.

The Aftermath

Retaliation was swift and ugly. Tays returned to the area with more men, including a supplement of disreputable volunteers from Silver City, New Mexico. Tays’s men terrorized the local population, with reports of drunkenness and rape being common. Eventually, the army was dispatched to restore order. When the railroad arrived in the area in 1881, it made the conflict over the ownership of the salt moot because it was no longer profitable for locals to retrieve the salt with wagons. The El Paso Salt War typifies the various conflicts that erupted in the southwest at the end of the 19th century—conflicts between the Mexican American and Anglo populations, conflicts between local, state, and national concerns, and conflicts between traditional and formal legal authority structures.

Election 2012 and the 2010 Census

The 2012 election was one of the most bitterly fought and ideological in recent memory. From

the presidential election to state-level contests, contrasting visions of the role of government dominated headlines. Moreover, racial and cultural wars over the future took place and demonstrated just how divided America may remain in the near future.

Since the election of President Barack Obama in 2008, the United States has had to reckon with the meaning of race in contemporary society. More than 200 years after the founding of the country, Americans elected a biracial (black) man to the White House. In 2008 several factors played into the final elections results: (1) the failures of the administration of President George W. Bush, (2) the onset of the Great Recession (2007–09), (3) the public's weariness with the war in Iraq, (4) a lengthy and costly war in Afghanistan, and (5) one of the most heatedly run and dramatic presidential campaigns in decades. Also, the enormous number of Asians, African Americans, and Latinos who crowded the polling stations provided President Obama with a landslide victory, with more than 360 electoral votes and 53 percent of the popular vote.

When the new president was inaugurated, he faced challenges unique in the history of the presidency. Obama was considered by tens of millions of Americans to be fraudulent. Party lines were drawn and filibusters were used. Government virtually crawled along and failed to complete basic tasks. Death threats against the president spiked. Some parents refused to allow their children to hear the president's annual back-to-school message.

In a dramatic reversal of fortunes, in 2010 the voters gave the House of Representatives back to the Republicans and made serious inroads into the Democrats' majority in the Senate. Republican presidential hopefuls considered their bid for the 2012 election. The new racial demographics signaled that change was coming, perhaps much more rapidly than previously thought.

In 2010, the U.S. Census Bureau conducted the decennial census, which was politically important for several reasons. It is used to reapportion seats in the U.S. House of Representatives as well as state legislatures. It is also used to formulate policy in various areas under the purview of the government. Furthermore, how the count is conducted—its methodology—is also a source for

concern. Few political pundits took seriously the dramatic demographic shifts under way in the United States since the last census in 2000. Yet those shifts contributed greatly to the reelection of President Obama in 2012 and to Democratic gains in the House and Senate.

The New Millennium

As the United States reached the beginning of a new millennium, the nation was at peace and, with President-elect George W. Bush preparing for his inauguration, looking forward to a more conservative era. White Americans made up 78 percent, or nearly four-fifths, of all voters. With those numbers, white Americans could easily tip the election in one direction or another, the recount (*Bush v. Gore*) notwithstanding. Minorities were a significant electoral group but not enough to elect a minority on their own. While the 2000 U.S. Census showed that Latinos, for instance, made up 12.5 percent of the population, they were comparable to the African American community, which made up 12.3 percent of the population. In 1990, Latinos and African Americans comprised 9 percent and 12.1 percent, respectively. Asians made up 3.6 percent of the population in 2000.

Combined with the lack of nationally prominent and viable politicians, most of the elected minority members of Congress were in minority-majority districts. In fact, no African Americans or Hispanics served in the Senate in 2001. The Bush years and the Democrats' backlash, however, took place at precisely the time when the United States was undergoing transformative changes in demographics and cultural attitudes toward the minority population. Those changes contributed to Obama's election in 2008 and the somewhat surprising results of the 2012 elections.

Census 2010

The census is a controversial and highly contested process. The purpose is to count, as accurately as possible, how many people are living in the United States and where they reside. Municipalities, state governments, and the federal government use the census in a variety of ways. First, the data are used to ascertain where people reside and how that compares with the previous census

data. Second, the census results are used, in part, to direct federal resources to various communities around the nation. Third, the census is used to reapportion seats in the House of Representatives. Because of the last point, politicians take extra care in the results of this process.

After the census has been completed, the state legislatures redraw the congressional map for their respective state. The political party in power in the state legislatures largely controls the process and draws up the new districts according to the needs and desires of their caucus. This turns the process into a highly partisan affair, in which data are sometimes used to contort congressional districts into amalgamations of economic, political, and racial groups (what some have likened to gerrymandering). The concept of one person, one vote is the important factor under consideration. Observers of this process argue that congressional districts must not be designed in such a way that it dilutes the political strength of minorities. Moreover, legislatures cannot put a million people in one district and half a million in another; that would dilute the voting power of the district that has a million people.

The origin of the term *gerrymander* is Massachusetts Governor Elbridge Gerry, one of the Founding Fathers who became governor in 1810 and proceeded to use the power of his office and state government in Boston to draw congressional districts that highly benefited his political party. It was noted that a district in Massachusetts—after Gerry and others were done drawing it—looked like a salamander. Thus, the practice of drawing districts for partisan advantage became known as “gerrymandering.”

Since the early republic, the highly competitive process of census taking and reapportionment has continued unabated. In fact, over the past 50 years, the practice has only gained speed and notoriety. An increasingly partisan war in Washington and various state capitals, along with dramatic ethnic, gender, and racial advancements, have made the controversial once-in-a-decade event even more contentious. In the early 2000s, House Majority Leader Tom DeLay of Texas, a prominent Republican, moved to capitalize on gains Republicans had made in the 2000 and 2002 elections. Along with the 2000 census, DeLay and others in the state legislature in Austin moved to do something

highly unusual: a mid-decade redrawing of the Texas political map. The plan was largely successful as the Republicans produced huge gains in state and congressional races. It accelerated the decimation of the Democratic Party in Texas, a process that began in the 1980s.

It is the highly partisan nature of redistricting that makes the decennial census so controversial. That did not change in 2010. There were several controversial aspects of the process of counting Americans. Democrats wanted to count as many people as possible because it helps their political fortunes, especially in diverse areas of the country where minorities account for a substantial portion of the population. Republicans, however, were skeptical of the methodology used in counting. Many Republicans have been critical of statistical sampling and the use of race. The modern Republican Party has struggled to make gains in the voting blocs of African Americans, Latinos, Asians, young people, and the lesbian, gay, bisexual, and transgender (LGBT) community. Increasingly, the GOP has become more dependent on older white Americans for electoral success. Consequently, the census has become even more important.

Latinos

Latinos are by far the fastest-growing racial group in the United States. Out of more than 308 million people living in the United States in 2010, more than 50 million were Latino. This means that they accounted for 16 percent of all Americans. By 2010, Latinos had surpassed African Americans as the largest racial minority group in the United States. This is a profound change that concerns both political parties. In addition, the rise of Latinos had exacerbated underlying tensions between Latinos and African Americans. These tensions are the result of long-standing historical differences between the two groups. African Americans' long history of enslavement, oppression, and indifference from the white majority has created extremely delicate and complex race relations. As minority politicians fight for control of scarce resources, political attention, and power, these tensions have grown. This is especially true in places such as California, Arizona, New Mexico, Texas, Louisiana, Georgia, and Florida, all of which have substantial

minority populations. Along with distrust and suspicion, both groups have tentatively warmed up to one another because of the stark differences between the two major political parties in the Obama era.

In terms of the make-up of Latinos, like all groups in America, they are not monolithic. Mexican Americans were the majority of the Latino or Hispanic population with 54 percent. There were more than 31 million Mexican Americans. Cuban Americans made up 1.8 million. Puerto Ricans also increased their presence to 4.6 million. In terms of voting, Latinos had nearly 24 million eligible voters and more than 12 million were registered to vote. As a result, Latinos were a highly sought-after voter group for both Democrats and Republicans. The political atmospherics between 2008 and 2012, however, have made it increasingly difficult for Republicans to appeal to this group.

Obama's election in 2008 signaled a sea change in national political affairs. Republicans took a strong nativist approach, addressing problems with both legal and illegal immigration. Laws were passed at the state level that wound up curbing the rights of many immigrants. Eventual Republican nominee Mitt Romney argued that illegal immigrants should "self-deport," which alienated many Latinos, 71 percent of whom voted for Obama. Many conservative policies appeal to Latinos, such as low taxes, strong defense, and strong family values, but other policies embraced by the GOP drove many of these voters toward the Democratic Party.

African Americans

In 2010, African Americans accounted for more than 42 million people, or 13.6 percent of the population. As a community, their numbers surged by 15.4 percent, or 5.6 million. In addition, the number of African Americans considered to be biracial also grew. More African Americans are dating, marrying, and reproducing children outside their race than ever before. By far the most common pairing has been African Americans and white Americans. Persons of African American and white lineage grew more than 133 percent. The growing multicultural dimensions of America have complicated race relations and produced new political dynamics. Nowhere

has this been more visible than in the 2012 presidential election.

The African American population grew faster than the overall population of the United States. The majority of African Americans lived in the south but also maintained a significant presence in major metropolitan areas, such as Los Angeles, Chicago, Milwaukee, Philadelphia, New York, Boston, and Washington, D.C. This pattern meant that African Americans maintained a strong political position, both within the Democratic Party and in the areas where they lived.

Decades after the Great Migration, African Americans have been returning home to points south. The historical and familiar ties to the south and the growing acceptance of African Americans by white southerners have made the south an attractive place for many African Americans. This is especially true for middle-class African Americans who have relocated to major areas such as Atlanta, Charlotte, Nashville, New Orleans, Durham, Richmond, Memphis, and Little Rock. Despite the progress of this group, there are substantial challenges yet to be overcome.

While approximately two-thirds of the African American community are classified middle class, a full third is poor or working class. African Americans in the middle class have a more tenuous grasp on it than their white or Asian counterparts. The decline of married black couples, the pernicious effects of racism, and the effects of the Great Recession have combined to limit the economic and educational prospects of this community.

Furthermore, African Americans are at a political crossroads of sorts. President Obama represents the new, diverse political class. He and those of his generation did not come from the church or the old civil rights battles or the 1950s and 1960s. They are highly educated with a greater degree of personal experiences than their elders. More willing to embrace the new political ideologies, Obama's generation is less tied to the politics of pain and protest. Included in these developments have been the growing number of blacks who are conservative or Republican, such as Allen West, Tim Scott, Artur Davis, Kenneth Blackwell, Mia Love, and Angela McGlowan. While Democrats can still count on 85 to 95 percent of the black vote in presidential elections, the African

American community is becoming more economically and politically diverse.

Asians

Since 1860, the federal government has been keeping track of the Asian population. In 2010, Asians made up 5.6 percent of the U.S. population, or 5.4 million, an increase of 45.6 percent. The Asian community is centered in the western United States but also has a strong presence in the south and northeast. As the African American and Latino populations have grown, so has the Asian population. The result of this growth has been a greater diversification of the U.S. population that has transformed our politics and economy. In fact, Asian Americans had more candidates for public office in 2012 than any previous year. In addition, Asians made up more new arrivals to the United States than Latinos or Africans. Furthermore, Asian Americans voted overwhelmingly for Obama in 2012 by a margin of 72 percent, compared to a 26 percent margin for Romney. This, too, has created tensions, as many in this community feel ignored by the two major political parties. Tensions notwithstanding, this community gained more political clout than they had previously.

Women

Arguably, women of all races gained political power in 2012. Increasingly, over the past four decades, women have become a more serious and forceful component in American politics. The successes of the women's rights movement opened tremendous opportunities for this segment of the population. Nondiscrimination laws, affirmative action, greater access to higher education, the growing acceptance of women in the workplace and politics, and a far higher success in education have contributed to political success. While the "playing field" is not yet level, women are making huge strides and, in the process, surpassing men in educational achievement and professional success. This is especially true as it relates to Americans aged 45 years and younger.

By 2011, women made up nearly 51 percent of the U.S. population, or 156.9 million. In the 2012 election, 55 percent of women voted for Obama and 44 percent for Romney. Men's voting pattern was almost exactly the opposite with 52 percent

voting for Romney and 45 percent for Obama. Along with minorities, women helped carry the election for Obama as well as many congressional and senatorial candidates. Moreover, a record number of women were elected to Congress in 2012. Twenty women—16 Democrats, and four Republicans—were elected to the Senate. In the House of Representatives, 78 women were elected in 2012—58 Democrats and 20 Republican. Nearly 100 of the 535 seats in Congress were won by women, thus demonstrating the growing importance of this key constituency.

Religion

The 2012 election was also the first in which neither presidential candidate was a white Protestant. Former Massachusetts Governor Mitt Romney was a Mormon. Controversial in the United States, Mormons have been perceived as cult by some. Regardless, many Protestants were willing to dismiss their earlier concerns and vote for Romney. This development did not receive as much attention as the president's race, but it was an important development nonetheless. The growing acceptance of difference in the United States has been a significant change in U.S. political culture. Romney's success was reflective of a new United States, one more diverse than anything the country had seen in the past.

Conclusion

The 2010 census and 2012 elections were historic moments for the United States. In 2010, the census revealed just how diverse the nation had become over the past 10 years. African Americans, Latinos, Asians, women, and LGBT Americans have forged a new, dynamic, and increasingly influential blocs of Americans that are transforming American politics in ways that were thought impossible not long ago. Obama's surprisingly comfortable reelection in 2012 proved to many that 2008 was not an anomaly, but a harbinger of things to come. White Americans have shown they are increasingly comfortable with racial and ethnic change. In fact, as all polling and demographics show, the pace of racial and ethnic change will likely only accelerate in the future.

Elementary and Secondary Education Act (1965 and Reauthorizations)

The Elementary and Secondary Education Act of 1965 (ESEA) was passed by Congress and signed into law on April 11, 1965, by President Lyndon B. Johnson, with his childhood teacher, Kate Deadrich, by his side. ESEA was ambitious legislation crucial to Johnson’s Great Society policy—reducing poverty through education and lifting the poor to the middle class.

Coming 11 years after the U.S. Supreme Court landmark decision, *Brown v. Topeka Board of Education of Topeka* (1954), and one year after the historic Civil Rights Act, ESEA enabled the federal government to partner with states to advance equal educational opportunities in order to better educate pupils disadvantaged by poverty.

ESEA’s Title I provided funds to public schools containing high concentrations of pupils from low-income families, allowing for “dual enrollment” of low-income pupils attending private schools. Title I became ESEA’s stellar program, injecting vast amounts of funds into schools for remedial programs, mainly in language arts, reading, and mathematics.

Title II funded school libraries, providing books, other print and nonprint materials, and audio-visual equipment. It prohibited federal government censorship, honoring local and state control over selection of subject matter.

Title III suggested categories of possible programs. Without prescribing methods, it allowed educators flexibility to develop programs for their unique settings. Suggested categories of activities include the following:

- Remedial instruction in all subjects
- Comprehensive guidance and counseling programs
- Specialized instruction for students interested in advanced science and foreign languages
- Specialized instruction for early childhood education, the handicapped, pre- and after-school programs, and parental involvement
- Development of educational radio and television programs
- Outreach educational services for rural areas
- Professional development for educators and parents

Title IV funded research and development centers to disseminate information derived from educational research, creating regional educational laboratories and a network of national diffusion of research-based educational practices. Title V provided funds to strengthen state departments of education (SEA), which received grants to build their capacities in order to offer information and training to Title I educators. Some states emulated national research and development centers by operating in-state regional services.

Title VI stipulated regulations for proper operation of the funded programs; all programs required parental involvement. Funded programs

were also required to supplement and not supplant regular programs, that is, federal funds were “seed money” so schools and SEAs could develop capacities to better serve low-income students. Gradually, SEAs and schools were to absorb the programs’ costs without relying on federal funds.

Title VII was added in 1968 to provide funds for students of “limited English speaking ability.” It allowed bilingual education for “Spanish-speaking students,” later expanding to other language populations. In the early 1970s, ESEA catalyzed individual equal educational opportunity laws for females (Title IX, enacted in 1972), non-English-speakers (Bilingual Education Act of 1974), and disabled students (Education For All Handicapped Children Act of 1975).

Persistent Academic Achievement Gap

By the late 1970s, the consensus was that ESEA had accomplished much, but not enough. Schools and SEAs had increased capacities to address some educational challenges posed by poverty, but these challenges appeared intractable. Low-income pupils were disproportionately at risk of school failure. They scored significantly lower on academic achievement tests compared to middle-income peers and were twice as likely to drop out of school before graduation.

In 1981, President Ronald Reagan’s policy of New Federalism changed the U.S. government’s role in education, proposing that states and schools could manage educational problems by reducing federal intervention and financial support. ESEA was reauthorized in 1981 as the Education Consolidation and Improvement Act (ECIA). This law contained three chapters allocating funds to schools in block grants. Chapter 1 replaced ESEA’s Title I, funding schools for “compensatory” education of “high cost students.” Chapter 2 consolidated ESEA’s remaining titles into basic skills development, educational improvement, and special projects. Chapter 3 funneled funds to schools via SEAs, but schools were free to operate programs without federal accountability. Meanwhile, advocacy groups for Title IX and the bilingual and handicapped education laws successfully lobbied Congress to stave off consolidation into block grants. They remained specialized equal educational opportunity laws.

By 1990, the academic achievement gap between low- and middle-income pupils had narrowed slightly, though it persisted, and dropout rates remained high for low-income pupils. In 1994, the Bill Clinton administration reauthorized ESEA, the Improving America’s Schools Act (IASA.) Keeping ESEA’s original intent, this law offered a new vision. Rather than funding remedial programs, IASA envisioned school-wide reform based on the adage “A rising tide lifts all boats,” attempting to lift all students by school-wide improvement of teaching and learning, thereby assisting low-income students to succeed in a school’s regular programs, and to achieve the same high standards set for middle-income students. The name of its Title 1 reflects IASA’s vision “Helping Disadvantaged Children Meet High Standards.”

IASA contained greater depth and breadth than ESEA with 14 titles, restoring original titles and making new titles of ESEA’s subtopics. More funds were allocated for programs, such as early childhood education, gender equity, dropout prevention, public charter schools, and professional development of pre- and in-service educators. IASA caused fundamental changes for state and school operations by adding accountability for use of the funds: The act required that states must adopt uniform, challenging content standards to be taught in all schools; and uniform and challenging student performance standards to be assessed, which should include the same knowledge, skills, and levels of performance expected of all students.

IASA allowed states and schools to use funds more flexibly for school-wide improvement and school choice for parents, such as enabling parents to send their children to magnet and charter schools. IASA significantly revised the original ESEA and was the last major alteration in federal education policy before the No Child Left Behind Act of 2001.

Ellis Island

The nation's primary immigrant entry point and processing station during the late 19th and early 20th centuries, Ellis Island is synonymous with American immigration in the public consciousness and popular culture. From 1892 to 1924, more than 12 million immigrants seeking a new life passed through the halls of Ellis Island, their first stop as they began their journeys on American shores. Today, more than 100 million Americans (roughly one-third of the nation's total population) are the relatives of ancestors who entered through Ellis Island. Although no immigrants have been processed at this national historic site in nearly a century, Ellis Island remains a powerful symbol of America's proud tradition as a nation of immigrants.

Early History

Although New York City, one of the nation's most significant ports, had long been a major destination for immigrants entering the United States, Ellis Island did not become an immigrant processing center until 1892. Originally a three-acre atoll named Kioshk (an indigenous term meaning Gull Island) by local Native Americans, Dutch colonialists acquired this territory with their purchase

of New Amsterdam During the colonial era, Dutch and English settlers nicknamed it Little Oyster Island because New York Harbor sat on 350 oyster beds. The island switched possession among owners numerous times until Samuel Ellis, for whom the island is now named, acquired it during the late 18th century. New York State purchased the island from Samuel Ellis in 1808 and subsequently sold the land to the federal government, which converted the island into a fort in anticipation of a British attack on New York City. Following the War of 1812, Ellis Island served primarily as a military post until its conversion into an immigration station in 1890.

Until the late 1880s, immigration policies were regulated separately by each state. Legislative changes during the late 19th century federalized immigration policy, placing it under the sole authority of the federal government. As part of this overhaul, the federal government established immigrant processing stations at various points of entry to screen the would-be migrants and exclude certain immigrants from admission to the United States. In 1890, the U.S. Congress selected Ellis Island as the site of a new immigration depot and allocated \$75,000 for construction.

Immigration Center: 1892 to 1924

Ellis Island officially opened its doors as an immigration processing station on January 1, 1892. Annie Moore, a 15-year-old girl from Cork County, Ireland, who made the voyage across the Atlantic with her two younger brothers aboard the steamship *Nevada*, made history as the first immigrant processed at the island. Colonel John Weber, the commissioner of Ellis Island, presented Moore with a \$10 gold coin to commemorate the occasion. Today, a bronze statue of Annie Moore is located inside the main building of Ellis Island as a symbol of all immigrants who were processed there, and another statue of Moore is found at her point of departure in Ireland.

Only third-class passengers aboard steamships were required to undergo processing at Ellis Island. Immigration officials processed first- and second-class passengers aboard the ship itself en route to New York. This discrepancy in treatment stemmed from the belief that immigrants who had the means to purchase a higher-priced fare were more affluent and would be less likely to become a

public charge on American shores. Conventional wisdom also held that the more affluent immigrants were likely to be properly nourished and less likely to suffer from mental illness or physical ailments. Consequently, they were subject to a less stringent immigration inspection than their third-class counterparts.

A fire in one of the towers on the island broke out after midnight on June 15, 1897. The flames quickly spread to other structures at Ellis Island and completely burned the immigration station, built from Georgia pinewood, to the ground. No one was killed or injured in the fire, and temporary immigrant processing stations were set up at the southern tip of Manhattan and other points in New York City. The federal government immediately authorized emergency funding for the construction of a new, fireproof immigration center on Ellis Island. The new facility opened on December 17, 1900, and processed 2,252 immigrants that day alone.

Immigration peaked between 1900 and 1914. During this 15-year period, officials at Ellis Island processed as many as 5,000 immigrants a day. An expedited processing would last approximately three or four hours, while immigrants deemed to require further medical examinations or questioning could be held for several more hours or even days. Upon disembarking from the ship, immigrants made their way to the Registry Room (also called the Great Hall) located on the second floor of the main building. As immigrants huddled into the Registry Room, immigration officials subjected them to a medical examination and questioning to determine whether they would be granted or denied admission to the United States.

Doctors at Ellis Island conducted a quick “six-second physical” of each immigrant in the Registry Room, in search of obvious diseases or other health impairments. Some of the most common symptoms that doctors looked for included anemia, enlarged goiters, varicose veins, and trachoma, a highly contagious eye disease that could lead to blindness. Doctors marked immigrants who needed more thorough health inspections with chalk on the outer layer of their clothing. Trachoma was the single leading cause of immigrants being detained during the health inspection phase of processing.

Following the initial health screening, immigrants made their way to the front of the Registry Room, where immigration officials attempted to verify an immigrant’s name with the names of passengers contained on the ship’s manifest. Officials also subjected immigrants to a 29-question inquiry, checking to see if immigrants’ responses matched the answers they had given in their homeland prior to embarkation. Among these questions, immigrants were asked to state their nationalities, how much money they had, and if they had ever been in prison. Interpreters facilitated the questioning process, as most immigrants (except for those from Britain, Ireland, Canada, or the British Caribbean) lacked a conversational knowledge of English.

The purpose of such screenings was to prevent “undesirables” from entering the United States. Inspectors sought to single out two categories of immigrants, in particular, for exclusion: persons with serious health conditions and persons who were deemed unable to provide for themselves and thus likely to become public charges. Although in some cases families were torn apart by the denial of entry of certain members, the vast majority of immigrants seeking admission at Ellis Island were granted the right to remain in the United States. Officials denied entry to only 2 percent of arrivals.

The vast majority of immigrants processed between 1892 and 1924 came from Europe, with more than four million coming from Ireland alone. Large numbers of immigrants also arrived from Italy, Germany, Poland, Britain, Russia, and the Austro-Hungarian Empire. Other migrants hailed from Spain, Portugal, Greece, the Balkans, and the Ottoman Empire. Approximately 143,000 black immigrants arrived from the Caribbean West Indies and other areas, including prominent psychologist and civil rights activist Kenneth Clark, black nationalist Marcus Garvey, and Harlem Renaissance author Claude McKay. Afro-Caribbean immigrants exerted a significant cultural influence in New York City during the Harlem Renaissance of the 1920s and 1930s.

Although Ellis Island has become virtually synonymous with the public’s recollection of immigration during the late 19th and early 20th centuries, it was not the nation’s only immigrant processing center. Other major points of entry included Boston, Baltimore, Philadelphia, Miami, New Orleans,

Chicago, and San Francisco. Angel Island, located in the San Francisco Bay, operated as a major immigration station from 1910 to 1940 and has been nicknamed “the Ellis Island of the west.”

Immigration to the United States declined precipitously during World War I (1914–18), interrupted by the ravages of fighting and the disruption of transatlantic transportation service. The U.S. military interned enemy aliens and prisoners of war at Ellis Island when the army and navy assumed control of the island in 1918 until the end of the war. The relatively low number of immigrants who did enter the United States during the war were either inspected aboard steamships or on the docks once their ships reached shore. Ellis Island resumed its duties as an immigration station in 1920, with more than 225,000 immigrants processed there that year.

Decline: 1924 to 1954

President Calvin Coolidge signed the Johnson-Reed Act into law on May 26, 1924. Propelled by the alarmist rhetoric of Anglo-Protestant nativists, such as anthropologist and eugenicist Madison Grant and Massachusetts Senator Henry Cabot Lodge, who feared that the large influx of “Asiatics” and Catholic and Jewish Europeans threatened the cultural, demographic, and “racial” stock of the United States, the act imposed severe immigration restrictions. In order to preserve the “Anglo-Saxon” or “Nordic” population, the Johnson-Reed Act barred immigration from the Asia-Pacific Triangle (the region of the world between central Asia and the Pacific Rim) and implemented stringent quotas on the number of immigrants permitted to enter the United States from southern and eastern European societies. Reflecting the racial concerns of Anglo-Saxon nativists, Coolidge remarked upon signing the act, “America must be kept American.”

The Johnson-Reed Act significantly reduced the volume of immigration to the United States, as well as diminished the importance of Ellis Island. Whereas 12 million immigrants had been processed on the island from 1892 to 1924, prospective immigrants began to apply for visas at the American consulate in their country of origin after 1924. Ellis Island remained open, but its primary operations shifted focus. The U.S. Coast Guard trained 60,000 recruits at the island during

World War II, while the military detained prisoners of war in the island’s dormitory. The government also used the island to detain immigrants who had overstayed their visas. The final detainee was released in November 1954, after which the General Services Administration designated Ellis Island surplus property, effectively closing the island.

Restoration

After sitting dormant for 11 years, President Lyndon B. Johnson placed Ellis Island under the authority of the National Park Service in 1965. Johnson’s designation of Ellis Island as a historic landmark for the key role it played in the nation’s past waves of immigration occurred the same year that he signed the landmark Hart-Cellar Act. This legislation, passed shortly after the Civil Rights Act of 1964, prohibited racial segregation, overturned the 1924 immigration law by abolishing national origins quotas aimed at restricting southern and eastern Europeans, and abolished the exclusionary Asia-Pacific Triangle. Johnson signed the Hart-Cellar Act into law at a ceremony held beneath the Statue of Liberty. The law greatly diversified immigration to the United States by dramatically increasing the numbers of immigrants permitted to enter the nation from Asia, Latin America, the Caribbean, Africa, and the Middle East. By the early 21st century, the Hart-Cellar Act had become the catalyst for much of the current racial and ethnic diversity in the United States.

Ellis Island’s designation as a national historic site fostered renovation and restoration campaigns for 17 years, although relatively little was accomplished. For the most part, Ellis Island sat neglected in New York Harbor. Finally, the Ronald Reagan administration initiated a public-private partnership in 1982 to secure funding for the renovation of the Statue of Liberty and Ellis Island. President Reagan wanted restoration of the statute and the island to be completed by 1986 and 1992, respectively, in time for the 100th anniversaries of the two landmarks.

Chrysler executive Lee Iacocca, who was deeply emotionally attached to Ellis Island, led fund-raising efforts for the renovations. The son of Italian immigrants, Iacocca’s father had been processed at Ellis Island in 1902 at the age of 9. His father later returned to Italy, married his mother, and

the couple then migrated to the United States. Because of health concerns, immigration inspectors nearly denied Iacocca's mother entry at Ellis Island, although his father managed to convince authorities to grant her the right to remain in the United States. By 1991, Iacocca had succeeded in raising \$350 million for the renovation of Ellis Island and called his efforts "a labor of love for my mother and father." Reflecting on the personal connection between his fund-raising and his family history, Iacocca referred to Ellis Island as "a cathedral, a churchlike setting, a place to pray. It brings tears to your eyes."

The renovated Ellis Island opened its doors to the public on September 2, 1990. The restoration project included an immigration museum designed to capture the essence of immigrants' experiences at the island, including the joys, sadness, optimism, fears, and gratitude that were expressed by the millions who had once passed through the Great Hall.

Ellis Island in Motion Pictures

Because of its profound historical importance in American immigration history, various American and international films have used Ellis Island as a setting. One of the most noted depictions of life at Ellis Island during the early 20th century occurs in the *The Godfather Part II* (1974), directed by Francis Ford Coppola. The film follows the experiences of a prepubescent Vito Andolini, who flees his Sicilian village of Corleone following the murder of his mother and father at the hands of a local Mafia leader. Vito stows away on a steamship bound for New York City and is processed at Ellis Island with other immigrants. Coppola vividly illustrates the standard operating procedures that millions of newcomers underwent through Vito's character. Immigration officials register Vito in their logs and, uncertain of his last name, assign his hometown, Corleone, as his last name. During the routine health inspection, a physician discovers that Vito is infected with smallpox, and he is quarantined in a small room for three months before beginning his new life in the United States.

The romantic comedy *Hitch* (2005), starring Will Smith and Eva Mendes as an interethnic African American–Latina couple, also contains scenes shot at Ellis Island. Alex Hitchens (Smith) takes Sara Melas (Mendes) to Ellis Island on their first date. Hitchens retrieves registration information from official records of Melas's great-great-grandfather Juan. Intended to impress Melas, Hitchens instead upsets his date by uncovering that Juan was a murderer and that Melas's family has attempted to bury any recollection of him.

The Myth of Name Changing

Perhaps the greatest myth surrounding Ellis Island is the perception that immigration inspectors routinely changed the "foreign-sounding" names of arrivals to more "Anglo-sounding" surnames. In reality, officials did not reassign names to immigrants. Inspectors asked immigrants their names during processing to ensure that the names of immigrants matched the names indicated on the steamship passenger manifests. Inspectors only wrote down the names of immigrants on forms when they required a hearing or additional medical testing. Because many immigrants were illiterate, inspectors wrote down permutations of

their names. However, these forms were internal paperwork and not official documents that legally changed one's name.

Many immigrants did change their names upon reaching American shores, but this phenomenon took place after they had undergone processing at Ellis Island. Others changed their names by providing aliases when boarding steamships in their homeland. Immigrants who changed their names often did so voluntarily in an effort to de-emphasize their "foreignness" and facilitate the assimilation process amid a social climate marked by strong nativist sentiments in the early decades of the 20th century.

Nevertheless, complete assimilation into American society was not a quick and simple process for the vast majority of immigrants. Historian Vincent Cannato notes the following:

. . . the name change story lives on as urban legend. Many Americans are convinced of its truth because their grandparents told them the story. It is a convenient myth that emphasizes the traumatic nature of Ellis Island and the supposed rough treatment of immigrants, as well as the facility's role in Americanizing immigrants, often against their will. . . . Better to blame insensitive immigration officials than Grandpa for the fact that your name is Smith and not Hryczyszyn.

Public pressures to assimilate into the Anglo-Saxon cultural mainstream of American society compelled large numbers of immigrants to modify their names. The societal emphasis on pluralism and multiculturalism did not take root until the 1970s. Expectations of Anglo conformity reigned supreme across the nation for much of its history, with anti-immigrant sentiments rising during periods of intense immigration.

Hurricane Sandy Impact

The National Park Service announced on November 1, 2012, that Ellis Island and the Statue of Liberty had been closed indefinitely in the wake of Hurricane Sandy. Although preliminary investigations did not reveal damage to either landmark, federal authorities planned to conduct more thorough examinations to uncover any possible damage to the infrastructures of the

statue and the buildings on both Liberty Island and Ellis Island.

Emancipation

The American slavery regime ultimately collapsed as a result of a bitter, four-year civil war. By the war's end, some four million bondspersons were officially liberated from a life of chattel slavery in the American south. Though President Abraham Lincoln and the Union government had taken steps to strategically emancipate thousands of slaves in the rebellious Confederate states via the Emancipation Proclamation, real freedom came only once the practice of slavery was abolished by constitutional amendment in 1865. Thus, it was the Thirteenth Amendment that proclaimed that "Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall

have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.” The amendment also gave Congress the power to “enforce this article by appropriate legislation.” That emancipation ultimately came as a direct result of the Civil War should not elide the long history of activism and the numerous clarion calls for freedom by blacks from the earliest days of American nationhood.

Beginning in the mid-17th century, America’s small black enslaved population sometimes made successful grasps at freedom even as slavery and indentured servitude became entrenched features of life in the Americas. In the Virginia colony, a small cargo of Africans had arrived in 1619 to supplement the growing population of English tobacco farmers. Within a short time, the Chesapeake Bay colonies produced most of the world’s tobacco and so monetary wealth in the colonies and in the metropole became inexorably tied to a planter’s wealth in slaves. Meanwhile, in the north, Massachusetts became the first English colony to recognize the institution of slavery in 1641, followed by Connecticut (in 1650), and Virginia (in 1661). Two years later, Virginia further ordered slavery a perpetual status passed from mother to child. Simply, a child born to an enslaved mother would also be enslaved. That slavery was now codified along racial and gendered lines now meant even fewer avenues to freedom by generations of blacks.

As the tobacco plantation economy thrived throughout the Chesapeake, a man’s, and exclusively a white man’s, success and indeed his very own freedom was connected to the prevalence of slavery around him. At bottom, slavery and freedom were symbiotic factors in shaping the American character for nearly two centuries, yet over time, the push toward freedom grew stronger and more resolute.

By the early to mid-18th century, slavery had taken hold as the primary mode of labor in the young but thriving British American colonies. Spurred by the booming transatlantic slave trade, the plantation complex had arrived from the Caribbean islands and many eager American planters, especially in South Carolina and Georgia, now boasted large landholdings with an equally impressive number of slaves. Broadside advertising the sale of slaves and the arrival of

slave ships at various southern port cities colored the developing landscape and littered the pages of a nascent American press. At the dawn of the 18th century, slavery had fully arrived, leaving its imprint on America’s economics, politics, and social relations.

The Middle Passage

As the demand for tobacco and other cash crops increased, so too did the importation of slaves from western Africa. The African slave trade became a lucrative business in its own right and was international in scope. European investors, Boston shipbuilders, and New York insurers all participated in the shameful buying and selling of human “property.” However, the captured and traded Africans did not willingly submit to European enslavers. Many resisted enslavement from the very start. The so-called Middle Passage often witnessed enchained bondsmen jumping overboard to their deaths; sometimes large bands of brave Africans engaged in mutinies in the open Atlantic. Some carried out hunger strikes in hope of perishing before reaching the Americas and a lifetime of bondage. Some vessels, however, met altogether different fates. In 1701, the slave ship *Henrietta Marie* sank off the coast of Key West, Florida, with a cargo of some 400 slaves. While scholars cite wreckage as the cause for the *Henrietta Marie*’s demise, one cannot assert with any authority that the captive Africans aboard did not have a role in the gruesome final outcome.

Still, numerous vessels delivered throngs of slaves to America during this period, even as Europe began to experience some unease with slavery and the slave trade. Undoubtedly, slavery was now a part of the American way.

The transatlantic slave trade coupled with natural increase augmented the slave population in America, though not without a small but gradually growing chorus of antislavery sentiment. The 1790 U.S. Census counted some 293,000 slaves in Virginia alone, and more than 694,000 slaves in the original 13 colonies. By 1800, that number rose to more than one million enslaved persons out of the 7.2 million persons living in the United States. It was not until 1808, however, that the U.S. Congress banned the importation of African slaves.

Meanwhile, years before the eventual closing of the transatlantic trade on the American side, Quakers in Pennsylvania and some northern evangelicals stood at the forefront of early abolitionism in America, though most enslaved blacks unmistakably harbored abolitionist sentiments. By 1688, Quakers began to criticize the slave trade and slave ownership in Pennsylvania and the other colonies. Black writer Phillis Wheatley published abolitionist poems in 1773, and a black woman named Elizabeth “Mum Bett” Freeman sued in court for her freedom in Massachusetts. And as blacks in the north and south pressed toward freedom, the larger society around them took additional steps to further establish slavery as a part of American life.

Abolitionist Fervor Builds

Nonetheless, in many northern colonies especially, emancipation moved piecemeal; shortly after the American Revolution, slavery in the north died out, state by state. New Jersey became the last northern state to officially end slavery in 1865. Unquestionably, the American Revolution provided white and black abolitionists with the appropriate rhetoric and discourse with which to discuss the possibility of emancipation throughout the new nation. Asserting that “all men are created equal” in the Declaration of Independence, Virginia slaveholder and Founding Father Thomas Jefferson ironically offered effective language to guide the abolition cause. Frederick Douglass and David Walker, two prominent black abolitionists, embraced the philosophical reasoning that made American independence possible and applied it to expose the gross contradictions found in American society writ large, and most damning, in the American Constitution itself. Soon, the abolitionist fervor would engulf both north and south until compromise over the slavery issue seemed impossible.

By the dawning of the 19th century, the spirit of emancipation swept through the Americas, especially following the Haitian Revolution in 1804. If anything, the Haitian Revolution gave hope to the millions suffering under the yoke of slavery in America. For those aware of this watershed event, freedom appeared relatively closer than it had in years past. Bondsmen knew that liberation would not be handed to them. Instead, they would have

to either take it for themselves or fight for it. And this is precisely what happened throughout much of the antebellum period. Numerous slave rebellions—from Gabriel’s (1800) to Pointe Coupee (1811) to Nat Turner’s (1831)—demonstrated a visible discomfort and agonizing longing for freedom among the enslaved. Even those who did not participate in full-scale revolts found themselves committing a host of passive and active forms of resistance. Some ran away, others broke farm tools to avoid work, and many abused their seemingly close relationships with slaveholders to produce outcomes that favored their particular circumstances. By and large, the enslaved worked within the confines of their condition to inch their way closer and closer to freedom.

Yet, it was not until the outbreak of civil war that many bondsmen voted with their feet and fled southern plantations to Union lines. All across the south, the enslaved took full advantage of the ensuing chaos that comes with war and made their way to contraband camps or safer grounds. As one historian maintains, the Civil War was but one massive slave rebellion, a point largely ignored by most. Altogether, the war wrought wholesale change to the south and obliterated the institution of slavery, a system that had grown alongside the nation. And though the Civil War made emancipation a fully realized dream for many, the resolve to take full advantage of those “inalienable rights” described in the Declaration of Independence was always there.

Emancipation Proclamation (1863)

At the beginning of the Civil War, President Abraham Lincoln's primary purpose was to preserve the United States intact. However, the issue of slavery received much public attention. As the U.S. Army began to move into Confederate states, escaped slaves sought refuge within its lines. The Fugitive Slave Law of 1850, however, legally bound people to assist in the apprehension and return of fugitives. Regardless, some Union generals attempted to protect the fugitives, arguing they were "contraband of war" and thus could legally be seized, while others refused sanctuary and instead returned them to their owners. In March 1862, Congress enacted a law prohibiting the return of fugitive slaves, but the question remained uncertain because of existing federal laws and previous decisions by the Supreme Court.

By 1862, Lincoln wanted to push the issue through a presidential proclamation, but at the time there was a long string of Union defeats on the eastern battlefields in 1861 and 1862 that led some of the president's advisers to believe any such move would be interpreted as an act of desperation. When the Confederate invasion of the north that fall was repelled at the Battle of Antietam on September 17, Lincoln used the occasion to proclaim a northern victory and to announce his intention to emancipate slaves in the Confederate states as of January 1, 1863. Since the stated intention was to free slaves in the rebelling states only, the announcement left open the possibility that if a state resumed allegiance to the United States prior to January 1, it would be able to avoid emancipation.

The final Emancipation Proclamation ordered that "all persons held as slaves within any state or designated part of a state, the people whereof shall then be in rebellion against the United States, shall be then, thenceforward, and forever, free." Lincoln's action made emancipation a central objective of the war, holding out the promise of freedom for over three million people enslaved in the areas defined by the proclamation. While this outraged the south and angered anti-war Democrats and Copperheads in the north, it energized the abolitionists and other antislavery factions and had international implications that were especially important at the time. The south hoped to gain foreign assistance, especially from Great Britain, which appeared to be dependent on southern cotton to feed its huge textile industry. But Great Britain had already prohibited slavery in its empire and the British laboring class was largely antislavery. Thus, the Emancipation Proclamation gained the support of many Britons and is usually considered to be one factor that convinced the British government against open intervention in the Civil War.

Criticism of the Proclamation

Even before its official announcement, critics attacked the proclamation, claiming that since it applied only to areas "in rebellion," it actually freed no one because those areas were controlled by the Confederates, who were not about to emancipate anyone. Similar arguments appear frequently today, often accompanied by

assertions that Lincoln never really intended to end slavery but only to use the proclamation for political leverage with the antislavery forces and abroad.

A frequent response is that Lincoln feared including the slaveholding border states of Delaware, Maryland, Kentucky, and Missouri in the proclamation because they might then decide to join the Confederacy, which would place their manpower and resources at the disposal of the rebellion. Of course, regardless of what Lincoln might proclaim, in the end any emancipation in the south depended on a northern victory in the war. Adding four more states to the rebellion at a time when the United States appeared to be losing would not have been a very intelligent thing to do.

But there were key legal reasons why Lincoln worded the proclamation as he did. In the *Dred Scott* decision of 1857, the U.S. Supreme Court found that slaves were property and that the Fifth Amendment of the U.S. Constitution protected the right of people to own property. Since the decision had in effect declared that slavery was legal in the United States, Lincoln reasoned that if he attempted to proclaim emancipation throughout the country, the Supreme Court would most likely declare the effort unconstitutional. However, there was precedent that the president, acting in his capacity as commander in chief of the armed forces, could order the confiscation of enemy property. Further, in 1862, Congress enacted a Confiscation Act giving the president the authority to confiscate the property of citizens in rebellion against the country. So, Lincoln believed that by wording the proclamation to apply only to those areas in rebellion, he had a much better chance that his action would stand the test of legal challenge than if he attempted universal emancipation.

While revisionist historians have argued that Lincoln's record on slavery was not one of support, the president was not above the requirements of the Constitution and had to abide by its provisions, as interpreted by the Supreme Court. Following the proclamation, Lincoln supported a constitutional amendment to eliminate slavery. When it failed to gain congressional approval in 1864, he exerted considerable political pressure on individual members of Congress until it finally received the required two-thirds vote in February

1865. It was eventually ratified in December, eight months after Lincoln's death. His use of presidential leverage to push it through Congress is often overlooked.

Emotional Intelligence

While there may be disputes about the credibility, value, and legitimacy of emotional intelligence (EI) as a field of study, what is not in doubt is how powerful emotions are in shaping behavior and influencing our choices on a daily basis.

To appreciate the emotional intelligence and diversity model and its usefulness, it is important to understand how EI came about, its history, and how it is viewed, both positively and negatively. While *New York Times* science writer Daniel Goleman popularized the concept of emotional intelligence and put it on the radar in organizations, his ideas and those of others are built on the 1990 work of leading researchers Peter Salovey, a professor at Yale, and John D. Mayer, a professor at the University of New Hampshire. The pair defined the concept of EI as the “subset of social intelligence that involves the ability to monitor one's own and others' feelings and emotions, to discriminate among them, and to use this information to guide one's thinking and actions.”

History

Emotional Intelligence as a field had its start in the 1930s, when E. L. Thorndike, who is known as the father of modern educational psychology, first mentioned social intelligence and discussed the ability to get along with other people. In the 1940s, the conversation was moved forward by David Wechsler, a psychologist whose contribution was rooted in developing intelligence scales. He argued that effective components of individuals were essential to success in life. Continuing the evolution, in the 1950s, Abraham Maslow, a humanistic psychologist, discussed how people can build emotional strength. Slowly but surely, more writers and thinkers contributed to this conversation. Howard Gardner, in his 1975 book *The Shattered Mind*, writes of multiple intelligences that involve understanding the feelings and motivations not only of ourselves but others as well.

The first use of the term *emotional intelligence* was in a doctoral thesis by Wayne Pages in 1985. The term gained more traction in 1990 when Salovey and Mayer wrote their seminal article, "Emotional Intelligence," in the *Journal of Imagination, Cognition and Personality*. Two years later, Goleman asked Salovey and Mayer for permission to use the phrase in an article he was writing. Since then, the definition has been expanded by Goleman and others to such an extent that it no longer has any scientific meaning or utility, as it is no longer a predictor of outcome.

The history and evolution of emotional intelligence is long, with ample supporters and detractors. Some define EI as a model that is personality based, while others see it through competencies, mental abilities, or even traits.

Goleman posits that EI is a set of competencies that are organized around self-awareness, self-management, social awareness, and the ability to manage relationships. In a different paradigm, Mayer and Salovey look at a person's ability to perceive, use, and understand emotions in self and others.

A different model that is also prominent is trait-based and looks at sociability, emotionality, self-control, and well-being. There is no universal definition, standard, or even measure that indicates whether a person has some mastery over EI or how EI will affect an individual.

The Emotional Intelligence and Diversity (EID) Model

For people living in a very connected, yet diverse, global, and dispersed world, researchers Lee Gardenswartz, Jorge Cherbosque, and Anita Rowe created the Emotional Intelligence and Diversity (EID) model, which integrates its core concepts with those of EI to help people manage emotions in the face of differences that can trigger negative responses. The four-part EID model—affirmative introspection, self-governance, intercultural literacy, and social architecting—provides a structure for gaining insight and understanding about emotions and subsequent behaviors. It also builds skills that lead to interactions that are more productive and harmonious as well as less difficult and contentious. The competencies are both insight and action based and pave the way for an intentional approach to more productive relationships that lead to the successful accomplishment of goals.

Affirmative introspection gives one the ability to take an honest and nonjudgmental look inside. It is insight based. As Socrates said, "Know thyself." Being aware of one's own hot buttons and biases is the first step in managing them and being open to others. However, helping people get along in a global world requires more than insight. It also requires action, which leads to self-governance, or the ability to manage feelings (rather than exploding) by paying attention to the internal or self-talk that can be destructive, especially in the face of rapid change.

Self-governance means being an editor in one's own life. Paying attention to these frequently harmful and inhibiting messages and understanding the losses felt during rapid change can help a person better manage emotions in a rapidly changing world. Learning to reframe the perception and messages about what is happening can change the dynamics of increased communication and interplay among a wide variety of differences.

The third part of the model, intercultural literacy, is the segment that touches most directly on the varying cultural norms faced by people all over the globe. The intent of intercultural literacy is not only to understand that there are different norms and what might be behind these customs and behaviors, but also to gain a fresh, new perspective on one's own culture. The intent in this part of the model is to have all people contemplate

the upsides and downsides of every cultural norm, starting with their own. With these two goals in mind, there is a chance that cultural humility can be an element of any interaction.

Finally, social architecting conveys the idea that each individual is responsible for doing his or her part to be a bridge-building, interpersonal engineer, whether in one-on-one relationships or workgroups. It is about taking action to intentionally create good dialogue across differences and communicate in ways that resolve conflict effectively. It also means structuring a work environment that gets the best of everyone's talents and skills in a way that creates emotional safety, thereby unleashing even more creativity.

This EID model was designed specifically to help people in multicultural America and around the globe relate in ways that are uplifting and gratifying. It is well known that diversity has the potential to bring both creativity and conflict. Human beings are not neutral about differences. Responses are triggered by emotions, and human reactions to differences range on a continuum with conflict, frustration, fear, or anxiety on one

end to stimulation, excitement, and new visions or perspectives from open minds on the other.

This model is also designed to help people understand and manage their emotions in a healthy, productive way. By starting with oneself and learning more about one's own reactions and triggers and how culture shapes everyone's behavior, as well as finding the connection amid the differences in a very diverse and multicultural world, EI has a chance to flourish, thrive, and create harmony and understanding in areas where there is often discord. These differences can be a catalyst to stimulate, energize, and connect a global world in a respectful, satisfying, and beneficial way.

With its emphasis on effectively managing emotions in a world of differences, the EID system is designed to enable all people to bring their whole selves wherever they are. Emotions drive people. They are powerful. This model helps individuals be intentional and wise in displaying emotions. The insight gained from understanding oneself and others, coupled with the willingness to be flexible and open to working with and learning from others, is at the foundation of this model. By learning more about one's own emotional life, paying attention to others, and acting in emotionally healthy ways, individuals will be able to increase their effectiveness and satisfaction.

While EID differs from other EI models in its specificity of focus, it is one more valuable avenue for bringing heightened awareness and intentionality to people's behavior in any environment, and it provides clear tools and steps for growth, dialogue, connection, and harmony.

English Americans

English Americans are U.S. citizens who have emigrated from or trace their ancestral roots, wholly or in part, to England. The English migration and settlement in America has its own history, which dates back to first English colonies of the early 17th century. Because of cultural similarities, English Americans for centuries have acclimated to American society very easily. They are often seen as, and simply called, "American."

According to U.S. Census 2010 data, the population of English Americans currently living in the United States is estimated to be 25.9 million, or 9 percent of the total U.S. population; they form the third-largest European ancestry group after Irish Americans and German Americans. The largest populations of English Americans live in New York, New Jersey, Massachusetts, Pennsylvania, Michigan, California, Illinois, Ohio, Texas, and Florida.

English Colonies, Immigration, and Settlement in the United States

After Native Americans, the English were the first to settle what is now the United States. The origins of English colonies in America began in Jamestown, known as Virginia Colony in 1607, and at Plymouth and Massachusetts Bay from 1620 to 1622. Many English men and women were attracted to America and immigrated there for economic opportunities and cheap land. In addition, some were looking for religious freedom; thus, they sought liberation from intolerant religious institutions. The majority of colonies were controlled and managed by the royal administration, which was established by the Church of

England in 1776. They created laws—or imposed the English systems of law—that influenced every professional arena, including governmental administration, commercial and financial management, education, agriculture, and entertainment and the arts.

In 1607, Virginia Company sent to America a group of single men who searched for gold in the belief that this would create a profitable trade; however, this did not happen. Agriculture and tobacco growth exports in the 1620s did, however, became profitable. This attracted several thousand English to migrate while England was suffering economically.

According to the 1790 U.S. Census, the English settlers and their descendants comprised 60 percent of total European settlers. They were able to dominate and manage various levels of governmental institutions in the new republic, as reflected in national and state government leaders as well as in their contribution to the new Constitution and the English-style Bill of Rights.

Furthermore, in the 18th and 19th centuries, England—with its government and corporate enterprises—was the number one investor in American land, including heavy industry, mining, railroads, and other diverse, environment-transforming industries. Because of their numbers and influence as a group in the new territory, English American settlers are believed to have had an easy transition into American society compared with other ethnic groups, and they were able to create organizations and institutions that helped them preserve, learn about, and transmit their English traditions and heritage to succeeding and non-English generations. In the 19th century, the English comprised 15 percent of the total European migration to the United States. However, by 1820 and until 1920, people leaving England en route to America had declined to less than 10 percent of migrants to the United States.

One hundred years later, in the 20th century, English emigrants set their sights on Australia and Canada because both countries offered better opportunities and more favorable immigration policies than did the United States.

There was a decline of English immigration in the decade after the World War I, when only about 100,000 English (18 percent of all European immigrants) came from England. However,

English immigration rose by 20,000 in the 1960s and continued for decades because of the attractive work program in the United States, causing a “brain drain” in England. Multinational corporations became instrumental in bringing professionals such as engineers, scientists, and medical doctors to America.

In 1980, U.S. census data revealed that 23.7 million people claimed wholly English ancestry, and another 25.8 million claimed English along with another ethnic ancestry. The number of English increased in the 2000 census, with 24.5 million Americans claiming English ancestry in whole or in part. An additional 1.03 million claimed British ancestry.

Contemporary Scene: Culture, Acculturation, Religion, and English Language

Like any other ethnic group, English immigrants brought with them their culture, worldviews, traditions, heritage, religious and medical beliefs, arts, and literature to their new home.

English Americans contributed greatly to the creation of medical schools, societies, and public-health-related industries throughout the United States. As early as the 19th century, the English brought models and ideas related to the creation and running of group health insurance structures. (By the mid-20th century, England had created a National Health Service, which benefited employers and their employees with access to affordable and appropriate medical benefits.)

The English also brought to America their music, both classical and contemporary, which served to enrich U.S. musical traditions. They also had an influence on U.S. and world society through movies, television, and the theater, which continues today. In these venues and through these vehicles, English performers spoke English like Americans did, but with an accent. Despite minor differences in the language and colloquialisms, both English and Americans understand each other. Sir Laurence Olivier, Sir Richard Burton, Elizabeth Taylor, and Bob Hope are among the many entertainers identified as English Americans.

For most groups of English immigrants who settled in America, the church was an important part of their lives, work, and identity. They were affiliated with such different denominations as

Anglican/Episcopal, Methodist, Presbyterian, and Baptist, churches that were similar to those in England. Despite their various names, these Christian congregations maintained and supported local, national, and global missionary projects of the Anglican/Episcopal Church of England. In the midst of this Christian denominational diversity, a unique brand of American Protestantism emerged and continues to greatly influence the religious practices and beliefs of English Americans today.

England’s oldest and famous universities, Cambridge and Oxford, were founded in the medieval era. They initially trained priests but later became very important centers for all disciplines that attracted the brightest students and scholars. Both universities now open the door for all students from all over the world, including English and Europeans. England was greatly influenced by the rebirth of learning and artistic activity in Europe known as the Renaissance. Those who attended English schools were trained in various fields of study such as mathematics, engineering, medicine, logic, and social sciences. These centers trained and developed professional scientists and scholars who helped advance technical and scientific discoveries. For instance, Roger Bacon did pioneering work in mathematics, logic, and human sight, and advanced observation and scientific experimentation in the late 13th century. Sir Isaac Newton also excelled in and greatly contributed to the advancement of science. Specifically, he invented calculus and discovered and explained the phenomena of gravity. Newton also built the telescope that was the inspiration for other scientists who contribute to the field of astronomy.

Since the colonial era, English Americans were interested and had an influence in higher education. They understood and valued the need for trained, skilled workers and professionals who possessed the formal education and training essential to, and critical for, both sacred and secular jobs. Additionally, they saw the need for a trained ministry who would educate the masses in the basic tenets of Protestant religious beliefs. Initially, Yale College was founded by English colonists in New Haven in 1701 with an emphasis on religious instruction, an education that primarily centered on religious teaching and learning. Later,

Yale also became a learning center for natural and social sciences.

At that time, education for English settlers in the northern United States was more advanced and accessible than in the south. Because the population was more spread out across the countryside and not organized in towns or districts, the building of schools was seen as more difficult and not feasible because of geographic factors. In addition, the availability and dissemination of information in the form of books, newspapers, pamphlets, and other learning material was very poor or even nonexistent; for example, about half of all Virginians were illiterate.

However, in 1700, the situation started to change for the better once the printing press became available in the south. Seven years prior, the first college in the south, William and Mary, was opened. The name was given in honor of England's monarchs. For the first few decades, enrollment was low. Through various challenges, however, the college survived and continues to thrive.

A large number of colleges and universities were supported and founded by English emigrants and their descendants, particularly in New England and the southeast. The English Puritans and the English Quakers in Pennsylvania, among other English groups in America, were almost the first to advocate for free public education at all levels. However, the professional and wealthy among English settlers favored or advocated more private schools, which were often in line with their denomination or belief system. Many of them created exchange programs that allowed students to travel between England and the United States through the "grand tour" portion of their learning.

English immigrants and their descendants were also philanthropists who raised and gave money to support colleges, cultural organizations, and museums. In the aftermath of World War II, Americans of English descent raised millions of dollars for the restoration of schools, churches, and other public buildings in England.

For centuries, English Americans continued to intermarry more frequently than any other European group, in part because of increased numbers of mobile craftsman, tradesmen, and merchants among the new English Americans. The

percentage of English women increased from 15 percent to nearly 25 percent of English settlers.

Contemporary Scene: Famous English Americans

The majority of the Founding Fathers of the United States were of English ancestry, including George Washington, Benjamin Franklin, James Madison, John Adams, and Thomas Jefferson. In addition, many notable English Americans have made significant contributions to the creation, development, and prosperity of the United States, such as Clara Barton, founder of the American Red Cross; Ernest Hemingway, Nobel Literature Prize laureate and author; Jody Williams, Nobel Peace Prize laureate; and Bill Gates, Microsoft Corporation founder, entrepreneur, and philanthropist.

The Future of English Americans

Over the past century, English Americans have been actively involved in public service and are influential in local, state, and national governmental and political organizations. Moreover, the oral and written language of English Americans and their relations in England will continue to be the dominant language of global communication, education, and commerce.

English as a Second Language Education

English as a second language (ESL) is a specialized approach to English language teaching, intended for immigrants and other Americans who do not speak English in the home. This may include children born in this country who are exposed to another language in their home, or primarily speak another language in their home, as well as students who were born outside the United States. According to the U.S. Census, the number of children ages 5 through 17 who speak a language other than English at home doubled between 2000 and 2010. Over the past 20 years, the population of students who are English-language learners (ELLs) in American schools has increased by 160 percent, whereas the general student population has shown only a 20 percent increase.

English as a second language education dates back to the 1500s with the expansion of British trade routes around the world. English became important as a lingua franca for this trade, and was a language one needed to know to participate in this lucrative endeavor. As the British Empire grew and British colonies were created, it became important to have an educational system for teaching English to foreign-born colonists and local elites. The native leaders needed English to become functionaries for colonial governments.

In the United States, English as a second language education did not become important until the 20th century. Prior to this, immigrants tended to live in their own enclaves, where English was not necessary for survival. The jobs performed by immigrants were primarily manual labor, which did not require English language skills. In 1906, the Naturalization Act formalized the necessity of English instruction by requiring immigrants to learn English in order to become naturalized citizens.

Henry Ford in 1914 instituted the \$5-a-day wage ceiling, which required his employees to live in single-family homes and learn English. By making people move out of their apartment neighborhoods, English became necessary for integration into the community, and if his workers moved and took English classes they were eligible for the maximum wage of \$5.

Definition and Demographics

The language diversity in American schools presents unique challenges in education. By law, American schools must provide specialized instruction for ELLs. Instructional programs may use English and another language (bilingualism), or they may use English alone (ESL). English as a second language pedagogy is to teach English in English. This type of approach is also known as immersion. Bilingual programs use the student's first language to build language skills, which can then be transferred to the second language. Both approaches have merit, but bilingual education must have a homogenous language group of students to be effective. Many schools have students who speak more than one language, which precludes bilingual education.

English as a second language instruction is different from foreign language instruction in that a

nonnative student is learning English in an English-speaking environment rather than a native student learning a language from a distant non-English speaking environment. Students studying a foreign language are not expected to do grade-level content work in the target language, whereas ELLs must learn English while mastering academic content. English as a second language instruction may also include civics, etiquette, traditions, and popular culture.

There are some strategic uses of the first language (also known as L1 or heritage language) that are appropriate in ESL classrooms. A teacher, bilingual aide, or another student may translate instructions, explain a concept, or help another student make connections to the content being taught. Translation is also helpful for cognates and false cognates. Cognates are words that are similar in both languages and mean the same thing; false cognates are words that look or sound similar but do not mean the same thing in both languages. This primarily works for Romance languages that share Latin roots with English.

ESL teachers have specialized training in language acquisition and pedagogy in order to teach English-language learners. Licensing requirements vary by state, but a qualified teacher will either have a degree in ESL education, or an add-on certification to a content-area teaching license. These teachers may be in stand-alone classrooms or supporting mainstream classrooms.

The U.S. Department of Education defines English-language learners as national-origin-minority students who are limited in English-language proficiency. The ELL term is often preferred over limited-English-proficient (LEP) as it highlights accomplishments rather than deficits. ELLs represent one of the fastest-growing groups among the school-aged population in the United States. Estimates place the ELL population at over 9.9 million students, with roughly 5.5 million students classified as limited-English-proficient by virtue of their participation in Title III assessments of English-language proficiency. Title III is the federal government funding for language instruction of limited-English-proficient and immigrant students in elementary and secondary schools. This group of students speaks over 400 different languages, with Spanish being the most common (spoken by more than 70 percent of ELLs).

Challenges in Instruction

Many English-language learners are successful in school, but a persistent conundrum is the group of students who continue to struggle even after years of specialized instruction. Data from the 2000 U.S. Census indicate that over half of secondary school ELLs were born in the United States, and of the 44 percent of ELLs who are immigrants, many entered U.S. schools at some point before or during the elementary years. In studying this problem, instructional practice has shifted. New approaches emphasize literacy strategies and explicit instruction of academic language to help students access grade-level material in the content area. Academic language mastery is the single most important predictor of academic success for ELLs.

Academic English is the English used in school discourse, as opposed to conversational or social English, which is acquired more rapidly. Research indicates that it takes five to seven years to become fluent in academic English. The Cognitive Academic Language Learning Association makes this distinction by calling this dichotomy BICS (social, conversational language) and CALPS (academic language); BICS is the acronym for Basic Interpersonal Communicative Skills, and CALPS is the acronym for Cognitive Academic Language Proficiency. The profound difference between these two skill sets is the difference between discussing a current event from television news, and being able to compare and contrast two events in a written essay.

The four domains of language learning in English as a second language education are speaking, listening, reading, and writing. While learning these skills explicitly, English-language learners must also acquire the academic content that their non-ELL peers are learning. Thus, best practice in the ESL classroom is to have both content and language objectives included in lesson planning. Instruction in the English as a second language classroom includes explicit vocabulary instruction, building background for the lesson, putting the lesson in a familiar context for the student, materials at an appropriate reading level, and checking for comprehension. English as a second language instruction uses many visuals, including photos, pictures, maps, graphs, video, and realia.

The complexity of English as a second language instruction challenges school districts to

provide appropriate programming. Students with less English proficiency may be placed in a sheltered environment for part or all of the day. This is less common in elementary and middle schools, where the content is believed to be more accessible and the perception is that younger students learn language more easily. English-language learners struggle, however, as learning to read shifts into reading to learn. In high school settings, sheltered instruction is more prevalent as the students are arriving at a later age, sometimes with greater educational needs. A 15-year-old student arriving with a strong academic background in his or her first language will need less sheltered instruction than a student arriving with interrupted schooling because of economic or political reasons. The 15-year-old student who has been educated mostly or completely in the United States but is still limited-English-proficient will need ESL support for his or her academic classes.

The Achievement Gap

The complexity of the types of students qualifying for English as a second language instruction manifests itself in the persistent nationwide achievement gap. For these students, becoming proficient in English is more than learning what is in the book. They have deep gaps in prior knowledge, as well as socioeconomic factors that have to be overcome. The National Assessment of Educational Progress results for 2008 show a large gap between ELLs and their English-only counterparts on achievement scores in science and mathematics at grade 8 (ELLs score 31 points behind non-ELLs in math) and grade 12 (ELLs score 28 points behind non-ELLs in math). The literacy results for ELLs are worse: only 4 percent of fourth-grade ELLs scored at the proficient or advanced levels in reading, while only 3 percent of eighth-grade ELLs and 20 percent of students classified as “formerly ELL” scored at the proficient or advanced levels.

Nonacademic Benefits of Learning English

Aside from academic success, acquiring English in the United States is seen as an important factor for upward mobility and access to the American Dream. The ability to speak and write English influences employment status, and once employed, one’s ability to find full-time,

year-round employment. Even among those who have full employment, those with the highest ability to speak English have the highest earnings. According to the 2000 census, fluent English-speaking immigrants earn nearly double that of non-English-speaking workers and have substantially lower unemployment rates. English proficiency is also a tool for cultural assimilation for an increasingly diverse population. English is needed for full participation in the political and economic life of the United States.

Federal Mandates

School districts are required by law to identify and provide services for English-language learners. New students are tested to determine their language proficiency, and once identified must be tested yearly for proficiency. These levels of proficiency are determined by a yearly state-specific assessment given only to ELLs. Under the No Child Left Behind Act, ELLs are included in standardized testing once they reach a minimal level of proficiency. When students are fully English-proficient, they are required to be monitored for two more years.

Local school districts are required to implement an effective means of outreach to parents of ELLs. Schools must provide information in a language the parents can understand, and make sure that the parents know and understand the instruction their child is receiving. Parents can decide to have their children drop ESL instruction, and students who opt out may reenter after a language assessment is conducted.

Census Data

The American Community Survey (ACS) is an ongoing U.S. Census Bureau survey that provides data every year to give communities the current information they need to plan investments and services. Information from the survey generates data that help determine how more than \$400 billion in federal and state funds are distributed each year. The Census Bureau collects data about language use, English-speaking ability, and linguistic isolation for inclusion in the ACS. The current census questions related to language use are these: Does this person speak a language other than English at home? What is this language? How well does this person speak English? (Answer choices

for the last question are very well, well, not well, or not at all.) According to the 2000 census, there were 5.5 million students who spoke a language other than English at home (LOTE); this number increased to 11,227,000 in the 2009 American Community Survey.

Government agencies use the information about languages spoken at home for their programs serving the needs of the foreign-born and specifically those who have difficulty with English. Under the Voting Rights Act, information about language spoken in the home is needed to meet statutory requirements for making voting materials available in minority languages. Specifically, the Census Bureau is directed to use data about language spoken at home and the ability to speak English to identify minority groups that speak a language other than English, and to assess their English-speaking ability. A household is determined to be in linguistic isolation when no one in the home aged 14 or over speaks English at least “very well.”

The U.S. Department of Education uses these data to prepare a report to Congress on the social and economic status of children served by local

school districts. Data on language are used to allocate grants to school districts for children with limited English proficiency. State and local educational agencies receive grants for programs to improve educational skills, complete secondary schooling, and provide job training and placement for adults based on data about language.

The 2010 American Community Survey data highlight the shift in immigration patterns away from the historical origins of American immigrants. The 2010 ACS data found that 13 percent of the American population were foreign-born (29 percent from Mexico). Of the 53 percent from Latin America, 55 percent were from Mexico. Asian immigrants were the next-largest group at 28 percent, while European immigration accounted for only 12 percent.

Population Projections

More than half the total population growth in the United States between 2000 and 2010 was due to the increase in the Hispanic population. For 2010 the American Community Survey projected that 75 percent of Hispanics spoke a language other

The New Americans Welcome Area in Montgomery County, Maryland, provides information and classes in English as a second language (ESL) education to encourage the integration of immigrants into the United States. While federal grants are given to U.S. school districts to teach ESL to children, state and local educational agencies receive grants for programs to improve educational skills, complete secondary schooling, and provide job training and placement for adults.

than English at home (LOTE). This number is expected to decrease to 66 percent of the Hispanic population by 2020. Spanish, Vietnamese, and Russian are expected to be the most commonly spoken languages, with 20 percent increases over the next 10 years.

English Language: Ethnic and Regional Variations

In the early 1600s, the first permanent English-speaking colony was established in North America, and the Americans soon developed a form of English that differed in a number of ways from the language that was spoken back in the British Isles. In some cases, older forms were retained. For example, the way most Americans pronounce the /r/ sound after a vowel in words like *bird*, *dirt*, and *search* is very similar to the pronunciation in 17th-century England. Similarly, the distinction between past tense "got" and past participle "gotten" still exists in American English but disappeared in most dialects in the United Kingdom.

Standard American English (SAE) is sometimes defined as a variety that does not show conspicuous features characteristic of any particular regions or ethnic groups. In particular, "General American" (GA) is sometimes seen as a notional accent of American English perceived by Americans to be most "neutral" and free of any regional characteristics. It sometimes corresponds with what is now called "Network English," which is used to describe the variety spoken by radio and TV announcers on the national networks. To a certain extent, it may be true that linguistic variations within the country are now leveling off as a result of the impact of network television and radio stations that cover the entire country and that use "Network English." However, most people's speech is likely to be influenced by some kind of regional or ethnic dialect. As a result, there still exist identifiable regional and ethnic variations in the English language used across the United States. Often, the use of dialects, or accents in particular, could serve as bonds of solidarity between speakers living in the same region and/or speakers with similar ethnic backgrounds.

Regional Variations

Regional variations in American English refer to the linguistic variations based on how people living in various geographical regions of the United States speak English differently, and the dialects that have emerged are called "regional dialects."

Speaking a regional dialect only means a tendency for a speaker to make use of some of the same linguistic choices as other people from the same region. In other words, the term *dialect* is more of a generalization or an abstraction that is used to characterize a variety of the language by highlighting a few prominent linguistic features.

The study of the regional variations of American English began with the creation of the American Dialect Society in 1889, an active organization that hosts annual meetings and publishes the international journal *American Speech*. A series of linguistic atlases was first developed and published between 1939 and 1943, including *The Linguistic Atlas of New England*. Subsequently, *The Dictionary of American Regional English* was published as the official dictionary of the society, and three of the volumes appeared in 1985, 1991, and 1996.

In these publications, dialect maps are plotted into more detailed isoglosses, which are boundary lines between places or regions that differ with respect to a particular linguistic feature. Specifically, the process of drawing a regional dialect map consists of collecting samples of the way people call certain objects, especially objects used every day or found in nature. A group of people speak the same regional dialect if they share many of the same words.

For example, a major isogloss in American English was identified as the north-midland isogloss, which demarcates numerous linguistic features, including the northern cities vowel shift. While the regions north of the line (including western New York; Cleveland, Ohio; lower Michigan; northern Illinois; and eastern Wisconsin) show traces of the shift, the regions south of the line (including Pennsylvania, central and southern Ohio, and most of Indiana) do not. Furthermore, maps of the dialects of the United States are constructed according to the ways in which particular sounds are produced.

Generally, dialects on the East Coast of the United States are most diverse, primarily because the East Coast was populated by English-speaking people relatively longer than any other regions. Western speech is much more homogeneous because the west was settled by English speakers more recently, and so there was less time for the west to diversify into a multiplicity of distinctive accents. As a result, as speakers moved westward,

different dialects tended to influence each other and merge. The main reason for the differences between eastern (on the one hand) and midwestern and western accents (on the other hand) is that the East Coast areas were in contact with England and imitated prestigious varieties of British English. On the other hand, the interior of the country was settled by people who were no longer closely connected to England, since they had no access to the ocean during a time when journeys to Britain were always by sea. As a result, western and inland speakers did not imitate the changes in speech from England.

Broadly speaking, there are three major regional dialects in the United States: the northern dialect, the midland dialect, and the southern dialect. These dialect regions show considerable phonological and lexical variations.

The northern dialect: The northern dialect area stretches from New England and New York to Oregon and Washington, along the northern border of the United States. The major northern cities include Boston, New York, Buffalo, Cleveland, Detroit, Chicago, and Minneapolis. Although Boston and New York differ in some ways from the other cities, they remain linguistically northern speech areas.

Dialectologists in the first half of the 20th century distinguished the north from the midland on the basis of a large collection of lexical isoglosses, mostly dealing with differences in agricultural terms that are now largely obsolete (such as the use of *ko-dayin* in the north versus *sheepie* in the midland to call sheep from the pasture). A number of words are also characteristic of the northern dialect, for example, *brook* (meaning “creek”), *packie* (meaning “liquor store”), *tonic* (meaning “soft drink”), *wicked* (meaning “very”), *ayuh* (meaning “yes”), *Italian* (meaning “submarine sandwich”) and *muckle* (meaning “to grasp”).

Despite the obsolescence of some of these lexical differences, the boundary between the north and midland is still maintained in the same place by phonological and phonetic isoglosses.

In terms of pronunciation, the northern dialect is characterized by rhoticity, that is, the use of the sound -r in words like *bird* and *car*. However, exceptions to this are New English and New York, which do not pronounce the -r after a vowel or at

the end of words. In addition, whereas the midland has /ɔ/ (as in “dawn”) in “on,” the north has /a/. As such, there is no “cot-caught” merger in the north. Finally, in the northern dialect region, words like *matter* and *madder* are pronounced with the same medial consonant, which is called the “flap.”

The midland dialect: The midland region refers to a very large area extending across the United States, from southern New Jersey and Pennsylvania and northern Delaware, Virginia, the Carolinas and Georgia, Tennessee and western Arkansas, and spreading into the whole of the western United States. In particular, the region of the midwestern United States west of the Appalachian Mountains begins the broad zone of what is generally called “midland” speech. In traditional dialectological research, there are two discrete subdivisions, namely the “north midland” that begins north of the Ohio River valley area and the “south midland” dialect area. In more recent work, the former is designated simply “midland” and the latter is considered part of the south. The (north) midland is arguably the major region whose dialect most closely approximates GA, and the enormous size of the midland area accounts for general uniformity in American English.

Midland pronunciation is characterized by the use of the sound -r in words like *bird* and *car*, as in the case of GA. Another feature of the midland dialect is the merger of pronunciation (especially vowels), so that such pairs as *cot/caught* and *tot/taught* sound the same. In other words, the people in the midland use the vowel of the words *cot* and *tot* for the vowel of the words *caught* and *taught*. The word *on* contains the vowel in the word *caught*, rather than the vowel in the word *cot*.

The north midland and south midland dialects are both characterized by having a distinctly fronter realization of the phoneme in the word *boat* than many other American accents, particularly those of the north. Moreover, in some areas of the midland, words like *roof* and *root* are pronounced with the vowel in words like *book* and *hoof*. On the other hand, the north midland and south midland dialects are both characterized by having a distinctly fronter realization of the vowel in the word *boat* than many other American accents, particularly those of the north.

In the greater midland area, there is also a common grammatical construction with “anymore.” It is possible to use the word *anymore* with the meaning “nowadays” in sentences such as “air travel is convenient anymore” (air travel is convenient nowadays). In addition, a number of words are characteristic of the Midland dialect, including *bub*, *cross-purposes*, *fall* (meaning “autumn”), *flapjack*, *greenhorn*, *guess* (meaning “suppose”), *homely*, *homespun*, *jeans*, *loophole*, *molasses*, *peek*, *ragamuffin*, *reckon*, *sorry* (meaning “inferior”), *trash*, *well* (meaning “healthy”).

The southern dialect: The southern region includes Virginia, the Carolinas, and the Gulf states, extending to the western end of Texas. Because there is great variation between regions in the south, few generalizations can be made about southern pronunciation as a whole. Upheavals such as the Great Depression, the Dust Bowl, and World War II caused mass migrations throughout the United States. Southern American dialect began to take its current shape only after World War II.

One of the phonological features is the merger of certain vowels, as in the *pin-pen* merger. In addition, the southern dialect is characterized by Americans from other areas as being spoken more slowly than others, with a “southern drawl.” For example, the people from the deep south speak English with a pronounced “drawl” through the lengthening of vowels. In terms of grammar, the prefix -a is sometimes used with the progressive form of the verb—for example, in sentences such as *he’s a-singin’* (“he is singing”) and *it’s a-rainin’ out there* (“it’s raining out there”).

The south midland dialect follows the Ohio River in a generally southwesterly direction, moves across Arkansas and Oklahoma west of the Mississippi, and peters out in West Texas. It is a version of the midland speech that has assimilated some coastal southern forms, most noticeably the loss of the second-person plural pronoun “you-all.” South midland pronunciation is also characterized by the use of the sound -r in words like *bird* and *car*, and it is the main feature that distinguishes south midland speech from the coastal southern varieties. In addition, south midland English can be characterized by its vocabulary, including *big daddy* (meaning “grandfather”),

big mamma (meaning “grandmother”), *Confederate War* (meaning “Civil War”), *cooter* (meaning “turtle”), *fixing to* (meaning “going to”), *goober* (meaning “peanut”), *mouth harp* (meaning “harmonica”), and *on account of* (meaning “because”).

Regional Variations in Vocabulary

A number of words and expressions are characteristic of specific dialect areas of the United States. Many of these terms spread from their area of origin, and many people in different dialect areas use these different words for the same object, or to distinguish between variations of an object. Some of the lexical variables include the following:

- Faucet (north) and spigot (south)
- Frying pan (north and south, but not midland), spider (New England), and skillet (midland, Gulf states)
- Clapboard (northeast) and weatherboard (midland and south)
- Gutter (northeast, south), eaves trough (inland north, west), and rainspouting (Maryland and Pennsylvania)
- Pit (north) and seed (elsewhere)
- Teeter-totter (widespread), seesaw (south and midland), and dandle (Rhode Island)
- Firefly (less frequent south and midland) and lightning bug (less frequent north)
- Pail (north, north midland) and bucket (midland and south)

It must be noted that the picture of regional variations was never a neat one, because of widespread north-south movements within the United States and the ongoing inflow of immigrants from other parts of the world. As a result, there are mixed dialect areas as well as pockets of unexpected dialect forms. However, the main division of north, midland, and south dialects remains more or less the same today. These regional dialects show no signs of disappearing, and the western English is even showing signs of dialect genesis.

While there are identifiable regional dialects within the country, American English can be characterized by its remarkable uniformity, in that roughly two-thirds of its population speak the same dialect. Aside from the emergence of “Network English,” one reason for the relative

uniformity is concerned with the mingling of settlers. In the course of westward movement, people who came from linguistically different regions in Britain intermingled a great deal. Another reason is the alleged conformity of Americans. In other words, the ready acceptance of group allegiance or identification on the part of many Americans may also explain their linguistic uniformity.

Ethnic Variations

Apart from regional variations, there are also ethnic variations in the English language spoken in the United States. In particular, two most important “ethnic dialects” (dialects that are spoken by ethnic minorities) of American English are African American Vernacular English (AAVE) and Chicano English. However, regional and ethnic varieties often intersect with each other, and any speech is conditioned by a host of factors, including regional, social, and situational factors.

African American Vernacular English: AAVE is an African American variety of American English. It is also called African American English, black English, black vernacular, black English vernacular, or black vernacular English. The term *vernacular* refers to the everyday language spoken by a speech community, often a nonstandard variety. Among lay people, AAVE is also sometimes called “ebonics,” but it is a term that carries strong connotations.

AAVE originated from slave Creoles who arose from the transatlantic African slave trade and the need for African captives to communicate among themselves and with their captors. As a result, the captives developed what are called “pidgins,” that is, simplified mixtures of two or more languages that develop from close contact between members of different language communities. AAVE also contains many distinctive forms that are more homogeneous from region to region than the accents of white speakers, but African American speakers are also subject to regional variation. While it is clear that there is a strong relationship between AAVE and southern American English, the unique characteristics of AAVE are not fully explained and its origins are still widely debated.

AAVE displays pronunciation, grammatical structures, and vocabulary features in common

with various West African languages. While these features are mostly regionalisms (originating from the dialect commonly spoken in the area, regardless of color), a number of them—such as the deletion of “is”—are used much more frequently by African American speakers. Its pronunciation is common to southern American English, which is spoken by many African Americans and many non-African Americans in the United States.

It is also noteworthy that AAVE gradually influenced the speech of southern white people, particularly the children of the aristocratic slave owners. One reason was that many black nannies helped raise white children in the area, and the children of blacks and whites played together freely before the Civil War. As linguistic features acquired in early childhood are likely to be retained throughout life, southern English naturally became mixed with AAVE. Some of the phonological features that set AAVE apart from forms of SAE include the following:

- The word *cub* sounds like “cup.”
- The word *this* is pronounced like “dis.”
- The word *stripping* is pronounced like “strippin.”
- The consonant -r is usually dropped when not followed by a vowel.
- The consonant -r may also sometimes be pronounced as an unstressed vowel.
- The consonant -l is often vocalized in patterns similar to that of -r (though not between vowels), thereby making the pairs “toll” and “toe,” “fault” and “fought,” and “tool” and “too” sound the same.
- The word *test* is pronounced like “tess”; similarly, *hand* is pronounced like “han.”

AAVE also contains words that either are not part of SAE or carry very different meanings from their common usage in SAE. For example, there are several words in AAVE referring to white people that are not part of SAE. Some examples include the word *gray* as an adjective for whites (as in gray dude), and the word *paddy* as an extension of the slang use for Irish. Another example is the word *ofay* (a term for a white person but is pejorative). It derived from the Ibibio word *afia*, which means “light-colored.” The word *kitchen*

refers to the particularly curly hair at the nape of the neck, and the words *siditty* or *seddity* means snobbish or bourgeois.

In terms of its grammatical structure, AAVE displays the following features:

- Present-tense verbs are uninflected for number and person. For example, there is no -s ending in the present-tense, third-person singular in “she write poetry” (“she writes poetry”). Similarly, the word *was* is used in place of both the words *was* and *were* in SAE
- The genitive -’s ending may or may not be used, which may result from a simplification of grammatical structures. One example is “my momma sister” (“my mother’s sister”).
- There is the use of double negatives, “ain’t,” as in early English.
- The words *it* and *they* denote the existence of something, equivalent to the words *there is*, or *there are* in SAE.
- There is altered syntax in questions. For example, questions such as “why they ain’t sleeping?” (“why aren’t they sleeping?”) and “who he think he is?” (“who does he think he is?”) lack the inversion of SAE. As a result, there is no need for the auxiliary verb *do*.

Chicano English: Another widely spoken ethnic dialect is Chicano English. It is often used by Hispanics who are descendants of immigrants from Mexico. Hispanic Americans comprise the second-largest ethnic minority in the United States, and the largest group of these Hispanic Americans moved to the United States from Mexico. However, Chicano English is spoken not only by people who know both English and Spanish, but also by people who do not speak Spanish but who are members of a Hispanic community. Chicanos mainly live in the American Southwest, an area including Texas, New Mexico, Arizona, and California. It should also be noted that Chicano English should not be mixed up with Spanglish, which is not a recognized dialect of English but rather a mixing of Spanish and English.

Chicano English, the most uniform of the varieties of Hispanic English, displays stable speech

patterns and a distinct phonological system of its own. For example, words like *check* or *change* are pronounced as if the spelling was “sh” rather than “ch.” Chicano English also shows a characteristic stress pattern so that the stress of compound words falls on the last syllable instead of the first, as in the words *week-end* and *trouble-maker*. In addition, there is an absence of –th, so that the word *think* may be pronounced in various ways like *ting*, *fing*, or *sing*. Also, in Chicano English, the word *job* may sound like *yob*, and the word *yes* may sound like *jes*. In addition, statements are likely to be pronounced with rising rather than falling intonation in the speech produced by Chicanos.

In terms of lexical features, Chicano English also borrows words from Spanish. For example, the Spanish word *quinceañera* is used to refer to a special party for a 15-year-old girl. Other examples include *comadre* (godmother), *compadre* (godfather), *simon* (yes), *firme* (good), *flika* (picture), *vato* (guy), and *feria* (money). Also, the verb “borrow” is used to replace “lend” in Chicano English, and so the sentence “lend me a pen” becomes “borrow me a pen.”

English-Language Learners

The term *English-language learners* (ELL) refers to national-origin-minority students who are limited in English language proficiency. This may include children born in this country who are exposed to another language in their home, or primarily speak another language in their home, as well as students who were born outside the United States.

According to the U.S. Census, the number of children ages 5 through 17 who speak a language other than English at home doubled between 2000 and 2010. ELL is the common acronym for this student population. Over the past 20 years, the population of ELLs in American schools has increased by 160 percent, compared to a 20 percent increase in the general student population.

The U.S. Department of Education defines ELLs as national-origin-minority students who are limited in English language proficiency. The term *ELL* is often preferred over the term *limited English proficient* (LEP), as it highlights accomplishments rather than deficits. Another term for these students is language minority students. As a group, ELLs represent one of the fastest-growing

groups among the school-aged population in the United States. Estimates place the ELL population at over 9.9 million students, with roughly 5.5 million students classified as Limited English Proficient by virtue of their participation in Title III assessments of English language proficiency. This group of students speaks over 400 languages, with Spanish being the most common (spoken by more than 70 percent of ELLs). It is projected that English-language learners will represent 30 percent of the school-aged population by 2015. The largest and fastest-growing population of ELLs are students who immigrated before kindergarten and the U.S.-born children of immigrants.

Federal Mandates

School districts are required by law to identify and provide services for ELLs. New students are tested to determine their language proficiency and, once identified, must be tested yearly for proficiency. These levels of proficiency are determined by a yearly state-specific assessment given only to ELLs. Under the No Child Left Behind Act (NCLB), ELLs are included in standardized testing once they reach a minimal level of proficiency. When students are fully English proficient, they are required to be monitored for two more years.

Local school districts are required to implement an effective means of outreach to parents of ELLs. Schools must provide information in a language the parent can understand and make sure that the parents know and understand the programming their child is receiving. Parents have the choice of opting out of receiving English as a Second Language services for their child, and students who opt out may drop back in after taking a language assessment.

Challenges for English-Language Learners

Many ELLs are successful in school, but a persistent conundrum is the group of students who continue to struggle even after years of specialized instruction. Data from the 2000 U.S. Census indicate that over half of secondary school ELLs were born in the United States, and that of the 44 percent of ELLs who are immigrants, many entered U.S. schools at some point before or during the elementary years. In studying this problem, instructional practice has shifted. New

approaches emphasize literacy strategies and explicit instruction of academic language to help students access grade-level material in the content area while learning English.

Academic language mastery is the single most important predictor of academic success for ELLs. Academic English is the English used in school discourse, as opposed to conversational or social English, which is acquired more rapidly. Research indicates that it takes five to seven years to become fluent in academic English. ELLs struggle as “learning to read” shifts into “reading to learn.” Research has shown this group of students’ vocabulary levels are well below average (some as low as the 20th percentile), and this lack of vocabulary impedes reading comprehension and writing.

The National Assessment of Educational Progress 2008 results show a large gap between ELLs and their English-only counterparts on achievement scores in science and mathematics at grades 8 (ELLs score 31 points behind non-ELLs in math) and grade 12 (ELLs score 28 points behind non-ELLs in math). The literacy results for ELLs are worse: only 4 percent of 4th grade ELLs scored at the proficient or advanced levels in reading, and only 3 percent of 8th grade ELLs and 20 percent of students classified as “formerly ELL” scored at the proficient or advanced levels.

Census Data

The American Community Survey (ACS) is an ongoing U.S. Census Bureau survey that provides data every year to give communities the current information they need to plan investments and services. Information from the survey generates data that help determine how more than \$400 billion in federal and state funds are distributed each year. Language use, English-speaking ability, and linguistic isolation data are currently collected in the American Community Survey. The U.S. Census Bureau is both the sponsor and the collector of the American Community Survey. In the 2000 census, there were 5.5 million students who spoke a language other than English at home (LOTE), which increased to 11,227,000 in the 2009 American Community Survey.

Government agencies use this information about language spoken at home for programs that serve the needs of the foreign born and

specifically those who have difficulty with English. The U.S. Department of Education uses the data to prepare a report to Congress on the social and economic status of children served by the local school districts. Data on language are used to allocate grants to school districts for children with limited English proficiency. State and local educational agencies receive grants for programs to improve educational skills, complete secondary schooling, and provide job training and placement for adults based on data about language.

Environmental Protection Agency, U.S.

The Environmental Protection Agency (EPA) was created by executive order (Reorganization Plan No. 3, signed by President Richard Nixon) in December 1970. The federal agency tasked with creating and enforcing regulations to protect human health and the environment, it is not a cabinet-level department but is not under the jurisdiction of any other department, and the EPA administrator (a vacant position in 2013, with Deputy Administrator Bob Perciasepe acting as administrator) is generally given cabinet rank. Some of its powers are delegated to state and tribal governments. The EPA employs 17,000 full-time workers and thousands more contract workers, and more than half of its workforce consists of scientists and engineers. It operates out of 10 regional offices, 27 laboratories, and its Washington, D.C., headquarters. The EPA's enforcement powers are generally exercised through sanctions and fines.

History of the EPA

The EPA was formed in response to a groundswell of public concern over environmental problems, which began with the 1962 publication of Rachel Carson's *Silent Spring*, a best-selling study of the effects of pesticides on the environment. The book inspired the beginning of the environmental movement and popularized key scientific concepts and concerns, such as the endangerment of species due to environmental factors (rather than hunting or other more obvious threats) and the problem of carcinogens in the environment (as opposed to carcinogens introduced through ingestion, such as in cigarette smoke). The book also figured prominently in the field of ecology and related sciences, encouraging scientists to become involved with public policy and other advocacy. The popularity of *Silent Spring* led to President John F. Kennedy's ordering a federal investigation of pesticide safety, which in turn led to stronger pesticide regulations in the short term. In the longer term, the need was clear for a national environmental policy that would guide agencies and legislators. In addition to the publication of *Silent Spring*, a number of events in the 1960s continued to bring attention to the environmental movement and to make clear

how broad that movement's scope was, including the building of the interstate highway system and its impact on local environments, concerns about nuclear weapons and nuclear power, and the 1969 Santa Barbara oil spill.

In 1963, the Clean Air Act was passed to introduce national air pollution controls, which were enhanced in a series of amendments (notably in 1970, 1977, and 1990). It also established a pollution research program. The Wilderness Act in 1964 created the first legal definition of "wilderness" in the United States and created better mechanisms to protect federal wilderness areas. The National Environmental Policy Act of 1969 (NEPA) defined this policy for the first time and established the President's Council on Environmental Quality. The cornerstone of NEPA is the requirement that all federal agencies prepare environmental assessments and environmental impact statements explaining the environmental effects of any and all proposed federal agency actions. Specific procedures for doing so are established and the Council on Environmental Quality oversees agencies that carry them out. Shortly after NEPA was signed into law, the 1970 amendments to the Clean Air Act expanded the federal mandate over air pollution, creating a requirement for comprehensive federal and state regulations over stationary and mobile pollution sources (i.e., factories and vehicles, respectively). The federal government's enforcement powers were greatly expanded, and the National Ambient Air Quality Standards were established for the first time.

President Nixon, through executive action, reorganized the federal government's environmental responsibilities, consolidating them under a single agency: the Environmental Protection Agency. The EPA was created in 1970 and began operation in 1971. The agency is responsible for enforcing the laws enacted by a large body of environmental protection legislation passed both before and since its founding.

Although the EPA has sometimes been criticized by business interests or staunch conservatives for allegedly interfering in American business to an extent detrimental to job growth or economic activity, the more substantive complaint has been that the EPA does too little. It has rarely been proactive in its efforts; it tests the fuel efficiency of

fewer than 15 percent of new car models; in all industries it too frequently accepts the claims manufacturers make of the efficiency or environmental friendliness of their products, with little or no testing; and optional programs like Energy Star offer energy-efficient certification to products of inherently inefficient design based on flimsy criteria. During the George W. Bush administration, the EPA also succumbed to political pressure, agreeing to rescind a declaration that climate change endangered the public welfare. A subsequent survey of 1,600 EPA staff scientists found that more than half reported they had experienced political interference in their work.

Environmental Racism

Environmental racism is the unequal distribution of the effects of environmental degradation such that low-income and minority communities experience a disproportionate level of suffering. It refers not only to conditions that result as a matter of policy or racist institutions but to environmental inequalities that result from disparities of wealth: for instance, a common example is a neighborhood where property values have fallen because of poor local environmental conditions, whether the noise pollution of a nearby airport; the poor quality of the drinking water, soil, or air because of industrial activity; or proximity to a waste site. Because of the unequal distribution of wealth, as families who can afford to do so move out of the neighborhood and other families move in, a situation develops in which poor families are the only ones exposed to this environmental hazard—and in all likelihood experience no benefit associated with whatever activity created the hazard. The distribution of wealth in the United States being what it is, it is also true that in most parts of the country these poor families are likely to be nonwhite or Hispanic. Some have suggested restricting the usage of the term *environmental racism* to deliberate targeting of people of color, but this ignores important realities about contemporary American culture.

There are, of course, examples of deliberate targeting to which one can point. One of the most famous in this context is the placement of a hazardous waste landfill in a wealthy African American neighborhood in Houston, Texas. Sociologist Robert D. Bullard produced a paper in 1979 showing that, while most in the environmental

justice movement at the time assumed that ethnic groups were targeted only incidentally as a result of targeting low-income communities, in this case race had been an important factor in the decision to locate the landfill—income had not played a role. Bullard's paper was key in the mobilization of African Americans and allies in the environmental movement in the 1980s, and both government and third-party studies found that people of color were statistically more likely to live near hazardous waste facilities than were whites. A study by the United Church of Christ emphasized that, as in the Bullard paper's case, race was more strongly correlated than income level.

In addition to deliberate targeting, common forms of environmental racism are the uneven impacts of environmental policies, the disproportionate access to services like garbage removal and recycling, disproportionate access to amenities like parks and local waterways, the disproportionate representation of minority workers in hazardous jobs, and the zoning of toxic facilities. Means by which these situations may result, beyond targeting and effects of wealth, include low voter registration and education, leading to community members' being less likely to challenge proposals, realize their potential harmful effects, or seek compensation for damages; lack of full access to the tools and resources to fight the placement of toxic sites and other private sector or policy decisions that impact them; and, related to the wealth disparity, a greater likelihood to accept environmental risks in return for an increase in jobs or other economic incentives to the community. Statistically, white communities are more likely to succeed in their attempts to oppose environmental hazards such as policy changes, new construction, landfill placements, and sewage treatment facilities, and have greater access to policy input and policy awareness.

Some social scientists continue to treat the placement of known environmental hazards like sewage treatment facilities or landfills as a case of intentional conscious racism, whether one that is conscious of the race predominant in the targeted community or one that is protecting the racial group privilege of the white policy maker. Others see racist results as the product of processes like gentrification, suburbanization, and decentralization, as white flight drives nonminorities away

from the zones most vulnerable to environmental hazards. Cases cited as situations of environmental racism include the fate of New Orleans communities after the collapse of inadequate levees in the aftermath of Hurricane Katrina in 2005. Subsequent investigations found that city and state officials had failed to account for the large numbers of residents (predominantly black) who relied on public transportation and would be unable to participate in the evacuation plans as drafted, which relied almost entirely on residents driving out of the city. Further, a history of institutionalized segregation that had continued as unofficial segregation of neighborhoods along racial lines had led to predominantly black and Vietnamese populations in neighborhoods like New Orleans East, which were low lying and among the hardest hit by the flooding. Many people in and outside New Orleans also accused the federal government of being slow to act and of acting without due diligence because of the city's largely black population.

The case of the PCB landfill in Warren County, North Carolina, is also widely cited and is considered by many to be the birth of the modern environmental justice movement. Located in North Carolina's "black belt," Warren County is predominantly black and poor. A 150-acre landfill was created there by the state to dispose of soil that had been contaminated by illegal PCB-dumping activities. The illegal dumping had taken place along 240 miles of highway crossing 14 counties in 1978, but disposal was held up for four years because of opposition to the landfill. The EPA approved a "dry tomb" PCB landfill, with a perforated pipe leachate collection system. However, the landfill as installed lacked a collection system and was capped with a million gallons of water and no means of pumping it out—creating a pool of contaminated water that would leach into the soil.

The landfill was protested by Warren County citizens who used displays of civil disobedience. Though environmental protests had resulted in arrests before, this is believed to be the first case of arrests for protesting pollution.

Within months of the landfill's installation, the EPA demonstrated that PCB air emissions were at significant levels even half a mile away but did not release this information to the public. The contaminated soil buried in the landfill was located only seven feet away from the groundwater, and

the first independent study of the site had predicted an inevitable failure because of this proximity. Though the North Carolina government repeatedly insisted that the site was the only site suitable for the landfill, it was clear long before the site's groundbreaking in 1982 that the criteria for that suitability could only have been demographic, as both groundwater proximity and soil permeability were at inappropriate levels for a landfill of this nature, even using the dry tomb method prescribed by the EPA.

In order to appease protesters and their supporters, the North Carolina government pledged to detoxify the Warren County site. More than

10 years later, in 1993, the water that had capped the landfill was in danger of breaching its plastic liner. A joint committee of state appointees and county citizens was formed to study the problem and to make an immediate recommendation, but years passed before funding was released to clean the site. In 1999, the legislature finally pledged \$8 million toward cleanup if another group could be found to provide matching funds; the EPA agreed to provide these matching funds, and cleanup began at the site in May 2002. At the end of 2003, more than 20 years after the original pledge and 10 years after the start of the emergency leak, the decontamination was completed.

Environmental Justice

Environmental justice, sometimes called environmental equity in EPA publications, is a remedy to environmental racism. It emerged as a social movement at the intersection of environmentalism and the civil rights movement in the 1980s. There are generally few minorities represented in mainstream environmental groups like Greenpeace and Friends of the Earth, and those groups have done little to address environmental justice concerns. Environmental justice advocacy groups include the Tulane Environmental Law Clinic in New Orleans, Greenaction, and the Coalition Against Environmental Racism. The EPA defines environmental justice and environmental equity as "the fair treatment and meaningful involvement of all people regardless of race, color, sex, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies." It is explicitly stated as one of the goals of the EPA.

The EPA has been criticized for its failures in environmental justice and, under some administrations, its willful ignorance. The agency's Office of Environmental Equity was established in 1992, and an executive order by President Bill Clinton in 1994 required government agencies to form and enforce environmental policy and regulations while taking poor and minority populations into account. But the EPA reinterpreted this executive action in the 2000s, proposing the elimination of race and class from its environmental justice programs, as well as explicit identification of minority or low-income communities. Its argument was that environmental justice should apply to all

communities, but in formulating this argument, the agency willfully denied the existence of institutional racism, of the racist effects of wealth disparity, and other issues discussed above. A subsequent internal investigation in 2004 found that the agency had failed to develop a comprehensive environmental justice strategy—12 years after the formation of the Office of Environmental Equity. A follow-up investigation two years later found little to nothing had changed. Many feel the EPA's environmental justice record is actually worsening.

Native Americans are one of the groups most impacted by environmental injustice. Their suffering from the uranium mining industry is infamous. In Churchrock, New Mexico, the Navajo tribal government leased land to mining companies without reporting the consequences of uranium mining or obtaining the consent of affected families. The water supply was contaminated with uranium over the course of 15 years of continuous mining, and the mining companies argued that federal water control acts did not apply to them because they were operating on tribal lands.

Epidemiology and Ethnic Diversity

Epidemiology is the study of patterns of disease, illness, and health that occur in populations according to variables of interest such as gender, age, race, and ethnicity. It is an interdisciplinary field that combines medical science, social and behavioral science, and biostatistics. Epidemiological research has provided an understanding of the progression of many illnesses and diseases from inception to end, or the natural history of a disease. This knowledge is useful in the design of health intervention and disease prevention programs, policy recommendations, and to highlight areas in need of change in the nation's health care system.

A guiding principle is that risks or exposures to diseases are unequally distributed among a continuum in a population, and this distribution is influenced by social forces, a relationship best examined at the population level. A defining feature that sets epidemiology apart from much of clinical medicine is its population-level focus, versus examination of the individual. A population is a group of people who share a common characteristic(s) of interest, such as geographical region, gender, or religion. This approach enables the identification of different patterns of health and illness across a population.

The Development of Epidemiology

Scientific observations regarding the fact that some groups of people seemed more susceptible to a particular disease or illness have been made for hundreds of years. Often negative health outcomes were associated with an economic force, such as occupation. Early studies include Sir Percivall Pott's study of high testicular cancer among chimney sweeps and John Snow's findings that a cholera outbreak was traceable to a contaminated drinking water source. Based on their findings, both men were able to make recommendations to improve the public's health. Emile Durkheim's observations that suicide rates in Europe were related to social integration also provided an early framework.

Social epidemiology developed in the 20th century as a means to better focus on social and

biological determinants of disease. Work by a number of different researchers put forth and advanced the idea that stressors in the environment can have adverse physiological effects on the body. A landmark article by Saxon Graham detailed the manners through which membership in a social group (such as an ethnic group) can start a chain of events that begins with behavior patterns, risk, and exposures that affect disease and health outcomes. Social epidemiology has been and continues to be a major contributor in the identification of health disparities, or that some groups disproportionately suffer more from a disease or illness than another.

Methods, Data, and the U.S. Census

Epidemiology relies heavily on quantitative data in order to track cases of diseases, illnesses, or health outcomes and examine the distribution across person, place, and time variables. Such data are instrumental in the documentation of racial and ethnic health disparities. The U.S. Census provides a wealth of population-level information on economic, social, and demographic characteristics. Data such as average household income for geographic regions and ethnic and racial group population sizes are invaluable for examining social forces on patterns of health and illness. Of particular interest to epidemiologists are census tracts and metropolitan statistical areas (MSAs), as some disease and illness patterns are correlated with urban and rural life, types of residence, and proximity to industrial plants. Other sources of epidemiologic data include the Framingham Heart Study, the oldest continuing running study of coronary heart disease risk, the National Vital Statistics System, the Behavioral Risk Factor Surveillance System, and the National Health and Nutrition Examination Survey.

Epidemiology, Ethnicity, and Race

Race and ethnicity are ambiguous concepts that refer to socially constructed categories of people with perceived differences. In other words, the characteristics that are predominantly used to group people are arbitrary, with much cross-cultural and historical variation. The constantly changing treatment of racial and ethnic categories since the inception of the U.S. Census is a perfect illustration of how society, rather than natural laws

of science or inherent genetic differences, draw the boundaries between racial and ethnic groups.

Ethnicity is multifaceted and generally refers to a group of people with a sense of shared ancestral origins and shared culture, language, religion, and traditions, whereas race is an indicator of skin color and other phenotypes. While there is often an overlap, ethnicity is not the same as race, yet it is increasingly being used as a substitute for race in health research.

The examination of health disparities among different ethnic and racial groups in a given population is an important piece of epidemiology. Most people working in the field today agree that health disparities are a social justice issue, rooted in systems of economic, racial, and ethnic inequality that privilege white people. In 1899, sociologist W. E. B. Du Bois was one of the first to connect the poor health of African Americans to racial inequality in the United States. Du Bois argued that the observed differences between the health and health outcomes of black and white Americans were primarily social, such as inadequate living conditions, inadequate diets, and improper sanitation. Since his time, a growing body of literature continues to indisputably show the existence of health disparities between African Americans and whites across a wide range of disease, illness, and health outcomes. For example, African Americans have higher rates of infant mortality, maternal mortality, homicide, HIV, many cancers and with more late-stage diagnoses and worse survival rates, hypertension, and heart disease. In addition, even when the rate of some diseases or illnesses among African Americans is the same or less than that of whites, they are more likely to have a worse prognosis.

The health status of racial and ethnic minorities is often compounded by the increased likelihood for these persons to live in or near poverty conditions. Material conditions directly related to health, such as the ability to refill prescriptions or to access a doctor, are distributed across class lines, as well as the resources that can keep people healthy and limit exposure to risk factors. Despite the established connection between economic status and health, health disparities between racial groups exist even when variables such as poverty, insurance status, education, and access to medical care are controlled, indicating that racial inequality

and discrimination at the interpersonal and/or structural level are likely contributing factors.

While African Americans have made relative gains in society as a group, they continue to occupy lower social and economic statuses in the United States. These inequalities are correlated to a number of risk factors—from exposure to violence to lead paint in the home—that impact a person's health in direct and indirect ways. Many of these risk factors and exposures are present from birth or early childhood and compound or multiply over a person's life. Some hypotheses expand on the work of early social epidemiologists to suggest that poor health and health outcomes work through indirect channels, such as stress or depression, which not only have real biological and physiological effects but can also lead to negative coping behavior such as alcohol abuse or unprotected sex that increase risk factors. Racial discrimination and bias embedded in all levels of the health care system are also sources of critique. For instance, data show that racial and ethnic minorities receive a lower quality of health care even when access and affordability issues are controlled.

However, these patterns are not unique to health differences between African Americans and whites. Many health disparities exist between whites and other racial/ethnic groups that have been marginalized in society. For example, rates of diabetes, liver cirrhosis, hypertension, and homicide are higher among Hispanics than their white counterparts. In addition, ethnic minorities may experience additional barriers to care, such as language or cultural differences, that do not affect the health care delivery of whites.

It is important to note that not all health disparities entail worse outcomes for people of color, yet, these examples are rarely addressed despite what they can inform about the health of all persons. As an example, Asian Americans on average have longer life expectancies than whites. A second example is that research on maternal mortality rates typically focuses more on the black-white gap, despite more Hispanic women having a lower maternal mortality rate than white women. Known as the “Latina paradox,” this phenomenon could benefit from further investigations into Hispanic and non-Hispanic maternal health outcomes.

Importance of Categorization

Because epidemiology focuses on the identification of disparate patterns of health and illness among populations, the manner in which race and ethnicity are categorized and used can be very important. The inclusion of race and ethnicity variables has increased in epidemiological studies; however, so too have concerns about the applicability and ethics of including an ethnic analysis, particularly when a study may not warrant it. Raj Bhopal, a leading expert in ethnicity and epidemiology, outlines a number of factors that should be taken into consideration. These include the measurement difficulties, heterogeneity of populations, ethnocentricity, and ambiguity of variable purpose. His purpose is not to dissuade researchers from including race or ethnicity but rather to highlight the reasons why these issues matter.

Of the four, measurement difficulties may be the most important because terminology, definitions, classifications, and reporting methods (interviewer-assessed or self-identified) impact the data and lead to different interpretations. The socially constructed character of race and ethnicity lends itself to these difficulties, and there is no single, worldwide definition of who or what definitively belongs in which category and the associated terminology. For example, “Asian” has a different meaning in different countries. In the United States, Asian typically refers to Chinese, Japanese, and Korean and excludes people from the Indian subcontinent, but in the United Kingdom, Asian applies to people with Indian subcontinent origins. A second illustration is that as changes occur in how race and ethnicity are captured by the U.S. Census, so too do the population sizes and the denominators. These differences affect statistical calculations and can skew or mask the full picture of a disease distribution.

The second problem, heterogeneity, captures the issues with grouping large numbers of different nations and cultures into one category, such as “Asian” or “Hispanic.” These are often too broad to be meaningful because they can hide the substantial within-group morbidity and mortality rates. For example, in the United States, the Chinese have the highest mortality rates from lung and bronchial cancers than any Asian subgroup, whereas the Japanese have the highest mortality rates from colorectal and uterine cancers.

The last two concerns, ethnocentricity and sound rationale, speak to issues of discrimination and bias. With ethnocentricity, the tendency to view one's culture as the standard by which to view all others, the absence of bias is a key component of scientific research. Yet, much medical and health research treats whites and white bodies as the standard. This is problematic because it assumes racial superiority and also masks instances in which being a member of a nonwhite ethnic or racial group offers a protective benefit.

Summary

The rationale for collecting data by race and ethnicity must be clear because the underpinnings of racism are that whites are biologically different and inherently superior to nonwhites. Further, there is a dark history of scientific racism, initially developed as a means to justify slavery and colonialism. These studies attempted to show, usually with the aid of faulty research and forged records, that Africans and African Americans were inferior in some manner to whites and thus exploitable.

Later, scientific racism gave birth to the eugenics movement that left thousands of poor women and women of color sterilized in the United States and other countries, the Tuskegee Syphilis Study that purposefully denied medical treatment to African American males, the Holocaust in which Jews and Jewish bodies were exploited in the pursuit of medical knowledge, and, as recently as 1994, in *The Bell Curve*, a book (and theory) that related intelligence with race. In addition, racial and ethnic data that show differences in health can blur the confounding effect of poverty and inadequate resources and access to medical care. Thus, while differences are often easy to describe, the reasons behind their occurrence are not so readily apparent.

As the United States continues toward greater multiculturalism, epidemiological issues surrounding race and ethnicity will be important to understand in order to improve public health for all persons.

Epithets, Ethnic and Racial

An *epithet* is a descriptive term, word, or phrase used to enhance—or add to—the characterization of a person, place, or group, providing a generally accepted valuation. It is used extensively in poetry, where it is called poetic diction. An epithet formulaically applies actual or attributed qualities to people, individuals, or groups. Sometimes

this valuation becomes a nickname, like labeling a very effective football defensive back “bruiser.” Names of historical personages that could be confused with other individuals are given epithets as descriptive titles: William the Conqueror, Charles the Bald, Isabella the Catholic, or Wenceslaus the Drunkard.

At other times, the labels carry information about how the labeler thinks about culture, the individual, and his or her role in history or public events, ethnicity, or race. All are reductionist metaphors that stand in place of a group’s name, just as in historical texts; for example, “The Father of His Country” stands in place of George Washington.

Use in Cultures and Political Groups

Epithets can refer to social groups and describe their characteristics from the point of view of the user. In ancient Greece, “barbarian” was a descriptive term reserved for anyone who was not Greek with the connotation that a barbarian did not know how to act properly—they were not properly enculturated in Greek culture. In contemporary America, to say someone is a barbarian is considered an insult for it infers the referent has

not developed into a civilized person, or is someone who cannot control their violent emotions or ascribed background. As a result, epithet has come to be connotatively associated with expressions used to convey hostility and contempt and used invectively, dismissively, or abusively. An example of this process is the use of the words *communist*, *fascist*, or *socialist* for a person who does not agree with the speaker’s political views, invoking an ad hominum logical fallacy meant to undermine the butt’s intellectual arguments and marginalize the referent so he or she will not be listened to. The ultimate goal of a negative epithet is to eliminate the referent from the social group and negate his or her influence. Two of the most commonly used demeaning words, *bitch* or *bastard*, are often combined with obscenities or an ethnic designation.

When ethnicity, nationality, or race is centered in an epithet it is almost always derogatory. Sometimes the ethnic term is combined with a general insult—dirty, pig, dog—used as a modifier. Others are based on specific racialized adjectives (“nigger,” for any group with dark skin when light skin is assumed to be superior; or “Redskin,” used by U.S. sports teams to refer to a Native American) Other derogatory terms refer to specific times, places, and heritages: “bog,” a person of lower-class Irish ancestry; “gook” or “gook-eyed,” a term used by U.S. military in Asia during World War II; the Korean and Vietnam Wars refer to the Asian heritage enemies. For Native Americans, terms that have been used include “buck,” “warrior,” “chief,” “squaw,” or “papoose.” Mexican illegal immigrants who crossed the Rio Grande to find work in the United States were called “wetbacks.” Sometimes names have been broadened to refer to types of people regardless of ethnic or national heritage, such as “gringo,” “hun,” “thug,” or “vandal.” Such epithets and names have become disparaging stereotypes, although they were first used as neutral terms.

A caricature in the January 3, 1912, issue of *Puck* depicts the plight of Chinese in China with “Lo, the Poor Chink!” This English epithet, which refers to a person of Asian descent, is considered extremely offensive. Epithets have become associated with expressions or terms used abusively—in other words, racial slurs.

Stereotyping and Slurs

The use of racial or ethnic slurs theoretically raises the social position of the insulter and demeans the butt of the insult. In this sense, epithets are a form of stereotypes, culturally, socially, and individually determined by ideas about differences, often visualized in representations. Based on limited knowledge and assumed expectations, racialized

epithets carry perceptual, moral, and judgmental overtones viewed as derogatory and offensive. As a result, stereotypes tend to harm targeted social groups and individuals because they systematically distort reality while helping the user.

Epithet formation mechanisms assume that there are differences between two groups and accentuate some features while downgrading others. Often these stereotyped differences are based on the presence or absence of a key physical feature, social activity, or cultural trait, such as the way people greet each other, the type of eye contact people make, hair color, the loudness of voices, or the speed with which people talk. Epithetical words refer to either the exaggeration of valid group differences or the projection of illusionary distinctions. Distinctions assume that what the epithet stereotyper's group does is positive and "right," compared to the referent social group. It is the illusionary category on which racial slurs or epithets are formed; ethnic-based epithets are found in both categories.

Epithet stereotypes are often called slurs, and this is their most common usage in the contemporary United States. Epithet usage leads people to "see" homogeneous, almost reified, characteristics expressed by a person from a targeted social group that may not be present and to "ignore" other attributes that might be present or expressed. Thus, epithet usage robs groups of their diversity and people of their individuality. They are disrespectful, hateful, and generally pejorative, yet are socially debated because of issues of free speech.

Equal Employment Opportunity Commission, U.S.

The U.S. Equal Employment Opportunity Commission (EEOC) is a federal administrative agency responsible for explaining and enforcing federal employment antidiscrimination laws. These include all relevant parts of the Equal Pay Act of 1963, Title VII of the Civil Rights Act of 1964, the Age Discrimination in Employment Act (ADEA), the Rehabilitation Act of 1973, the Pregnancy Discrimination Act of 1978, the Immigration Reform and Control Act of 1986, the Americans with Disabilities Act (ADA), the Civil Rights Act of 1991, the Genetic Information Nondiscrimination Act of 2008, and the Lilly Ledbetter Fair Pay Act of 2009. If Congress passes the most recent version of the Employment Non-Discrimination Act (ENDA), which would extend Title VII of the Civil Rights Act to prohibit discrimination on the basis of sexual orientation and/or gender identity, it will be enforced by the EEOC.

As it stands, the EEOC enforces regulations prohibiting discrimination on the basis of race, color, ethnicity, national origin or nationality, religion, sex or gender, and pregnancy status, as well as retaliation against those who report concerns pertaining to these categories. The EEOC has the authority to file lawsuits against employers who violate federal antidiscrimination laws but rarely needs to do so. The vast majority of charges are resolved via administrative enforcement, such as settlements and policy changes,

rather than by litigation. In the 10-year period between 2001 and 2011, 948,543 discrimination charges were filed with the EEOC; of these, only 4,010—fewer than 0.5 percent of the total—resulted in lawsuits.

In fiscal year 2012, the EEOC operated with 2,571 staff members and a budget of \$360 million. The size of the EEOC has dropped by 36 percent over the past three decades, dwindling from 3,390 employees under the Jimmy Carter administration in 1980 to 2,158 employees under the George W. Bush administration in 2007, but began to climb again following the election of President Barack Obama in 2008.

Policy positions on the size and scope of the EEOC tend to correlate with party identity; Republican policy makers tend to favor a smaller EEOC that focuses exclusively on individual cases of bias-motivated discrimination, while Democratic policy makers tend to favor a larger EEOC with the resources to address more subtle patterns of systemic discrimination. This reflects philosophical differences between the two parties regarding the nature of discrimination—the conservative movement having historically taught that discrimination requires conscious intent, while progressives believe that it can function in a more inertial, institutional way without conscious intent on the part of employers. It also reflects differences between the two parties regarding the role and scope of federal government agencies.

The current EEOC chair, Jacqueline Berrien, has served in that role since 2010. Prior to her appointment, she worked as an attorney for the National Association for the Advancement of Colored People (NAACP) Legal Defense Fund (LDF), the Voting Rights Project of the Lawyers' Committee for Civil Rights, and the American Civil Liberties Union (ACLU). The EEOC's first chair was Franklin D. Roosevelt, Jr., son of the late president. The longest-serving and most controversial chair in EEOC history was Clarence Thomas, who served in the role from 1982 until he was appointed to the District of Columbia Appeals Court and then to the U.S. Supreme Court by President George H. W. Bush in 1989.

Origins of the Commission

On July 26, 1948, President Harry S. Truman issued Executive Order 9981. The order both

banned racial discrimination within the U.S. Armed Forces and established a seven-member President's Committee on Equality of Treatment and Opportunity in the Armed Services, which was, in essence, a military-specific precursor to the EEOC. On March 6, 1961, President John F. Kennedy expanded the ban on racial discrimination to include all federal contractors in Executive Order 10925, which also established a President's Committee on Equal Employment Opportunity. This committee became the Equal Employment Opportunity Commission (EEOC) with the enactment of Title VII of the Civil Rights Act of 1964.

Initial public reaction to the EEOC was mixed. While southern segregationists prepared to challenge the Civil Rights Act's constitutionality on the basis that the federal government did not have the authority to regulate employment discrimination, many civil rights activists suspected that the law was a largely symbolic gesture and would not result in any significant enforceable government action. The EEOC essentially functioned as an advisory body during the 1960s, but its authority to pursue litigation was limited. The Civil Rights Act itself did not give the EEOC the authority to file its own lawsuits, which essentially limited the agency's role to investigation and support, but the threat of private Title VII lawsuits was enough to convince many corporations to desegregate. In its first year, the EEOC negotiated with 111 businesses to ensure that their company policies and facilities conformed to Title VII requirements. The EEOC also began to submit amicus briefs in 1968 to assist, in a more formal way, with private lawsuits.

The EEOC gained the power to litigate with the passage of the Equal Employment Opportunity Act of 1972, by which time the U.S. Supreme Court had already held—in *Griggs v. Duke Power Company* (1971)—that policies that have a discriminatory effect violate Title VII even when intent cannot be proven. Over the next two years, the largest private company in the United States—AT&T—agreed to pay \$75 million in compensation to employees affected by discriminatory practices. Most of the EEOC's early efforts focused on race, gender, and national-origin discrimination but quickly expanded to include disability discrimination (with the passage of the

Rehabilitation Act in 1973) and age discrimination (pursuant to passage of the Age Discrimination in Employment Act of 1967)—and with the added threat of litigation, the EEOC's investigative efforts were taken more seriously by the business community.

The 1970s were an immensely successful period for the EEOC. By the end of the decade, it had investigated, confronted, and reformed nearly every major corporation in the United States, including General Electric, United Airlines, General Motors, Ford, Sears Roebuck, Bechtel Corporation, and the Illinois Central Gulf Railroad. It soon became clear that no corporation had enough power, influence, or money to completely escape the EEOC's attention, and—because the government took on litigation expenses—no victim of discrimination was too poor or marginalized to hold a corporation accountable for discrimination. This new level of corporate accountability necessitated aggressive reforms in corporate diversity and affirmative action policies, bringing the broader cultural reforms of the 1960s civil rights movement into corporate culture. The EEOC did not, of course, end discrimination—but it made discrimination less respectable as a business practice, and gave women, people of color, the disabled, and older workers a broader range of options and the possibility of greater social mobility.

Skepticism and Scope

The 1980s were an extremely controversial time for the agency. The conservative backlash against civil rights and feminism came just as the EEOC became known for embracing affirmative action guidelines and sexual harassment litigation, initiatives that had not achieved the same level of broad-based public support as investigations into employment discrimination. Although the Ronald Reagan administration was broadly supportive of the EEOC's viability as an agency, increasing both its funding and the number of employees, the period between 1979 and 1991 represented a compromise between the EEOC's supporters and skeptics—ending further expansion of the EEOC's mandate but securing the agency's long-term survival.

The EEOC's emerging transition toward remedial affirmative action programs in the late 1970s

followed a similar trajectory already established by unions, which in some cases established collective bargaining agreements that mandated percentage targets for the hiring of women and people of color as an effort to remedy past discrimination. Opponents of these affirmative action policies were initially emboldened by the U.S. Supreme Court's ruling in *McDonald v. Santa Fe Trail Construction Company* (1976), which held that Title VII of the Civil Rights Act of 1964 protects men and whites from intentional discrimination just as surely as it protects women and people of color, but the Supreme Court later held in *United Steelworkers v. Weber* (1979) that companies may establish affirmative action programs in an effort to remedy or mitigate existing disparities in employment. Confusion over this policy led to the publication in 1979 of new guidelines on employee selection, which established standards that would allow companies to adopt voluntary affirmative action criteria in compliance with Title VII. The promotion of affirmative action criteria offended many conservative white men, who considered these policies tantamount to reverse discrimination.

Equally controversial in some sectors was the EEOC's decision in 1980 to clearly define sexual harassment as a violation of Title VII's gender discrimination statute, a decision that was constitutionally validated by the U.S. Supreme Court's majority ruling in *Meritor Savings Bank v. Vinson* (1986). Under the guidelines, predatory behavior that makes workplaces inhospitable to women constitutes sex discrimination just as surely as more direct forms of employment discrimination. This policy, like the affirmative action reforms that took place concurrently, was offensive to many conservative white men. President Bill Clinton went so far as to suggest that the Republican congressional victories of 1994, which led to the first congressional Republican majority since 1954, could be attributed in part to the resentment that many "angry white men" felt regarding this broader interpretation of Title VII, which had by that point been indelibly associated with the presidency of Jimmy Carter and the congressional Democratic majority of the 1960s, 1970s, and 1980s.

By the end of the decade, the increasingly conservative U.S. Supreme Court had begun to grow tired of the EEOC. In four 1989 rulings, based on

technical details of statutory interpretation rather than broader constitutional objections, the court substantially limited the scope of Title VII. *Martin v. Wilks* allowed white employees who were not directly affected by affirmative action consent decrees to challenge them anyway; *Patterson v. MacLean Credit Union* established, contrary to the spirit of *Meritor v. Vinson*, that racial harassment did *not* constitute a Title VII violation; *Price Waterhouse v. Hopkins* lowered the standard by which an employer could defend itself against a Title VII lawsuit; and *Wards Cove Packing Company v. Atonio* required employees affected by racial disparities to document the policies behind these disparities in an implausibly specific manner.

Senator Edward Kennedy (D-MA) and Representative Augustus Hawkins (D-CA) responded to these rulings by proposing the Civil Rights Act of 1990, which would have clarified the language of Title VII to address these statutory ambiguities. The bill passed Congress, but this initial draft was vetoed by President George H. W. Bush on the grounds that it would impose racial quotas on businesses and discriminate against prospective white employees—an unlikely outcome given the Supreme Court’s existing precedent in *McDonald v. Santa Fe*, but a persuasive nightmare scenario for older white men who felt targeted by changes in employment law. After further negotiation, President George H. W. Bush agreed to sign the revised Civil Rights Act of 1991, which addressed the Supreme Court rulings without otherwise significantly expanding the mandate of the EEOC.

Although expansion of the EEOC’s mandate has slowed down over the past two decades, it has not halted entirely. With the passage of the Americans with Disabilities Act (ADA) of 1990 and the Genetic Information Nondiscrimination Act of 2008 came a new wave of significant civil rights protections for disabled workers and other workers with long-term health issues and, with the Lilly Ledbetter Fair Pay Act of 2009, greater large-scale equal pay protections for women. Today, activists focus primarily on expanding equal pay legislation and expanding Title VII to include lesbian, gay, bisexual, and transgender workers, as well as more aggressively enforcing existing EEOC policies. Meanwhile, the U.S. Supreme Court has continued—most notably in *Ricci v. DeStefano* (2009)—to narrow the circumstances under which

affirmative action policies can be implemented to address institutional disparities.

The Equal Employment Opportunity Commission is no longer new—but it has become an enduring instrument of the executive branch of the U.S. government, and its role will continue to shift, subject to public opinion, judicial review, and legislative revision.

Equity and Equality

Equity and equality are related but significantly different concepts. Equity means fairness, and in the American legal tradition inherited from England, it is a principle giving judges in certain civil cases a degree of discretion in order to achieve an equitable result that the letter of the law might not explicitly provide. One of the “maxims of

equity,” a set of legal principles expanding on the concept of equity in law, is “equity will not suffer a wrong to be without a remedy.” Commonly, the goal of equity cases is to provide a better remedy to a wrong that has been done than the common law remedies available, which are usually limited to monetary damages.

In economics, equity is specifically contrasted with the idea of equal treatment. A flat tax treats each taxpayer equally, but not equitably. Economic equity requires policies to achieve fairness to account for unequal access to resources and unequal opportunity. Most people today embrace the simplest tenets of egalitarianism—that all people are created equal, should be treated as equal, and have the same rights. This is encoded not only in the U.S. Declaration of Independence but in the Universal Declaration of Human Rights adopted by the United Nations in 1948, which states that “All are equal before the law and are entitled without any discrimination to equal protection of the law.”

Disagreements arise from the creation of new rights or routes to resources in order to correct economic, social, or civil inequalities, such as in voting rights laws or affirmative action programs. Classical liberalism favors individual rights and equal treatment by the law without regard to equity as such. Economist John Maynard Keynes, on the other hand, emphasized egalitarianism as the pursuit of an equality of *outcomes*: if two children are sitting at a restaurant booth and the smaller one is given a booster seat to bring him to the level of the table, that is not equal treatment in the sense of each party being treated identically, but it is equitable treatment in that the outcome for each party is equal.

The concept of “equality of opportunity” is interpreted differently by various parties. The opportunity in question refers to access to resources, especially employment, but includes education, housing, health care, and financial resources such as fair credit terms, small business loans, and mortgages. The difference in interpretation mirrors that between classical liberals and Keynes mentioned above: conservatives generally feel that it is sufficient to outlaw discrimination, while liberals have often supported programs that act as the figurative booster seat to increase the opportunity of disadvantaged groups, with an eye

toward the Keynesian equality of outcomes. Affirmative action is perhaps the best-known example.

Affirmative action programs are those that are adopted by universities or employers in order to actively prevent and counter discrimination against race, ethnicity, religion, or sex. Rather than simply outlaw discrimination, affirmative action programs actively support the hiring, or admission into college, of minorities through programs that include targeted recruitment, special grants and loans available to minority students, employee development programs for minority groups, and other such actions. Though the concept of affirmative action is popularly associated with quotas—whereby a minimum number of students of a particular gender or ethnicity would be admitted in a given year, for instance—the Supreme Court has limited universities’ ability to set such quotas, primarily in the *Regents of the University of California v. Bakke* (1978) and *Gratz v. Bollinger* (2003) decisions. What has been upheld, however, is a school’s ability to consider race or gender as a positive factor in evaluating candidates for admission.

Equity in Education

Equity is an often-raised issue in educational policy and the challenge of serving a student population in an equitable manner. Equity issues are sometimes raised in discussions of standards-based education reform, which seek to ensure that all students of a particular level achieve a particular minimum set of specific knowledge and skills. Given that students have different needs, aptitudes, and styles of learning, and come from different backgrounds, equal treatment—exposing each student to the same number of hours in each subject, grouping them all in the same classes—is not sufficient to achieve this minimum set unless it is pegged to the achievements of the least adept students.

A better solution is to tailor each student’s educational experience more specifically: to offer classes to help in the areas that are the most difficult for them, to offer tutoring and study groups and one-on-one learning experiences, and other methods. Equity in education also requires serving the needs of students with disabilities, whether physical or learning disabilities, and students of any ethnic or cultural background.

A phrase common in discussions of standards-based education reform is the “meaningful high school diploma.” The goal of standards-based reform is not just to better tailor the educational experiences of students but to create and maintain a system in which a diploma is a guarantee of a specific level of achievement and skills. Both Republican and Democratic presidents, notably George H. W. Bush, Bill Clinton, and George W. Bush, have supported standards-based education initiatives, and the nationwide education policy in the 21st century is grounded in standards-based education. Unfortunately, one of the initiatives that standards-based reformers succeeded in implementing was the adoption of exit exams in many school districts—exams students must pass in order to graduate. Perhaps sound in theory, in practice exit exams have been found to be extremely problematic, overemphasizing certain types of skills because of the ease of their testability, as well as inevitably resulting in a cottage industry of exit exam preparation tutors and summer school classes that “teach the test,” that is, cover the specific material that will be tested while neglecting other areas.

Equity in education is also a concern of advocates of antibias curriculums. Such curriculums, which originated in the multicultural education movement, are developed with the intention of removing biases such as racism, sexism, and homophobia. While such biases are rarely explicit, traditional educational materials may nevertheless reflect them, especially in the assumptions made about social norms or students’ family backgrounds or in the use of noninclusive language. An equitable antibias curriculum should not, for instance, leave students with the impression that a white Christian heterosexual American is the “normal” or “average” American against which other Americans are contrasted as exceptions to the mainstream. The concerns of the antibias curriculum range from the use of inclusive language in textbooks to abandoning the traditional practice of assigning female students to home economics classes and male students to shop classes.

The school curriculum consists of two layers: the formal curriculum, which is explicitly addressed and created by educational policy and consists of such things as course materials, the sets of available and required courses, graded work, and classroom instruction; and

the informal or hidden curriculum, consisting of the values, beliefs, norms, and biases reflected by educator behavior. Certain norms of behavior are inculcated in students by teachers who may otherwise be radically different and teach very different material, for example, such as arriving to class on time, ending class on time, and conducting class in an orderly manner (with students raising hands to be called upon, for example). There is nothing necessarily wrong with such norms. Other norms may be more problematic, such as the heteronormative character of the language and imagery that surrounds school dances and other social functions, the often heavily gendered presentation of content in school yearbooks, or the privileging of Christian culture that is implied by having a long vacation at Christmas.

Students are treated equitably when a range of cultural traditions are discussed in class, not just the major holidays of white western European culture. But only discussing these “other” cultures on holidays or other special occasions ghettoizes them and emphasizes their otherness, continuing to contrast them against a culturally dominant norm. One of the difficulties of antibias curriculum has been in being truly multicultural. Asian Americans, Native Americans, and others have pointed out that in many cases, multicultural or antibias material does little more than expand its focus from white Americans to white and black Americans, addressing many of the concerns of African American education activists but doing little to actually reflect a multicultural, complex America.

In other cases, revisionist textbooks that correct the biases of older textbooks may do so in a way that reads sensibly to an adult reader who is familiar with the older biased narrative but reads as a condemnation of European or white American culture when considered on its own terms without that greater context. Antibias curriculum has also been criticized for frequently being blind to intersectionality, the interactions between multiple forms of discrimination, such as against black women (who face both racist institutions and sexist ones) or disabled homosexuals.

Though the humanities may be the subjects most obviously impacted by these curriculum adjustments—in the public imagination, multicultural education is often synonymous with

the shift away from a focus on the writings of “dead white men”—bias in mathematics education is also a serious issue. Antibias mathematics materials include discussions of the mathematical contributions of non-European civilizations, and avoid relying exclusively on European names in story problems and other included narratives. At advanced levels, antibias mathematics can also discuss mathematics as a cultural product. Most education reform has focused on high school, both because it offers the largest variety of courses that can be objectively tested and because it is the final stage of public education, with a limited secondary focus on elementary school. But many reformers have pointed to the importance of early childhood education and the ways attitudes about gender, race, and other matters form at young ages.

Regardless of changes wrought to high school and other public school curriculums, students who wish to go to college are still in most cases required to take a standardized achievement test, such as Educational Testing Service’s Scholastic Assessment Test (SAT), and are impacted by the bias that has been found in such tests.

The criticism of the SAT (the largest standardized test used by college admissions departments) for cultural bias goes back for decades, and it has especially centered on the verbal portion of the test, where there are significant differences in specific vocabulary inventories (which is not the same as a difference in actual verbal reasoning ability or even vocabulary size) between different cultural, ethnic, and racial groups, and in which the test has long favored non-Hispanic white Americans.

Attempts to remedy the problem have been of questionable success. Research has confirmed a persistent correlation between family incomes and mean SAT scores, but not everyone agrees on the degree to which this reflects testing bias and the degree to which it reflects the effects of income on access to educational resources and other factors (poorer students may be more likely to have to work after-school jobs while middle-class students do their homework, for example, even apart from the likelihood of wealthier students having access to tutors and exam prep materials). In 2005, the SAT experienced its most thorough changes in years, with the Verbal test renamed the

Critical Reading test and a separate Writing test added. This was the first structural change to the test since the division into Verbal and Math tests in 1930.

The 2005 changes came in response to numerous complaints and the threat of the University of California to drop the SAT, which would have made it the largest college system to do so. Analogies, which were the most problematic and clearly biased portion of the Verbal test, were left out of the new Critical Reading test. However, significant problems have been discovered with the new Writing test, and one study revealed that there was a stronger correlation between long essays and high scores than between factually correct or rhetorically sound essays and high scores.

Further, recent studies have confirmed that cultural bias in the tests continues. In 2009, black students scored an average 99 points lower than white students. Studies in both 2010 and earlier in 2003 (before the changes) showed that this score disparity could not be attributed solely to social inequalities over which the SAT had no control—black students consistently scored worse than white students of similar educational background and skill set, meaning that the scores were not simply revealing that one group performed worse than the other academically with the test as only one of many instances of that performance. In 2012, a study of New York City students found that although blacks and Hispanics comprised 70 percent of the student population, they represented only 11 percent of the student body in the city’s elite public schools, because of consistent low performance in standardized tests relative to white and Asian American students.

In some cases this disparity in performance has persisted for so long and been demonstrated so consistently that educational policies are founded upon the assumption that it will continue. In 2012, Virginia and Washington, D.C., public school districts, setting metrics for whether a school would remain in good standing, set separate metrics for each race group. In Virginia, while 82 percent of a school’s Asian students and 68 percent of its white students must pass the standardized math test for the school to retain good standing, only 45 percent of its black students—less than half—need to do so. These policies, too, make it clear that the disparity cannot be solely accounted for by

differences in wealth, given that students within the same school are generally going to be closer to one another economically than will students in separate districts.

Eskimos

The Eskimos, or Inuit-Yupik, are an indigenous people of Alaska, Canada, and Greenland, having migrated from eastern Siberia. They are closely related to the Aleuts, who inhabit the Aleutian Islands. The term *Eskimo* is used in Alaska and considered acceptable, and refers to two main groups: the Yupik and the Inupiat. In Canada,

“Eskimo” is deprecated in favor of “Inuit,” in part because of the now-discredited myth that the word *Eskimo* means “eater of raw meat.” (Its actual origin is uncertain.) There are few Yupik in Canada, so the usage of “Inuit” poses no problems there; there is no collective term apart from “Eskimo” that includes both the Inuit and Yupik peoples and excludes others. The term *Alaska Natives*, used to differentiate the indigenous people of Alaska from those of the lower 48 states, includes many unrelated peoples.

Eskimo Cultures and Languages

The earliest evidence of Eskimo culture dates to about 3000 B.C.E., Siberian descendants who had likely migrated between 15,000 and 5000 B.C.E. These early Eskimos were part of the Arctic small-tool tradition (ASTt), an anthropological term for a tradition of tool-using cultures found in Alaska, Canada, Greenland, and eastern Siberia. The ASTt cultures used microblade technology consisting of side and end blades, scrapers, and burins (chisel-like tools made of lithic flake) in spears and arrows fashioned from bones or antlers. The ASTt probably introduced archery to the Arctic and included both nomadic and sedentary groups, typically living along waterways for better seal hunting or salmon fishing.

At some point the Aleut, though descended from this early Eskimo culture, became culturally distinct, perhaps due to their geographic isolation from the people who became the Yunik and Inupiat. The Aleut language is part of the Eskimo-Aleut family, but they are not considered an Eskimo people.

The Yupik peoples include speakers of four Yupik languages—Naukan Yupik, spoken by a small community on the Chukotka Peninsula of Siberia; Central Siberian Yupik, spoken mainly in Siberia but also by the community of about 1,000 Yupiks on St. Lawrence Island, Alaska; Central Alaskan Yupik, spoken throughout the Alaskan mainland; and Alutiiq or Pacific Yupik, spoken from the Alaska Peninsula to Prince William Sound. A fifth language, Sirenik, was spoken on the Chukotka Peninsula of Russia, but it has been extinct since the last native speaker died in 1997.

The Inuit language, spoken by the Inuit and Inupiat peoples of the Arctic, is descended from the language of the Thule people. The Thule culture dates to about 1000 C.E., with beginnings in coastal

Alaska and spreading across Canada to Greenland over the next four centuries. The Thule most likely were in contact with the Vikings of Greenland and the Canadian coast and lived migratory lives based on their hunting of large sea mammals, including whales. Their culture splintered during the Little Ice Age (1650–1850), with individual groups becoming the direct ancestors of today's Inuit cultures. In Alaska, the main Inuit dialects spoken are Qawwaraq, spoken on the Seward Peninsula and in the Norton Sound and Bering Strait areas; and Inupiatun, spoken on the North Slope and northwestern Alaska. Inuit is also one of the official languages of Canada's Northwest Territories.

Eskimo languages have no single, standardized writing system. Most groups in Alaska, whether Inuit or Yupik, use a Latin alphabet introduced during or just before the territorial period. Some Yupik groups use the Cyrillic alphabet, introduced during the period of Russian control. In Canada and Greenland, other systems altogether are used.

The kinship system used by Eskimo peoples was the subject of study by 19th-century Lewis Henry Morgan, and “Eskimo kinship” has become the name for that kinship system regardless of which culture uses it. One of the major kinship systems in the world, Eskimo kinship is familiar to most North American and European families, as it focuses on kinship distance relative to the nuclear family (parents and siblings). Relatives are grouped together according to kinship distance—grandparents, great-grandparents; first cousins, second cousins, cousins twice removed—with no distinction as to whether they are patrilineal or matrilineal relatives. Parental siblings are identified according to gender (“aunt” or “uncle”) but children of parental siblings are not (“cousin”).

One of the best-known foods of Eskimo culture, called *akutaq* by the Yupik and “Eskimo ice cream” by many non-Natives, is found throughout the Arctic region, and similar foods are found in most far-north cultures. It consists of berries, used for sweetness and flavor, pounded with whipped animal fat and frozen. Traditionally, the animal fat may have included tallow from the walrus, reindeer, or moose, or oil from seals. Today, Crisco shortening is frequently used to re-create the treat. Fish or meat were sometimes added in the traditional preparation but are less common today.

A young Alutiiq dancer displays the sewing and weaving skills of his heritage during a Native cultural event called “Celebration,” held every two years in Juneau, Alaska. The art of sewing was extremely important to the cultures living in the freezing Arctic.

Under the terms of the 1986 moratorium on whaling, the International Whaling Commission permits whaling by aboriginal groups such as Eskimos if it is done on a subsistence basis, meaning that whalers and their communities depend on the catch to live, not simply to profit from. In the United States, this exemption applies to nine Alaska Native groups, which hunt less than 100 bowhead whales a year out of the 10,000 in Alaskan waters, and to the Makah people of Washington State, who are allowed to hunt a single baleen whale every year. The yield from whaling is shared communally, a long-standing tradition in Eskimo cultures.

Specific formulas dictate how much meat and other products (blubber and skin) are allocated to each family in a village, according to how much was caught, and relatives living outside the village

are entitled to claim their share. Whale blubber has been a vital source of nutrients to Arctic peoples; living so far north in such cold conditions, few fruits and vegetables can be grown, and whale blubber is a rich source of vitamins A and C. Thinning sea ice has made whaling more difficult, jeopardized the traditional hunting of seals and walrus, increased coastal flooding where many villages are located, disrupted the migration and spawning habits of many fish species upon which Eskimos depend, and made travel more dangerous.

The Inupiat

Most Inuits in Alaska are Inupiat (or Inupiaq), indigenous to the Bering Strait region and the northwest Arctic. The Inupiat number about 13,500, are represented by the Arctic Slope Regional Corporation, Bering Straits Native Corporation, and NANA Regional Corporation, and include the Siberian Yupik people, the Bering Strait Inupiat, the Kotzebue Sound Inupiat, the North Alaska Coast Inupiat (or Tagiugmiut), and the Interior North Inupiat.

Barrow, Alaska, the northernmost American city and one of the oldest permanent settlements in the country, is located in the Inupiat homelands in the North Slope and is ice-locked nine months of the year. It is also home to Ilisagvik College, a public community college that is the only college in Alaska operated by a Native tribe. Established in 1996, Ilisagvik offers courses in Inupiat studies, industrial and construction trades, business management, office administration, allied health, and accounting. It offers two-year associate's degrees and is accredited by the Northwest Commission on Colleges and Universities.

Barrow is also home to the Inupiat Heritage Center, dedicated in 1999 and affiliated with the New Bedford Whaling National Historical Park in Massachusetts. Owned and managed on behalf of the North Slope whaling villages, the Heritage Center is home to exhibits and artifacts related to Inupiat whaling. The whale harvest has long been an important part of Inupiat culture, and both the Inupiat and Yupik peoples used to celebrate a midwinter whale harvest festival. Barrow continues to hold a Kivgiq Feast (also called the Messenger Feast), a three-day celebration of dance, song, and bartering. Held at the end of the midwinter festival every two to three years, it is

attended by visitors from all over the Arctic as a way to renew family ties and share traditions. The modern Kivgiq was revived in 1988.

The Kivgiq is followed by a spring festival in mid-April called Piuraagiaqta, when a path is broken in the ice for the whalers. The festival occurs when the weather allows for outdoor activities—half the year in Barrow, the daytime temperature is below zero degrees Fahrenheit, but approaches mere freezing temperatures in April. A number of Eskimo games are played during the spring festival, as well as on the Fourth of July and in the week after Christmas. Winners of the Fourth of July games are eligible to compete at the World Eskimo-Indian Olympics in Anchorage, Alaska, held every year (unlike most Olympics). Events include high kicks, also known as *akratcheak*, a sport that originated in whale hunting and requires the competitor to jump in the air, touch a hanging target with both feet, and land on both feet. Another traditional game is a simple contest of pain tolerance called the ear pull, in which two competitors, attached by the ears with a loop of string and facing each other, pull on the string until one forfeits because of the pain.

Another Eskimo sport, the blanket toss, is associated with Nalukataq, the spring whaling festival held throughout the Inupiat lands. In Barrow, it is held in the third week of June, when the temperature finally rises above freezing and the midnight sun begins. Nalukataq celebrates the distribution of whale meat and *muktuk* (blubber and skin) to the Inupiat community from the whalers, who are accorded great respect by their villages. Today it is also a celebration of traditional Inupiat culture, songs, and storytelling. After everyone feasts on whale meat, a sealskin blanket is erected atop four beams at about waist height. The blanket toss consists of dancers being thrown into the air as everyone else holds the blanket's edges. Traditionally, whaling captains and their wives go first and throw candy to children while they are in the air.

Yupik Peoples

There are about 24,000 Yupik in the United States, most of whom live in Alaska in the traditional Yupik territories in southwestern and western Alaska. Approximately 2,000 additional Yupik live in Russia. Most Yupik are fluent in their people's language. In traditional Yupik

culture, the people's time was split between fishing camps in the warm months and winter villages, and today many Yupik families are still subsistence fishers, relying heavily on salmon and seal. Singing, storytelling, and dancing are vital customs at cultural festivals. As in many cultures, gender roles are important in traditional Yupik culture. Men and women maintain separate communal houses, the *qasgiq* and the *ena*, used primarily in winter to teach boys and girls traditional skills—hunting, tool-making, and wilderness survival for the boys, and sewing, tanning, weaving, and cooking for the girls. Young boys until age five would live with the women in the *ena*, and in many villages, girls and boys would switch places for a few weeks every winter to learn the other gender's skills.

The largest group of Yupik is the Central Alaskan Yupik people, found from the southern Norton Sound southward along the Bering Sea coast. They are often called the Yup'ik or YUPIIT. Though they were traditionally nomadic, the abundant fish and game of the region allowed them a more sedentary existence than the Inupiat in the north, and a lifestyle that once depended more heavily on far-ranging nomadism eventually settled into seasonal migratory patterns. Many modern Yup'ik communities date to before the time of Russian contact, including the Unalirmiut of the Norton Sound area; the Pastulirmiut of the mouth of the Yukon River; the Kuigpagmiut of the Lower Yukon River; the Marayarmiut of the Scammon Bay; the Askinararmiut of Hooper Bay; the Akulmiut of the Kuskokwim River; and the Nunivaarmiut of Nunivak Island, who speak their own dialect of Yupik.

St. Lawrence Island, though part of Alaska, is closer to Siberia than to the Alaskan mainland, and consists of two villages—Savoonga and Gambell—which, under the Alaska Native Claims Settlement Act of 1971, control most of the land of the island. The island is inhabited primarily by the only Siberian Yupik community in the United States, who live a subsistence existence dependent on reindeer herding, fishing, and hunting. A population that was about 4,000 in the middle of the 19th century has been reduced to less than 1,500; most of the non-Siberian Yupik population left the island during an 1870s famine or have since died. The island was home to a U.S.

Air Force station during the Cold War, serving as a U.S. Security Service listening post and warning radar site, and residents have experienced elevated cancer rates that have been attributed to polychlorinated biphenyl (PCB) exposure from the station.

Eskimo Words for Snow

One of the most propagated ideas about Eskimos has no basis in fact. There is a long-held cliché that Eskimos have an unusually large number of words for snow, which is sometimes cited to demonstrate various claims about language, cognition, or culture. In fact, the English language has many words for snow—for example, slush, sleet, thundersnow, flurry, blizzard, drift, and snowbank are just as recognizable as words for snow as the Inuit examples sometimes cited. Eskimo languages could be said to have more words for snow only insofar as they are polysynthetic, which is a language that combines morphemes into sentence-long words. It is technically true that a polysynthetic language has more words for snow in that every possible sentence that can be written about snow constitutes a separate word, but in this sense, a polysynthetic language has more words for anything than does English.

In any event, the myth—which is sometimes called a hoax by linguists, because it has been spread long after it was discredited—seems to be based not on a misunderstanding of polysynthetic languages but on hoary anthropological notions about cultural differences. Benjamin Whorf, one of the linguists responsible for the Sapir-Whorf theory of linguistic relativity, cited the “fact” of many Eskimo words for snow as an example of language structure determining cognitive processes.

Estadounidismos

In early 2012, the term *estadounidismo* was acknowledged by the Royal Academy of the Spanish Language to refer to proper Spanish as spoken in the United States.

The interaction of Spanish speakers with their English-speaking neighbors has encouraged integration of English words with Spanish dialects to the point of becoming the norm in Spanish communities within the country. For this reason, the Royal Spanish Academy (RAE) confirmed the use of the terms *estadounidismo* and *Spanglish*. However, these terms are not synonymous. Spanglish has been identified by the RAE as a “form of popular speech in which elements combine morphological, lexical and grammatical Spanish and English.”

For its part, the *estadounidismos* “are words that maintain morphological integrity but senses acquire new lexical affinity with similar words of English in cases reinforcing their understanding with reference to the concept of the dominant language.” In other words, *estadounidismos* are acknowledged by the Royal Academy as proper Spanish words, not Spanglish slang. Many *estadounidismos* hold specific meanings in regard to life in the United States. For example, the word *department* is used in the United States regarding the Department of Education. However, in other countries the same governmental entity may be called a ministry or secretariat.

Arguments Over Semantics

According to the 2010 U.S. Census, more than 50 million Hispanics are currently living in the United States, and a significant portion of them are native Spanish speakers. In fact, the size of the Spanish-speaking population of the United States is second only to Mexico (including Spain itself). The increased importance of Spanish in American

culture is further indicated by the growing Latin American enclaves in urban areas and cable television packages regularly including Spanish-only networks.

Both English and Spanish have been historically dynamic languages. English, as it exists today, developed over thousands of years and has incorporated elements of Celtic, French, and Scandinavian into its vocabulary over the centuries. Likewise, Spanish is a combination of Indo-European, Latin, Romance, and Native American languages. Thus, it should be no surprise that when Spanish and English speakers interact in a country as diverse as the United States, the syntax and vocabularies of those languages are impacted.

Despite the inevitability of linguistic and cultural exchange, certain English and Spanish speakers see the acknowledgment of the phenomena surrounding *estadounidismos* as threatening. Recent federal legislation also addresses some of the fears that surround Spanish-English language mixing. Since 1906, English tests have been a requirement for naturalization. However, exemptions have existed, which certain groups have found objectionable. In early 2011, Republicans in Congress introduced the English Language Unity Act, legislation that would declare English the official language of the United States and eliminate exemptions for English language testing in the naturalization process. Republicans contend that the act would preserve and enhance the role of English as the official language of the federal government.

Oklahoma Senator James Inhofe testified before Congress that a “nation divided by language cannot pull together . . . effectively as a people.” Thus, Inhofe expressed his concern with the cultural and linguistic mixing caused by a significant number of Spanish speakers living in the United States. Similarly, Spanish linguists have also expressed concern over language mixing. These individuals fear that if the mixing of English and Spanish is officially acknowledged by organizations such as the Royal Academy, their language will somehow turn into something else.

From an academic standpoint, such fears from lay people could be labeled as reactionary. However, academic controversy exists in this regard. The academic controversy is best illustrated by the defined difference between *estadounidismo* and

españolish (Spanglish in English). As it will appear in the 2014 Royal Academy Dictionary, españolish is defined as “a modality of speech among some Hispanics by which Spanish and English lexical and grammatical forms are mixed, thereby weakening both.” The key difference between the two terms for Spanish mixing with English is that españolish weakens both Spanish and English in structure and vocabulary, while *estadounidismos* represents the creation and strengthening of language structures.

Language Mixing Appears Here to Stay

In response to the current linguistic mixing that is occurring in the United States and the controversy involved, the North American Academy of the Spanish Language proposed the term *estadounidismos* as a first step toward recognizing the use of Spanish in the United States. The North American Academy has pushed for the official acknowledgment of the term *estadounidismos* by the Royal Academy because its leadership felt that its use has become another highly complex variant of the Spanish language. Additionally, the North American Academy argues that because immigrants come from a wide variety of Spanish-speaking countries, the United States has become an area where many variants of the common tongue are created. In officially recognizing *estadounidismos* as a word, the Royal Academy of the Spanish Language recognizes the importance of the Spanish language in the United States. Additionally, by taking this action, the academy acknowledges that this unique form of Spanish exists and that it is not going away. The academy does not proclaim the existence of the term, or associated linguistic intermixing, as either good or bad. It simply records the widely accepted words that are in the common usage.

Estonian Americans

Estonia is a European country on the Gulf of Finland and the Baltic Sea, a former Soviet republic. Estonia is one of the least populous countries in Europe, and Estonian Americans are one of the country's smallest ethnic groups, numbering only about 25,000. A former Soviet republic that gained independence and became a democracy in the 1990s, Estonia is considered a Nordic country by some of its citizens, having more in common culturally and linguistically with Finland than with Latvia or Lithuania.

Estonian immigration to the United States was sparse until the World War II era. The first Estonians arrived as part of the Swedish colonization of North America along the Delaware River in the 17th century, but they were few in number. Until 1922, those Estonians who did immigrate to the United States—farmers driven away by the Russian Empire's changing agricultural policies, and sailors who jumped ship—were identified as Russians in immigration records. Notable turn-of-the-century Estonian communities were founded in San Francisco and New York, and

rural communities in Fort Pierre, South Dakota; Bloomville, Wisconsin; Chester, Montana; and Dickenson, North Dakota. When the 1905 Estonian revolution failed, groups of socialists fled political reprisals by immigrating to the United States, joining the growing socialist movement here. There are no reliable figures for the Estonian presence in the United States before the middle of the 20th century, but estimates of the 1930 Estonian American population vary from about 3,500 to nearly 100,000.

What immigration did occur was constricted in the 1920s by newly restrictive immigration laws, but the first significant wave of Estonian immigration came in the World War II years. War refugees and political refugees fled Estonia during the war and in response to the Soviet takeover of the country after the war. In contrast to the 1905 minor wave, this group was nationalistic and strongly antisocialist. Most fleeing Estonians settled in Sweden or Germany, but 15,000 came to the United States. The 20th-century immigrants settled primarily in cities. About half settled in the northeastern cities of New York, Boston, Baltimore, District of Columbia, and parts of Connecticut and New Jersey; about one-fifth settled in Los Angeles and San Francisco; the remainder settled in midwestern cities and parts of the south and northwest.

Estonian Americans are well assimilated into American culture, and since World War II, most Estonian immigrants have become citizens. Relative to the size of the population, there are many Estonian American cultural organizations and fraternal groups. There are also a number of Estonian churches. The Estonian Evangelical Lutheran Church, with 38 congregations, has over 12,000 members—nearly half as large as the Estonian American population (though, of course, not all of its members are Estonian, and membership includes non-Estonian spouses). The Estonian Baptist Church in New York was one of the first Estonian churches founded and remained an important cultural center even for non-Baptist Estonians. There are a small number of Estonian Orthodox and Pentecostal parishes in the major cities. This religious diversity reflects the diversity of the Estonian people, as well as the very different circumstances surrounding various waves of immigration; the 1905 socialists, for instance,

were not always atheist, but typically eschewed organized faith, especially since Estonia's Lutheran Church at the time had long been dominated by Baltic-German oppressors. That same oppression, though, also motivated the founding of an Estonian Lutheran Church in New York in 1896, by Hans Rebane, a Lutheran minister to whom the American German Missouri Lutheran Synod had reached out. Rebane's church provided Estonian immigrants with a Lutheran parish of their own, outside Baltic-German control; an outspoken leader, Rebane was a vocal opponent of the later socialist immigrants.

Rebane's church and the fighting between socialist and antisocialist factions in the Estonian American community were all signs of the uneasy nature of the Estonian national identity; the country had been dependent on foreign powers for so long that it lacked a solidly developed national character or story, and the various factions had very different ideas about what it should be, and little common ground. The Soviet takeover of Estonia ended many of these arguments. Most Estonians since then have supported the Republican Party (a Democratic president signed the agreement at Yalta in 1945, which in many Estonians' eyes capitulated to Soviet demands), despite frequent involvement in labor unions.

Ethics

Ethics is a branch of philosophy concerned with moral principles and human conduct. Ethical values determine whether an act may be, should be, or should not be performed: in essence, how one's deeds are judged as good or bad within particular norms. Ethics studies have cultural connotations because principles derived from the Eastern origin and those of cultural minorities often differ from traditional ethics of Greek and European origin dominant in the United States. Western cultures adhere to ethical tenets that emphasize the individual's actions and rights, while other cultures regard the collective will superior in ethical decisions.

The study of ethics enables one to understand problems in context and to make informed judgments, whether discussing cultural assimilation or arguing the efficacy of affirmative action. Given today's multicultural landscape, it is essential that an examination of ethics includes both knowledge of the history that produced current dominant norms and an awareness of the issues that arise from cultural distinctions and diversity present in American society.

Historical Origins

Ethics includes rights, obligations, benefits to society, and fairness, and many have evolved and changed during the United States' history. An abbreviated synopsis of the Western foundational concepts delineates the dominance of individualism in American society, compared to group-centered collectivism of other populations. It is not surprising, therefore, that the root of Western moral philosophy is *virtue ethics*, which emphasizes the virtues of an individual.

Virtue ethics often begins with Socrates (5th century B.C.E), who held the teleological view that humans have a purpose. Morality was not about obeying laws but about understanding oneself sufficiently to know how best to behave. Plato believed in both empirical knowledge and reason, which he deemed "real" knowledge because it required deep thinking. U.S. citizens have traditionally questioned their lawmakers in his model and often affirm that this right is not similarly allowed in other nations.

Aristotle postulated an examination of the ends: if one chose to do wrong, one must be

punished. Decades later the Stoics and Epicureans emphasized pleasure and passion in contrast to Aristotle, but Christianity supplanted these and other early doctrines, and St. Augustine and his contemporaries underscored theology rather than morality until humanism reestablished the importance of the usefulness of one's life.

John Locke believed in natural law, which ultimately inspired the Declaration of Independence concept of "inalienable rights" from Locke's principles of human nature as defined by an inborn ability to reason. From this followed the natural law tenets of freedom, rights to possessions, and the right to life, above even a government's rules. Thomas Hobbes, however, replaced Locke's doctrine with his social contract because he did not believe in society's ability to govern itself without fighting over goods and power.

Hobbes declared that people were selfish, fundamentally unethical, feared misery caused by material desires, and that government was essential to establish strict laws to punish those not in compliance. Immigrants from countries with recent histories of socialism and communism are familiar with and may adhere to this dogma. By contrast, Thomas Jefferson espoused the tenets of Locke's Second Treatise of government because it asserted that people are created equal with equal rights. It remains the cornerstone of American ideology today.

A later 18th-century philosophy of note, deontology, postulated by Immanuel Kant, concluded that ethics is not about doing what one wants to do but about carrying out moral obligations and duties. In opposition, utilitarian philosophers Jeremy Bentham and John Stuart Mill held that motives were not important, but rather that consequences were the determinants of ethics. Mill's Greatest Happiness principle stated that an action was right if it maximized pleasure and minimized pain for the majority of people: of consequence in a multicultural society where majority opinion outweighs the rights of the few and may disallow rights of minorities.

Existential ethics meant the highest good for humans was becoming an individual. Martin Luther King, Jr., proposed that ethics provided standards that precede laws, and emphasized cultural relativism. And, postmodern ethics emphasizes systems within societies, usually advising

community members to work together for individuals to achieve.

The majority of Western ethical principles were developed by and aimed toward individuals—primarily, white males. This has potential to be problematic in a multicultural society where cultural groups often have opposing, collectivist values.

Individualism and Collectivism

In multicultural America today the concept of individual rights versus a collectivist philosophy is at the core of many ethical dilemmas. Eastern philosophies of Buddhism, Confucianism, Taoism, and Zen emphasize collective principles such as social responsibility and duty to family and society, as well as eminence of inner development over external rewards of money or popularity. A tragic past example of collectivist versus individualist ideologies is the early settlers' misunderstanding of Native Americans' ethics regarding community, spirituality, land, honor, nature, and morality. Ethnic Americans today often have similar touchstones regarding ethical behavior based on family, religion, or cultural origins less in alignment with European-derived values.

Masculine–Feminine Divergence

Another site for ethical dilemmas is the status and treatment of women. Women born in the United States may find it common to be assertive and independent, while immigrants and families from cultures accustomed to absolute masculine authority may disagree about the legality and ethics of both laws and customs. Immigrants from countries where religion supersedes the government, or Americans whose religious doctrines contradict specific laws, may encounter further ethical dilemmas.

As part of his proposed challenges to modern ethics, James Sterba addresses both the view that Western ethics is biased to favor men and male thinkers as well as the view that Western ethics has not taken women thinkers and their positions seriously. And Carol Gilligan, among others, utilizes a feminine perspective of judging actions as moral or immoral. Through a feminine framework of ethics males tend toward an “ethic of justice” that views morality as a question of rights,

while females tend toward an “ethic of care” that emphasizes responsibilities.

Females find greater moral worth in networks and lateral relationships, while males tend to focus on hierarchical chains of command. Strength has a different meaning for men and women. Men emphasize assertion and aggression while women emphasize nurturance and interdependence.

Despite these differences, an ethical person, male or female, is expected to adhere to justice and equality based on universal principles of acting in the best interests of society, meeting one's responsibilities, and doing no harm.

Principles and Practice

In a 2010 national survey, the U.S. Census, collected data from residents across the United States for the purpose of informed decision making regarding political, economic, legal, and societal services, as well as determination of House of Representatives' seats. In the same year, a very different survey produced the “2010 Report Card on the Ethics of American Youth.”

The results of over 40,000 students who participated in the investigation revealed entrenched habits of unethical behavior and decision making. A majority of students (59 percent) admitted to cheating on a test that year, 80 percent admitted to copying someone else's homework, and one in three plagiarized assignments using the Internet. The survey also reported that 80 percent admitted to lying to their parents about something significant. Disturbing from a cultural perspective, 42 percent admitted to using racial slurs.

The Josephson Institute notes that these numbers appear to be understated since more than one in four of the students confessed that they lied on some survey questions to conceal misconduct. Perhaps most disconcerting is that the students' baseline of values, while alarmingly low, allowed 92 percent of them to report that they were satisfied with their personal ethics. Although these findings may be considered ethical misdemeanors in contrast to universally condemned acts, such as murder and rape, they do demonstrate specific values and ethics for this particular research sample of the U.S. population.

At issue are questions of what determines one's moral development, what social and legal norms influence one's maturation into an ethical citizen,

and which principles are most important in becoming an adult in pursuit of knowledge and happiness. Despite differences in cultural origins, it is important to teach responsibilities associated with ethics to members of a multicultural society for continuing productive coexistence and progress.

It is unlikely that everyone will agree upon a universal definition of ethics, but in a democratic America one can choose among several paths: a disregard of ethics, a decision to follow one of many traditional ethical ideologies, or a multicultural approach described by American philosopher Richard Rorty as philosophical pluralism, which progresses from individuality to plurality as one accepts a variety of equally valuable principles in pursuit of an honorable human life.

Ethnic Studies

Although research on racial and ethnic groups and their interrelations had long existed in the United States, ethnic studies as a discipline did not emerge until the late 1960s. Before then, there existed no ethnic studies programs and no ethnic studies faculty, and almost no ethnic studies courses were offered at universities and colleges. School curricula primarily reflected Eurocentric histories and views; they largely overlooked the histories, cultures, and perspectives of minority groups. Faculty and administrators of higher education were predominantly white males. Ethnic studies was not a concern of American society; ethnicity was often perceived as an obstacle to the full assimilation of ethnic groups into the mainstream of society. The emphasis of American society at that time was on assimilation into white Anglo-Saxon Protestant culture.

The tumultuous 1960s witnessed waves of social movements and social unrest. The modern civil rights movement, which began in the 1950s, culminated in the mid-1960s, resulting in the enactment of the landmark Civil Rights Act of 1964. More and more Americans came to agree with the principle that all Americans, regardless of their race or ethnicity, should be treated equally, should have equal access to higher education, and should have their voices heard and their perspectives reflected in higher education. The women's liberation movement emerged in about the same period, adding its demand for equal rights and an equal voice to the foray. Anti-Vietnam War demonstrations erupted across the nation. Outside the United States, third world peoples were rising up against colonialism, especially in Africa.

These movements inspired student activism on university campuses. In 1968, students at San Francisco State College (now San Francisco State University), led by a coalition of separate ethnic action groups known as the Third World Liberation Front, staged the first strike for the creation of an ethnic studies program. In 1969, students at the University of California (UC), Berkeley, organized by their Third World Liberation Front rallied for their ethnic studies program. The students rebelled against the status quo and denounced racism, sexism, and elitism. These events culminated in students' occupation of the

administrative offices at both campuses, with a demand for fundamental changes in higher education. The movement soon spread to many other campuses across the country. Students of color, as well as their white supporters, demanded better access to higher education, changes in curricula to reflect their ethnic cultures and perspectives, recruitment of minority faculty, and establishment of ethnic studies programs.

As a result, ethnic studies programs were created in the late 1960s and the early 1970s as “fire insurance” to appease militant students. Among the pioneers were the School of Ethnic Studies at San Francisco State University and the Ethnic Studies Department at University of California, Berkeley. Following their lead, black, Asian American, Chicano/Chicana, and Native American studies programs mushroomed across the nation. Scholars began to pay greater attention to ethnic issues. Ethnic groups, especially minority groups, started to emphasize ethnic consciousness, ethnic identity, and ethnic pride. Slogans such as “Black is beautiful,” “Brown is beautiful,” and “Yellow is mellow” partly reflected this shift. Terms indicating ethnic identities, such as African American, Japanese American, Mexican American, and Jewish American became buzzwords. Societal emphasis gradually shifted from assimilation toward ethnic distinctiveness. Ethnic studies as a discipline grew out of this historical context.

Joining this emerging discipline was a renewed interest in the study of white ethnic groups, especially Catholic groups (such as the Italians, the Irish), the Jewish, and Eastern European groups (like the Polish). Studies of this so-called ethnic revival found that even among white ethnic groups, ethnic identities and ethnic cultures did not die out, as evidenced by ethnic awareness, ethnic foods, ethnic languages, ethnic literatures, ethnic festivals, ethnic holidays, and ethnic customs, although they disagreed on the meanings and causes of this ethnic revival. By the late 1970s, a significant number of ethnic studies programs on European groups such as Armenians, Germans, Italians, Polish, Jewish, English, Welsh, Canadians, Czechs, Slavics, Ukrainians, and Amish had appeared on the scene. Hence, ethnic studies was not limited to the study of minority groups.

During the latter half of the 1970s, the demand for social justice that bred the civil rights movement

waned significantly. Budgetary crises in the 1970s forced severe cutbacks in and consolidation of ethnic studies programs, and less than half of the then existing programs survived into the 1980s. Furthermore, the politically inhospitable climate in the 1980s instigated a backlash against ethnic minority communities and a degradation of their concerns. On college and university campuses, racism was resurrected and racial tension intensified. Ethnic studies was at a low ebb.

In spite of setbacks, the reorganization, reconceptualization, and redesign of ethnic studies programs have revitalized the field. After four and a half decades since its emergence, ethnic studies as academic discipline has grown stronger than ever before. One salient feature of this maturation is the growing institutionalization of ethnic studies programs. In 1996, Gretchen Bataille, Miguel Carranza, and Laurie Lisa recorded almost 700 ethnic studies programs or departments with an emphasis on minority groups. If programs on European Americans were counted, the total number of ethnic studies programs or departments was well above 800. Despite a lack of updated count, today the total number of ethnic studies programs should be significantly more because of the creation of new ethnic studies programs since 1996, especially in Asian American studies and Chicano and Latino studies.

Several of the strongest comprehensive ethnic studies programs are housed in public research universities, especially in the west. The Department of Ethnic Studies at UC Berkeley includes programs in Asian American studies, Chicano studies, and Native American studies and houses the first Ph.D. program in ethnic studies in the United States. Founded in 1990, the Ethnic Studies Department at UC San Diego takes a comparative approach with no ethnic-specific programs and started its Ph.D. program in ethnic studies in academic year 1996–97. The Department of American Ethnic Studies at the University of Washington, Seattle, was launched in 1985 by consolidating the existing programs in African American, Asian American, and Chicano studies. In a similar vein, the University of Colorado at Boulder created its Center for Studies of Ethnicity and Race in America (CSERA) in 1988 by merging the black studies and Chicano studies programs and adding new ones in Asian

American and American Indian studies. In 1996 the Department of Ethnic Studies took the place of CSERA. A Ph.D. program in comparative ethnic studies was approved in 2013 and will begin accepting applications in late 2013 for a cohort to enter in fall 2014. The Department of Ethnic Studies at UC Riverside offers a Ph.D. degree in ethnic studies. Bowling Green State University has one of the oldest ethnic studies departments, founded in 1979 with a comprehensive and comparative orientation.

Many other research universities have departments, programs, or centers in one or more ethnic studies subfields. Examples include Harvard University, Brown University, Cornell University, the University of Pennsylvania, the University of Michigan, the University of Southern California, the University of California, Los Angeles (UCLA), and other UC campuses. In recent years, an increasing number of research universities outside the west have been making genuine efforts in establishing ethnic studies programs, partly as a response to student demonstrations or demands (such as Columbia University, University of Texas at Austin). Many teaching universities have also installed ethnic studies departments or programs. Most notable is the 23-campus California State University (CSU or Cal State) system. All CSU campuses have either a comprehensive ethnic studies department or ethnic-specific departments or programs. Particularly, San Francisco State University houses the only College of Ethnic Studies in the country.

The institutionalization of ethnic studies programs has been accompanied by a growing number of faculty engaged in ethnic studies teaching and research. The establishment of ethnic studies departments or programs and the recruitment of full-time faculty in ethnic studies have resulted in a prodigious amount of scholarship. Exemplary works encompass not only the well-known writings of Cornel West, Henry Louis Gates, and bell hooks, but also Ramon Guitierrez's highly original study of power and sexuality in colonial New Mexico; Michael Omi and Howard Winant's acclaimed book on racial formation; Ronald Takaki's and Sucheng Chan's outstanding narratives of Asian American history; and Ward Churchill's powerful defense of Native American sovereignty.

Increasingly, ethnic studies courses have become part of requirements for degree programs or an important portion of the curriculum. For example, successful completion of a number of ethnic studies courses is a graduation requirement for all undergraduate students at many UC and CSU campuses, the University of Wisconsin-Madison, the University of Colorado at Boulder, Washington State University, and other colleges and universities. Enrollments in ethnic studies programs or courses have increased substantially. For instance, at UC Berkeley, the Ethnic Studies Department together with the Department of Afro-American Studies enrolls over 8,000 students each year, and there are still about 2,000 students on the waiting list.

However, attacks on ethnic studies have never stopped. They have ebbed and flowed from time to time. Among the latest assaults, the most publicized was represented by Arizona House Bill 2281 (known as H.B. 2281), signed into law in 2010. Effective January 1, 2011, this law prohibits a school district or charter school from teaching courses and classes that promote the overthrow of the U.S. government, "promote resentment toward a race or class of people," "advocate ethnic solidarity instead of treatment of pupils as individuals," or "are designed primarily for pupils of a particular ethnic group." Sponsored by Tom Horne, the state's then superintendent of public instruction, this law targeted Chicano studies program in the Tucson Unified School District, which, he claimed, promoted racial division and inculcated the notion that Mexican Americans are oppressed. Although this law applies to primary and secondary education in Arizona only, its impact may go beyond this scope as a result of media publicity. The law includes a number of clauses that permit the offering of courses under standard ethnic studies curriculum. Thus, H.B. 2281 may be viewed as a bashful attempt to revert what appears to be irreversible.

Despite on-and-off attacks, ethnic studies is becoming part of the mainstream in higher education. This trend is likely to continue in the near future as American society becomes increasingly multiracial and multiethnic and the ethnic composition of the college student population continues to diversify.

Defining Ethnic Studies

Unlike well-established disciplines, there may not be a consensus among ethnic studies scholars as to what ethnic studies is, or what constitutes the domain of ethnic studies. Ethnic studies is often perceived as the study of minority groups. The National Association for Ethnic Studies defines ethnic studies as “an interdisciplinary forum” for the study of “the national and international dimensions of ethnicity.” Still others contend that ethnic studies should focus on the intersection among race, ethnicity, gender, and class. On balance, ethnic studies can be defined as an interdisciplinary, multidisciplinary, and comparative study of ethnic groups and their interrelations, with an emphasis on groups that have historically been neglected.

One important component of ethnic studies is the study of ethnic groups. Two definitions of ethnic groups are often used: a narrow definition and a broad definition. The narrow definition defines an ethnic group as a group socially distinguished, by others or by itself, on the basis of its unique culture or national origin. According to the broad definition, an ethnic group is a group socially distinguished, by others or by itself, on the basis of its unique culture, national origin, or physical characteristics. Under the broad definition, a racial group, defined as a group socially distinguished, by others or by itself, on the basis of its unique physical characteristics such as skin color, eye color, hair color, or facial structure is part of ethnic groups.

This article uses the broad definition of ethnic group and treats racial group as a special case of ethnic groups based on physical characteristics. Ethnic studies has profound interests in all social aspects of ethnic groups including their histories (such as origin, immigration, settlement, population changes, and socioeconomic transformations); cultures (like languages, religions, customs, and popular cultures); institutions and organizations (such as, family, school, economic institutions, political, social, and religious organizations); identities; experiences; and contributions to American culture and society.

Another vital component of ethnic studies is the study of intergroup relations, which include ethnic stratification; social, economic, and spatial interactions among ethnic groups; political power relations; cooperation and conflict

between groups; ethnic prejudice and stereotype; and ethnic discrimination. Individual ethnic groups may be better understood in comparison with and relationship to other ethnic groups. Ethnic studies seeks to capture the social, economic, cultural, and historical forces that shape the development of diverse ethnic groups and their interrelations.

Ethnic studies adopts interdisciplinary, multidisciplinary, and comparative approaches to knowledge. Ethnic studies scholars study ethnic groups and their interrelations through the combination and integration of perspectives of various disciplines, including anthropology, economics, history, political science, psychology, sociology, and humanities (like, philosophy, literature, linguistics, arts). That is why ethnic studies scholars are of very diverse backgrounds, including social scientists and humanities specialists. Furthermore, ethnic studies emphasizes a comparative approach in order to understand the history, culture, and institutions of ethnic groups in comparison with others. It focuses on common trends and experiences of different ethnic groups. In addition, ethnic studies uses some discipline-based methodologies of the social sciences and humanities.

Currently, the emphasis of ethnic studies is on those ethnic groups that have been neglected in the past. Ethnic studies is concerned about all ethnic groups but focuses on minority groups such as African Americans, Asian Americans, Latinos, and Native Americans. A prime reason is that traditional disciplines have largely omitted the history, culture, and experience of minority groups and their contributions to the shaping of U.S. culture and society. This partly explains why ethnic studies departments or programs are normally staffed with specialists in specific minority groups or in comparative studies of ethnic groups. Ethnic studies seeks to recover and reconstruct the history of minority groups, to identify and credit their contribution to American culture and institutions, to chronicle their protest and resistance, and to establish alternative values, visions, cultures, and institutions.

Although ethnic studies in the United States focuses on ethnic groups and intergroup relations in this country, in more recent years ethnic studies programs and scholars have become increasingly interested in the diasporic and transnational

dimensions of ethnicity and ethnic relations. A primary consideration for such a shift is that ethnic groups and intergroup relations in the United States can be better understood in global contexts and in comparison with ethnic groups and intergroup relations across nations.

Subfields of Ethnic Studies

In the United States, ethnic studies currently consists of several subfields: African American studies or black studies, Asian American studies, Latino/a studies, Chicano/a studies, Puerto Rican studies, and Native American studies. All of these subfields share some common concerns, assumptions, and principles, but each subfield has its special interest in a particular minority group. African American studies, for instance, focuses on the experience of African Americans and their relations with other groups. There appears to be a unified field of Hispanic and Latino studies as represented by the National Association of Hispanic and Latino Studies (NAHLS), but NAHLS is still at an emerging stage as it depends on the National Association of African American Studies (NAAAS) as an affiliate. The most organized fields within Latino studies are Chicano/a studies and Puerto Rican studies, the former having an emphasis on Americans of Mexican descent. There are further divisions within some of these subfields. Chinese American studies, Japanese American studies, Filipino American studies, Korean American studies, South Asian American studies, and Vietnamese American studies are some examples of such divisions within Asian American studies.

These subfields are relatively autonomous. Each has its own constituency. Each is represented by at least one national professional association, such as the American Indian Studies Association, the National Association of Native American Studies (NANAS), the NAAAS, the National Council for Black Studies, the Association for Asian American Studies, the National Association for Chicana and Chicano Studies, the Puerto Rican Studies Association (PRSA), and the NAHLS. Normally, each organization convenes an annual meeting. However, the NAHLS, the NANAS, and the International Association of Asian Studies join the NAAAS to hold their annual conferences as affiliates of the latter, and the PRSA holds a biennial conference. Most organizations have their own publications.

What Ethnic Studies Is Not

Increasingly, traditional boundaries of disciplines have become nebulous. Nonetheless, certain confines do exist in order to define a discipline, at least until a greater integration of disciplines arrives. Ethnic studies is not international area studies. Often students and laymen mistake international area studies for ethnic studies. For instance, "Asian American studies" is often mixed up with "Asian studies." The Asian American Studies program at UC Berkeley had to post a note outside its office, proclaiming that "This is Asian American Studies Program, NOT Asian Studies Program." Similarly, distinctions between African American studies and African studies and between Latino studies and Latin America studies seem less palpable to outsiders. In general, area studies focuses on a particular region or country outside the United States and its relations with the United States, while ethnic studies centers on a particular group in America that originates from a region or country. The former is internationally oriented whereas the latter is domestic in orientation.

Sharp distinctions notwithstanding, linkages and overlapping between the two fields do exist. For instance, ethnic studies pays attention to how conditions in the country of origin and its relations with the United States affect the status and experience of the ethnic group in America from that area, and area studies is also interested in the impact of the ethnic group in the United States on its country of origin. Because of the connections between countries of origin and experiences of ethnic groups in America as well as the need for cross-national comparison of ethnic relations, ethnic studies also demands an international component to its curriculum.

Ethnic studies does not equate with cultural studies, though the two disciplines do overlap to some extent. Emerging in the 1950s in Great Britain, cultural studies is a field that has continuously shifted its interests and focus. A main difference is that cultural studies emphasizes the culture of a society, which may include ways of life, cultural forms, cultural industries, cultural markets, cultural products, cultural policies, and subcultures, whereas ethnic studies focuses on ethnic groups (including their cultures as well as their histories and social institutions) and intergroup relations.

Ethnic studies and women's studies have different emphases. Both ethnic studies and women's studies grew out of the 1960s and share similar concerns of achieving equality between the sexes or among ethnic groups. Some ethnic studies scholars underscore the importance of researching the intersection of race, ethnicity, gender, and class. While this is legitimate, women's studies also places a great emphasis on the intersection among race, ethnicity, gender, and class. In spite of common interests, ethnic studies focuses on the ethnic dimension while women's studies devotes more effort to the gender dimension, even when both deal with the junction of the multiple dimensions.

Ethnic studies differs from other disciplines of social sciences and humanities in its basic methodologies. Other disciplines of social sciences and humanities study issues that concern ethnic studies scholars, such as ethnic stratification, ethnic interactions, ethnic prejudice, and discrimination. However, ethnic studies differs from those disciplines in that it uses interdisciplinary, multidisciplinary, and comparative approaches while those disciplines mainly rely on discipline-bound methodologies. Some people outside ethnic studies tend to equate ethnic studies with political activism. Undeniably, ethnic studies originated from student political movement. Nevertheless, as it has evolved, ethnic studies cannot and should not be characterized as political activism, demonstration, protest, or the like. Ethnic studies is a scientific inquiry of ethnic groups and their interrelations. It pursues knowledge that will advance the interests of traditionally underprivileged ethnic groups and will help achieve eventual equality among all ethnic groups.

The Future of Ethnic Studies

Ethnic studies is here to stay in the United States. Its future survival and success will depend on how the discipline tackles the following issues: institutionalization of ethnic studies, academization versus politicization of ethnic studies, multiculturalism and ethnic studies, whiteness studies and ethnic studies, and ethnic studies and national unity.

Continuing institutionalization of ethnic studies. Since its inception in the late 1960s, ethnic studies has blossomed into a full-fledged academic

discipline in higher education in the United States. Institutionalization has become a salient feature of the discipline. Significant progress notwithstanding, success of ethnic studies programs in securing departmental status demands further endeavors. Institutionalization of ethnic studies also calls for the further expansion of ethnic studies programs to more than two-thirds of U.S. colleges and universities that still have no ethnic studies programs. Procurement of a general education or core course status for core ethnic studies courses and codification of ethnic studies courses into college graduation requirements can increase the audience of ethnic studies courses and solidify their status in higher education. Substantial and increasing demand for ethnic studies courses in turn sustains and augments demand for faculty and may lead to the growth of ethnic studies programs. Offering more general and ethnic-comparative courses rather than just ethnic-specific courses can also increase demand for ethnic studies courses.

Changing demographics provide a vital source of continuing institutionalization for ethnic studies. The shifting demographic composition prefigures a more diverse student population on college campuses, which in turn increases the demand for ethnic studies.

Academization versus politicization of ethnic studies. Ethnic studies must weigh academization against politicization. The issue of academization is particularly pivotal and difficult because, unlike traditional disciplines, ethnic studies as a discipline grew out of student activism in the 1960s. To be sure, the mission of ethnic studies and the process of establishing and sustaining an ethnic studies program are political. The cause of ethnic studies aims at progressive social changes, humane treatment of ethnic groups, and improved intergroup relations. Each step of progress entails hard-fought political battles. As a discipline, ethnic studies is a systematic study of ethnicity, ethnic groups, and intergroup relations using interdisciplinary, multidisciplinary, and comparative methodologies. It is by no means synonymous with political activism. The academization of the discipline and curriculum of ethnic studies is important for the survival and advancement of the discipline, changing social milieu, and shifting

student composition of ethnic studies courses. The academization of the ethnic studies discipline and curriculum is not only imperative, but it is also attainable today. Calls for academization in the 1960s and 1970s would not have been realistic because of the paucity of expertise and scholarship in the field. The remarkable growth of the literature in the field in the last four decades has made the academization of the discipline viable.

The academization of ethnic studies invites endeavors in several areas. One such area is the continuing production of scholarship through scholarly books, academic journals, and creative writings. Textbooks constitute another area of undertaking as they play an important role in popularizing the discipline and increasing its acceptance by the larger society.

The academization of ethnic studies does not necessarily contradict the promotion of interests of minorities. Academization calls for further research on minorities and their communities. Via scientific study of the traditionally disadvantaged, ethnic studies scholars can better fathom their status; pinpoint their problems, needs and solutions; and speak on their behalf.

Multiculturalism and ethnic studies. While the meaning of multiculturalism varies greatly across disciplines, no one will deny that multiculturalism is a social movement toward openness and diversity. A genuine drive toward multiculturalism in American universities and colleges has been most evident since the 1980s. As multiculturalism expands its domain into the college curriculum and becomes an accepted curriculum-organizing principle, some concerns have been raised as to whether multiculturalism threatens the existence of ethnic studies. According to the literature, multiculturalism imperils the existence of ethnic studies at least in two ways. First, multiculturalism could co-opt or ingest ethnic studies. Since traditional disciplines of social sciences and humanities and their departments increasingly recruit ethnically diverse faculty, integrate multicultural perspectives in their curricula, and/or offer multicultural courses themselves, ethnic studies will lose its ground of necessity and vitality. In other words, the prevalence of multicultural education efforts in traditional disciplines could endanger the justification of autonomous ethnic studies programs.

Second, the establishment of broad ethnic studies course requirements vies for the limited resources of ethnic studies programs since they will become service stations.

The multiculturalism menace is exaggerated, but it should alarm ethnic studies scholars to take preventive actions against this peril. Several measures may be considered by ethnic studies programs: (1) strengthen ethnic studies programs by sharpening the uniqueness and advantages of the ethnic studies curriculum and making it irreplaceable, (2) take an active leading role in coordinating the campus multicultural curriculum, (3) prevent or lessen competition for resources and prioritize important areas of development, and (4) expand single-group-oriented ethnic studies into *multiethnic* studies by emphasizing the comparative approach.

By making assorted and precautionary efforts, the multiculturalism threat can become an impetus and advantage for the advancement of ethnic studies. The prevalence of multiculturalism per se is partly an outcome of ethnic studies, and it could, in turn, strengthen ethnic studies programs if steered properly. Ethnic studies and multiculturalism are in essence complementary rather than competitive. Multiculturalism is an ally of ethnic studies more than its rival.

Whiteness studies and ethnic studies. Another critical issue that could have great potential impact on the future of ethnic studies is whether to incorporate whiteness in ethnic studies. The study of whiteness is a growing field of scholarship that examines whiteness as a social construct, as a system of power and privilege, as a group, as an identity, and as a social movement. There are risks of engaging in the discourse of whiteness. For one thing, intellectual work on whiteness may be construed as an affirmation and rendition of white privilege and domination. For another, the study of whiteness may contribute to the re-centering, rather than de-centering, it, as well as the reification of whiteness as a fixed category of experience and identity. Moreover, the invention of so-called “whiteness studies” could eclipse important work done on “people of color.” In addition, white writers may revel in a narrative of guilt, accusation, or denial, and therefore dispense with the real work of racial justice and antiracism pedagogy.

Turning a blind eye to the existence of whiteness studies is ostrichism. The exclusion of whiteness studies would not aid the cause of ethnic studies. A better strategy is to incorporate the study of whiteness in ethnic studies. The incorporation of whiteness studies could have significant effects on the development of ethnic studies.

First, the inclusion of whiteness studies as a focus of analysis shifts the emphasis of ethnic studies from the study of minority groups to a comprehensive and comparative analysis of all ethnic groups. This move is consonant with the direction of ethnic studies toward comparativeness and academization. Second, the study of whiteness will affect the ethnic studies curriculum. It means the addition and modification of ethnic studies courses that reflect this area of scholarship, and it also means more comparative courses. Third, the incorporation of whiteness studies may increase the acceptance of ethnic studies courses and boost ethnic studies programs.

For instance, at UC Berkeley, the inclusion of comparative analysis of European Americans with other minority groups in the curriculum resulted in the passage of the American Cultures Requirement for all undergraduate students. Finally, and perhaps most controversially, the incorporation of whiteness studies could change the faculty composition of ethnic studies programs in the near future. The inclusion of whiteness in ethnic studies may give the green light to the entry of white scholars into ethnic studies programs, especially those multiethnic studies programs. The inclusion of progressive white scholars in ethnic studies programs may strengthen them and might well change the image of ethnic studies programs from primarily minority programs to more inclusive ones.

Ethnic studies and national unity. Ethnic studies is often mistaken for ethnic particularism and even separatism. To be sure, ethnic studies does not champion separatism but calls for self-consciousness; it does not seek division but searches for accurate and mutual appreciation. Ethnic studies is not a force of fragmentation, Balkanization, and tribalization but a force that forges an unshakable national unity based on the knowledge and respect of diverse ethnic cultures. Ethnic studies seeks to “reunite America” on the basis

of equality and equity and to redefine American identity. Ethnic studies prepares students for a common citizenship through understanding and appreciating cultures of different groups. Ethnic studies acclaims “out of many, one.” Ethnic studies can have a distinctive role to play in reuniting America, redefining “American,” and rebuilding a more inclusive, multicultural American society.

Ethnicity

While “ethnicity”—and especially the adjective “ethnic”—have become two of the most frequently used English words of the last quarter century, there is still much confusion about their precise meaning, particularly in reference to social science definitions. This confusion may exist because *ethnos*—the ancient Greek term from which *ethnicity* derives—originally simply meant “people” or “nation,” broadly understood as referring to a human population sharing a common ancestry, language, heritage, and lifestyle, and recognizing their group membership on the basis of these criteria. Currently, however, the term *ethnicity* is usually correlated either to exotic tribal people or minority-majority relations, often involving problematic diversity issues.

The complex factors leading to this shift underlie the substantially different definitions of ethnicity still being debated among social scientists, which emerged from the same historical processes that also gave birth to the modern social sciences now studying ethnicity. These social sciences include psychology, sociology, anthropology, and political science, and these processes involve European colonialism, on the one hand, and the social, political, and economic changes triggered by “modernization” on the other.

Western colonialism’s date of birth is usually correlated to Christopher Columbus’s “discovery” of the New World in 1492, a date also ushering in the period during which the foundations of European modernity became established, through the application of the new perspectives on art, science, religion, and economic and sociopolitical organizations that made the Renaissance a major turning point in the history of Western civilization. Throughout this period the English term *ethnic* was used rarely, and mainly to refer to “heathen” populations, not belonging to the Christian community of nations. As colonial expansion intensified contacts with a broad range of non-European populations, and as scientific advances led to a revision of traditional views about the Earth and its inhabitants, the concept of ethnicity was supplanted by that of race, which applied biology to human diversity (relating it to “inherited traits”), organized it hierarchically (on the basis of Eurocentric assumptions of superiority), and justified

Western colonial imperialism because of its “civilizing mission.”

Modern Anthropology and Ethnicity

It can be argued that if early anthropology incorporated many of the theoretical mistakes and empirical misunderstandings undergirding these social evolutionist perspectives, the modern version of the discipline, established by Franz Boas around the beginning of the 20th century, specifically aimed at counteracting racialist ideology. Fifty years later, the United Nations Educational, Scientific and Cultural Organization (UNESCO) commissioned some of the most renowned scientists of the time to address “the race question,” and there was consensus among them in supporting the Boasian perspective on human diversity—totally denying the scientific validity of the race concept, and recommending it should be dropped altogether and substituted by ethnicity.

But the race concept has had remarkable staying power, possibly because human beings are sensitive to visual markers and to symbolic emblems of ingroup-outgroup membership. Even members of populations who have suffered centuries of discrimination because of racialist ideology and consequent racist policies—such as African Americans—continue to place importance on maintaining, and even emphasizing, those “racial” characteristics that distinguish them from the majority population. So, race is now often used to strengthen a sense of group identity, which in turn can be a powerful political tool. However, the lack of correspondence between the physical and cultural characteristics of human groups makes the race concept dangerously unreliable, and its continuing imbrication with ethnicity considerably complicates contemporary social science treatments of this topic.

The modern social science definition of ethnicity came from the German sociologist Max Weber in his *Economy and Society*, published posthumously in 1922. This definition did not explicitly involve a correlation with race, highlighting instead the importance of a sense of “common descent,” which members of an ethnic group believe they share. However, it did refer to the perception of ethnicity as being related to contrasting one’s population with other populations encountered through migration or colonization, and this

is an important change from the ancient meaning. While ethnicity was originally a synonym for “peoplehood”—implying membership in a distinctive, self-contained, autonomous, sovereign nation—the modern social science meaning refers instead to populations that are not autonomous, particularly at the political level. In other words, ethnic groups may still be considered, or even officially be recognized, as “nations” or “nationalities,” but they are not sovereign nation-states.

This explains why ethnicity has perhaps become the most potent trigger worldwide for political mobilization, majority-minority conflict, and separatist movements. This is also why contemporary discussions of ethnicity often intersect with discussions of nationalism. The theory that nationalism is the ideology of the modern nation-state—a theory developed by Western political scientists, social historians, and sociologists—relates the separatist aspirations that ethnicity can trigger to the fact that the modern nation-state “needs” to ensure the cultural homogeneity of its citizens, in order both to legitimize its political organization (which wields power in the name of the “people”) and to ensure the compliance of all citizens with its laws, norms, and overall institutional structures. In this framework, ethnic groups that do not become assimilated within the “national culture”—that is, the hegemonic cultural framework of the majority—become implicitly problematic.

It is revealing, in this respect, that theorists of nationalism relate the emergence of this one-nation/one-state ideology to the same 19th-century European “discovery of culture” that also gave rise to modern anthropology. When Franz Boas described culture-making as the main adaptive mechanism of the human species, and cultures (in the plural) as the geographically and historically contingent products of this mechanism, he was expressing a major shift in how to understand human diversity. This is a shift that eliminates the “biologizing” of human group differences (a culture is “learned,” rather than inherited, and populations with similar physical characteristics may vary dramatically in cultural characteristics). Also, this view dismantles the social-evolutionist hierarchical placement of different cultures on a “ladder of progress” (every culture expresses “the genius of a people,” and

definitions of progress are culture-specific). Thus, cultural relativism and long-term participant observation were the fundamental methodological principles applied by modern anthropologists in the study of different cultures, and their work solidly documented that various “peoples” often have overall cultural characteristics distinct from those of other populations, even when they live in close proximity, may physically look very similar, and share some historical experiences and/or organizational characteristics.

As it happens, these early studies mainly focused on small-scale, tribal populations, often because anthropological research was encouraged by the Western colonial powers needing information on their subjects in order to better rule or assimilate them. Thus modern anthropology often became the handmaiden of colonialism. But through their work, anthropologists confirmed the ancient definition of “ethnos” as an autonomous, sovereign nation, with a distinct and recognizable “culture”—no matter what its size. The tribal populations so often studied by anthropologists in the first half of the 20th century were not nation-states, since state systems of political organization appear in history only fairly recently and seem to require a certain population size, but they definitely were “culture units.”

As tribal populations became incorporated into Western colonial empires, at least some were able to maintain their cultural specificity and organizational autonomy, but this could not continue as they became part of the nation-states that were either directly established by the European settlers (as in the case of Canada or the United States) or that emerged from decolonization molded into a Western model of government (as happened throughout Latin America, parts of Asia, and the African continent). It is precisely in these settings that ethnicity acquired its modern meaning, referring now to populations that see themselves as culturally distinct from others with which they are inextricably related at the sociopolitical level. In other words, ethnic groups are often nations “trapped” within a culturally alien state structure.

Western Concepts of Human Nature

The centrality of culture, and of cultural differences, for understanding ethnic relations in the contemporary world should have given

anthropologists a distinct advantage in the study of “the ethnic phenomenon.” This, however, has not been the case, and the social scientists who have so far contributed the most to the study of this topic remain the sociologists, the social historians, the political scientists, and the social psychologists. This development is partly explained by the centrifugal internal dynamics of anthropology as a discipline, in which consensus has been lost about fundamental theoretical tenets—such as definitions of culture—methodology, and even scientific status. But this is also the consequence of unacknowledged ethnocentric assumptions about human nature, which in the West is generally conceived as basically asocial, contentious, avaricious, driven by self-interest, and overall defined by possessive individualism.

As remarked by American anthropologist Marshall Sahlins, this is the view expressed by a long line of Western thinkers, from Aristotle to St. Augustine, and from John Calvin to Benjamin Franklin. It seems to be behind the preoccupation with “checks and balances” as the basis of the U.S. Constitution, and it is definitely the view expressed by Austrian psychologist Sigmund Freud when characterizing the process of a child’s socialization as the repetition of the collective “civilizing process” of the human species, requiring the repression and sublimation of its malignant inclinations.

But this is also a view belied not only by the unbroken record of culture-making sociality characterizing human beings from their emergence but also by the fact that many cultural traditions—actually, the majority of the non-Western ones—define humans as essentially good; see enculturation as the process by which people realize and express (rather than thwart and repress) their human natures; and see people as fundamentally defined by sociality, and so embedded in a complex web of social relations that individual agency is seen as the outcome (rather than the antagonist) of the solidarity ties anchoring everyone to their social matrix. This basic difference between what could be called the “I-cultures/we-cultures” views of human nature profoundly affects the conceptualization of ethnicity and ethnic relations, and may also explain some of the misunderstandings incurred by Western social scientists studying the treatment of ethnic groups in non-Western societies.

A view of humans as basically isolated individuals, potentially engaged in a constant “war of each against all,” highlights the need for people both to engage in “constructing” their identity (rather than “acquiring” it automatically through group membership) and to constantly protect their autonomy from outside control, interference, and influence. In a way, then, this is a view that denies the reality of culture as the distinctive lifestyle of a whole population, emphasizing instead the rights of individuals to define their own identity according to their contingent instrumental needs.

Consequently, this is a view leading to a definition of sociopolitical organization as a control mechanism, which can itself only function by pitting interest against interest and power against power, in order to establish a precarious uniformity—which in theory protects the rights of everyone, but which in practice establishes “the tyranny of the marketplace,” in which the only behavioral guideline is competitive individualism. Within this scenario, the fact that ethnic groups differ from the majority is both belittled and bemoaned. Since differing culturally from the majority is an obvious “instrumental handicap,” individuals should actively engage in “shedding their ethnicity” so they can successfully become assimilated. And since identity is individually constructed, people can “choose” their cultural identity and should obviously do so to maximize their self-interest.

In the United States, where the ideology of possessive individualism has probably found its most radical expression—establishing a quintessential “I-culture”—being American has in fact long been perceived to be what remains when ethnicity has been erased. This is probably why Americans generally deny there even is an American culture. Apparently most mainstream Americans still feel, as the American anthropologist Margaret Mead acutely pointed out in the 1940s, that “however many generations we may boast of in this country, however real our lack of ties in the old world may be, we are all third generation, our European ancestry tucked away and half forgotten, the recent steps in our wanderings over America immortalized and over-emphasized.” In this context, the inability of certain groups to successfully acculturate in order to be assimilated has

long been seen as a “failure”—often related to some original characteristics (once thought to be racial, and now redefined as cultural) that actually impede their “reinvention” as all-American.

Postmodernism and Circumstantialism

Another consequence of Western views of human nature for the study of ethnicity is which social science disciplines have mainly become engaged with it, and how they influenced each other’s approaches. Until the late 1960s, for example, the anthropological approach was strongly influenced by psychology and, in those settings in which ethnicity was studied at all, the central issue was “identity,” especially in reference to processes of acculturation. In other words, the main model was one of ethnicity as a transitional phenomenon with chiefly psychological manifestations.

By the end of the 1960s, however, many anthropologists turned to a model borrowed from political science, in the sense that ethnicity came to be seen as a “situational” strategy, aimed at negotiating relations across groups perceived as culturally different. The turning point in the theoretical tide is often cited as 1969, the year Norwegian anthropologist Fredrik Barth’s book *Ethnic Groups and Boundaries* was published, since this text most clearly spells out an approach—variously called situationist, circumstantialist, or instrumental—which ended up exerting the most influence on the social science treatments of ethnicity for several decades. The factors that have given this approach its remarkable success are the rise of postmodernism as an overall social science perspective and the increase in ethnicity-related conflict—factors that are themselves connected with the further expansion of Western cultural hegemony through globalization, and with the change in patterns of international migration and nation building it triggered.

Postmodernism, as a general ideological stance, emerges from the conditions created by multinational consumer capitalism—the engine of globalization. The postmodern condition is one in which traditional social frameworks—such as the family or the workplace—lose their strength and stability, so that consumption becomes the only mechanism for self-definition. As a consequence, the postmodern subject hungers for affiliation, but only to the extent that it implies personal

choice (the exercise of “consumer freedom”). The circumstantialist approach to the study of ethnicity fits the postmodern zeitgeist particularly well since it is constructivist, in the sense that it emphasizes the subject’s agency in the process of ethnic-boundary development, and it is dynamical, since both ethnic boundaries and ethnic identity are seen as the result of contingent, and constantly fluctuating, interactive processes. This harmonizes well with the postmodern critique of “objectification” in social science and the concomitant attention to subjectivity and creative agency in identity formation. As a matter of fact, the postmodern preoccupation with rejecting any type of “essentialism” is also behind the critique of the anthropological culture concept itself.

It is therefore hardly surprising that a cultural approach to the study of ethnicity, while arguably canonical at the stage in which anthropologists saw no reason to distinguish between tribes and industrial nation-states, is now often considered irrelevant or even inappropriate. Furthermore, by taking the circumstantialist argument to its ultimate conclusions, ethnic groups become equated with interest groups, and ethnicity is simply seen as a “political” phenomenon. This fits in well with the “conflict model” of social relations, which seems to have become paradigmatic in Western social science. Within this model, culture gets both politicized and trivialized, simply becoming another commodity.

That ethnic diversity has led to so much intergroup conflict since the 1970s is the other factor that may have favored a circumstantialist view of ethnicity among social scientists. The management of ethnic boundaries in interaction leads almost implicitly to ethnically rooted inequality and thus to conflict. Consequently, a circumstantialist approach ends up highlighting the inevitably conflictual component of ethnic diversity. But it is precisely this phenomenon that most highlights the conceptual dissonance between the circumstantialism of so many Western social scientists and the importance given to the “cultural content” of ethnicity by so many ethnic group members themselves, who claim an inherited collective cultural uniqueness and make it the basis of their social and political activism. At the popular level, in fact, the historical processes triggered by globalization seem to have catalyzed a growing

attention, and attachment, to cultural heritage, and an increasing unwillingness to assimilate.

Globalization and the New Diaspora

In a way, therefore, the major transnational migratory flows characterizing recent history have created a new type of diaspora—involving populations maintaining strong connections with their homelands, and holding on to their cultural distinctiveness from the host country with pride, implicitly resisting acculturation. In the world of scholarship this has given rise to new areas of study, such as “cultural studies,” which specifically looks at the expressive dimension of social life and at the symbolic representation of diversity, and “ethnic studies.” Also, and perhaps most importantly, some scholars have attempted to address contemporary trends by introducing a perspective on “group rights” even in the context of “I-cultures” long committed to prioritizing individual agency and identity. Consequently, there has been a growing debate on the concept of “cultural citizenship,” and

“multiculturalism” has become a major ideological trend in political philosophy and in pedagogy—being translated into a myriad of programs variously aimed at facilitating diversity training, cross-cultural competence, or even the acquisition of “cultural intelligence.”

These recent trends seem to intimate the value of “reclaiming” the anthropological perspectives on culture for the effective study of ethnicity, and it is ironic that the lead on this promising path has been taken by several non-Western anthropologists—particularly in Asia—who are able to evade both the postmodern zeitgeist, and the epistemological foundations of the “I-cultures.” The cross-cultural differences characterizing the study of ethnicity may, in fact, implicitly indicate the crucial importance of looking at ethnic groups as cultural units and studying them in a comparative framework. However, such an approach also demands a robust clarification of the culture concept, which has currently become ever more loosely applied both popularly and in new social science fields such as cultural studies.

At the elaborate opening ceremonies of the 2008 Summer Olympics in Beijing, China, 2,008 performers of the fou—the most ancient percussion instrument in China, made of clay or bronze—produce the sound of rolling thunder to greet spectators from around the world, August 8, 2008. The long and distinguished history of China’s culture was intertwined with the theme of the Olympics: “One World, One Dream.” The study of ethnicity underscores the importance of looking at ethnic groups as cultural units.

By analyzing the differences between whole cultures (holocultures) and ethnic groups, and by relating their reality to the structure of the nation-state, new analytical frames might emerge that could greatly facilitate research. Also, the historical formation of ethnic groups—that is, whether they emerge from migration or invasion—needs to be comparatively assessed. And the relationship between ethnicity and physical appearance on the one hand, and ethnicity and social roles—such as those created by age, gender, or socioeconomic status—on the other, needs to be studied, documented, and placed within an overall theoretical framework.

Ethnicity is a lived experience, and the anthropological research approach, aimed at detecting macro patterns on the basis of micro observations, and analyzing the global through the local, is a particularly useful tool for understanding a phenomenon that is now affecting all areas of the world and that has wide-ranging repercussions. Whether modern nation-states embrace or reject multiculturalist policies, the multiethnic composition of their citizenry is an undeniable historical reality. The universalization of ethnicity may well require a basic overhauling of the political organization of nation-states, but a better understanding of this phenomenon may make all the difference in how successfully, and peacefully, this major transition in the history of humankind will ultimately take place.

Ethnoburbs

Ethnoburbs are multiethnic suburban neighborhoods with a high density of one particular ethnic minority group, possessing both a strong residential and economic presence. Immigrants living in ethnoburbs come from varied socioeconomic and educational backgrounds, and these areas are comprised of both international and local businesses. Wei Li originally used the term *ethnoburbs* to describe the settlement patterns of Chinese immigrants in the United States, in areas such as Monterey Park in Los Angeles County, which now hosts a population of 61,571, dominated by Asians. Changes in U.S. immigration policies, the global economy, and geopolitics have all led to the development of ethnoburbs. These areas have also received much recent interest, in both academia and popular discourse.

Historically, ethnoburbs began to emerge in the 1960s, with Monterey Park being one of the first to attract ethnic residents. Prior to this, immigrants settled in ethnotowns: strictly defined ethnic enclaves found in inner-city areas, such as Chinatowns. Openly racist exclusion laws (such

as the Chinese Exclusion Act of 1882) served to support this inner-city settlement pattern. However, following World War II, with the introduction of laws allowing servicemen to bring their war brides to the United States and the introduction of the Immigrant and Nationality Act of 1965, immigration increased exponentially. In the case of Asian immigrants, their influx into the United States, coupled with the decrepit conditions of many Chinatowns and inner-city race riots (for example, the Los Angeles, California, Watts race riots, 1965), led to an outward migration of many Chinese to the suburbs. This pattern was replicated in other ethnic groups, including Latino and African American.

Features of Ethnoburbs

Ethnoburbs possess a number of features. They attract immigrants from both high-income educated backgrounds and low-income unskilled backgrounds. Compared to ethnotowns, which tend to have strictly defined boundaries, ethnoburbs possess less clear boundaries. They are more ethnically diverse, are comprised of more recent immigrant generations, and are car dominated. Here, ethnic groups have the ability to maintain their traditional cultural identities and practices relating to language, education, and religion. This can facilitate community cohesion and the adaptation of new immigrants to their surroundings. Yet, it can also limit their ability to completely assimilate into the U.S. culture. Ethnoburbs also tend to focus on facilitating the needs of one particular ethnic group, and less on those from other groups living in the same space.

The varied socioeconomic makeup in ethnoburbs develops in a number of ways. With the globalization of the economy, and the key role of multinationals in this process, there comes a rise in the demand for highly skilled and educated immigrant professionals to work in financial, information technology, and a range of other globalized firms. These professionals tend to migrate to more tolerant, ethnically and racially diverse suburban neighborhoods. This inflow of middle- and upper-middle-class immigrants leads to a demand for an ethnic-based service industry, with restaurants and other local businesses serving the local population's needs. It is the creation of this service industry that facilitates opportunities for

low-income unskilled immigrants from the same ethnic/language group and thus leads to stratification in class. These suburbs function as social networks and hubs wherein immigrants may do business with one another and in turn with the wider globalized economy.

Ethnoburbs dominate the San Gabriel Valley in California, with eight Asian-concentrated ethnoburbs. Bellevue, Washington, is another example of an Asian ethnoburb, with Asians comprising 27 percent of the 122,363 population. In Massachusetts, Quincy is rapidly becoming an Asian-centered suburb, with 22 percent of its population made up of members from this ethnic group. These areas all share common features of ethnic-based local economies and global and multinational linkages, of built large houses and malls catering to Chinese businesses.

Ethnoburbs are not limited to Asian groups. Over half of the Hispanic population in the United States lives in three states: California, Texas, and Florida. An example of a Latino-based ethnoburb is Riverside County in California. This minority-majority area is comprised of 45.5 percent Latinos, making their numbers greater than the white population. Here, the median family income is well above the national average and more than one in five businesses is owned by Latinos. With its population of 18 percent black and 54.4 percent Latino, Moreno Valley in California is an ethnoburb dominated by two groups. In the United States, 55 percent of blacks (alone or in combination) reside in the south. Areas including Houston and Dallas in Texas; Memphis, Tennessee; and Baltimore, Maryland, all host large suburban populations. Ethnoburbs are also located near other ethnically diverse cities, including New York City; Philadelphia, Pennsylvania; and San Francisco, California. Dearborn, Michigan, represents a white-minority ethnoburb where Arabs comprise 41.7 percent of the population.

The development of ethnoburbs has an influence on the political conditions and social relations of a city. Rapid change, racialized conflicts, and interracial cooperation have all been generated in their establishment. With the redistricting of states following the 2010 population census, high-ethnic-density ethnoburbs have implications for voting patterns and the representation of ethnic group members in Congress.

Based on their population compositions, as measured by the census, and their widespread distribution, the development of ethnoburbs highlights the changing landscape of multicultural America. These areas allow immigrants to practice their culture, language, and traditions freely in the area in which they live, and serve as a means by which ethnic diversity is maintained in the United States.

Ethnocentrism/ Xenophobia

The term *ethnocentrism* was coined by William Graham Sumner in reference to the view that one's own group is the center of everything, with others judged in terms of the familiar standards of that group. One manifestation of ethnocentrism

is xenophobia, or the fear of outsiders. Xenophobia may have served an evolutionary purpose in the development of homo sapiens by allowing them to automatically reject potentially competitive groups, but it is an increasingly dysfunctional response to modern mobility and multiculturalism. Fear, like all emotions, arises from perceptual experience. To address the fear of outsiders, people need to understand how insiders and outsiders are being created and maintained by their perceptual experience of culture.

The idea of ethnocentrism has long been associated with a kind of national xenophobia, but the basic mechanism of ethnocentrism is equally applicable to understanding many troublesome aspects of domestic intergroup relations. The key to reducing xenophobia among domestic ethnic groups, including immigrant groups, is to assume (1) that all groups have a cultural dimension and (2) that relations among groups include a kind of intercultural communication. With these assumptions, it is possible to see three major aspects of ethnocentrism that impact multicultural relations in America (and elsewhere).

Ethnocentrism as Denial

The primary mechanism of ethnocentrism is perceptual. The groups in which people are socialized provide a set of figure/ground distinctions that give form to some phenomena and not to others. For instance, American women as a group are taught to make many more distinctions in texture and color than are American men, while generally men are provided with more categories for distinguishing technical objects like automobiles and computers. The result of this socialization is that women tend to treat color and texture as objects of interest, while men tend to treat them as just background. Men, on the other hand, tend to treat cars or computers as important objects of interest, while women tend to see them as just the mechanisms through which transportation or information occurs.

In communication between these two groups, American women may see American men as aesthetically incompetent, while men may lament women's intransigence toward learning basic mechanical skills. However, in both cases, the issue is not really about behavior—it is about perceptual conditioning. If people have not learned

to differentiate certain objects, categories cannot be generated that let people talk about or even think about those objects. The others may seem incompetent but really they are simply oblivious.

There are at least two major implications of perceptual conditioning for multicultural group relations. One is that entire groups of people may exist and not be perceived at all by people of other groups. For instance, not so long ago in the United States, many straight people did not have a well-developed perceptual category for gay people. Consequently, straights tended not to perceive the existence of gays as a group; when asked, they greatly underestimated the size of the group, and they reacted to individual gay people who came to their attention as deviants from their own group rather than normal people in a different group. The perceptual category for gays is now much better defined, as evidenced by the recent event of the president of Iran claiming that there were no gay people in Iran—a statement ridiculed by many of the same people who once claimed the same thing in the United States.

African Americans and other minority groups have usually experienced having their existence denied, meaning that they were not noticed as objects of attention and treated only as part of the general background. Recipients of this inattention often report that they would rather be the object of discrimination than not an object at all.

The second implication of this kind of ethnocentrism is that people may fail to attribute equal humanity to others. The reason for this is that ethnocentric people experience their own culture as much more complex than other cultures; they have well-developed perceptual categories to organize the familiar events of their own culture, while they have at best only vague notions of the perceptual categories generated by other cultures. As a consequence, these people may experience themselves and their compatriots as complex human beings while they experience others as more simple and primitive. In its relatively benign form this contrast generates the “little brown brother” syndrome, wherein dominant-culture members help others to develop the obviously superior dominant-culture perceptual categories.

The more serious implication of denying equal humanity to others is its potential to support

exploitation or even extermination. If others are not as human as oneself, it is no more exploitive to enslave them than it is to harness animals. And from perceiving others as valuable animals, it is only one more step to experiencing them as disgusting rodents or insects, possibly justifying genocide or ethnic cleansing.

Ethnocentrism as Defense

As people’s perceptual categories for other groups become somewhat better defined, those groups may seem to be more threatening; they seem more human but in a simple and primitive way. Following basic psychological attribution theory, ethnocentric people attribute complex motivations to members of their own culture while attributing simple motivations to other groups. For instance, immigrant groups assumedly come to the United States only because “they want to take our jobs” and minority groups have children so “they can collect government welfare checks.” These and the other typical negative stereotypes form the basis of a perceived attack on “our way of life.” Under this threat, ethnocentric people defend their own culture by derogating others and by asserting the superiority of themselves.

The defense/derogation form of ethnocentrism is more obvious than the denial form, since it generally involves a strong polarization of “us and them” and overt expressions of disrespect for others. We are the good guys and they are the bad guys. But the boundaries of who constitutes “us” and who constitutes “them” are mutable. Against immigrants, “us” may be U.S. Americans of all majority and minority groups. But an arbitrary generational boundary may separate some of “us” who have been in the United States more than three or four generations from “us” who have only been in the United States for one or two generations. For this reason, African Americans of U.S. slave heritage may consider more recently arrived African Americans as “them,” but both groups may be “us” compared to the “them” of blacks of Caribbean slave heritage. While this is an obvious cultural identity issue, it also fuels different expressions of ethnocentrism, since the culture that is experienced as central is a moving target.

Slightly more subtle expressions of defense are statements of the superiority of one’s own culture.

Rather than derogating others, ethnocentrism may be expressed by affirming the standards of one's group as central to quality and civilized action. Thus, community development efforts, like colonialism, may be enactments of an experience of cultural superiority, and schools may insist, in the name of preserving educational quality, on helping students match the cultural standards of one ethnic group. People who promulgate such efforts often do so with good (albeit ethnocentric) intentions, and they may be surprised or even angered if prospective recipients reject the offered assistance. On an interpersonal level, similar ethnocentric assumptions may underlie some coaching or mentoring efforts in organizations. When an ethnocentric member of the dominant group (in the United States, usually an older white male) is given the task of mentoring a younger person, a woman, or a person of color, he may take it as a directive to help his charge get over his or her troublesome cultural predilections and adopt the clearly successful cultural standards of European Americans.

Sometimes ethnocentrism is expressed in a reversed polarization of "us" and "them." This may occur when a member of a dominant group takes on the cause of an oppressed group in a way that romanticizes the adopted group while derogating the dominant culture. Romanticizing, or exotifying, a group involves experiencing the group's culture in terms of positive stereotypes, such as "all Asians are smart" or "Latino people have a deep love of life." The simplistic (but positive) experience allowed by these stereotypes is juxtaposed to the more complex experience of the shortcomings of one's own culture. In other words, "them" become the good guys and "us" become the bad guys. This is still ethnocentric defense, but with the poles reversed.

Ethnocentrism as Minimization

The subtlest form of ethnocentrism is when cultural difference is minimized in favor of stressing human similarity and common experience. On the surface, such minimization appears to be the solution to ethnocentrism, as it reduces many of the expressions of denial and defense. However, minimization actually reinforces the basic mechanism of ethnocentrism—the experience of one's own culture as central to reality. Rather than rejecting or derogating other groups, one's own

culture is taken as being central to the experience of all human beings, whatever cultural group they belong to.

In the minimization form of ethnocentrism, attention is directed to the facts that human beings of all groups are genetically quite similar and that they all face the challenge of satisfying needs for safety, security, socialization, and spirituality. Further, certain "universal values" are assumed to underlie our various cultural experiences, making particular cultures like transforms of a universal cultural grammar shared by all human beings. Variations in group experience therefore become relatively trivial compared to our immersion in the basic experience of being human. Here, ethnocentrism is expressed as a kind of worldview projection. For instance, ethnocentric Christians tend to believe that deep down, whether they know it or not, everyone is a child of God. But ethnocentric Hindus tend to think that everyone has dharma and karma. Ethnocentric Marxists believed that everyone given a chance would revolt against class-based economic control, but ethnocentric capitalists think that everyone given a chance would try to become an individual entrepreneur in a market-driven society.

In domestic relations among groups in a multicultural society, minimization becomes a pressure toward assimilation. In the United States, ethnocentric members of the dominant ethnic group of European Americans tend to define aspects of their culture—for example, individualism, personal responsibility, and communicative directness—as central to all human experience. Further, they may see the United States as "exceptional" in its adherence to these assumedly basic human qualities. Consequently, in this view, to be an American is to share these cultural qualities—not because European Americans have the power in many cases to enforce these qualities through education and selection, but because they are the universal human qualities that America has the responsibility for upholding. And to note that alternative cultural qualities coexist within the American national culture is not taken as an accurate description of multiculturalism but as a betrayal of the sacred covenant upon which the country was founded.

Minimization also masks cultural privilege. European Americans tend to believe that all

people have an equal opportunity for success in the United States unless they are victims of active prejudicial discrimination.

When it is noted that the higher ranks of nearly all organizations are populated by a predominance of European American males, including in organizations with strict antidiscrimination policies and procedures, ethnocentric members of that group may claim that other people certainly had the chance, but they just didn't want to work as hard. This expression of minimization ignores the privilege enjoyed by dominant culture members, which is to define the path to success in their own cultural terms.

Ethnopharmacology

Ethnopharmacology is the study of the use of various drugs as used by different ethnic groups for therapeutic ends. It is a subfield of ethnomedicine, which studies the traditional medical practices of ethnic groups, especially those that are orally transmitted rather than contained in a corpus of written work, as with traditional Chinese

medicine. Ethnopharmacologists are generally anthropologists or botanists, though there is growing commercial interest in pharmacognosy. The specific study of the efficacy of traditional medicines used by ethnic and cultural groups is ethnopharmacy, though ethnopharmacology is often used metonymously. Ethnopharmacy also overlaps considerably with ethnobotany, the use of plants by ethnic groups. Ethnomedicine worldwide is on the rise in urban areas. While this is because the rate of urbanization is higher than the rate of access to mainstream medicine, ethnomedical practices are also on the rise in urban areas of the developed world such as New York City, where recent immigrant groups include traditional medicine practitioners.

Medical Pluralism and Traditional Medicine

Two key concepts in understanding ethnopharmacology and ethnopharmacological literature are medical pluralism and traditional medicine. Medical pluralism is the adoption by a group, family, or individual of more than one medical system. Common Western examples of medical pluralism in practice include dealing with depression with both Prozac and Zen meditation or treating a cold with both a decongestant and a homeopathic remedy. Treating depression with Prozac and cognitive behavioral therapy, on the other hand, is not a valid example; while pharmaceutical remedies and behavioral remedies are two different types of remedy, they are not from wholly separate medical systems. Even these distinctions have become blurred over time as medical systems have gradually integrated elements from other medical systems.

Medical systems outside mainstream medicine, which has been subjected to scientifically rigorous testing, are often referred to as complementary and alternative medicine (CAM) in professional literature. Some examples include acupuncture, homeopathy, and chiropractic medicine. In ethnographic and anthropological literature, CAM is more often called traditional medicine or folk medicine and comprises the medical practices followed by a given culture. In some states, practitioners of alternative health practices are subject to some form of licensing.

CAM systems and the ethnopharmacological practices included therein are generally predicated

Foxglove, found in temperate regions of North America, is the original source of the heart medicine digitalis. The presence of digitoxin makes the plant's leaves, flowers, and seeds poisonous to humans. The plant's clinical use was pioneered by William Withering, an English botanist, chemist, and physician.

on religious or supernatural grounds or on traditional practices, which predate and have not yet been proven (or have been disproven) by modern science. There is an important distinction between unproven and disproven. The “unproven” element is especially important because ethnopharmacology seeks to ensure that many traditional practices are scientifically sound. For example, a certain leaf used in traditional medicine to alleviate headaches may contain caffeine or may expand the capillaries in a manner similar to caffeine. Similarly, cayenne pepper was used in folk medicine as a pain-relieving salve long before it was discovered that capsaicin, the chemical that

causes chili peppers to be “hot,” was a topical analgesic, one that is now included in over-the-counter medicines.

The combination of CAM with scientifically proven medicine is called integrative medicine. About 20 percent of Americans rely on substance-based CAM therapies such as herbal remedies and other supplements, ethnopharmacological treatments, megavitamins, and so on. The drugs prescribed by medical systems studied by ethnopharmacology may include either raw unprocessed materials or processed preparations as well as plants, herbs, foods, vitamins and nonvitamin supplements, and even nonbiological substances such as colloidal silver or the use of lead in traditional Chinese medicine.

Traditional medicine often thrives in countries where access to modern medicine is constrained by circumstances or poverty. One-third of the developing world lacks access to basic modern medications, for instance, and traditional medicine takes the role of primary health care in many of these regions—although in many cases, these traditional health practitioners will refer patients to modern hospitals for treatment, placing them in a role similar to triage nurses. Immigrant groups to the United States often continue practicing their traditional medicine, and this is where medical pluralism is typically found, as immigrants and their descendants rely on both a traditional medical system and the modern scientific medical system.

Other Subsets

An overlap between modern science and ethnopharmacology is pharmacognosy, which studies medicines prepared from natural sources and is an important part of the search for new drugs. As mentioned, many traditional herbal remedies are efficacious for reasons perfectly consistent with modern science.

Within mainstream medicine, there is a subset of drugs that might be considered ethnopharmacological. Isosorbide dinitrite/hydralazine, for instance, is a combination of the antihypertensive hydralazine with the vasodilator isosorbide dinitrite. Developed in the 1990s and approved by the Food and Drug Administration (FDA) in 2005, it is marketed under the name BiDil as a congestive heart failure treatment approved for use only for

African Americans. It is the first prescription drug in the United States developed for use by a specific race or ethnic group. The medicine combines two drugs available in generic forms in a specific combination that has therapeutic benefit, and its approval was contingent on studies demonstrating that African Americans are less likely than Caucasians to show positive results from other congestive heart failure treatments like ACE inhibitors.

Religious Movements and Ethnopharmacology

Ethnopharmacology in the United States includes the use of substances involved in ritual. A well-known example is the Native American Church. Believed to be the most widespread indigenous religion in the United States, the Native American Church was formally organized to petition for legal protections under the First Amendment of the Native American use of peyote in religious ceremonies. A hallucinogenic cactus native to the United States and Mexico, peyote has been used in religious ceremonies for hundreds of years by many different Native American religious groups.

The Native American Church represents not one specific religious worldview but rather the intersection of these peyotist groups. The church was formally founded in 1918, but the movement leading to its founding began with the powerful Comanche leader Quanah Parker in the 19th century. The church has generally been successful in obtaining legal protection for peyote (federal protection exists, but state laws vary), and a trade network of three peyoteros along the Texas–Mexico border are responsible for obtaining and selling legal peyote. Each peyotero is licensed by the U.S. Drug Enforcement Administration and the Texas Department of Public Safety.

Seeking to follow in the footsteps of the Native American Church are two Brazilian religious movements with adherents in the United States. They have sought legal protection for their ritual use of ayahuasca, a psychoactive tea made from certain Amazonian vines. Santo Daime (Holy Ayahuasca) is one such religious group, originating in the 1930s and growing in their American presence since the 1990s. Along with the more recent group, Uniao do Vegetal (Union of the Plant), they have made inroads in gaining acceptance for ritual use of ayahuasca, with the Supreme Court ruling in

2006 that a sufficient case to bar religious groups from using ayahuasca had not been made. While ayahuasca specifically (and DMT-containing plants more generally) are not listed as controlled substances on the federal drug schedules, the active ingredient, dimethyltryptamine (DMT), is classified as a Schedule I drug, which are drugs that have a high potential for abuse, no currently accepted medical use in the United States, and a lack of accepted safety under medical supervision. DMT is a powerful psychedelic within ayahuasca that is combined with a monoamine oxidase (MAO) inhibitor, allowing it to be orally ingested.

Eugenics

Sir Francis Galton used the term *good stock* to define eugenics in 1883 as a way to encourage the best marriages between the fittest, healthiest, and wealthiest individuals in order to produce the best children. The goal of eugenics was to improve the human species through careful selection of parents to preserve the superior stock and to breed intelligent children.

Eugenics in the United States

As a result of Galton's influences—and those of his followers, who believed that behaviors and conditions such as criminality, insanity, and poverty are genetically inherited—the eugenics movement gained popularity in the United States between 1870 and World War I. During this time, eugenicists worked hard to look for ways to resolve what they believed were inherited abnormal behaviors. Among the solutions eugenicists felt would resolve the problems they felt were destroying America were the institutionalization and segregation of people whom they identified as having cognitive impairments, the prohibition of such people from marrying so they would not reproduce what eugenicists feared would be unfit children, and involuntary sterilization laws.

By 1924, 24 states had passed involuntary sterilization laws, and the 1924 Immigration Act was enacted, a law that limited the number of immigrants admitted from any country to 2 percent. As a result of these laws, eugenics reached its height of popularity in the United States. Eugenicists believed that immigrants were contributing to a national degeneration, and they pushed to keep what they saw the unfit or degenerate from reproducing, marrying, and entering the country.

Professors, industrialists, educators, social scientists, government officials, and other professionals were among eugenicists who believed that

the vast majority of the population were imbeciles and not worthy of survival because of their heredity. In particular, they believed if certain ethnic groups did not have the perceived intelligence level, strength, or physical features of the superior Nordic race, they were inferior. As a result, hundreds of thousands of immigrants and Americans were denied the right to have children and sterilized against their will. In 1927, Virginia's sterilization statute was challenged in the Supreme Court in *Buck v. Bell*. The court ruled that Virginia's sterilization statute did not violate the due process clause of the Fourteenth Amendment and could not be considered cruel and unusual punishment because it was not punishment but rather a means to provide an opportunity for the plaintiff to "do good" for the community and society. The decision was a victory for eugenicists and resulted in other states passing similar sterilization laws. Eugenicists believed that government control of reproduction, directed specifically at hereditary defects, was a necessity for racial improvement and to save America.

Nazi Germany to Genetic Technology

Overseas, *Buck v. Bell* was followed closely and influenced the adoption of the 1933 eugenics sterilization law in Nazi Germany. Shortly after, the policy targeted Jews and other people deemed "unfit," resulting in genocide and the Holocaust. Not until the atrocities of Nazi Germany entered the public consciousness did eugenics begin to curry disfavor. Beginning in the 1940s and extending into the 1950s, the term *eugenics* was avoided. However, from the mid-1950s until the 1960s, efforts to improve race in America reappeared with sperm banks and genetic counseling. The development of reproductive technologies like human gene therapy and in vitro fertilization in the 1970s led to the resurgence of eugenics in the United States. Additionally, the publication of psychologist Richard Herrnstein and political scientist Charles Murray's *The Bell Curve* in 1994 renewed debate over the relationship between intelligence, ethnicity, and social class reminiscent of the eugenics movement in the 1920s.

Today, with a new focus on genetic technologies, the idea behind the term *eugenics* may not have completely disappeared. Some experts fear recent innovations in genetic research, including

the Human Genome Project, could lead to resurgence in eugenic ideas.

Eugenics and Education

In the early 20th century, eugenics ideology made its way into education. The development of the IQ test by Alfred Binet was instrumental in the identification of feeble-mindedness. Although Binet did not believe this test measured innate ability and intelligence, it was used to support the idea of genetic differences between races. Eugenicians, specifically Henry H. Goddard, argued that the average IQ scores from different national groups reflected innate racial differences, and eugenicians used IQ testing to reinforce their ideology that intelligence was hereditary. In their view, test scores were scientifically sound and therefore legitimate in identifying, classifying, and separating students based on intelligence. Identification of children as gifted or at-risk became popular in schools.

As a result of Goddard's influence, differences in children's intelligence levels equated with the idea that certain children should be educated differently, giving rise to the popularity of programs that focus on vocational education, special education, and programs for gifted and talented children.

Eurasian

The term *Eurasian* generally refers to a person who has Asian and European ancestry. Though it is still used in the context of the British Commonwealth, it is less frequently used in the United States, where it is viewed as antiquated.

Originally referring to children of white (British) fathers and Indian mothers, it is credited as being invented by the first Marquess of Hastings, Francis Edward Rawdon-Hastings, who was the Governor-General of India from 1813 to 1823. Joachim Hayward Stocqueler's 1844 *The Handbook of British India* contains one of the first recorded uses of the term and provides the following definition: ". . . conventionally accepted as embracing all the progeny of white fathers and Hindoo [sic] or Mahometan [sic] mothers. . . ."

Other earlier terms included "country-born" and "Indo-Briton," as well as "chee-chee," a more vulgar expression derived from the Hindi term for "dirt" or "filth," which was used to describe both the accented and stilted English used by Eurasians as well as the people themselves. The term was adopted in different British colonial contexts such as Hong Kong and Australia to refer to a person with white and Asian heritage. In Hong Kong, for example, the term *Eurasian* referred to people who were mixed European and Chinese, with a specific emphasis on English rather than Portuguese ancestry.

Tendrils of Colonial Power

Throughout the span of European empire in Asia, the term *Eurasian* was, and still is, an identity that channels fears and tensions regarding race, gender, and imperial and sexual power. Caught in a space between colonizer and colonized,

Eurasian identity was a site of contestation both on an individual and a national scale. Different colonial institutions legislated the legal status of mixed Asian and white people differently, calling into question the stability of notions such as “citizen,” “race,” and cultural belonging. As a living symbol of the transgression of racial and cultural boundaries, as well as, usually, a colonial system structured to give white men sexual agency over women of color, “Eurasian” was for a long time synonymous with degeneracy, impurity, and loose morals.

The figure of the Eurasian has a long history in popular culture, often used as a parable for the tragic perils of miscegenation, carrying an implicit imperative to shore up the boundaries of race. Recurring frequently in English-language fiction in the late 19th and early 20th centuries, Eurasian characters act as dangerous figures, close enough to both races to understand them intimately but never ultimately aligned with either one. These Eurasian characters usually yearn to obtain full whiteness but never can, and often end up dying by the narrative’s end. This archetype is parallel to the “tragic mulatto” stock character in American fiction, who has both black and white racial ancestry and who usually dies after her secret black heritage has been revealed.

Beginning in the 1980s, however, the figure of the Eurasian began to take on a different connotation within popular culture. Coupled with the rising influence of Asian nations, particularly Japan, in the 1980s, the figure of the Eurasian began to reemerge in popular culture as someone who contained the “best” qualities of both races. As the 1990s saw a general shift toward cosmopolitanism, both as an ideology and as a marketable quality, Asian-descent multiracial people (most always Asian and white), were portrayed as literally embodying the cachet of being a globe-trotting citizen-of-the-world. Whereas before, tragic Eurasians were doomed to certain death for being unable to claim membership in either of their ancestral groups, in the 1990s and after, Asian-descent multiracial people were cast as models and actors who appealed to cosmopolitan sensibilities and diverse audiences around the globe. Notable figures included the actor Keanu Reeves, the model Devon Aoki, and the actress Maggie Q. Though this represented a recuperation of an

identity that endured a long history of exclusion and prejudice, this trend was also criticized for putting a slightly “exotic” face on top of long-standing legacies of European economic and cultural domination, as well as for altering Asian standards of beauty to physically conform to hegemonic whiteness.

“Eurasian” by definition refers only to Asian-descent multiracial people who have European heritage. It is therefore not synonymous with other terms such as “hapa,” since it excludes the large number of people who are Asian-descent multiracial with some race other than white. While not explicit, the American term *Amerasian*, originally coined to refer to the children born in Asia of white Americans and Asian women, also contains this connotation as well as the subtext of the U.S. imperial project in Asia. Although as of 2010 the majority of Asian-descent multiracial people living in the United States were Asian and white (1.6 million), there are approximately one million people in the United States who report Asian and one or more additional races that are not white.

It should be noted that the term *Eurasian* is also frequently used in a geopolitical sense, referring to the Europe-Asia supercontinent and not to a person. This usage usually describes a political concern that spans these two regions, or an animal species that is found across these two regions. Careful attention should be paid to the context in which this term is used.

European Americans

Although the first to establish a permanent settlement in the present-day United States were the Spanish colonizers (St. Augustine, Florida, in 1565), it was the white Anglo-Saxon Protestants (WASPs) who established the core of what was to become the dominant culture of the United States. As the country expanded through purchase or conquest, other Europeans were also incorporated within its boundaries. Nevertheless, most Europeans entered the United States as immigrants. Until the 1920s, they constituted the majority of arrivals, yet the two great waves—from the 1820s until the 1880s and from the 1890s until the introduction of the quota system in 1924—differed substantially in terms of ethnic origin. The newcomers were, thus, received differently. Today, Europeans account for only a fraction of immigrants, as the most considerable flows come from Latin America and Asia. The enduring European legacy has, however, been vital in the social, cultural, and political development of the country.

European Ancestry in 2011

The data on ancestry—collected from 1980 to 2000 by the U.S. Census and since 2010 by the American Community Survey (ACS)—demonstrate that Americans report a variety of national, regional (such as eastern European), and pan-regional (such as European or Arab) ancestries, including those that have their roots in colonial

times (such as Pennsylvania Germans) or former political entities (such as Czechoslovakian ancestry). In 2011, according to ACS data on people reporting ancestry, the top five European ancestries were the following:

1. German (reported by 47 million people): These estimates do not include over 330,000 Pennsylvania Germans, who are considered a separate ethnic group, nor 26,000 German Russians. People of German ancestry reside throughout the country but mainly in the midwest. Pennsylvania Germans are concentrated mostly in southeastern and south-central Pennsylvania.
2. Irish (34.5 million): The largest ancestry group in the northeast.
3. English (25.7 million): The prevalent ancestry in New England, Utah, and southern Idaho.
4. Italian (almost 17.5 million): In the northeast.
5. Polish (9.5 million): Mainly in the Great Lakes region.

The sixth-largest ancestry in the United States is French (8.6 million). As in the case of the German-origin population, the ACS estimates provide separate data for French Canadians (2 million) and Cajuns (a distinct ethnic group, the descendants of the French-speaking settlers from the colony called Acadia in Canada, 104,000). The French-origin groups reside mainly in Louisiana and in the northeastern part of the United States.

As most European Americans descend from more than one group because of ethnic intermarriage, the collected data provide the answers that respondents chose to give and thus may not reflect their full ethnic origin. Therefore, the subsequent year estimates may vary.

Colonial Times and Early National Period

Although the British comprised by far the largest group in the British colonies, other settlers were also attracted. Driven by either religious or economic reasons, newcomers from northern and western Europe arrived in relatively significant numbers—among them were Germans (mainly in Pennsylvania), Dutch (New York and New

Jersey), and such religious minorities as Mennonites. The colonies were, thus, pluricultural and plurilingual. Nevertheless, as early as the colonial period some negative sentiments arose, especially toward the Irish and Germans. Benjamin Franklin himself, for example, openly expressed his concerns about the growing numbers of Pennsylvania Germans.

According to the first census, in 1790 the English comprised about half the population (48 percent), followed by Germans (7 percent), Scottish (7 percent), Scots-Irish (almost 5 percent), and Irish (3 percent). The Dutch, French, and Swedish together made up a relatively small proportion of the population (below 5 percent).

In the following decades, thousands of people of Spanish, Spanish/Mexican, and French descent were incorporated into the American territory following the Louisiana Purchase (1803), the Adams-Onís Treaty (1819), the Mexican-American War (1846–48), and the Gadsden Purchase (1853). These groups themselves comprised heterogeneous communities.

Immigration From 1820 to 1921

European immigrants started arriving in increasing numbers in the 1820s. The first wave, from the 1820s until the 1880s, came mostly from northern and western Europe. The total number of Germans and Irish—the two largest groups of newcomers—in this period was similar (3 million and 2.8 million, respectively). The Irish immigration commenced at the beginning of the 19th century; however, it was the Great Famine (1845–52), otherwise known as the Irish Potato Famine, that was a major factor in triggering mass migration. From 1841 to 1860, almost 1.7 million Irish came to America, and in the 1840s they comprised over 45 percent of total immigration.

The German immigration differed from the Irish not only in terms of language and religious composition (Protestants, Catholics, and Jews). The flow itself was triggered by different factors and the settlement patterns were more diverse; while the Irish mostly settled in the urban centers of New England, New York, and New Jersey, Germans headed both to urban centers in eastern cities and to the “German triangle” in the midwest—Cincinnati-St. Louis-Milwaukee—and to rural areas, mainly in the midwest. German

immigration reached its highest, unprecedented numbers in the 1880s (1.4 million in one decade) and dropped significantly in the following decades.

From 1880 to 1920, Europeans continued migrating in great numbers, accounting for almost 90 percent of the 23.5 million immigrants who arrived in the United States. The influx was so substantial that between 1890 and 1910 almost 15 percent of the U.S. population was foreign born, the highest rate in the whole of American history. What distinguished this wave from the earlier one was an unprecedented number of newcomers from southern and eastern Europe, among them Italians (as many as 4 million from 1880 to 1920), Poles, and immigrants from Austria-Hungary and Russia, including Jews.

Immigration From 1921 to 1965

As the number of immigrants soared, important immigration and naturalization legislation was passed, culminating in the restrictive national quota acts of 1921 and 1924, which sharply reduced immigration from southern, central, and eastern Europe. Notwithstanding this, the Irish and Germans and other northwestern Europeans were not negatively affected.

In the following decades some Europeans migrated to the United States outside the quota system. In 1948, the U.S. Congress passed the Displaced Persons Act, which eventually allowed for the entry of over 400,000 people. The refugees from Communist-ruled Europe also kept coming in the 1950s (such as Hungarians). Although the Immigration Act of 1952 included some important changes in immigration policy, it did not repeal the national-origin quotas. Germans, who were less affected, remained the largest group of immigrants.

Immigration Since 1965

The abolition of the 1924 quotas in the 1965 Immigration Act and the family reunification provisions—enacted also to increase immigration from those European countries that had been affected by the 1920s quotas—did not attract as many immigrants from Europe as expected. One of the reasons was that by this time postwar western Europe had, also due significantly to U.S. assistance, recovered and prospered economically and sent fewer immigrants. Since 1965 the main

suppliers of immigrants to the United States have been Latin America and Asia. In 2000, only 15 percent of the total foreign-born population in the United States came from Europe, while 50 percent originated from Latin America and 25 percent from Asia.

Today, European immigration to the United States is still diverse in terms of ethnic origin. The immigrants come for various reasons: they are joining their families, looking for better job opportunities, or on visas for highly skilled immigrants. The Germans and the British are among the 10 top foreign-born populations. The British, however, because of their similar ethnic and cultural origins, remain mostly “invisible immigrants,” as Charlotte Erickson puts it.

Immigration from the former Communist countries (such as Poland, Bulgaria, Hungary, Romania, and the former Czechoslovakia) had different characteristics/trajectories. Immigrants from these countries generally fall into two major categories: those who arrived before 1989 and those who arrived after 1989 (the fall of the Berlin Wall). Today, some former eastern bloc nations (such as the Czech Republic, Estonia, Hungary, Latvia, Lithuania, and Slovakia) participate, along with western European countries, in the Visa Waiver Program (VWP). Some others, such as Poland, still do not meet the requirements to be included in the VWP.

Intergroup Relations and Nativism

The Protestant religion and whiteness were essential elements of the group identity of the British colonists. These two factors have been, in fact, of much importance for many Americans and provoked strong nativist attitudes. The Catholic religion became a major concern in the mid-19th century with the arrival of unprecedented numbers of Irish and Germans. Nativists believed that Catholics posed a real threat to American values, institutions, and the democratic political system. This fear was reflected in the birth, development, and relative success of the American Party (Know-Nothings) in the 1840s and 1850s. Although the party had disappeared by the Civil War, it managed to gain some political success.

Race shaped U.S. immigration policy and citizenship law for a long time. “Whiteness” became a requirement for naturalization in 1790.

Surprisingly enough, this policy was changed only as late as 1952, when all races were made eligible for naturalization. Nevertheless, some Europeans also fell victim to unequal treatment based on religion or nationality. For example, in the mid-1840s and 1850s the Irish were ostracized and discriminated against when applying for jobs (“no Irish need apply”). Stereotypically seen as criminals and troublemakers, they were definitely not treated like whites but were rather equated with African Americans.

Racial concerns were even more marked from 1880 to 1920. In this period racist theories became widespread even among influential public figures such as Theodore Roosevelt and Woodrow Wilson. Based on late-19th-century racial ideas, which distinguished between the Nordic (Teutonic), Mediterranean, and Alpine “white” races, the “new” immigrants were seen as less skilled and less likely to assimilate into American culture. Thus they were generally less desirable than those coming from western and northern Europe. These positions found support in some research and official reports, for example, the 1912 study conducted by Henry Goddard and the 1911 Dillingham Commission Report. In this social, political, and intellectual context, the Immigration Act of 1924 was passed.

While the big influx of “new” immigrants awoke xenophobic sentiments in the 1880s (such as the American Protective Association), World War I fueled hostile attitudes toward Germans. In different parts of the country various attempts were made to eliminate the use of the German language in public life. In many states it was forbidden in schools, sermons, and public addresses, and in some localities people speaking German on the street could be fined. Overall, the first two decades of the 20th century witnessed the broadest Americanization campaign in the United States, with the English language becoming one of its key tools. By 1923 as many as 34 states had introduced teaching in English only, in public as well as in private schools. Also, some businesses, like the Ford Motor Company, launched obligatory English-language classes for their workers.

During the second Red Scare in the 1940s and 1950s nativist attitudes targeted advocates of un-American ideas rather than religious and

national-origin groups. It is interesting to note that Joseph R. McCarthy, Jr., the chief Communist hunter of the 1950s, was of Irish Catholic descent—thus, paradoxically, he himself belonged to a group that had experienced strong nativist attacks in the past.

Racial and religious views have shifted over time, ceasing to be a factor that totally impedes the crossing of boundaries. In the decades following World War II the increase in marriages across nationality groups within the same religious traditions led to the relative blurring of ethnic boundaries. The sociologist Ruby Jo Reeves Kennedy described this assimilation process as a “triple melting pot” in which Protestants, Catholics, and Jews intermarried within the same religious tradition. In the later decades, intermarriage across racial and religious lines—an important test of assimilation—increased substantially.

Assimilation and Culture Maintenance

For a long time the widespread ideology of assimilation in the history of the United States was “Anglo-conformity,” demanding that immigrants shed their ancestral culture in favor of that of the Anglo-Saxon core group. Newcomers were expected to assimilate to the broader American society. Even if an ideology of “melting pot” was evoked, it was in fact often used to refer to “Anglo-conformity.” After the 1960s, cultural pluralism became the predominant concept. Cultural pluralists argued that groups could maintain elements of their ethnic/racial identity while participating in a broader society. Cultural pluralism focused on diversity and accepted cultural differences among groups. Diversity was to be protected and preserved. This resulted in a rise in ethnic identification during the 1970s, when ethnic and racial identities became a source of pride, as was the case with black or Latino groups (such as the Chicano movement).

It was specifically in 1970 that Michael Novak discussed the integration of non-northwestern European immigrants (the “new” immigrants) into American society. In his book *The Rise of the Unmeltable Ethnics* (1972) he demonstrated that the “white ethnics,” as he called them, experienced similar problems/exclusions as racial minorities. Since the 1970s other important analyses of white ethnic identity have been proposed,

such as Herbert Gans, *Symbolic Ethnicity: The Future of Ethnic Groups and Cultures in America* (1979); Joshua Fishman, *The Rise and Fall of the Ethnic Revival* (1985); Richard Alba, *Ethnic Identity: The Transformation of White America* (1992); Mary Waters, *Ethnic Options: Choosing Identities in America* (1990); and others.

The desire to preserve and maintain ethnic culture is reflected in a plethora of ethnic organizations, associations, and cultural and educational centers, as well as ethnic media. Traditional festivals or national celebrations are especially salient in the regions of high concentration of particular groups: the German Oktoberfest in Milwaukee, the Irish St. Patrick’s Day in Boston and New York City, or the French Mardi Gras in New Orleans being just some examples. Language is of much importance in this context due to its important role in group identity formation. The Amish in the mid-Atlantic and the midwest regions of the United States still use their old German dialect, while Cajuns struggle to revive their dialect (distinct from both the standard French of Paris and of Quebec, as well as the French Creole). Both groups display resistance to the crossing of ethnic barriers (Cajuns have high rates of endogamy, while the Amish maintain cultural customs, preserve their identity, and have managed to stay in relative isolation); as such, they contribute greatly to multicultural American society.

European Impact on U.S. Society and Culture

The colonial dominance of the population from the British Isles (about 63 percent in 1790) left an indelible impact on the emerging American society and culture: the legal and political systems, customs and values, and the English language as the de facto national language.

The Spanish and French colonial heritage is probably most evident in the names of places, mountain ranges or rivers, such as California, Los Angeles, San Francisco, as well as Louisville, Kentucky; Vincennes, Indiana; Lake Champlain, or Lake Pontchartrain. The Dutch contributed with some of the most world-famous names, for example, Brooklyn (*Breuklen*), the Bowery Street (*bouwerij* meaning “farm”), and Wall Street in New York (which owes its name to a wooden stockade

that protected the Dutch settlement against British and Native American attacks).

Spanish, French, and Dutch colonial architecture—missions, presidios, and other types of buildings—are reminders of the rich and turbulent history of the country. The Spanish past is evident in tradition and customs, especially in New Mexico where some people still consider themselves *Hispanos* (of Spanish colonial descent). Also, in California a limited number of people identify with the regional term *Californio*, although the Hispanic/Latino culture in this state is today predominantly Mexican. The French influence is evident in Louisiana; it should, however, be kept in mind that the French group is not homogenous and includes several subgroups, such as Cajuns, French Creoles, and French Canadians. California and Louisiana have also retained some elements of the Spanish/Mexican and French legal systems, such as, respectively, community property and “parishes” instead of “counties” as administrative subdivisions.

Both colonial settlers and immigrants had a great impact on the development of religious pluralism in the United States. Colonial America was heterogeneous in terms of denominations, Protestants being the dominant Christians. Among the arriving immigrants were the adherents of Protestant denominations but also a very substantial number of Catholics (especially from Ireland, Germany, Italy, or central Europe—all of which had their own characteristics), Orthodox Christians (eastern Europe), and Jews (especially from central Europe).

Today, although Protestants in general account for the highest number of adherents, Roman Catholicism is the largest single denomination in the United States (59 million adherents in 2010 according to the Association of Religious Data Archives). Catholics are traditionally found among Irish descendants in the northeast, Hispanics in the southwestern United States, and French descendants in Louisiana. Western states, due to their historical development and pioneering characteristics, are more religiously diverse.

The Anglo-Saxons were crucial in the formative period, and they still keep a prominent position in U.S. politics. American presidents have been of predominantly Anglo-Saxon origin, the first Irish president being John F. Kennedy (1961–63).

Among the politicians from other European groups who have occupied important federal, state, and local positions are, for example, German-born Henry (Heinz) Kissinger, secretary of state; Danish-origin Janet Reno, attorney general; Polish-born Zbigniew Brzezinski, national security advisor to President Jimmy Carter; and Antonin Scalia, the first Italian American appointed to the U.S. Supreme Court. Also of Italian descent were Fiorello LaGuardia and Rudolph W. Giuliani, the 107th mayor of New York City.

European-origin writers have greatly enriched the American literary tradition with their outstanding writing skills, exceptional insight, and originality. Among the American Nobel Prize winners are Eugene O'Neill (Irish), John Steinbeck (German), Saul Bellow (Russian Jewish), and Isaac Bashevis Singer (Jewish). Other internationally renowned American poets, writers, and playwrights of European descent are, for example, those of Irish origin: Edgar Allan Poe, F. Scott Fitzgerald, and Flannery O'Connor; of Dutch origin: Walt Whitman; Franco American authors Henry David Thoreau (French) and Jean-Louis “Jack” Kerouac (French-Canadian); Jewish authors Joseph Heller, Arthur Miller, Allen Ginsberg, Elie Wiesel; Portuguese John Dos Passos; German Thomas Mann; and Russian Vladimir Nabokov.

Classical musicians who profoundly influenced not only American but also world 20th-century classical music include, for example, George Gershwin (of Jewish descent) and immigrants Igor Stravinsky (Russia), Béla Bartók (Hungary), and Arnold Schönberg (Austria). At the same time, American musical life was enriched with ethnic music and instruments, for example, Irish fiddle music and Cajun zydeco music.

Just as Jewish artists, composers, lyricists, and directors have made an indelible impact on Broadway (such as Russian-born Irving Berlin), the Hollywood film industry was virtually established by Jewish Americans of eastern European origin, who started and operated such production companies as, for example, Columbia, Metro-Goldwyn-Mayer, Paramount, Twentieth Century Fox, and Warner Brothers. Some of the most famous American filmmakers and actors come from various European-origin families (such as the Coppolas, Martin Scorsese, and Quentin Tarantino).

Although in most films ethnicity is not the main issue, there are many in which historical experience, intergroup relations, internal problems, traditions, and cultures are well portrayed and provide a vivid snapshot of the American experience, for example, *Far and Away*, *Gangs of New York*, *The Godfather*, and *My Big Fat Greek Wedding*.

In art and architecture, European Americans—either U.S. or foreign born—substantially contributed to the development of existing trends

A sketch of a woman and children from the December 22, 1849, *Illustrated London News* represents Bridget O'Donnel, an Irish woman whose family suffered through the Irish Potato Famine. This famine was a major factor in triggering a mass migration of almost 1.7 million Irish to America from 1841 to 1860; in the 1840s, they represented over 45 percent of total immigration.

or initiated new movements and schools that inspired others around the world. For example, the Chicago school projects, such as by Louis Henry Sullivan (Irish-Swiss), which used new technologies to create formally simple, spacious steel-frame construction buildings with little or no ornaments, are considered to be the first examples of functionalism in architecture. The second Chicago school, in turn, came into being thanks to the work and teachings of German immigrant Ludwig Mies van der Rohe.

Another German immigrant, Walter Gropius, renowned modern architect and founder of the Bauhaus School in Germany, was one of the leading architects of the international style. Another important figure was the famous industrial “Detroit architect” Albert Khan (Prussia-born Jew), known for his designs of the large American automobile factories. The American car industry itself flourished under the influence of Henry Ford (of Irish and Belgian descent), Walter Chrysler (Dutch), and Louis Joseph Chevrolet (Swiss).

The pop art movement in the 1960s, considered to be an artistic reflection of American everyday life, mass culture, and mass production, emerged also with the contribution of the children of European immigrants, such as Andy Warhol (Carpatho-Rusyn). American life was also depicted, for example, in the 1930s in the Bronx Post Office murals by Ben Shahn, a Lithuanian-born artist, muralist, and social realist.

Among either foreign- or U.S.-born world-renowned American academics of European origin who greatly contributed to American and world academia and science are Noam Chomsky (Jewish), Thorstein Veblen (Norwegian), Einar Haugen (Norwegian), as well as many distinguished intellectuals who settled in the United States shortly before or during World War II, some of whom were of Jewish descent. Among the prominent Germans were Albert Einstein, Hannah Arendt, Leo Strauss, and Erik Erikson, while among the Hungarians were physicists Leo Szilard, Eugene Wigner, and Edward Teller.

In the hotel industry, the world-famous Hilton Hotel chains were established by Conrad Hilton (Norwegian). In fashion and cosmetics there are, for example, Ralph Lauren (Jewish), Calvin Klein (Jewish), Estée Lauder (Jewish), and Elizabeth Arden (Canadian).

Also worth mentioning are some contemporary global phenomena. The most typical American foods, the hot dog and the hamburger, most probably have German antecedents. The most popular worldwide chain of fast food restaurants was established by Ray Kroc (of Czech origin), who bought the first McDonald's restaurants from the McDonald brothers (of Irish origin). Two of the most popular American sports—baseball and hockey—most likely developed from earlier forms brought from Europe. The popular blue jean trousers were first popularized in the 19th century by Levi Strauss (German).

Finally, a favorite doll among girls, Barbie, was created by Ruth Handler, a woman born to Polish immigrants. Mattel has created Barbie dolls representing numerous ethnicities, ranging from African American dolls to the Quinceañera Barbie (named for a Hispanic/Latino girl's 15th birthday celebration).

In sum, Americans of European descent have been present in all aspects of American life and have fundamentally contributed to U.S. and global society, culture, academia, and industry.

Contemporary Scene

As of 2011, according to U.S. Census data, white Americans rank second—following Asians—in educational attainment (bachelor's degree or higher), median household income, and personal income. They also have the second-highest proportion of workers in management, professional, and related occupations. The poverty rate among whites is the second-lowest among all racial groups in the nation.

Executive Actions

Executive actions from various presidential administrations have repeatedly hammered the multicultural landscape of the United States. Some of the most dramatic multicultural shifts in American history have resulted from executive action.

Basics of Executive Actions

Executive actions include executive orders and other directives of the executive branch. They are generally used by presidents to issue policy directives and to assign related tasks and duties to executive officers and cabinet members. When

the Senate or House of Representatives grant relevant permissions, executive orders actually have the force of law, meaning they are legally binding in the United States. Until the 1950s, there were no limits on how far executive orders could go; then, in 1952, the Supreme Court ruled that an executive order by President Harry S. Truman was invalid because it attempted to make law—which is the province of Congress.

Today, executive actions that deal with laws are only allowed to clarify existing laws, not make new ones, and all executive orders, proclamations, and other actions are announced to the public. Executive orders can be defeated or overturned by the Supreme Court through a case before it based on the order, or through Congress either passing a law that contradicts the executive order or refusing to fund actions required to enforce the order. To date, only two executive orders have been overturned by the other two branches.

Indian Removal Policy in the 1830s

One of the most striking examples of executive action that changed the multicultural landscape of the United States was President Andrew Jackson's Indian Removal Act, which amounted to an ethnic cleansing of several tribes.

Jackson signed the order into law in 1830. The act authorized the president to negotiate to buy tribal lands in exchange for lands outside existing U.S. borders to the west. Eventually these "negotiations" with the Cherokee—which were done under significant pressure and threat of violence and with an unrecognized tribal leader—led to the enforcement of the treaty, despite protest by the Cherokee Nation.

The treaty was enforced by Jackson's successor, President Martin Van Buren, who ordered an armed force of 7,000 soldiers and militia to remove the Cherokee from their homes and land. This forceful removal resulted in the relocation of 15,000 Cherokee to camps along what has been referred to as the Trail of Tears. Thousands of Native Americans died during the march between 1831 and 1838 from exposure, disease, starvation, and otherwise inadequate rations and by violence at the hands of frontiersmen. Those who survived the relocation were subject to unfair dealings, outright theft, and even more violence at their various destinations along the way.

The Emancipation Proclamation

President Abraham Lincoln issued the Emancipation Proclamation on January 1, 1863. The proclamation's language was sweeping: "all persons held as slaves" within any state that had seceded from the Union "are, and henceforth shall be free."

In the case of this executive action, the president used his authority as commander in chief of the armed forces under Article II, Section 2 of the U.S. Constitution to legitimize the proclamation. This authority arguably granted him the right and power to declare martial law in the secession states that remained disloyal to the Union.

The Emancipation Proclamation allowed those freed from slavery to enroll in the U.S. military forces. During the Civil War, more than 200,000 blacks joined the Union army. Most of these troops were formerly enslaved, and their numbers were vital to the north's success. The Confederacy did not allow freed enslaved people to serve in the military until the last weeks of the war. Cultural and specific racial differences between military forces, originating in former northern or Confederate states, continued to play a role in military culture well into the 20th century.

Although the proclamation did not instantly eradicate slavery, it did cause a major change. Immediately upon its issuance many enslaved people in the south fled for the Union. As the political tide turned, slavery was abolished in all but a few states before the ratification of the Thirteenth Amendment. The effective result of the proclamation was to make slavery the issue of the war; the north was the side of freedom and emancipation, which had a political and cultural effect on the outcome.

Japanese American Internment

In 1942, the U.S. government relocated and interned approximately 110,000 Japanese Americans and Japanese living in the United States, mostly along the Pacific Coast. These "war relocation camps" were almost all on the West Coast, although some internments were in Hawai'i, as well. The action came after the Japanese attack on Pearl Harbor. Of all those who were interned, approximately 62 percent were U.S. citizens.

The executive action was taken by President Franklin D. Roosevelt on February 19, 1942, when he signed Executive Order 9066. The order

allowed the designation of “exclusion zones” from which the military were to exclude “any and all persons.” This sweeping power was used to exclude all people of Japanese ancestry from all of California and most of Arizona, Oregon, and Washington. The practical result was that all people of Japanese descent were interned in camps, aided by the U.S. Census Bureau, which provided confidential personal information on numbers and addresses of Japanese Americans.

In March 1942, Executive Order 9095 was issued, freezing assets of “aliens.” This made relocation for Japanese Americans out of the designated military zones even more difficult.

Detainees were often housed in livestock stalls and shanties that lacked sufficient ventilation, sanitation, and electricity. There were shortages of food and medicine, and food that was available was often rotten. The camps were surrounded by gates and barbed wire and the perimeters were guarded by armed soldiers with shoot to kill orders. The camps were essentially prisons.

Finally, at the end of 1944, Roosevelt announced the end of the exclusion order of Japanese Americans. By then, many had already lost their homes, their livelihoods, and most of their possessions. No Japanese American was ever found to have committed a single act of treason or espionage.

Several lawsuits were filed during internment, and a few reached the Supreme Court. In *Yasui v. United States* and *Hirabayashi v. United States*, the court held that the curfews were constitutional. In *Korematsu v. United States*, the court found the exclusion order itself to be constitutional. And in *ex parte Endo*, the court ruled on a writ of habeas corpus that the government could not continue to detain an individual whom the government had found to be loyal. The decision came down a day after Roosevelt had lifted the exclusion order.

In 1988, Congress passed the Civil Liberties Act, which apologized for the internment on behalf of the United States government and made more than \$1.6 billion in reparations to Japanese Americans who had suffered internment and to their heirs.

Recent Action for Undocumented Immigrants

In June 2012 the Barack Obama administration announced an executive action that allows certain illegal immigrants who came to the United States

as children to work and remain in the country without fear of deportation, but it does not grant permanent legal status. Rather, this executive action states that the Department of Homeland Security (DHS) will no longer initiate deportation of young people without criminal records who were brought to the United States illegally by their parents and allows them to get driver’s licenses and to work and live free of constant fear of deportation.

For all eligible immigrants who come forward, the DHS will use its prosecutorial discretion to grant a reprieve, which must be renewed every two years. President Obama’s action stays within the lines of existing legal authority because it grants neither immunity nor amnesty but simply shifts the deportation priorities within the Department of Homeland Security. This executive action is the first measure by President Obama to offer instant relief to a large number of illegal immigrants, and he did not consult Congress on this action.

The action benefits the same group of people who would have been helped by the DREAM Act, which the Obama administration also supports. Thus far the legislation has been blocked by Congress, and the executive action is a means to get past the block. This move comes at a time when Latino voters, previously supportive of Obama, are putting increased pressure on his administration to assist the beleaguered immigrant community.

As many as 1.4 million immigrants could benefit from this executive action. Most of them are Latino, with about 70 percent born in Mexico. The Obama administration announced the action on the 30th anniversary of the *Plyler v. Doe* decision, a case that held that all children have the right to a public school education regardless of their immigration status. While the future of this executive action and the issues it addresses are uncertain, it undeniably will impact the trajectory of American multiculturalism in the arena of illegal immigration, one of the most salient cultural battles of our time.

Executive Order 8802 (1941)

Executive Order 8802 was issued by President Franklin D. Roosevelt on June 25, 1941. The executive order was a response to efforts by black civil rights leaders, led by A. Philip Randolph, who threatened a March on Washington to raise concerns regarding civil rights. The executive order sought to combat discrimination on the basis of race, creed, color, or national origin in wartime industries. Though Executive Order 8802 was relatively limited in scope, it set the stage for further executive intervention in civil rights and set

in motion the creation of the President's Committee on Fair Employment Practices (FEPC), the first federal civil rights agency.

Origins of Executive Order 8802

In 1941, A. Philip Randolph was the president of the Brotherhood of Sleeping Car Porters, a union affiliated with the American Federation of Labor, and a black civil rights leader. Randolph also remembered that blacks had been mobilized during World War I only to return to a nation characterized by segregation and discrimination. Randolph and other black leaders such as Bayard Rustin organized the March on Washington movement, threatening to bring 100,000 people to the Lincoln Memorial to protest discrimination.

In June 1941 Randolph met with President Franklin D. Roosevelt and presented an extensive list of demands, including a fair employment practices committee and greater opportunities for blacks to participate in the industries mobilizing for World War II. Roosevelt's New Deal coalition included blacks eligible to vote in the large cities of the north who had switched their traditional Republican allegiance. However, Roosevelt also depended on the votes of the Democratic-solid south, and segregationist Democrats often held the balance of power and key leadership positions in the House and Senate, making broad-scale action risky. The continued efforts by Randolph and other black leaders created an increasingly significant problem for Roosevelt. Faced with the threat of a march on Washington exhibiting the racial inequality in the American south and throughout the nation while mobilizing for a war to protect democracy, Roosevelt responded by issuing Executive Order 8802.

Executive Order 8802 was written primarily by young attorney and administration official Joseph L. Rauh, Jr., who later would serve in prominent positions with the advocacy group Americans for Democratic Action (ADA). Rauh was given the assignment quickly and composed an executive order for Roosevelt's signature. Even though congressional action on civil rights was not possible at this point, the executive power of the presidency could be utilized to combat discrimination.

Combating discrimination on the basis of race, creed, color, and national origin in wartime

employment was the primary objective of Executive Order 8802. The reasoning behind combating discrimination was cloaked in the language of wartime mobilization. All groups in the United States must mobilize to defend democracy according to Executive Order 8802. The U.S. government's departments and agencies as well as organizations receiving government contracts were to comply with the order by ending discriminatory practices.

The primary result of Executive Order 8802 was the creation of the President's Committee on Fair Employment Practices, known as the FEPC, that was to be headquartered within the Office of Production Management. A chairman and four other members were to be appointed by the president and they would investigate complaints and make recommendations regarding combating discrimination. The FEPC worked as the first federal antidiscrimination agency to investigate complaints on the basis of race, creed, color, or national origin. The FEPC was in many ways the precursor the Equal Employment Opportunity Commission (EEOC), the federal civil rights agency that remains in place today. The FEPC held hearings and investigated individual complaints throughout the nation. Lobbying by blacks was the impetus for the creation of the agency but the broad-based charge of Executive Order 8802 allowed any group being discriminated against on the basis of race, creed, color, or national origin to file a complaint. Jews in the northeast, Mexican Americans in the southwest, and others discriminated against on the basis of race, creed, color, or national origin had their complaints investigated. While the FEPC was constrained by a lack of enforcement authority and limited resources, it did have some tangible accomplishments in enhancing employment opportunities.

Legacy of Executive Order 8802

Executive Order 8802 was one of the first steps taken in an expansion of federal civil rights activity in the 1940s, 1950s, and 1960s. President Roosevelt reaffirmed his commitment to combating discrimination in 1943 when he issued Executive Order 9346, which increased the capacity of the FEPC. While the FEPC ceased to exist in 1946, Executive Order 8802 set a precedent for

executive action continued by future presidents and helped set the stage for federal intervention in the arena of civil rights in the 1950s and 1960s.

The inclusive nature of Executive Order 8802 is another legacy. Rather than merely seeking to combat discrimination against blacks, the order was written with a pluralist mission. Civil rights legislation was passed in the 1960s and beyond, but that vision of protecting people from multiple types of discrimination has endured with groups such as people over 40, people with disabilities, and men and women facing barriers on the basis of gender. It also set a precedent for using executive action for civil rights, a tradition continued with subsequent presidents issuing executive orders to combat discrimination.

Executive Order 9066 (1942)

On December 17, 1941, the Japanese navy attacked Pearl Harbor, an American naval base in Hawai‘i. This unexpected attack brought the United States into World War II. On February 19, 1942, Executive Order 9066, issued by President Franklin D. Roosevelt, gave the American

military broad powers to remove individuals from any areas deemed necessary for security and military purposes. Designated military zones were established in western California, Oregon, Washington, and southern Arizona. On March 18, Executive Order 9102 created the War Relocation Authority (WRA) to supervise the evacuated population. Milton Eisenhower (brother of General Dwight Eisenhower) was appointed to direct it. Although most people affected by the order were of Japanese ancestry, smaller numbers of persons of Italian or German heritage were also interned by authority of its powers.

Executive Order 9066 was issued as a precautionary measure, in response to security concerns based on large numbers of persons of Japanese descent living in Hawai‘i and the West Coast. Identifying and removing persons of Japanese ancestry was aided by the Second War Powers Act of 1942, which suspended the prohibition against revealing personal data collected by the U.S. Census. (The prohibition was restored in 1947.) As a result, records from the U.S. Department of Commerce show that the Census Bureau released information about the names and locations of persons of Japanese ancestry living in Washington, D.C., and block-level data were also used in several states to identify neighborhoods in which persons of Japanese ancestry were living.

Forced Evacuations

The War Department was charged with removing people of Japanese descent from the military zones. A voluntary removal program was tried at first, but only about 5,000 Japanese people responded. The first forced evacuations took place in February 1942 at Terminal Island, near Los Angeles Harbor, and in March on Bainbridge Island, in Puget Sound, Washington. Large-scale evacuations began later that month. Over 90,000 evacuees (about 70 percent of whom were American citizens) were brought to one of 16 assembly centers located in California, Oregon, Washington, and Arizona.

Most evacuees had only a few weeks to sell their homes and personal property and get their finances in order. Assembly centers were hastily prepared and often located in inhospitable areas. For instance, one camp in California’s Owens

Valley recorded temperatures of over 110 degrees in the summer.

Most evacuees stayed at the assembly centers for one to four months before being moved to more permanent relocation centers. Ten relocation centers were established in isolated regions of Utah, Arizona, Arkansas, Colorado, Wyoming, Idaho, and California, and were constructed on the model of military barracks. Each family was allotted one room, no matter how many people were in the family. Bathing and toilet facilities were communal, and meals were served in communal mess halls. Although it originally had been thought that residents of these centers could work in agriculture, many locations were unsuitable for this purpose, including Manzanar, California; and Gila River, Arizona; which were located in deserts, and Jerome and Rohwer, Arkansas, located in swamp areas. Ultimately, the War Relocation Authority interned over 120,000 people during World War II.

There was little public or official opposition to Executive Order 9066, and the order withstood several legal challenges. In 1943, the U.S. Supreme Court ruled in *Hirabayashi v. United States* and *Yasui v. United States* that it was legal to impose a curfew exclusively on members of a minority group, even if they were American citizens. In 1944, the U.S. Supreme Court ruled in *Korematsu v. United States* that the exclusion order was constitutional, and that U.S. interest in protecting its security outweighed the individual rights of Fred Korematsu, a Japanese American living in California, and the rights of other Americans of Japanese descent.

Public Proclamation 24, issued on September 4, 1945, two days after Japan surrendered to the United States, revoked the exclusion orders and military restrictions against persons of Japanese ancestry. All WRA internment camps were closed by December 15, 1945, except for the Tule Lake Segregation Center in California, which was closed on March 20, 1946. In March 1983, the National Council for Japanese American Redress filed a class action on behalf of all those who were interned. In August 1988, President Ronald Reagan signed H.R. 442, which provided for payments of \$20,000 to each surviving former internee.

Today, Executive Order 9066 is generally regarded as a great injustice perpetrated against large numbers of innocent people. Some historians cite the order as an early example of racial profiling because people were singled out for relocation solely on the basis of their national origins, rather than any suspected criminal activity or disloyalty.

Historians also point out that the order was issued after the United States had been attacked by the Japanese navy, forcing the country to enter World War II, actions that may have prevented those who would otherwise have spoken against the order from doing so in the interest of preserving national unity.

Fallen Timbers, Battle of

The Battle of Fallen Timbers (August 20, 1794), fought in northwestern Ohio, was the last major battle of the U.S. military campaign against the Northwestern Native American Confederacy known as the Northwest Indian War of 1785–95. General Anthony Wayne commanded the U.S. forces in a decisive defeat of the Native American forces under the leadership of Shawnee Chief Blue Jacket. The U.S. victory was key to ending Native American resistance in the area, resulting in Native American land cessions under the 1795 Treaty of Fort Greenville. The defeat and subsequent treaty paved the way for Euro-American settlement and development in the region.

The U.S. military had been fighting the Northwest Indian War since 1785. The British had ceded the area to the United States in the 1783 Treaty of Paris that ended the American Revolution, although the British still maintained forts in the area. Euro-Americans had begun settling in the Northwest Territory, sparking conflict with the Native American tribes living in the region. U.S. forces were in the region to protect settlers against the predations of the Northwestern Native American Confederacy, consisting of members of the Shawnee, Miami, Ottawa, Chippewa, Delaware, Iroquios, Wyandot, and Potawatomie tribes, among others.

President George Washington had appointed General Anthony Wayne, widely known by the nickname “Mad” Anthony Wayne, as commander of the U.S. Army of the Northwest in 1792. Wayne took command after previous commanders General Josiah Harmar and General Arthur St. Clair had failed to end the Native American resistance. General Wayne, hoping to avoid the mistakes of previous regional commanders, ensured that his troops were well-supplied, drilled, and disciplined. He utilized pre-existing forts, such as Fort Washington and Fort Jefferson, and constructed several new forts, including Fort Greenville, Fort Recovery, and Fort Defiance.

General Wayne and his men arrived in the Northwest Territory in May 1793 and entered northwestern Ohio by 1794, moving toward the Maumee River area. Meanwhile, Native American warriors had been gathering along the Maumee River, near British-controlled Fort Miamis in present-day Ohio. In the summer of 1794, Wayne answered a Native American raid on a supply train with his own raids on Native American villages and crops.

General Wayne commanded a force of approximately 2,000 U.S. soldiers aided by approximately 1,000 militia and cavalry troops from Kentucky under the command of Major General Charles Scott. Blue Jacket led a combined Native American force of approximately 1,500 to 2,000

warriors. Blue Jacket had assumed full control of the Confederacy when Miami Chief Little Turtle, who had shared the duties, resigned his position in the belief that peace was the best option. Chief Black Wolf and Chief Ottawa were among the other prominent military leaders of the Native American forces.

The Battle of Fallen Timbers occurred on August 20, 1794. The Native Americans took positions behind the fallen trees that littered the area, giving it the name Fallen Timbers. Wayne's men attacked, resulting in hand-to-hand combat. Wayne's men were reinforced by the accompanying cavalry forces, which attacked from the rear. Blue Jacket's forces were outnumbered, and the expected support of their British allies from the British forts remaining within the Northwest Territory never materialized. The Native Americans were forced to break their position and retreat from the battlefield after only several hours of fighting.

The Battle of Fallen Timbers ended as a decisive victory for General Wayne and his U.S. forces. The United States reported 33 casualties and 100 wounded. Conflicting reports estimate

Native American casualties of between 19 and 40 dead, although some scholars believe the number to be higher. Native American casualties included Chief Ottawa. Today, the Fallen Timbers Battlefield is an Ohio state park located west of the city of Maumee and southwest of the city of Toledo.

The Native American forces retreated to nearby Fort Miamis (Fort Miami), where they sought reinforcement from their British allies. General Wayne and his forces pursued Blue Jacket and his men but left when it became clear that the British were unwilling to provoke a confrontation with the United States by offering aid. General Wayne returned to Fort Greenville, but not before destroying a number of Native American villages and crops in the region.

After the Battle of Fallen Timbers, the federal government signed the Treaty of Fort Greenville with the Northwestern Native American Confederacy on August 3, 1795. Wayne had remained at the fort to assist in the treaty negotiations. Miami Chief Little Turtle was among the confederation's representatives, who ceded Native American territory in Ohio, Indiana, Illinois, and Michigan to the United States. Long-term results were an

"The Road to Fallen Timbers," a poster commissioned by the Department of the Army in 1953, depicts the final battle of the Northwest Indian War on the banks of the river in Maumee, Ohio, on August 20, 1794. The war centered on the struggle for control over the Northwest Territory, an area bounded on the south by the Ohio River, on the west by the Mississippi River, and on the northeast by the Great Lakes. The battle, a decisive victory for the United States, ended the major hostilities in the region until 1811.

end to any potential alliance between British and Indian forces, further U.S. acquisition of Native American territory, and increased Euro-American settlement in the region.

The Northwest Indian War ended in 1795 with the defeat of the Northwest Native American Confederacy. Sporadic Native American resistance to Euro-American settlement in the region continued into the early 19th century, when Shawnee Chief Tecumseh once again sought to unite a Native American confederacy against white encroachment and the destruction of traditional Native American culture. Tecumseh had been among those Native Americans who refused to sign or recognize the Treaty of Greenville.

Family and Ethnic Diversity

Families, which may be defined differently in different races and ethnicities, play important roles in individuals' lives and deeply affect their well-being. According to the 2010 U.S. Census, family households account for 68 percent of all households. This percentage is highest among Hispanic households (78.4 percent), followed by Asian, American Indian, non-Hispanic white, and black. It is worth noting that race and Hispanic origin (ethnicity) were regarded as distinct concepts by

the 2010 census. In addition, the census allowed reporting of more than one race, which helped collect more accurate information, but also presented more complexity in describing ethnic diversity of families, even though the overwhelming majority of families described themselves as only one race.

This article focuses on the comparison among non-Hispanic white (sometimes referred to as "white"), African American, Hispanic, and Asian families, citing statistics concerning those who reported that they were only one race. The comparisons are not among completely mutually exclusive groups, but they come very close. The studies on American Indians are relatively sparse, so this article has limited discussion on these families.

Race and ethnicity are regarded as important indicators of stratification in examining family relations, with their importance comparable to age, gender, and socioeconomic status. People from different ethnicities have kept their own historical and cultural heritage and are subject to their own constraints and identities formed in broader social conditions. Nevertheless, vast heterogeneity exists within each ethnic group. For example, among Hispanics, Mexican Americans are quite different from those with Puerto Rican and Cuban origins. Asian Americans also include a population with different origins and cultures. It is almost impossible to address all these diversities in this article. A description of the differences is more about general observed differences among different races/ethnicities with only brief discussion of diversity within each major group.

In addition, ethnic differences are also closely related to immigration status. Particularly, the increased Hispanic and Asian population is to a great extent driven by immigration. The 2010 census found that among the foreign-born population, 53.1 percent were from Latin America and the Caribbean, 28.2 percent from Asia, 12.1 percent from Europe, and 4 percent from Africa. First-generation Hispanic and Asian immigrants show many different patterns in their family-related behaviors from their U.S.-born counterparts.

Structural and cultural factors (they are intertwined to some extent) affect differences among families of different ethnicities in respect to fertility, marriage, single parenthood, divorce, cohabitation, interracial romantic pairings, extended familism, multigenerational coresidence, grandparenting,

and caregiving. Many of the differences observed among whites, Hispanics, African Americans, Asians, and American Indians are associated with their differences in socioeconomic status. Socioeconomic status, such as education, income, and occupation, may result from historical and cultural conditions and enforce some behaviors that are consistent with cultural expectations. For example, on average Hispanics and African Americans usually have lower socioeconomic status, such as lower educational levels and lower incomes, than whites and Asian Americans. The unemployment rate among African Americans is particularly high. These social conditions are combined with historical and cultural conditions to shape family behaviors with huge ethnic differences.

Fertility

Total fertility rate is usually used to describe the number of children a woman expects to have during her lifetime at the current birthrate. Data in 2006 revealed that the total fertility rate in the United States on average was around 2.1. This is approximately equal to the replacement rate, which is the number of children a woman should have for the population to maintain its current level. Among different ethnicities, Hispanic women have the highest fertility rate, followed by African American, Asian, white, and American Indian women. Among Hispanics, the high fertility rate is driven by the high fertility rate of Mexican Americans, with those from Puerto Rico and Cuba having much lower rates. In addition, the fertility rate is lower among the second-generation Mexican Americans (those born in the United States) than among the first-generation Mexican Americans.

The high fertility rate among Mexican Americans is sometimes attributed to the cultural norm in Mexico of having many children. However, recent studies have found different fertility behaviors among Mexicans and Mexican Americans. While the fertility rate among Mexicans is decreasing, the fertility rate among Mexican Americans is increasing. This suggests that something other than cultural reasons, such as structural and practical factors, may explain the high fertility rate among Mexican Americans. Similarly, although second-generation Mexican Americans' lower fertility has been explained as the result of

assimilation, the findings that third-generation Mexican Americans have a higher fertility rate than second-generation Mexican Americans questions the dominant role of assimilation. Overall, cultures may play important roles in affecting fertility among different ethnicities; other structural factors may also exert significant impacts.

Marriage

The marriage rate is lowest for African Americans and highest for Asians, followed by whites and Hispanics. The 2010 census shows that among family households, around 50 percent of Hispanic and white families were husband-and-wife households, compared with 60 percent for Asian Americans and 29 percent for African Americans. It is also estimated that 81 percent of white women, 77 percent of Hispanic women, and 52 percent of African American women will get married by age 30.

The reasons for the comparatively low marriage rate among African Americans usually includes their history of slavery, which made stable marriage unlikely. Additionally, the diversity of marriage statistics among ethnicities is associated with their socioeconomic status. Recent studies have shown different marriage rates among populations with different educational and socioeconomic backgrounds, with those with higher socioeconomic status more likely to get married. The relatively lower socioeconomic status of African Americans and the unemployment rate among African American males, in particular, are barriers to marriage, which to some extent is a declaration of status and builds upon economic stability.

However, even with lower socioeconomic status on average, Hispanics retain a comparatively high level of marriage rates, similar to whites. This is usually explained by cultural factors, such as the strong familism dominating Hispanic cultures that favors marriage. The marriage rate among Mexican Americans is higher than the rate for people of Puerto Rican origin. There is also a greater proportion of two-parent, single-earner families in Mexican American families than in other Hispanic families. Asian Americans also have a comparatively high marriage rate, which is usually explained by the cultures of their home countries and their generally favorable socioeconomic status.

Ethnic diversity is intertwined with immigration status. A large proportion of Hispanics and Asians are first-generation immigrants. First-generation Hispanics and Asian Americans have higher levels of marriage rates than their second-generation counterparts for several reasons. First, first-generation immigrants may have higher marriage prevalence because of the favorable immigration policy that endorses family reunification. In addition to home countries' traditional values about marriage, the limited resources of many new immigrants makes it beneficial for them to stay in their marriage and pool resources. This is particularly true for women with low levels of education, whose limited social resources will challenge their independent living; thus, they are very likely to be married and stay in the marriage. This may also explain why traditional marriage values are emphasized among first-generation immigrants.

Some researchers regard cultures as tool kits rather than doctrines because individuals may actively choose what will best serve their needs within these tool kits. As a result, both cultural and practical factors determine individuals' behaviors. Even when some behaviors seem to be consistent with traditional values, practical factors may be the actual reasons for individuals' upholding those values. In contrast, the second-generation Hispanics typically have higher educational and socioeconomic attainment than the first-generation immigrants. Their pursuit of education may delay the marriage, and abundant financial resources may reduce the need to get married.

Divorce

Whites and Hispanics have similar divorce rates within the first 15 years of their marriage, while African Americans have a higher divorce rate. Generally speaking, the divorce rate among Asian Americans is much lower than the national average. Similar to differences in marriage rates, higher divorce rates among African Americans are related to social and cultural factors. For example, divorce is likely to occur as a response to stress in the marriage. This stress quite often results from unfavorable financial status and unemployment, which is more prevalent in African American families. Among Hispanics, Mexican Americans are less likely to be divorced than those with Puerto

Rican and Cuban origins. Divorce rates among first-generation Mexican Americans is very low, while the second-generation Mexican Americans have a divorce rate similar to whites. In addition to divorce, permanent separations are also more likely to be an option for Hispanics and African Americans than for whites.

Single Parents

The number of single parents has been steadily increasing over the past decades. According to the 2010 census, 7.2 percent of all households were single-mother-headed households with children younger than 18 years old. When examined by ethnicity, single-mother-headed households accounted for 17.4 percent among African American households, 12.1 percent among Hispanic households, 4.7 percent among white households, and 4.1 percent among Asian American households. In comparison, there are far fewer single-father-headed households with children younger than 18 years old, with only 2.4 percent of these families among all households counted in 2010.

Single parenthood is closely related to divorce and unmarried birth. In the past, single parents were typically described as "disadvantaged." Although single-parent families still have higher poverty rates and lower socioeconomic status on average, recent research has shown many positive aspects of single-parenthood. Some studies have examined resources that could be mobilized for single parents, including increased involvement of grandparents. Maternal grandparents are more involved in these households, possibly because there is a much higher percentage of single mothers than single fathers.

Cohabitation

Cohabitation has become more normative in past decades. In 1970, there were only about 500,000 cohabiting couples. The number dramatically increased to five million in 2000, but stabilized in the following decade with a little more than five million cohabiting couples in 2010. In addition, a substantial proportion (40 percent) of children spend some part of their childhood in cohabiting families, which suggests that cohabitation also serves the purpose of child rearing.

The prevalence of cohabitation differs among different ethnic groups, which is often attributed

to differences in perceptions of cohabitation, as well as the social and economic status of different ethnicities. Cohabitation rates are higher among African Americans and Hispanics than whites. Asian Americans have the lowest cohabitation rate across ethnicities. One reason often proposed to explain these differences is the different levels of cultural acceptance and norms concerning cohabitation among ethnic groups. Whites are more likely to regard cohabitation as a step toward marriage, whereas African Americans and Hispanics are more likely to regard cohabitation as a substitute for marriage. For example, white partners who cohabit are more likely to marry as a result of pregnancy than African Americans and Hispanics. Even when African American partners who cohabited reported their plans to get married, their relationships were less likely to lead to marriage. In addition, children in African American and Hispanic families spend larger periods of their lives in cohabiting families than children in white families. For African Americans, the high cohabitation rate again is sometimes attributed to the history of slavery, which made marriage very unlikely, and is sometimes associated with lower socioeconomic status.

Furthermore, because the Hispanic and Asian American groups are made up of a large number of recent immigrants, the home countries' values also exert substantial influences on their behaviors. A detailed examination of Asian Americans reveals that only the first-generation Asian immigrants have a much lower cohabitation rate than whites. However, the second-generation Asian Americans are much more likely to cohabit than their parent generation, and their cohabitation rate is even higher than that of Hispanics. This may be related to the fact that cohabitation is usually not widely accepted in Asian countries and is sometimes stigmatized. In contrast, consensual unions or common-law marriages in Latin American countries are much more common and may be a stable arrangement that has many characteristics of marriage. This explains why cohabitation rates among the Hispanic population are higher.

In addition to different values and cultural heritages, increased cohabitation rates seem to be driven by the disadvantaged population with lower educational and financial resources, who

are usually overrepresented in the Hispanic and African American population. For the more disadvantaged population, marriage is usually described as a goal that is not attainable because of inability to have a secure and stable environment in which to raise a family.

Interracial Romantic Pairings

There has been increased attention to interracial marriage in the past decade because of the increase in the diversity of the population. By some estimates, interracial marriage increased more than twentyfold since the 1960s; in 2010, almost 7 percent of married-couple households consisted of couples of different races, and 14 percent of all couples (including unmarried) were interracial partners. Interracial marriage between nonwhites and whites has increased dramatically. Hispanics and American Indians are more likely to marry whites than are Asians and African Americans. Among Asian Americans, those with Japanese and Filipino origins are more likely to marry whites than those with origins in southeast Asia. This is usually explained as the differences in their socioeconomic status, which result in the segregation of occupations and residential neighborhoods. With increased education, U.S.-born Hispanics and Asian Americans are more likely to marry whites, but similar patterns are not found for African Americans.

Many studies are exploring how race/ethnicity is negotiated in this intimate relationship. For example, some studies have suggested that marriages between African Americans and whites are particularly vulnerable to racism when compared with other types of interracial marriages, and thus couples may experience more stress in the relationships and be more likely to divorce.

Extended Familism

Hispanic, African American, and Asian families appear to have stronger extended-family ties, which may provide additional safety nets for family members when nuclear families seem to be in trouble because of high divorce rates, high single-parent rates, and low marriage rates. However, recent studies have cautioned against the idea that minority families have stronger extended family ties and family members are more likely to get support from extended families, because the

exchanges between parents and adult children in minority families may not necessarily be stronger simply because of stronger beliefs in familism.

In exploring extended family ties, intergenerational relationships are the most important relationships examined. Many studies have paid attention to ethnic differences concerning intergenerational relationships between adult children and their parents, including how they exchange resources, intergenerational emotional closeness, coresidence, as well as norms and values guiding these relationships.

Minorities usually are believed to have stronger extended familism and thus stronger expectations of intergenerational obligations than whites, who are more likely to endorse the individualized self. In African American, Hispanic, and Asian cultures, the individual is more likely to be defined in relation to families, resulting in a stronger feeling of family obligation. This stronger, intergenerational obligation is sometimes described as familism, or more specifically, extended familism, in order to stress the importance of extended family ties. In Asian cultures, particularly in countries in which Confucianism is a dominant religion, such as China, Japan, and Korea, the obligations to one's older parents are described as filial piety, which has been a major theme in studying intergenerational relationships in these countries and immigrants from these countries.

Extended families of different ethnicities exchange different types of support. The patterns of exchanges are not only related to cultural norms but also are more closely related to the socioeconomic status of families. It has been generally found that African Americans and Hispanics are less likely to provide financial support to their kin; conversely, white adult children are most likely to receive financial assistance from their parents. Differences in financial support from parents can usually be attributed to differences in both parents' resources and socioeconomic backgrounds.

Concerning instrumental support or practical help, the evidence is equivocal. Although some studies find that African American and Hispanic families are more involved in exchanging this kind of help, such as providing care and housing, some studies do not. Even if African American and Hispanic families are more likely to exchange

practical help, the quality may not be comparable to that of white families because of the limited resources available to African Americans and Hispanics. Moreover, there is heterogeneity among the Hispanic population; it is reported that Mexican Americans are more likely to be involved in hands-on support between parents and adult children than are Puerto Ricans.

Some studies show that African American, Hispanic, and Asian American older adults are more likely to live with their adult children. Some studies also conclude that Hispanics live closer to their kin than whites do. Findings about familial contact are more inconclusive. Most studies find that Mexican Americans have more phone and in-person contact with their extended kin than whites; however, some studies have not found any difference, or that whites have more contact than Mexican Americans. Results concerning emotional support are also equivocal, with some studies concluding that whites have stronger emotional support exchanges among extended kin than Hispanics, and other studies presenting conflicting evidence.

Multigenerational Coresidence

From 2000 to 2010, the number of multigenerational families increased from 3.9 million to 5.1 million, accounting for 4.4 percent of all households. "Multigenerational families" refers to households with three or more generations of relatives. Multigenerational households are usually associated with poverty and overcrowded housing. This living arrangement is more prevalent in places where there is a high proportion of recent immigrants, housing costs are high or there is a housing shortage, and there are relatively high percentages of unmarried mothers who live with their parents.

Higher multigenerational coresidence rates have been identified in Hispanic and Asian American families, particularly among first-generation immigrants. Different hypotheses are proposed to explain why this is so. Some cite the stronger extended familism or filial piety in these families, while some argue that practical needs play a determining role, because this living arrangement offers the opportunity to pool resources in order to provide housing, transportation, child care, and share of household chores for the benefit

of each of the family members. Recent studies have found that the nature of multigenerational coresidence among recent Mexican American immigrants is different from the multigenerational coresidence among Mexicans. For Mexican American immigrants, multigenerational coresidence is more likely to be among those who are relatives but not as closely related as parents and their adult children. But multigenerational coresidence in Mexico is more often a living arrangement of grandparents, parents, and children. This suggests that practical needs may outweigh cultures in explaining multigenerational coresidence among immigrants.

Caregiving

Studies have found stronger norms of intergenerational obligations to care for older parents among African American, Hispanic, and Asian American families. Nevertheless, the underlying mechanisms may not necessarily be the same. For example, although both African Americans and Hispanics show a stronger preference for care by adult children, some studies have pointed out the different reasons for this preference between these two groups. African American adult children may prefer to provide care for their older parents by themselves instead of using personally or publicly paid services because of their limited opportunities for employment. Their unemployment enables them to provide care for their older parents. In contrast, because many Hispanics are recent immigrants, language barriers and traditional mistrust of public services in home countries may be more consequential in explaining Hispanics' preference for family care. Moreover, different expectations of assuming caregiving roles also suggest different psychological consequences on caregivers. For example, African Americans may feel that caregiving is less of a burden than their white counterparts do.

Grandparenting

The contributions of grandparents to the care of their grandchildren have attracted wide attention in recent years. This development is partly related to improved life expectancy that has increased the shared time available for grandparents to spend with grandchildren. It is also related to grandparents' greater ability to care for their

grandchildren because of grandparents' improved health. Generally speaking, grandparenting roles in the United States are greatly ambiguous, with no clearly defined role expectations. Intimacy at a distance has been regarded as the norm among white grandparents; that is, grandparents are expected to be supportive in grandchildren's lives, but grandparents should not be too involved and interfere with parents raising their own children. Only when the parents are facing difficulties with their children, such as in cases of teen pregnancy, drug abuse, or incarceration, will grandparents step in to help their grandchildren out.

However, grandparents from other ethnic groups may play more active roles in grandchildren's lives than their white counterparts. Grandparents in African American, Hispanic, and Asian American families are more likely to be involved in intensive care of their grandchildren. While Hispanic grandparents are more likely to assume coparenting roles, African American grandparents are more likely to serve as surrogate parents. African American children are also more likely to live with their grandparents than children of other ethnicities. The American Community Survey in 2009 showed that among grandchildren who lived with their grandparents, 62.2 percent were African American, 24.7 percent were Hispanic, and 7.3 percent were Asian American. Additionally, a higher proportion of African American children lived in skipped-generation households, that is, households with grandparents and grandchildren but no parents. This is a living arrangement that typically involves grandparents in a surrogate parenting role. In contrast, Hispanic children are more likely to live with their grandparents in parent-headed families, in which grandparents are more committed to supporting the parents.

African American grandparents have a tradition of taking care of their grandchildren, which may be traced to this group's history during and after slavery. Grandparents often looked after grandchildren in order to keep their families intact during slavery, and later looked after grandchildren whose parents went to the north to seek employment. Nowadays, African American grandparents who care for their grandchildren could be a response to teen pregnancy and single motherhood, which are more prevalent among African American families.

Grandparents, especially grandmothers, are instrumental in supporting and even substituting for their daughters in caring for grandchildren.

The involvement of grandparents could also be a response to family disruptions. In contrast, Hispanic grandparents are more involved in providing day care, that is, supporting their children instead of replacing them. This is related to familism, which emphasizes the care of extended family members. Some studies also show that even when Hispanic grandparents serve in a custodial role without the presence of parents, there may be other adult children in their households, the result of strong extended familism.

In white families, grandparents may also assume the custodial role to buffer the negative consequences related to single parenthood and family disruptions. Because these grandparents do not expect to take this role, after they assume it they report a higher level of burden than African American grandmothers. Moreover, when the grandparenting roles are more ambiguous in white families, the support available is also limited.

Despite the increased role of grandparents in caring for their grandchildren, it would be wrong to be overly optimistic about the resources that grandchildren in minority families can receive from their grandparents. Studies have shown that children from disadvantaged families obtain less help from their grandparents than those from more advantaged families. One reason is that children from disadvantaged families are more likely to have disadvantaged grandparents, who are more likely to experience financial hardship, have low levels of education, and be in poor health. This substantially limits the resources they can provide to their grandchildren. While these grandparents do make important contributions to their grandchildren, their ability to satisfy the physical and emotional needs of their grandchildren may not be comparable to the assistance provided by more affluent and better-off grandparents.

For example, living in skipped-generation households is strongly associated with poverty. In addition, children from single-parent families are less likely to receive support from both paternal and maternal grandparents. Thus, even though children in African American and Hispanic families may be more likely to receive their grandparents' care, the quality of support has to

be carefully considered, especially among those families with lower socioeconomic status.

Federal Indian Trust

The Federal Indian Trust represents an evolving legal battle and economic relationship between the United States, individual American Indians, and over 560 indigenous tribal nations. In modern courts, the trust has been defined as having all the elements of a true fiduciary relationship, in which the United States is seen ideally as a

protector of the rights and assets of its American Indian beneficiaries.

The trust has taproots that reach into indigenous traditions of diplomacy and negotiation among the many nations of the Americas' pre-colonial and diverse, multicultural past. But the trust's lateral root system can be traced most obviously to the General Allotment, or Dawes, Act of 1887, and from there to the foundational court cases of federal Indian law called the Marshall Trilogy (named after Chief Justice John Marshall) that connect the trust to a 16th-century edict of the Catholic church.

Marshall Trilogy and Federal Protection

Issued in 1493, the church's Doctrine of Discovery intended to control competition among European nations in their claims of political sovereignty over recently "discovered" lands. The preemptive right that the Discovery Doctrine allowed European explorers to claim was the right to exclude other Europeans from extending their nations' jurisdiction (not ownership) over New World lands and peoples. With that right, Marshall ruled in his U.S. Supreme Court decisions published in 1823, 1830, and 1831, came a responsibility of protection.

The protective aspect of the federal-Indian relationship has been mirrored less in practice than in intention, as revealed in the hundreds of treaties and other agreements negotiated during several centuries of interaction between indigenous Americans and their European colonizers. In treaty after treaty—even early in that relationship, before Euro-Americans began to overwhelm indigenous Americans by the sheer force of their numbers—indigenous leaders are seen trading certain rights to land and resource use for promises of protection, sometimes against other indigenous groups, but mainly against Euro-American settlers.

The Cherokee Nation cases represented in the Marshall Court's 1830 and 1831 decisions (*Cherokee Nation v. Georgia* and *Worcester v. Georgia*) make clear that the court considered America's duty toward the Cherokee to be a military one: the Cherokee needed protection from the state of Georgia and its citizens. But by 1830, Congress had passed the Indian Removal Act, and President Andrew Jackson was in league with those who wanted what is now called ethnic cleansing,

in which as many Indians as possible were forced from their homelands in the east and marched westward to Indian Territory, encompassing what is now Oklahoma, Nebraska, Kansas, and part of Iowa.

In 1871, the U.S. Congress unilaterally refused to allow constitutionally established, executive treaty-making powers to continue and declared that American Indian tribes would no longer be considered separate self-governing nations. For most of the next century, the protective aspect of the federal-Indian relationship disappeared into a twisted notion of "guardianship." Marshall had written in *Worcester v. Georgia* (1831), "[p]rotection does not imply the destruction of the protected." But American indigenous nations were nearly (some wholly) destroyed in a process that characterized American Indians as mere impediments to Euro-American Manifest Destiny.

General Allotment/Dawes Act

In keeping with the prevailing attitude that indigenous Americans were inferior to white settlers, Congress passed the General Allotment, or Dawes, Act of 1887. The law essentially privatized many indigenous homelands, attempted to destroy indigenous forms of land tenure and governance, and imposed America's trusteeship over the lands and assets of the newly allotted American Indians, ostensibly for their own good.

The act divvied up what had been collectively owned Indian lands among the individual members of allotted tribes, and turned allotted individuals (and later tribal governments) into beneficiaries of the imposed trusteeship. In doing so, the act created what courts have referred to as a general trust, which is supposed to be protective in nature. But it also paved the way for the creation of a fiduciary relationship, wherein the United States imposed upon itself certain duties toward its Native American beneficiaries, enforceable in a court of law.

Consequences

Of the many intended and unintended consequences of the Dawes Act and the Federal Indian Trust, several stand out. The act made little provision for the inheritance of allotted Indian lands, leaving (until recently) the question of the quasi-privately owned Indian estate to state courts, a

direct assault on American Indian cultural and national sovereignty; and a passing of the buck as the vast majority of Native Americans have no cultural tradition of writing wills. Greater than 90 percent of American Indians die intestate, or without a will. The Indian Land Consolidation Act of 1983 and its amendments—including the American Indian Probate Reform Act of 2004 and the American Indian Trust Fund Management Reform Act of 1994—represent Congress's attempts to remedy this and other problems created by the Dawes Act.

The major problem involved a 1910 provision for the inheritance of Indian allotted lands to heirs as tenants in common, a form of collective ownership. This meant that instead of inheriting the allotted lands of their ancestors as separate individuals, heirs of allotted Indian lands inherited interests in (percentages of) the entire allotments in common with their relatives. As a result, some allotments are now co-owned by hundreds of mostly distantly related heirs. This fractionation of ownership, coupled with restrictions on the leveraging of federal trust lands (which cannot be used as a loan guarantee) and the widespread leasing of allotted lands to non-Indians has created a situation whereby allottees and their heirs are essentially absentee landowners, even if they live on their own reservations. They own the land but have very little control over what is done with it.

And while the courts have generally agreed that the Federal Indian Trust represents a self-imposed duty that Congress and the regulatory agencies must not shirk, there has been enough financial mismanagement by federal departments and agencies that, after decades of congressional review, the largest class action ever brought against an agency of the federal government was filed in 1996. Led by Blackfeet banker turned activist Elouise Cobell and other named plaintiffs, *Cobell v. Secretary of the Interior* represented nearly half a million Individual Indian Money account holders—by definition, allotted landowners and their heirs whose assets are held in trust by the federal government.

Partial Settlement Achieved

After 14 years of heated litigation—in which federal district and appeals courts overwhelmingly agreed that the government was liable but

couldn't agree for how much—the Barack Obama administration offered a \$3.4 billion settlement for mismanagement occurring between 1985 and 2009 (although the mismanagement goes back to the trust's inception in 1887). The settlement was approved by Congress and certified by the courts in 2011. Appeals delayed its dispersal for more than a year, but late in 2012, the first \$1,000 checks were mailed to Native American individuals harmed by the massive mismanagement of the Federal Indian Trust.

Separate litigation representing the tribal trust mismanagement is ongoing. In April 2012, the Obama administration offered \$1.023 billion to settle 41 of those cases.

Feminism and Ethnic Diversity

The term *feminism* is derived from the French *féminisme*, which is a combination of the French words for women's, *féminin*, and social movement, *isme*. The term spread throughout Europe in the 1890s and to North and South America around the turn of the century. The concept of

feminism, the belief that men and women are of equal worth, has always been controversial. At its origins, even some women disavowed the term, instead asserting that to be equal with men might diminish their roles as mothers. Men who enjoy the privileges of living in societies that are patriarchal often find feminism to be a dangerous challenge to their authority. Patriarchy refers to societies that are male dominated. Such societies tend to divide qualities into “male” and “female,” valuing those associated with traditional gendered understanding of masculinity over those considered to be feminine. Some see feminism as exclusively focused on ending oppression of women, while others take a more global stance and seek the end of all forms of oppression that affect women.

The U.S. feminist movement is said to have occurred in three waves. The first wave, emerging even before the actual term *feminism* migrated from Europe, lasted roughly between the mid-1800s and the mid-1950s. The second wave, or what is often referred to as the Women’s Rights or Women’s Liberation Movement, began in the mid-1950s and lasted until the late-1970s. The third-wave began in the 1980s and continues today.

There are multiple forms of feminism. Liberal feminism is what most people are familiar with. Its focus is on legislative and judicial remedies to gender inequality. Radical feminism emerged in the late 1960s. Influenced by Marxism and the Black Power movement, radical feminists challenged capitalism as the root cause of patriarchy. Rather than advocating shared power between men and women, radical feminists asserted that the quest for power itself was the problem. Further, radical feminists denounced sex roles as rigid and oppressive. Radical feminist groups include the Redstockings, W.I.T.C.H, and Cell 16. A small group of radical feminists asserted that women should separate themselves from men, which likely created the long-lasting notion that feminists are “man-haters.” Many of these activists, however, believed that gender equality needed to be achieved before racial equality was a possibility.

The First Wave

The first wave was mostly concerned with gaining women’s suffrage. First wavers were also concerned about women’s right to own property, as

patriarchal laws generally prohibited them from doing so. Others, such as Catherine Beecher, saw education as key and spent their lives developing schools to train women. These early feminists were influenced by Native American women with whom they were in regular contact. The Iroquois and the six-nation confederacy (Seneca, Cayuga, Onondaga, Oneida, Mohawk, and later Tuscarora) were all in close proximity to Seneca Falls, New York, where the first women’s rights convention was held in 1848. Women in these tribes enjoyed far greater rights than did most white women.

Women also played major roles in the movement to abolish slavery, although that issue eventually divided the movement. In 1831, Maria Stewart, a black woman, was the first to speak publicly about women’s rights, more than five years before Sarah and Angelina Grimke did the same. Sojourner Truth also warned that if colored women did not have the same rights as colored men, then the situation would not be any better than before, as men would simply dominate women. In fact, it was gender discrimination within the abolition movement that spurred many of the first wavers.

As early as 1833, Lydia Maria Child authored *An Appeal in Favor of That Class of Americans Called Africans*, considered to be one of the first antislavery books. In her bold treatise, Child argued that people of different races should be allowed to mix freely with one another. Harriet Beecher Stowe’s *Uncle Tom’s Cabin*, one of the most influential books of all time, catalyzed the northern movement to end slavery. Women supported abolition for various reasons, including the breakup of slave homes and the horrific physical and sexual violence slave women endured. Women formed chapters of the Female Anti-Slavery Society in the 1830s, spending their time hosting conversations and distributing pamphlets that called on women to exercise any influence they had with men to abolish slavery. Former slave Sojourner Truth lectured audiences around the country about not just slavery but also women’s rights. Women’s groups gathered the bulk of signatures on petitions asking state legislatures to abolish slavery, and in 1863, feminists Susan B. Anthony and Elizabeth Cady Stanton formed the National Women’s Loyal League to petition

Women's suffrage hikers (from left) "General" Rosalie Jones, Jessie Stubbs, and Colonel Ida Craft gather in New York, circa 1910–15. Craft is wearing a bag labeled "Votes for Women Pilgrim Leaflets" and a banner with a notice for a "Woman Suffrage Party, Mass Meeting." First wave feminism was primarily concerned with gaining women's suffrage, and a push to include women of color within the ranks ultimately divided the movement. Women formed antislavery societies in the 1830s but many did not allow women of color to join.

Congress to free the slaves. It was the first women's political organization in the United States. In 1869, Frederick Douglass, Lucy Stone, and others formed the American Woman Suffrage Association to support the voting rights of black women. Similarly, Elizabeth Cady Stanton and Lucy Stone helped form the National Woman Suffrage Association with the same goal.

Interestingly, many of these antislavery societies did not allow women of color to join, suggesting that these groups opposed slavery but did not necessarily believe in racial equality. In 1840, Elizabeth Cady married abolitionist Henry Stanton and the two attended the World Anti-Slavery Convention in London. Cady was relegated to a small area designated for women. After that experience, she and another delegate, Lucretia Mott, became more serious about women's rights and on July 19, 1848, joined with more than 200 other women in Seneca Falls to draft the Declaration

of Sentiments, modeled after the Declaration of Independence, which called for full rights under the law for all. Women's suffrage, however, was not a part of the Fifteenth Amendment.

In 1892, black feminist educator Anna Julia Cooper, a former slave, is said to have authored the first black feminist book called *A Voice from the South by a Black Woman From the South*. At age 67, she was, the first woman student of the University of Paris–Sorbonne to earn a doctoral degree in 1925. She helped create a number of black community and cultural organizations devoted to equal employment, education, and housing, such as the Phillis Wheatley YWCA, Bethel Literary and Historical Society, and the Colored Women's League.

Although some feminists were satisfied with the ratification of the Nineteenth Amendment, which gave women the right to vote, many were not. Concerns about women's reproductive

rights, violence against women, and other issues remained salient for many activists. In particular, women of color remained vigilant about ensuring women's bodily integrity. Some women's activists, however, supported the eugenics movement of the 1910s and 1920s. They believed that some mixing of the races would lead to depravity and delinquency and advocated sterilization of those deemed "feeble-minded." Estimates are that more than 70,000 women endured coerced or forced sterilization from 1907, when states began enacting legislation authorizing it, until the 1970s. It was disproportionately women of color, and especially Native American women, who suffered from these procedures. Some of the women who fought so hard for suffrage, like Alice Paul, dismissed any of the race-related issues they had previously addressed.

The Women's Ku Klux Klan (KKK) was formed in 1924, during a period when the KKK was at record enrollment and was leading lynchings of black men throughout the country. Some feminists helped counter this era of hate by protesting against lynchings. In response to pleas from black churchwomen in the 1930s, Jessie Daniel Ames formed the Association of Southern Women for the Prevention of Lynching. Many took their lead from feminist and First Lady Eleanor Roosevelt, who vocally opposed anti-Semitism and racism.

Women of color were often prohibited from voting in the 1920s, 1930s, 1940s, and 1950s, despite passage of the Nineteenth Amendment. States had enacted harsh Jim Crow laws that required poll taxes or literacy tests. It was women like Mary McLeod Bethune, who founded the National Association of Colored Women, who fought to obtain equal access for all.

In sum, the first-wave feminists helped achieve suffrage for women and called important attention to issues. While some sought to address racism and to help women of different ethnic groups, this was not a primary focus, nor was the movement generally inclusive.

The Second Wave

The second wave began in the 1950s. Activists focused on a variety of issues, including gender equality in the workplace, sexual harassment, health and reproductive rights, educational opportunities for women and girls, political

participation, and sexual and racial harassment. Many supported passage of an Equal Rights Amendment (ERA) that was never ratified.

Critics have long asserted that the second wave, too, suffered from an inclusivity problem. Some black civil rights leaders, such as Cellestin Ware, Pauli Murray, and Shirley Chisholm, were integral to the Women's Liberation Movement. However, many have asserted that the second wave relied far too much on the voices and perspectives of middle-class white women and, while women of many racial and ethnic groups did work together at times, often it was on specific issues rather than as a general rule. Yet, it is clear that the women's rights movement gained much of its momentum in the 1960s and 1970s from the civil rights activism of the 1950s and 1960s.

In addition, feminists gained inspiration and tactics from the Chicano rights movement and the Native American rights movements. In 1973, several black women, including Michele Wallace, Faith Ringgold, Doris Wright, and Margaret Sloan-Hunter, borrowed the New York office of the National Organization for Women (NOW) to form the National Black Feminist Organization (NBFO) as a means of integrating black voices into the feminist movement. These women were also concerned that black women were marginalized within male-dominated civil rights organizations. The NBFO drew attention to the importance of interconnected or interlocking systems of oppression. They made visible the fact that women did not just suffer from sexism but also from racism, classism, homosexual prejudice, and other issues. Author Alice Walker called black feminism "womanism."

The Combahee River Collective was a black feminist lesbian organization that emerged from the NBFO in Boston from 1974 to 1980. The name was taken from the historic event at Combahee River, South Carolina, where Harriet Tubman led a movement that freed some 750 slaves. Determining that they were more radical than the NBFO, Barbara Smith, Demita Frazier, and others were concerned that other black feminist groups did not adequately address the issues faced by lesbians. The group authored the Combahee River Collective Statement, which addressed interlocking systems of oppression; the importance of black feminist activism; the connections between

capitalism, imperialism, and patriarchy; and the need to address racism within the white women's feminist movement. One of its best-known members was poet Audre Lorde, who wrote frequently about intersectionality, including "The Master's Tools Will Never Dismantle the Master's House," which asserted that white feminists were as oppressive as white slave masters.

Yet, what many do not know is that black women were some of the founders of the feminist movement. Among the movement's early leaders were Flo Kennedy, the second black woman admitted to Columbia University; Pauli Murray, the first black female Episcopal priest; and Shirley Chisholm, the first black female member of Congress. In 1971, Flo Kennedy formed the Feminist Party, making the movement overtly political. Chisholm became the first woman to run for president.

There were also many influential Chicana feminists in the 1960s and 1970s. Like many black women, Chicanas felt that their contributions to the Mexican American protest movements, like La Raza, had been minimized. In 1973, activists formed the Comisión Femenil Mexicana Nacional to connect Chicana feminists and to advocate for the rights of Chicana women. In particular, these women wanted to challenge the patriarchal Chicano value system and sought greater inclusion in Chicano/a movements. Many Chicana authors helped promote feminist beliefs, including Cherie Moraga, Gloria Anzaldúa, and Ana Castillo.

Native American women were also actively involved in promoting women's rights. They, too, were not typically included in white women's feminism but instead worked within Native American civil rights movements and formed their own organizations. Native American groups were more likely to emphasize the maintenance of ethnic and cultural identity than were other civil rights groups of the era, which were generally advocating for greater inclusion in mainstream society. The emphasis was on empowering the tribe, not individuals. The American Indian Movement (AIM), modeled after the Black Panther movement, was formed in 1968. Mostly male activists coordinated a series of efforts that often ended violently. In 1985, Wilma Mankiller made history when she became the first female chief of the Cherokee nation. Mankiller had been involved

with AIM's occupation of Alcatraz Island in 1969. As chief, she battled a male-dominated structure and value system.

The 1960s also saw the first appearance of organized Asian American feminism. They challenged the Confucian belief in male superiority and adherence to the status quo. Many identified with the activists opposed to the war in Vietnam. Activists sought to better the communities in which they lived, forming centers for drug-addicted women, child care centers, women's health care cooperatives, and domestic violence shelters.

By the 1980s, the feminist movement began to focus more globally. It also saw the beginning of a new type of feminism that has been characterized as the third wave.

Third-Wave Feminism and Transnational Feminism

Third-wave feminists, like authors Jennifer Baumgardner and Amy Richards, Judith Butler, and Elle Green, critique earlier feminists' narrow focus on gender, a critique long inspired by women of color, such as bell hooks, Gloria Anzaldúa, Patricia Hill Collins, and Audre Lorde. This wave emerged as a result of the idea that feminism had reached a turning point. As previous waves of feminism were known to address assumptions about gender and equality, more contemporary feminists began to draw attention to the limitations of these particular foci, instead emphasizing the importance of the multiple identities held by women. Third-wave feminists are influenced by both postcolonial and postmodern theories, which question the concepts of truth, certainty, and objectivity. Third-wave feminists re-examine social constructs related to gender that traditionally have been used to oppress women. Third-wave feminists create more fluid conceptions of identities by challenging and redefining what it means to be a feminist in a globalized world. Thus, third-wave feminists focus more on difference than on commonalities, asserting that women's unique experiences can only be understood in the context of their social, cultural, political, and economic backgrounds.

Third-wave feminism addresses misconceptions about the nature and intent of feminism and creates significant space for ethnicity to be directly addressed by feminists across borders.

This version of feminism debunks many of the negative misconceptions of feminist work as a white, middle-class movement primarily or solely invested in gender equity. Rather, third-wave feminism recognizes far more than did the previous waves that women of color, lesbian women, women with disabilities, third world women, and other groups have specific and differing needs than do white women from the developed world.

Third-wave feminism is often conceptualized as a contemporary wave of feminism involving a younger generation of activists. Young feminists are encouraged to explore personal and political contradictions, such as denouncing derogatory, mediated images of women but choosing to wear lipstick and traditionally “feminine” clothing. Because third-wave feminism emphasizes and encourages these different identities, activists unite around common issues that are related to social justice. They embrace feminist commitments to include critiques against militarism, negative media representations, immigration, and other issues related to social justice and human rights. Third-wave feminists have supported and created popular culture that embraces women.

Third-wave feminists acknowledge all of the negative associations and connotations of claiming the term *feminist*. In fact, the term *feminist* frequently evokes problematic emotional responses, and many young women have a difficult time claiming it, even as their political agendas directly align with values connected to feminism. Even as individual women live in ways that directly benefit from earlier feminist work, discomfort prevails about who can claim the term *feminist*. In sum, third-wave feminists acknowledge how they inherit a legacy of power and exclusion. Further, third-wave feminists are far more likely to engage males as allies in the movement toward equality. In particular, some scholars and activists in the second wave were perceived to have been “anti-male.” Third-wave feminists often seek to dialogue with men, and there are many male-led feminist groups such as the National Organization for Men Against Sexism (NOMAS).

Third-wave feminism examines the role of third world women in political activism and resists a monolithic understanding of feminism by situating difference at the fore. Western frameworks have historically discouraged third world women

and women of color from fully participating in the feminist movement; therefore, feminist activists and scholars today utilize new frameworks and methods to engage a more diverse set of women and men.

Transnational and Postcolonial Feminism

Transnational feminism addresses the problematic ways that differences between women have been addressed and/or denied in the feminist movement. Scholars such as M. Jacqui Alexander, Trinh T. Minh-ha, Wendy Hesford, and Wendy Kozol acknowledge how ethnicity, race, and class affect change. They explore how global capitalism creates unequal opportunities for women. Brought together by a common goal—social justice—transnational feminism addresses how gender matters within a global economy. They critically examine how histories of colonialism and imperialism disproportionately disempower women.

Postcolonial feminism, linked to transnational feminism, critically examines the effects of colonialism on the lives of women. Postcolonial feminists like Sara Ahmed critically assess the concept of “other”—nonwhite, non-Western women—and call attention to the effects of histories of oppression on women. In fact, postcolonial feminists critique misconceptions of the third world women, exploring ideas of how women are “othered” and how this process is inscribed with power and privilege. In these cases, a Western framework is imposed to misread and often dismiss, trivialize, or infantilize the third world woman, who is assumed to be passive, weak, and static. Thus, there is a consistent critique of the essentialism—a static representation of what constitutes a woman—that occurs within these discourses.

The key component of transnational feminism is the attention paid to identities, experience, and difference. Unlike different feminist movements of the past, transnational feminism places emphasis on making difference visible, rather than erasing difference. In fact, transnational feminism resists the idea of “global sisterhood” often found in multicultural feminism as well as in early versions of feminism. Global sisterhood and similar concepts that evoke community are important because they point out that all women experience gendered oppressions. However, transnational feminism recognizes that the idea of sisterhood

may serve to minimize the issues experienced by and contributions made by non-Western women in that those defining the “sisterhood” and the agenda for activism have been historically dominated by Western, white women. Real activism that changes conditions for women globally seeks to acknowledge the issues of power and privilege.

Transnational feminists are committed to creating opportunities for solidarity. Transnational feminists like Chandra Talpade Mohanty argue that solidarity occurs as a result of critically assessing the self and understanding how the values of capitalism are incompatible with antiracist feminism. Transnational feminists believe women must be reflective about their experiences and the relationship to global capitalism before common activism for social justice can occur.

Fences

Fences, the Pulitzer Prize– and Tony Award–winning play by August Wilson, examines generational conflict, access to opportunity, and evolving definitions of manhood in the interstitial period between the Korean and Vietnam Wars. It occupies the sixth slot in the Pittsburgh Cycle. By 2012, it had been produced twice on Broadway and was the most commercially successful of Wilson’s plays.

An Autobiographical Masterpiece

August Wilson was born Fredrick August Kittel, Jr., on April 27, 1945, to Daisy Wilson, an African American woman from North Carolina, and Fredrick Kittel, Sr., an immigrant from Germany. He was raised by his mother and stepfather, David Bedford, in Pittsburgh's predominantly black Hill District. During Wilson's adolescence, the family moved to Hazelwood, a working-class, mostly white immigrant neighborhood in Pittsburgh in which the family encountered considerable racial animus. Although he dropped out of high school at age 16, Wilson was such a voracious reader that the Carnegie Library of Pittsburgh eventually awarded him an honorary degree. He was especially attracted to the works of Malcolm X, Langston Hughes, Ralph Ellison, and Richard Wright.

Having been inspired by the Black Arts movement's embracing of African American culture and history, Wilson first worked as a poet prior to turning his attention to the theater. After successful presentations of his first two works, *Jitney* at the Playwright's Center in Minneapolis and *Ma Rainey's Black Bottom* at the O'Neill Playwrights Conference, Wilson developed *Fences* at the Yale Repertory Theatre, under the helm of Lloyd Richards, dean of the Yale School of Drama and director of the original Broadway production of *A Raisin in the Sun*.

Set in the Hill District between 1957 and 1965, *Fences* chronicles the Maxsons, a blended Pittsburgh family ruled by their titanic 53-year-old patriarch, Troy. A former baseball player in the Negro Leagues, Troy is an ex-convict-cum-garbage-man who campaigns for equal treatment at work and special treatment at home. He overwhelms his wife, sons, and best friend, imposing his will on every person he encounters. Gradually, Troy's behavior alienates his wife, Rose, and youngest son, Cory. When his ego leads him to impregnate another woman, his fall from grace is almost mythic and Rose emotionally withdraws from his life altogether.

In that it focuses on a single character rather than a large ensemble, *Fences* has the most conventional structure in any of the Pittsburgh Cycle's plays. A tragic hero in the mold of Greek and Roman dramas, Troy is torn between his duty to provide for his family and his own hubristic

personal desires. Wilson represents that schism in Troy's name, Maxson, which is a portmanteau of Mason-Dixon, the traditional cultural dividing line between north and south in America. Like many of his other works, *Fences* features a dysfunctional father-son relationship, a mentally impaired soothsayer, black religious practices integrated neatly into the plot, institutional racism as a constant impediment to success, and Wilson's trademark poetically naturalistic language. There are autobiographical elements as well. Bedford worked as a garbage man. Wilson had argued frequently with his stepfather about his high school athletic career. In addition, Bedford had served time in prison prior to marrying Wilson's mother, and he died while Wilson was still a young man.

Production History

Fences was first presented in a staged reading at the 1983 O'Neill Playwrights Conference, followed by a run at the Yale Repertory Theatre two years later. The original Broadway production opened at the 46th Street Theatre on March 26, 1987, where it played 525 performances. Leading the cast were James Earl Jones as Troy and Mary Alice as Rose. At various times during its run, Billy Dee Williams, Lynne Thigpen, Courtney B. Vance, Frankie R. Faison, Ethel Ayler, and Tatyana Ali essayed other roles. The production won four of the six Tony Awards for which it was nominated, including Best Play, Best Direction of a Play, Best Actor in a Leading Role (Jones), and Best Actress in a Featured Role (Alice). In addition, it won Drama Desk Awards for Outstanding New Play, Actor in a Leading Role, and Actress in a Featured Role. Finally, the play was awarded the Pulitzer Prize for Drama (Wilson would win again three years later for *The Piano Lesson*).

A well-received Broadway revival opened at the Cort Theatre on April 26, 2010, with Denzel Washington and Viola Davis as Troy and Rose. Wilson's wife, Constanza Romero, designed the costumes. Kenny Leon, who directed the production, previously had directed *Gem of the Ocean*, *Radio Golf*, and the revival of *A Raisin in the Sun* on Broadway. The production broke box office records, recouped its entire \$2.8 million capitalization in less than two months, and won three

Tony Awards: Best Revival, Best Leading Actor, and Best Leading Actress.

Feng Shui

Feng shui, which generally translates to "wind and water," is an ancient folk art that originated in China. It consists of arranging structures and objects to maximize *qi*, a movable life force that can be positive or negative. This arrangement is thought to increase the harmony between people and their environments. The slope of a building site, its soil quality, and the climate are all factored into a feng shui assessment.

Qi, pronounced "chee," is one of the most important concepts within the practice of feng shui. Qi represents the celestial breath of the mythical dragon as well as the life force of every person. Qi is thought to flow everywhere but is more plentiful in some places. As qi brings prosperity, good luck, and happiness, in general the

aim of feng shui is to allow for the ready flow of qi. Some ways to make this happen are to reduce sharp edges and remove clutter and debris.

During the early 19th century, the United States was introduced to feng shui by the first Chinese immigrants. The most notable examples of early American feng shui include the Chinese ghetto, the Four Corners section of New York, and the Chinatowns in San Francisco and Los Angeles. Mao Zedong outlawed feng shui in the Peoples Republic of China because he considered it a superstition and believed that many fraudsters promulgated the practice.

As of 2013, feng shui is again practiced in China, as well as many other places in the world. The United States in particular is home to a flourishing cottage industry of feng shui practitioners who consult about landscaping and interior design. One notable feng shui user is Donald Trump, who reportedly does not believe in the practice per se, but desires to retain Asian business by respecting the practice.

In 1991 the American Feng Shui Institute (AFSI) was founded in the Los Angeles area by Chinese American Larry Sang. As of 2013 it is the longest-established school of feng shui in the United States in one, steady location. The school boasts graduates in many countries all over the world.

Modern Meaning

The modern aim of the practice of feng shui is to collocate the constructed human environment and good qi places. Ideal qi locations are both temporal and physical. The practice includes lucky objects as well as ideal qi spots. These objects include aquariums, tassels, plants, statues, and wind chimes as well as representations of various animals. Each item is imbued with certain meanings. Many modern practitioners in the United States see clutter, a focus of Feng Shui, as a uniquely American problem that makes the practice especially well-suited for modern American life.

Aquariums are thought to bring prosperity and favorable luck to the structure they grace. They are ideally placed outdoors next to the home or in the central family living area. This is in part due to the supposed ability to absorb negative qi that fish have generally. Water itself, though, is beneficial, and fountains and waterfalls are also believed to bestow positive qi on a structure. This

tradition is one of the most common in current feng shui practice among modern Americans.

Tassels bless and protect a space. They are nearly always red and often feature symbols thought to be lucky. Chinese coins symbolize prosperity. The most modern and current practice of the coin and tassel is hanging from the rearview mirrors of cars; this is mostly an Asian American practice. Live plants are thought to harness chi and are ideally placed in the upper right corner of a room as determined when the viewer stands with his/her back in the doorway. Among the younger generations of Americans, even Asian Americans, this placement tradition is mostly forgotten and is not commonly used, even by professional feng shui practitioners.

Wind chimes mediate between wind and water and result in peace and stylishness. Different kinds of wind chimes are thought to work against different problems. In modern feng shui use, wind chimes are used more for general good luck as well as style.

The various animals in feng shui have well-established meanings within the practice. The dragon symbolizes power and authority and should only face inward, not out a window or door. Tigers represent strength and courage and should appear calm, not as if they are striking. Elephants symbolize dignity and the high moral behavior expected of powerful, prominent positions. In modern use, these animals do retain their basic feng shui meanings, but the detailed rules about their positioning are rarely followed.

Filipino Americans

Following almost 400 years of colonization by Spain and the United States, scholarship on Philippine history and its heritage among Filipino Americans, often referred to as the “forgotten Asians,” has emerged slowly since the Philippines became a republic in 1948. More studies have materialized in the past 40 years, capturing the unique historical and political ties between the Philippines and the United States.

Precolonial Period

Situated southeast of the Asian mainland above the equator, the islands of the Philippine archipelago received their first inhabitants as early as 40,000 to 50,000 B.C.E. The indigenous people developed a wide variety of tools, agricultural and hunting techniques, as well as varieties of pottery, folklore, textiles, wood carvings, musical instruments, and house- and boat-building technologies. As sea routes and trade communities expanded, so did prospects for increased migration to neighboring territories, cross-cultural dialogue, and intercultural marriage. Manila’s seafaring merchant trade began with Borneo and the Indonesian Islands by 300 C.E., with India and China by 800 C.E., and with Muslim missionaries who arrived in the southern Philippines by 1240 C.E.

Men, Pioneers, and Laborers

Though Ferdinand Magellan is celebrated for “discovering” the Philippines in 1521, Ruy Lopez de Villalobos named the archipelago Felipinas in honor of Crown Prince Felipe (Philip II), who finalized Spanish rule on June 24, 1571.

The enslavement of the Philippine Indios (a derogatory Spanish name for the indigenous peoples of their colonies) imposed new labor trades, including seafaring to the Americas. Known as Manila Men, Filipino sailors served on Mexico-bound galleon ships from 1565 to 1813. This sea cargo enterprise transported Asian goods twice a year between Manila Bay and the Bay of Acapulco.

The first documented presence of Manila Men in America occurred on October 17 or 18, 1587, in Morro Bay, California. Some historians theorize Filipino seamen wandered throughout various parts of America when galleon ships arrived in Mexico—escaping captivity and possibly traveling northward through Veracruz.

On March 31, 1883, Lafcadio Hearn's article dedicated to Filipinos in America for *Harper's Weekly* highlighted the bizarre existence of Filipino villages in St. Malo on the Louisiana bayous. Of note are historical documents discovered by Nestor Palugod Enriques chronicling at least 31 Manila-born men who enlisted to fight in the War of 1812 against the British, alongside many others of Asian descent.

With the Gold Rush of 1848, whaling ship expeditions to the arctic, and growing participation of Filipinos in the agriculture industry, even greater numbers of laborers and sailors of Philippine ancestry arrived in California with hopes of wealth acquisition and a new start in the "promised land." By this time, the growing Philippine diaspora extended throughout the United States, with some Filipinos even losing their ethnic identities over time through intermarriage with multiple nationalities.

U.S. Annexation of Philippine Territory

On December 10, 1898, Spain sold the independent Republic of the Philippines to the United States for \$20 million. This event responded to a countrywide initiative for independence inspired by the martyrdom of Philippine national hero, Jose Rizal. The ensuing Philippine-American War endured from 1899 to 1902.

The colonization and Americanization of the Philippines resulted in unique U.S.-Filipino relations. As early as 1903, pensionados (wealthy, upper-class Filipinos) were allowed to study in the United States, provided they return to serve in the

Philippine government for every year of schooling abroad.

Thousands of Filipino migrant laborers traveled to Hawai'i's sugar plantations starting in 1906. Still others traveled to Alaska's fish canneries and to California's agricultural farms. Many urban communities named "Little Manila" emerged as a result of mass Filipino migration to the United States, making available pockets of housing and providing cultural centers for Filipino camaraderie and entertainment.

Under the American occupation, Filipinos became U.S. nationals who were neither "aliens" nor "citizens" on American soil. Incoming first-wave immigrant travelers from the Philippines to Angel Island carrying American passports were granted unlimited arrival to and departure from the United States until the 1934 Tydings-McDuffie Act limited immigrant entry to 50 Filipinos a year. The Hawai'ian Sugar Planters Association's exemption from this law, however, allowed unrestricted Filipinos to continue to enter the United States as laborers (*sakadas*) via Hawai'i.

The second wave of Filipino immigrants, from 1941 to 1959, included war brides of World War II American veterans. Over 250,000 Filipino Americans were drafted into the U.S. military during World War II. They fought alongside Americans throughout Europe and Asia, though many were denied veteran status decades later. Following the declaration of Philippine independence, President Truman granted U.S. citizenship to Filipinos. Another wave of Filipinos entered the United States after Congress passed the 1965 Immigration and Nationality Act to assist with shortages in the U.S. workforce. By 1973, increasing numbers of Filipinos continued to move to the United States as laborers and professionals throughout the regime of Philippines President Ferdinand Marcos and the Aquino-led People Power movement of the successor regime. Migrant domestic workers, like nannies and helpers, continue to establish roots in the United States today.

Impact on the U.S. Medical System

During the U.S. occupation, many Filipinas received U.S.-sponsored training in American nursing curricula, which established collaboration between Filipino nurses and U.S. hospitals.

This education initiative prompted mass migration of nurses of Filipino origin to the United States, a tradition that continues to impact contemporary multicultural America. According to the National Council of State Boards of Nursing in Chicago, by September 2012, 2,662 more registered nurses and practical nurses from the Philippines comprised the nation's top tier of internationally educated candidates to pass the board exams. Health worker migration by Filipinos to the United States has increased over the past 65 years and affects the direction of career choice among many Filipinos entering and living in the United States. Established in 1979, the Philippine Nurses Association of America Inc. has expanded its response to the growing needs of Filipino nurses in the United States, while guiding the influential presence of Filipinos in the U.S. health care industry.

Multiculturalism and Filipino Americans

To understand with more gravity the significance of Filipino American history, identity, and lived daily experience, writers and scholars have sought to celebrate Filipino American culture and appreciate more fully the long historical relationship between the United States and the Philippines. Whether taking interest in rejuvenating Stockton's Little Manila or exploring responses

to American-style presentation of Filipino foods, like *palabok*, *adobo*, or *pancit* in Filipino restaurant chains in the United States (Jollibee, Max's, Goldilocks), Filipino Americans share a rich collective background and cultural pride in their roots, religious faith, and ancestral bonds.

Filipino American heritage and education initiatives, like www.FAHNS.net, the Filipino American Education Institute; the Filipino American Curriculum Project, www.ijeeepney.com; and Pinoy Teach have sought to explore more deeply the roots of Philippine and Filipino American history, identity, and ethnicity. The 2006 traveling national exhibition titled "Singgalot" represented the Smithsonian's centennial effort to tribute Filipino American contributions to U.S. history. Founders of the Filipino American National Historical Society, Fred and Dorothy Cordova, have collaborated with Filipino Americans from coast to coast, cooperatively reclaiming and archiving oral histories, reconstructing the Filipino American legacy, and connecting Filipino communities to their rich roots in the Philippine archipelago, as well as to one another.

Contemporary Filipino Americans

In 2010, the U.S. Census Bureau documented 2,555,923 Americans with ancestral roots in the archipelago of the Philippines. The Filipino

Whitney, an outdoor oven, and Lafcadio Hearn (top right); and a vegetable garden on a pier (bottom right). Whitney and Hearn were journalists and historians; Hearn's article in Harper's Weekly is the first known article written about Filipinos in the United States.

American diaspora has emerged as the second largest group of Asian Pacific origin, with concentrated populations in California (1,195,580), Hawai'i (197,497), Illinois (114,724), New Jersey (110,650), New York (104,287), Texas, (103,074) Nevada (98,351), Washington (91,367), Florida (90,223), and Maryland (43,923).

Not always visible to mainstream culture is the individual and collective impact of Filipino Americans in the artistic, literary, economic, cultural, religious, social, historical, political, educational, and academic facets of citizen life in the United States. Like many other inhabitants and U.S. citizens in multicultural America, Filipino Americans are professionals, technical workers, family caregivers, educators, entrepreneurs, students, skilled and semiskilled laborers, artists, athletes, entertainers, scientists, journalists, authors, medical practitioners, and filmmakers, among many other occupations.

Many Filipino Americans choose to remain in the United States and embrace a hybrid of ancestral and/or local traditions and ways of life, perhaps retaining ties to family, friends, culture, news, and other motherland connections in the Philippines. Others decide to return to the Philippines for vacation, school, work, education, and/or retirement. Exposure to the breadth of cultural exchange presented by multicultural models of education and/or exposure to multiethnic cosmopolitan hubs offer Filipino Americans unlimited choices to venture within or beyond their Filipino American roots to seek new opportunities for global travel and gather international educational and/or work experience.

Finnish Americans

Finland is a northern European country, notable for its sparse population (the most sparsely populated in Europe) and its late introduction of industrialization by European standards. Until 1809 it was part of Sweden, and so depending on the date of immigration, it is not always possible to

differentiate between Finnish and Swedish Americans. From 1809 to 1917, it was part of the Russian Empire but has since been independent.

Finns do not always agree about who is and is not a Finn; as a linguistic definition, it is easy to determine Finnish speakers, but as an ethnic group, there is not universal agreement about whether the Swedish-speaking population of Finland should be included. (A 2008 genetic study found that Swedish-speaking residents of Finland are more closely related to Swedish residents than to Finnish-speaking residents in their own province.) The Finnish language is in the same family as Estonian; Swedish is unrelated. The origin of the Finns as a people is unclear, adding to the controversy of defining who is a Finn today; while there is archaeological evidence that Finland has been inhabited since the last ice age, it is not clear that today's Finns are descended from the original inhabitants. Certainly Finns are more closely related to other Europeans than to the Sami, the indigenous people of Scandinavia, but given thousands of years of invasions and intermarriages, this does not necessitate an extra-Finland origin of the Finns.

Finnish Americans, of whom there are about 700,000, may be descended from Finnish speakers from either Finland or Sweden, Swedish speakers from Finland, or Sami. Some Norwegian Americans may also be descended from Kvens, the descendants of Finns who left Sweden or Finland for Norway in the 18th and 19th centuries. There have been Finns in North America since the founding of New Sweden, the 17th-century Swedish colony along the Delaware River. A small but healthy Finnish community developed in New Sweden before the colony was taken over by the Dutch in 1655. Just before the transfer, Martti Marttinen joined the colony. He later Anglicized his name to Morton, and his great-grandson John Morton was a signer of the Declaration of Independence.

Until the 19th century, Finnish immigration to the United States was low. In the 19th century, transportation advances that made the trip abroad cheaper and safer, combined with worsening agricultural and economic conditions in Finland, encouraged Finns to begin immigrating to the United States as so many other groups were doing. The vast land of America attracted many farmers, as well as thrill-seekers and other migrants.

Agents—professional recruiters for companies in industries like mining and shipping—moved in secret through Finland, against the wishes of the government, spreading the word of American opportunities. Three thousand Finns moved to the United States in the 1870s and 36,000 in the 1880s. When the Russian government began an extensive program designed to Russify Finland, that number jumped fivefold.

The Great Laestadian Migration of 1864–95 was a migration of Finnish families from Finland and northern Norway to the United States after the death of Lars Laestadius, the founder of their religious sect. Laestadians settled mainly in the midwest and northwest, homesteading farms in Washington, Oregon, South Dakota, and Minnesota, or settling down in mining communities in Michigan.

Today, the greatest concentrations of Finnish Americans are still seen in the three regions settled by Finnish immigrants in the 19th century: the northeast, particularly New York City and New England; the upper midwest; and the northwest. The Finn Hook of northeastern Minnesota, northern Wisconsin, and the northwest half of Michigan's Upper Peninsula has the greatest concentration of Finnish Americans in the country. Because their migration was late in the 19th century and so many other immigrant groups had already arrived to claim arable land for farming, many Finns took up work in forestry, mining, and construction.

Finns were well accepted by existing American communities; like other northern European immigrants, they seem to have been embraced as being closer to the “original American root stock” than the southern and eastern Europeans and non-Europeans, whose immigration had accelerated so greatly in the 19th century. In mining communities, they were somewhat less well accepted because of the competition for jobs; in particular, their relationship with Irish Americans suffered from this competition, as the Irish had been denied work in so many other places.

Finlandia University, founded in 1896 as the Suomi College and Theological Seminary, is currently the only Finnish American college in the country. A private university in Hancock, Michigan, it is affiliated with the Evangelical Lutheran Church but is not a seminary, offering bachelor's

degrees in business administration, fine arts, education, health sciences, and liberal arts. Finnish American culture is an important part of Finlandia University, which operates a Finnish American Heritage Center and Finnish American Historical Archives, as well as publishing the *Finnish American Reporter*, a monthly newsmagazine.

Fisher v. University of Texas (2013)

The 2008 suit that Abigail Noel Fisher brought against the University of Texas at Austin (UT-Austin) represents the most significant federal challenge to the decades-old policy of affirmative action as applied to minority applicants seeking much-coveted seats in college admission.

Affirmative action, a policy that permitted universities to take into consideration race as a way to ensure diversity in the university environment, has been viewed as a protocol to guarantee equal access to higher education to minorities whose access to such opportunity had, for generations, been deliberately or indirectly limited because of race. It is also one of the most controversial social engineering policies of the postsegregation era. Liberals tend to see such policies as gateways to assist minorities in closing the gap in education opportunities by maintaining a critical presence in higher education until such time, if ever, when America is authentically race neutral; conservatives, however, see the policy as an artificial leg up that has long since served its purpose and now disadvantages nonminority applicants in favor of less-qualified minority applicants.

In 2008, Fisher, then a senior at Stephen F. Austin High School in Sugar Land, Texas, a predominantly white, affluent suburb of Houston, applied for admission to UT-Austin. Under Texas law, state universities must accept any student ranked in the top 10 percent of their graduating class regardless of the school's academic standing. The policy had been in place to ensure state universities reflected the state's ethnic diversity. After the 10 percent admissions (which routinely accounted for just over 80 percent of each year's total admissions), the university was permitted a more holistic approach; a decision could consider nonacademic factors, including extracurricular activities, writing skills, demonstrated leadership, honors, language proficiency, and community service commitments, as well as income and race. The policy was thought to be in line with the Supreme Court decision in *Grutter v. Bollinger* (2003), which upheld a limited use of affirmative action for admissions to the University of Michigan Law School. At the time, however, the justices also found that colleges must also give serious, good-faith consideration to holistic criteria that did not include race.

The Texas system was by any measure a modest insertion of race into admission policy. However, on the first page of all state university applications, students were asked to indicate race. When her application to UT-Austin was denied, Fisher, who was white and in the top 12 percent of her high school class in a school routinely recognized as one of the state's most rigorous, challenged the

racial criteria for admission under the equal protection clause of the Fourteenth Amendment.

Revisiting the Goal of Affirmative Action

Although directed specifically at Texas policy, Fisher's suit has been seen as a petition for the courts to revisit the broader goal of affirmative action itself. Fisher's suit contends that the statewide policy of admitting the top 10 percent automatically to any state university sufficiently satisfied *Grutter v. Bollinger*. Beyond that, considering race disadvantaged white applicants. At the center of Fisher's suit is the difficult question of determining at what point a university has created critical mass—that is, a diversity profile sufficient to reflect the culture's makeup and serve the government and public interest.

As the University of Texas would argue in litigation, the holistic policy guiding its admissions policy after following the state-mandated top 10 percent was an effort to create a variety of perspectives, experiences, and backgrounds in the university system. The policy was not conceived as a way to achieve a quota, long held to be unconstitutional, but rather as way to ensure that applicants would be evaluated as individuals, not as members of some particular racial or ethnic group. That policy, Texas administrators argued, reflected an attempt to shape the strongest possible incoming class and to offer an environment in which students of different backgrounds would come together in both classroom and social interactions.

In 2009, the U.S. district court heard Fisher's arguments but ruled that the university admission policy did not violate *Grutter v. Bollinger*. In 2011, the appeal, heard by a panel of three judges in the U.S. Court of Appeals for the Fifth Circuit, also upheld the university. In February 2012, the U.S. Supreme Court agreed to hear the case in its fall term. The justices initially suggested that because Fisher's denial followed university procedure (in fact, Fisher's SAT scores fell considerably below university admission standards) and that, in fact, she had already applied to and graduated from another college (Louisiana State University), the entire case was moot. However, Justice Anthony Kennedy, held to be the key swing vote in a court perceived to be divided along liberal and conservative lines, questioned whether race as a factor in admissions policies had outlived its original

usefulness and no longer served a compelling government or public interest. Furthermore, how does a university measure diversity? Inevitably, local, state, and national demographics can be widely disparate. Other justices raised issues about how exactly to measure any one student's racial and ethnic makeup in a progressively multicultural America in which ethnicities now routinely married across racial lines and whose children in turn could be defined in fractions of ethnicity. Other justices raised broader issues about data that showed how such admissions often fared poorly in the university environment and how they often felt isolated and even illegitimate.

On June 24, 2013, after nearly nine months of anticipation, the Supreme Court handed down a modest ruling that sent a mixed message to universities struggling with the issue and reflected the fractured court's reluctance to confront the larger issues of how to achieve diversity in public education. It was a ruling less about diversity in public education or the University of Texas program and more about the judicial process. In a brief (only 13 pages) 7–1 ruling, the court returned the case to the Fifth District Court where the criteria the University of Texas used was to be more carefully scrutinized, specifically whether the university's "good faith" was sufficient to meet constitutional requirements for equal opportunity.

Supporters and opponents of affirmative action found grounds to claim victory in the ruling—defenders pointed out that the court had, in fact, not rejected the use of race as consideration for college admissions nor did they declare racial preferences a violation of equal rights protection and appeared, at least by not striking down the University of Texas program, to endorse the educational benefits of engineering diversity; while opponents were confident that the court's directive to the lower court to review the process sent the message that the Texas criteria would ultimately be modified or rejected, thus de facto setting the stage for future challenges and more lengthy (and costly) litigation, thus indirectly mandating universities to reevaluate admission criteria. But that impact, court experts acknowledged, could be years in coming.

Five Civilized Tribes

White settlers first used the name *Five Civilized Tribes* in the 19th century to refer to five southeastern Native American tribes: the Cherokee, Chickasaw, Choctaw, Muskogee (Creek), and Seminole, residing in Kentucky, Tennessee, North Carolina, South Carolina, Georgia, Florida, Alabama, and Mississippi. These tribes were considered “civilized” by European standards because they adopted European values and customs, such as attending Christian churches, sending their children to school, and farming, and because they had generally good relations with their European neighbors.

The term *civilized* needs to be understood as part of the larger U.S. policy toward Native Americans, encouraging the assimilation process whereby they would adopt European American customs and as such would be treated as members of American society. This began with George Washington’s policy of culturally transforming American Indians to European American ways of life. Washington’s civilizing policy was undertaken as his six-point plan, which included impartial treatment of, or justice for, American Indians; regulated purchase of their land; promotion of commerce; endorsement of experiments aimed at civilizing or “improving” American Indian society; presidential authority to offer gifts; and punishment of those found in

violation of American Indian rights. Later, government-appointed agents and missionaries were often placed on reservations, and children were sent to government-run boarding schools to aid in the process of assimilation.

Despite this designation, the five tribes were forced to relocate under the 1830 Indian Removal Act, as the U.S. government claimed their land for white settlement and development. In a series of removals made between 1830 and 1842, known as the Trail of Tears, all five tribes were moved to what was then called Indian Territory in parts of present-day Oklahoma. The westward migration of the Five Civilized Tribes was a devastating and tragic experience for each group, resulting not only in the loss of property, possessions, and their ancestral homelands but also in significant loss of life.

However, once situated in their new lands, each tribe developed thriving communities that included the creation of their own constitutions, governments, school systems, and successful economies. Despite their status as sovereign nations, which should have secured their new territory from further encroachment by settlers or U.S. authorities, their Oklahoma lands were opened up for white settlement in the late 19th century. In 1895, the Dawes Commission began negotiating allotment agreements with the Five Civilized Tribes. Communally owned tribal land was allotted to individual members registered with the Dawes Roll. Finally, the Curtis Act of 1898 put an end to tribal sovereignty by terminating tribal governments, courts, and laws. In 1907, Indian Territory was merged with the Oklahoma Territory to form the state of Oklahoma (which is a Choctaw word meaning Red People), where all five tribes have a strong presence today.

In the 1920s, assimilation and allotment policies came under attack, leading to changes that resulted in the Indian Reorganization Act of 1934 and new ideas about cultural pluralism. The key initiatives of the act included stopping allotment and establishing procedures for the creation of tribal governments and business corporations, the latter of which many tribal groups did successfully in the late 20th century. The 1950s reflected another policy change: termination, which entailed ending services provided by the Bureau of Indian Affairs. The 1960s began the era

of self-determination, allowing Native Americans to have more control in policy-making matters.

Cherokee

The Cherokee call themselves *ani'-yûñ'wiya'*, which means “the real people” or “the principal people.” Traditionally they occupied territory in the present-day states of Alabama, North and South Carolina, Georgia, Kentucky, Tennessee, Virginia, and West Virginia until they were relocated to Indian Territory (Oklahoma) between 1835 and 1838. Removal of the Five Civilized Tribes was complicated because this entailed forcibly relocating many educated groups that had already embraced the ways of “civilized” society.

The Cherokee fought removal by lobbying Congress and appealing to the U.S. Supreme Court. Although their legal battles were unsuccessful, the long-term impact upon issues of tribal sovereignty and Native rights were significant. As of 2010 there were 800,000 individuals self-identifying as Cherokee, and there are three federally recognized groups: the Cherokee Nation and the United Keetoowah Band of Cherokee Indians, in Oklahoma, and the Eastern Band of Cherokee, in North Carolina. There are additional Cherokee bands, like the Echota Cherokee Tribe in Alabama.

Chickasaw

Historically, the Chickasaw, known as the “Beloved Warriors” or the “Unconquered,” occupied a vast area that encompassed parts of present-day Kentucky, Tennessee, Alabama, and Mississippi. According to oral history, they migrated to this region with the Choctaw as one tribe, splitting into their respective cultural groups during the process. They spoke the same Muskogean language and practiced many of the same customs. At the time of European contact the Chickasaw located their primary settlement in northern Mississippi, where they possessed a highly developed system for governance and complex religious customs.

As the 18th century came to a close, intermarriage between Chickasaw and white settlers led to new tribal leadership and cultural changes. The first diplomatic agreement between the United States and the Chickasaw occurred with the 1783 Virginia-Chickasaw treaty, defining the eastern boundary of Chickasaw territory. The Hopewell Treaty of 1786 provided for peace

between the United States and the Chickasaw. The United States also secured a tract of land in Chickasaw territory for the purpose of trade and the exclusive right to regulate trade in the Chickasaw Nation.

The Chickasaw were the last of the Five Civilized Tribes to undergo removal from their homelands in the southeast. In 1837, the Treaty of Doaksville called for the Chickasaw to resettle in parts of the Choctaw Nation’s land in Indian Territory. Ultimately the Chickasaw leased land from the Choctaw and received representation on the Choctaw Council. Over the next decade and a half the Chickasaw worked to become politically independent and terminate their contract with the Choctaw. In 1856, a formal treaty signed by both tribes officially sanctioned the separation. Later the Chickasaw Nation formed a new constitution and three-tiered government system modeled after the American system.

According to the 2010 U.S. Census, there are 52,278 individuals identifying themselves as Chickasaw. The Chickasaw Nation of Oklahoma is federally recognized by the U.S. government.

Choctaw

As of 2010 there were 195,764 individuals in the United States who self-identified as Choctaw, making them the fifth-largest federally recognized Native American tribe. Prior to the 1830 Indian Removal Act the Choctaw resided in the southeast, in what are the present-day states of Mississippi, Alabama, and Louisiana. Today, the U.S. government recognizes three Choctaw Indian tribes: the Choctaw Nation of Oklahoma, the Mississippi Band of Choctaw, and the Jena Band of Choctaw in Louisiana.

The Choctaw Nation of Oklahoma is comprised of those Choctaw relocated to Indian Territory. The Choctaw Nation of Oklahoma was established by treaty in 1830. Today they control an area comprised of 12 tribal districts (6,400 acres of land in Oklahoma, with headquarters in Durant). The tribe is governed by the Choctaw Nation Constitution, which was ratified in 1984. They operate under a three-part government system with chiefs and tribal council members elected every four years.

Choctaw removal took place in three stages. About 5,000 Choctaw chose to remain in their

ancient homelands in Mississippi and became citizens of the state. In 1944, the secretary of the Interior set aside 18,000 acres of land held in trust for the Mississippi Choctaw. The Mississippi Band of Choctaw is also federally recognized, established in 1945 under the Indian Reorganization Act of 1934. In the same year the Choctaw Indian Reservation was created. It is comprised of 35,000 acres of land throughout 10 counties in Mississippi and is also home to the ancient earthwork mound known as Nanih Waiya, which was built around 1 to 300 c.e. Venerated by the Choctaw as their place of origin, Nanih Waiya (formerly part of the state) was returned to them in 2006.

The Jena Band of Choctaw of La Sale and Catahoula Parishes in the state of Louisiana received federal recognition in 1995.

Muscogee, or Muskogee (Creek)

Historically, the Muscogee (Creek) Indians, a confederacy comprised of various tribes, occupied major parts of what are now the states of Alabama, Georgia, Florida, and South Carolina. They trace their origins to the sky, where their ancestors lived in spirit form before descending to the Earth in the west, and later migrating east, where they divided into two geographic groups known as Upper and Lower Towns. The main difference was the proximity to European influence and the degree to which these groups maintained their own cultural traditions. The Muscogee traded actively with Europeans and allied themselves with the English by 1702. In the 1830s, 23,000 Creek were relocated to Indian Territory.

Today, three Muscogee (Creek) tribes are federally recognized: the Muscogee (Creek) Nation in Okmulgee, Oklahoma; the Poarch Band of Creek in Alabama; and the Coushatta Tribe of Louisiana. In addition, three Muscogee towns in Oklahoma (Alabama-Quassarte, Kialegee, and Thlopthlocco) also have federal recognition, and several tribes in Alabama and Georgia have state recognition. According to the 2010 census, there are 88,332 individuals who self-identified as Creek.

Seminole

Although the word *Seminole* is widely accepted today, it was first used by Europeans to identify a diverse group of independent Native American

tribes residing in Florida. The Spanish called them *cimarrones*, or “free people.” The original “Seminole,” the Ocone, were descendants of the Creek people, who combined with other Florida tribes. Later in the 18th century, the Seminole population grew with the inclusion of Back Seminoles, free blacks and escaped slaves who settled in towns near the Seminole for protection. The Seminole are comprised of three federally recognized tribes, the Seminole Nation of Oklahoma, the Seminole Tribe of Florida, and the Miccosukee Tribe of Indians of Florida.

According to 2010 census records, 31,971 individuals self-identified as Seminole (with more than half identifying themselves as part-Seminole with another tribal or racial affiliation).

The Seminole were required to relocate to Indian Territory under the 1830 Indian Removal Act despite their considerable, organized resistance in a series of conflicts known as the Seminole Wars (1818–58). In 1856, the Muskogee Creeks and the U.S. government signed a treaty establishing the first Seminole Nation of Oklahoma. Not long thereafter the Civil War began and members of the Five Civilized Tribes in Oklahoma armed themselves to fight alongside Union or Confederate forces. The Seminoles were divided, and those loyal to the Union, led by Big John Chupco, moved to Kansas, while those siding with the Confederates, under the leadership of John Jumper, lived in camps in Texas.

The Civil War was particularly devastating for the Five Civilized Tribes in Oklahoma. The pre-war treaties that guaranteed their new lands in Oklahoma were negated and they were forced to give up parts of their land in Oklahoma. The U.S. government negotiated only with the loyal Seminole fighting under Chupco. The Seminole (like many of the Five Civilized Tribes) were compelled to sign a new treaty in 1866 requiring them to emancipate their slaves, extend tribal membership to all freedmen choosing to stay with them, sell their land in Oklahoma to the U.S. government, and purchase new land for the creation of the Second Seminole Nation, which lasted until 1907. Today there are three federally recognized Seminole groups: the Seminole Nation of Oklahoma; the Seminole Tribe of Florida (controlling several reservations in Big Cypress, Brighton Seminole Indian Reservation, Dania, Florida State

Reservation, and Tampa Reservation); and the Miccosukee Tribe of Indians of Florida.

Flemish Americans

Flemish Americans are descended from Flemings—inhabitants of Flanders. Flanders today is a Dutch-speaking region of Belgium, which declared independence from the Netherlands in 1831; historically, the Flanders region has included parts of France. Flanders began as the County of Flanders from 862 to 1795, renowned for its wealth and education. It was originally a fief of France, but France lost control of Flanders in 1526 (it is the only territory of medieval France that is not part of modern France) and it soon became part of the Low Countries, the other constituent parts of which are Belgium, the Netherlands, and Luxembourg.

Community, Not a Country

Though the Flemish have not had a country of their own for centuries, the Flemish Community remains an important idea in Flemish identity. In Belgium, the Flemish Community is one of three

institutional communities making up the state, along with the French Community and the German Community, each of which has specific non-overlapping legal authority over issues pertaining to language, culture, education, and aspects of health care. The Flemish Community is celebrated every July 11 in remembrance of the Battle of the Golden Spurs, when the Flemish successfully defeated a French attack.

The Flemish Community also refers to the Flemish people in a broad cultural sense, one that encompasses Flemish cultural life and identity irrespective of political borders or the political authority of other ethnic groups: the Flemish nation. In this sense, the Flemish identity is similar to that of the Welsh or Quebecois, with the added issue that the Flemish homeland is not contained within another political entity (as Quebec is within Canada) but rather sprawls over into several political entities: Belgium, the Netherlands, and France.

It is difficult to determine the number of Flemish Americans. Immigration officials at various points in history could classify an incoming immigrant as Flemish, Dutch, Belgian, or French. There are about 360,000 Belgian Americans, some portion of whom are Flemish. They are distributed primarily in the midwest—Wisconsin, Michigan, Illinois, Minnesota, and Indiana have some of the largest Flemish populations.

Famous Flemish Americans include the artist Jan Yoors, who spent much of his adolescence with a traveling group of Romani and whose memoir was one of the seminal works about that culture; George Washington Goethals, builder of the Panama Canal and the first Flemish American graduate of West Point; and the novelist Marguerite Yourcenar.

Aspects of Flemish American Culture

One aspect of Flemish American culture is the carillon (sometimes misspelled carillion). Similar to the German glockenspiel, the carillon is a very large musical instrument including at least 23 bronze bells, which are played by using both a keyboard and a pedal keyboard. It is typically housed in a bell tower or church belfry. The keys are mechanical, not electrical (even today), which allows the performer to vary the intensity of the note by varying the pressure applied to the key. A

traditional musical instrument of the Low Countries, the carillon has become somewhat associated with Flemish identity—the Dutch-speaking regions of Belgium have a much greater concentration of carillons than the French-speaking regions do. Carillons in the United States include the Stanton Memorial Carillon at Iowa State University; the 49-bell carillon at Michigan State University's Beaumont Tower; the 48-bell carillon of the University of California, Riverside; and the 50-bell carillon at Duke University's chapel, which is played daily.

Another element of Flemish American identity is the Kermis Festival, which is celebrated in some parts of the country. Originally an anniversary celebration for the founding of a church (the name is Dutch for “church mass”), Kermis in the United States has become a harvest festival where Flemish, Dutch, or Belgian identity is celebrated. Participating communities often have a fair, a parade, a market and traditional foods, and sometimes live entertainment. Some parts of the country also celebrate a Winter Festival or Christmas Festival, celebrating the coming of Sinterklaas, the Dutch version of Santa Claus.

The Genealogical Society of Flemish Americans was founded in 1976 by interested Flemish Americans in Roseville, Michigan, and publishes the *Flemish Heritage* magazine, which presents genealogical tips and information as well as bits of historical trivia about Flemish Americans. The existence of the society is somewhat a sign of how assimilated Flemish Americans are, as the emphasis is on exploring the past rather than on preserving an existing connection to Flemish identity.

Flower Drum Song

Flower Drum Song is a 1957 realist novel by C. Y. (Chin Yang) Lee, set in San Francisco's Chinatown of the 1950s. The author was born in Hunan, China, in 1917. He left in 1943 to pursue a masters of fine arts degree from Yale University. Richard Rodgers and Oscar Hammerstein's 1958 Broadway musical version and Joseph Field's screen adaptation in 1961 soon overshadowed Lee's novel. The musical was taken to London in 1961. In 2001, David Henry Hwang introduced significant modifications to his revival of the Rodgers and Hammerstein production, including an attempt to bring back some of the darker threads of the novel.

The popularity of the musical and film with audiences has lessened through the decades; scholarly reception of both versions has been consistently negative, specifically with regard to the racist stereotypes of Chinese Americans and the depiction of Chinatown as exotic and alien. Hwang's revival, despite its parodies of stereotypes and other attempts to bring the musical in line with contemporary attitudes toward race, seems not to have attracted much scholarly attention. The only book-length work to trace the four texts is David H. Lewis's *Flower Drum Songs: The Story of Two Musicals*, a compilation of newspaper reviews, interviews, hearsay, and reportage from trade publications.

All four works should be considered within the context of national and global political situations; the novel and the revival in particular afford insights into the evolution of Asian American self-representation and sense of social and political agency in relation to shifting national and global realpolitik. C. Y. Lee's novel predates such canonical literary texts as Louis Chu's *Eat a Bowl of Tea*, Maxine Hong Kingston's *Woman Warrior*, and Fae Myenne Ng's *Bone*; the most notable and recent addition to this list is Karen Tei Yamashita's multi-genre narrative, *I Hotel*. Actually, *Flower Drum Song* was not the first

narrative on Chinatowns: Jade Snow Wong's *Fifth Chinese Daughter* was published in 1950, and Pardee Lowe's autobiography, *Father and Glorious Descendent*, in 1943.

Asian American scholarship, beginning with the rise of American "ethnic" activism in the 1960s and the emergence of postcolonial theory, critiques racist stereotypes of Asian American and other minority groups. Lee's novel, like the ones by Lowe and Wong, includes stereotypes of Chinatowns and Chinese immigrants and participates in reductive portrayals of the phenomenon of assimilation. However, the darker elements in Lee's novel, similar to Chu's or Hong Kingston's narratives, debunk the myth of Asian Americans as the model minority and the implications of that myth.

C. Y. Lee's novel depicts a bifurcated world: "white," mainstream America and San Francisco's Chinatown, which constitutes the daily reality of Chinese immigrants, while their American-born children grow up "Americanized" and grow away from their parents' heritage. Lee characterizes Wang Chi-yang, the main character, as a traditionalist, with both feet in prerevolutionary China. Wang Chi-yang and Wang Ta, the eldest son, and Wang San, the younger and even more Americanized son, epitomize the contrasts between the east and the West, between what is cast in the narrative as the old versus the new. In Lee's novel, assimilation into mainstream culture is as inevitable as the next generation succeeding the previous one. The existential angst is in Wang Chi-yang and not in his sons. For them, mainstream culture is their culture.

Lee's book departs from earlier Chinatown-assimilation stories in the subplot of Helen Chao's desperate and unsuccessful ploy to snag Wang Ta and her eventual suicide. Wang Ta—a man of (his father's) means—enjoys relative security vis-à-vis other Chinatown residents. Helen, disfigured and poor, faces a bleak future unless she can find a man like Wang Ta. Although Linda Low is dealt the same challenges as Helen, Linda's beauty enables her to make her way more easily. These female characters inhabit a much darker existence than the males, an existence that precludes any aspirations of economic self-sufficiency or mainstream cultural assimilation.

The Broadway musical and Hollywood film were blockbusters, because both versions were

rewritten as romantic comedies that focused the main plot on the entanglement of Mei Li (played by Miyoshi Umeki in both productions), Linda Low (Pat Suzuki in the musical, Nancy Kwan in the film), and Wang Ta (Ed Kenney in the musical, James Shigeta in the film). Linda represents supposedly mainstream American values of individualism and hustle, while Mei Li stands for so-called traditional Chinese values of faithfulness and humility. Wang Ta, of course, is attracted to Linda more than to Mei Li, although the audience perceives clearly that the girl from China has fallen in love with Wang Ta and that Linda is a gold digger.

David Henry Hwang's revival used the Maoist revolution in China gone wrong to give the Mei Li (Lea Salonga) character the motivation to leave China for the United States. Madame Liang (Jodi Long) is a media-savvy entrepreneur who transforms Wang Chi-yang's (Randall Duk Kim) imagined Peking opera house into a successful nightclub. This version ends with the marriage of Wang Ta (Jose Llana) and Mei Li. Hwang's agreement with the Rogers and Hammerstein Organization required that he retain most of the music and songs from the Broadway production. Hwang chose not to use the Helen Chao character; instead, a new immigrant, Chao Hai-Lung, is made to cast doubt on the model minority myth. At the conclusion of the play, Chao decides to return to China.

Folk Music and Ethnic Diversity

The term *folk* is used to describe the vernacular music of rural and ethnic minority communities that is not played by musicians with formal training. Folk music is created and evolved by common working people as their musical expression derived from a particular national, regional, or ethnic culture. It is a direct, simple, and unpretentious musical expression that is generally a simple melody with or without a chorus, with a freedom of rhythm that sticks to a more natural meter of lyrics. While philosophies, popular musical expression, and religious conventions have changed over time, folk music as a fundamental human expression has endured and has mingled with popular as well as classical music. When not performed with affectation, folk music is evocative and primordial to its originators. It conjures up intuitive or inherited "bloodline" experiences that have been expelled from classical and popular music. It could be argued that poverty groups, stripped of refinements and formal education, are the vectors for the movement of ethnic folk music in the United States. Folk music lyrics often express

idiomatic regional speech and dialect where words and shared experience may not readily be clear to outsiders. Within illiterate communities, the lyrics of folk songs were transmitted from generation to generation through oral tradition so their origins remain unknown; they sometimes are the only chronicles of that community's history.

Immigration and North American Folk Music
Between 1607 and 1700, North America experienced its first wave of immigration of English and Welsh settlement, which was accompanied by a large influx of Africans. This pattern continued between 1700 and 1775 with the addition of Germanic and Scots-Irish groups immigrating to the Pennsylvania region. This wave included large numbers of indentured servants, who planted the seeds for native folk music traditions. Enslaved Africans left behind material possessions but carried their diverse musical cultures. European instruments in the New World were unfamiliar, but Native Americans and enslaved Africans shared primordial rhythmic expression in vocal chants accompanied by rhythmic banging of natural or work implements.

European music traditions were adapted into native folk traditions by music enthusiasts independent of cosmopolitan or academic environments. Simple and unpretentious folk genres emerged during the 17th and 18th century that were derived from African traditions. The southern plantation system fostered "the holler," sad refrains cried across work fields to fellow enslaved people that evolved into a form of the solo blues song. Slave music melded music of the dominant English, Scottish, and Irish society with French-influenced Cajun music from the Louisiana swamplands. Spiritual folk songs, or spirituals, came out of complex relations in southern plantation society where white spirituals and black spirituals in the American south and west were culturally intermingled after 1801 during the Great Revival in Cane Ridge, Kentucky.

Music and American Collective Memory

Ordinary American musicians created folk music equal to any in the world. Music has historically been one of the most enduring records of shared heritage for ethnic groups. Folk music reflects a human connection to the Earth even as instrument

makers select natural resources indigenous to specific regions to make their instruments. Agricultural laborers working close to the soil sang songs with themes of relationships, home, and kinfolk. Musicologists have speculated that folk music sometimes conveys work life more than kinship or ethnicity within the collective consciousness, and therefore with folk music, national and regional music is shaped and evolved by working-class folk and not an ancient elite class.

Nationalism and patriotism shaped the development of folk music after the American Revolution as a distinct American identity was celebrated. Noah Webster asserted in his *American Magazine* in 1787 that Americans should unshackle thinking and become independent from British customs. While the First Great Awakening created a didactic demand for independence that led to revolution—the American people shared a heritage of hardship journeys expressed in ballads, work songs, and field hollers—the Second Great Awakening freed American musical expression to become more emotional. Itinerant preachers carried Protestant hymns to camp meetings in remote communities in the rural, traditionally segregated, south. Musicians of African descent heard these melodies and adapted them into Negro spirituals.

Initial Studies of Folk Music

Academics first defined “true” folk music in the United States as “ancient” music originating in Great Britain. The formal study of American folk music started with a Harvard Shakespeare scholar named Frances James Childs who was influenced by the Brothers Grimm. Childs collected and preserved English and Scottish ballads as narrative songs but he did not preserve the tunes. Folk traditions were derived from northwestern Europeans, Germans, and Dutch along with eastern Europeans, Asians, Canadians, and Latin Americans who immigrated to the United States between 1820 and 1870.

Pacific Rim maritime trade also opened at this time and ships carried people with diverse musical traditions and supplies, including transportable musical instruments, across oceans, first by sail and then by steam. The harsh realities of maritime life and culture were chronicled in working songs called “shanties.” For instance, the Pacific shanty *Blow the Man Down* carried along international

currents during the California Gold Rush was sung as men raised heavy sails to masts.

African American Folk Traditions

American historian Edward Everett Hale identified the African-based spiritual to be the only true American music. Blues music emerged with the abolition of slavery in 1863 when work songs, spirituals, and the holler, the soulful expressions of bondage, were subordinated into ballads of religious expression of transcendence, American vernacular music based upon African American music forms that originated from freed African Americans after the Civil War. However, freedmen rejected this musical vestige of slavery.

Zydeco music, indigenous to southwest Louisiana and eastern Texas, blended American, African, and French Cajun influences traced back to the end of the Civil War as well as Creole dance influences including the polka, mazurkas, the two-step, and “vales.” Northerners became enamored with African American spirituals during the 1870s. George L. White worked for the Freedmen’s Bureau and organized the Fisk University Jubilee Singers. Fisk University was a black college established in 1866; its singing group was comprised of nine singers, eight of whom were former enslaved people. Fisk was on the verge of bankruptcy in 1870 when the Jubilee Singers began a fundraising tour of the northeastern United States in 1871.

Thomas Fenner’s “Cabin and Plantation Songs as Sung by the Hampton Students” (1874), Marshall W. Taylor’s “Collection of Revival Hymns and Plantation Melodies” (1883), and Howard Odum’s dissertation at Clark University, “Religious Folk Songs of the Southern Negroes” (1909), were early music scores that promoted the importance of black folk music.

Collection of Folk Music

The greatest influx of immigration, including eastern and southern Europeans, and Scandinavians occurred between 1870 and 1920 and was accompanied by continued influxes of Latin Americans, Asians, and Canadians. Childs influenced the first documentation of music in the Appalachian Mountains. The American Folklore Society was established in 1888 with the mission to collect and preserve African American and

Native American folk music equally to that of European roots.

Pioneering blues singers were born during the 1880s. By 1900, a fusion of black and white folk music appeared in primitive forms of the blues with 12-bar tunes. The Arts and Crafts Movement brought “rustic” culture into vogue. John Lomax, a noted folklorist, recorded another indigenous American vernacular music tradition evolved by cowboys along the Chisholm Trail. Lomax published *Cowboy Songs and Other Frontier Ballads* in 1910, linking cowboy songs to British folk traditions. Cowboy songs were related to popular minstrel traditions. Alan Lomax asserted that music has historically been the most conservative of all cultural traits. At this time, female folklorist, collected gendered folk and domestic work songs of the Kentucky Blue Ridge Mountains for commercial use and published them as piano sheet music. The predominantly female informants preserved domestic oral traditions.

Folk Music After World War I

An influx of eastern European immigration during World War I brought new attempts to Americanize newcomers with American folk heritage. During the Harlem Renaissance, African American intellectuals and artisans disseminated their cultural heritage to broader society. Okeh Records first recorded African American vaudeville singer Mamie Smith singing “Crazy Blues” in 1920. It was successful in the commercial market place and record companies started targeting rural southern and urban black markets. Race music included spirituals, blues, jazz, and work songs. Race records were sold in record shops, mail order catalogs, bars, barbershops, and other black social hubs.

American folk culture was rediscovered during the 1920s when Gertrude Vanderbilt Whitney organized an exhibit of American folk art in New York City and chronicled diverse ethnic expressions in material culture unaffected by stylistic trends of the fine arts; this art reflected landscapes, race relations, occupations, and music instruments related to folk music. By the mid-1920s, “hillbilly music” became a term used to describe rural white commercial music like that performed by Fiddlin’ John Carson in northern Georgia. Columbia, Paramount, Victor, and other record companies followed Okeh’s example and

searched out hillbilly music. Race and hillbilly music remained segregated during the 1930s even within the same record company. Ralph Peer marketed commercial race and hillbilly music; Robert Gordon established ethnic inclusiveness with the Archive of American Folk Song, and Carl Sandburg popularized music ethnicity with his best-selling *American Songbag* (1927), but all three could not find the means to promote the folk behind the specific songs.

Musical Revelations of the Great Depression

During the Great Depression, lesser-known folk musicians were put out of work. Lomax purchased portable electronic recording equipment that fit in the trunk of a car to collect music from informants for the Library of Congress’s Archive of American Sound, recording Huddie “Lead Belly” Ledbetter, who was still serving a sentence in Louisiana’s Angola Prison in 1933. Lomax found that Ledbetter performed music distinct from the academic historic memory of British traditions. Exoticism in African American music allowed musicologists to study African-derived music while keeping black culture segregated.

The Ozarks, lying across Missouri, Arkansas, Oklahoma, and Kansas, became the epicenter for folk music during the 1930s when the National Folk Festival brought regional music to broader audiences. The ethnic core of Ozark music was predominantly white Anglo-Saxon music that migrated from the Appalachians as early as the 1820s and French music that followed mining opportunities beginning during the 1730s, along with Catholic and Lutheran German communities that maintained the mother tongue, and transplanted Cherokees forced to the Indian Territory to the west. Each culturally distinctive group diffused distinctive traits in the hill country.

Revitalizing American Folk Music Traditions

After World War II, folk music became the “rustic” entertainment for upwardly mobile veterans who attended folk festivals and “hootenannies” on college campuses. Record companies seeking new audiences changed the semantics of African American music when, in 1946, the term *race* was replaced with the term *rhythm and blues* on record album covers. Music professor Wendell Otey started teaching a survey course on “exotic”

(a euphemism for “ethnic”) music at San Francisco State College spotlighting oriental, folk, and primitive culture music in 1950. Colleges with recreation curriculum offered folk music that could be adapted to elementary classrooms and camping or recreation programs. Pete Seeger and the Weavers revived old Anglo-American music during the 1950s that briefly crossed over into popular music. Youth organizations, including the Boy Scouts and Girl Scouts, have kept campfire songs alive in popular culture.

The 19th-century American educator Lydia Marie Child described variant forms of clapping games in books with children’s early educational activities. Clapping games were shared in contemporary street culture that was adapted from call-and-response songs derived from African music

traditions. Teachers found that clapping games also involved social interaction and concentration. Unlike organized sports, street games provided students with opportunities to make up the rules and create new chants relevant to their own experiences. Clapping games only required two individuals sitting opposite each other with each person clapping hands together at the same time and then each reaching out with the right hand to clap the partner’s right hand. Variations included one or two hands at a time, backs of hands, palms of hands, double claps, hands up, hands down that made each rhyme distinctive. Repetition, coordination, and duration gave chants used in clapping games rhythmic conviction and power, even if the chants were nonsense verses like the musical equivalent of scattling.

The Bog Trotters Band from Ballard Branch, Virginia, here in 1937, were influential in American Appalachian music in the 1930s and 1940s with tunes such as “Cluck Old Hen” and “Shoo Fly.” Appalachian music is derived from various influences, including English ballads, Scottish fiddle music, and African American blues. First recorded in the 1920s, Appalachian musicians were a major influence on the early development of country music and bluegrass, playing an important role in the American folk music revival of the 1960s.

Musician and educator Ella Jenkins became the “first lady of children’s music,” after singing folk along with rhythm and blues in San Francisco coffee houses during the 1950s while studying social work at San Francisco State University. Her album *Call and Response: Rhythmic Group Singing* (1957) explored West African rhythms in a format popular with a generation of young listeners, and her *Travellin’ With Ella Jenkins: A Bi-Lingual Journey* (1979) was recorded in San Francisco with children from the Cross Cultural Family Center.

Politicizing Folk Music Traditions

Folk rock emerged out of revitalizing various folk music traditions to politicize the need for civil rights. Oklahoma-born Woodie Guthrie was known for his Dust Bowl ballads and the song “This Land Is Your Land.” Guthrie embraced and performed to benefit leftist causes in southern California. Folk music increasingly became connected with the political left; artists were targeted and blacklisted during the 1950s.

The Kingston Trio, established in San Francisco, rose to international acclaim with their recording of “Tom Dooley” in 1958, making acoustic folk music commercially viable and paving the way for folk rock in popular music. Two founding members, David Guard and Bob Shane, lived in Hawai‘i where they developed an interest in Hawai‘ian music. The Limelites, another San Francisco-based folk group was established in 1959; a founding member, Lou Gottlieb, was a musicologist who earlier wrote arrangements for the Kingston Trio and later operated the Digger Farm, a short-lived psychedelic political movement that supplied free food during the Summer of Love.

Joan Baez opened the three-day Monterey Folk Festival in May 1963, and Bob Dylan, influenced by Guthrie, made his West Coast debut singing “Only a Pawn In Their Game,” lamenting racial politics. The Monterey Folk Festival soon embraced counterculture movements and was replaced during the 1967 Summer of Love with the Monterey Pop Festival as folk music and rock merged into folk rock.

Folklórico

The term *folklórico* (folkloric) may refer to either Latino cultural practices popularly identified in the United States with a traditional Hispanic American past, or to the field of folklore studies to which many early Latino scholars, such as Américo Paredes, contributed. To cite three examples of the former, Latino cultural practices identified with traditional Hispanic American culture include such customs as folkloric Mexican dances performed at Mexican American celebrations, Afro-Cuban music played at Cuban American festivals, or the traditional cultural practices

of Puerto Ricans and Nuyoricans as displayed, for instance, at the annual Puerto Rican Day Parade in New York.

The second and broader definition of folklórico refers to the field of folklore studies as practiced by scholars like Paredes in the 1950s and 1960s who sought to recover ethnic minority history, in Paredes's case, that of Mexican Americans, by recuperating the "folk" narratives and other cultural practices of that group. Paredes and other early ethnic minority folklorists, such as the African American writer Zora Neale Hurston, sought through their research to give voice to their submerged ethnic group, offering a resistant folk counter or oppositional narrative to dominant accounts that either neglected or erased that group's history. The resistant element in their work, set within the larger project to recuperate ethnic American (folk) history, laid the foundation for later fields such as Chicano/a studies, Latino/a studies, and African American studies. Despite the relative decline of folklore studies as a scholarly discipline (see below), ethnic minority folklorists such as Paredes and Hurston, today regarded as foundational ethnic minority intellectuals, continue to be the subject of scholarly studies across the humanistic disciplines.

Popular and Scholarly Definitions

Both definitions of folklórico, the popular and the scholarly, have been criticized by scholars as part of the reappraisal of folklore studies dating to the post-World War II era and particularly post-1960s research in anthropology. The popular view of folklórico as being synonymous with a traditional Hispanic American culture is problematic not only on its own terms, since it assumes an authentic and unchanging folk culture but also because the term derives from the largely outdated field of folklore studies.

Among contemporary cultural anthropologists and cultural studies scholars, the term *folklore* in the sense used in both definitions is therefore anomalous at best because it refers to this outmoded early scholarly model that claimed to recover the authentic folk culture of an ethnic or national group. Folklorists argued that this recovered folk culture represented the "real" identity and/or history of that group as well as, therefore, its authentic "spirit."

Although folklórico may be used in the popular sense to denote some of the cultural practices under the first definition, today among scholars it refers to an early analytical model that must be examined critically and in historical context.

Although the field with which ethnic minority folklorists such as Paredes and Hurston are associated is now considered outdated, these early figures employed the folklore model to recover and affirm folk culture, rather than romanticize it. For Paredes the folklore of Mexican Americans encompassed an array of cultural practices by which Mexican Americans drew from the past to negotiate and affirm their identities in the present.

These practices, such as songs (corridos, or ballads), stories, legends, dances, humor/jokes, vernacular language, customs, and cultural celebrations, according to Paredes, expressed the collective or social memory of Mexican Americans. Today the diversity of Latino folklore reflects the heterogeneity of the U.S. Latino population, whose members, now numbering over 50 million, represent a variety of ethnic and national backgrounds.

Despite the distinction that must be drawn between early folklore studies and contemporary anthropology, the folklore model as practiced by figures like Paredes sheds light on a number of key assumptions that offer insight into Latino culture and its relationship to mainstream U.S. society, which is why Paredes and other folklorists of his generation continue to generate both interest and acclaim.

Much like African American culture, U.S. Latino culture has existed at the margins of European American culture even as its presence has been an unacknowledged influence on the dominant culture. For example, the early Spanish and Mexican society in the region that would become the southwest United States significantly shaped that regional culture, as it continues to do today as Mexican immigrants renew this cultural influence. Hispanic place names throughout the southwest offer the most obvious evidence of this early influence. Less obvious are the folkloric elements, usually unacknowledged by the dominant culture, which Paredes sought to recover and which continue to be the subject of study by his intellectual heirs.

The same contradiction has been identified in other Latino cultures, such as those whose origin is the Hispanic Caribbean. Due to their geographic proximity, the (folk) cultures of these regions exerted a strong influence on the United States even before large numbers of immigrants from these countries arrived on U.S. shores. These cultural exchanges occurred initially through such encounters as tourism, colonialism, and other types of travel. Immigration from these island nations, from the early era to today, strengthened these cultural exchanges. The Afro-Caribbean cultural influence, such as Afro-Cuban music or the religion of Santería, offers the most obvious example of how Latino Caribbean folk practices not only survive but continue to enrich and transform U.S. culture.

Food

Multicultural aspects of American food began long before immigrants arrived here from other countries. Hunters, travelers, merchants, warriors, explorers, and migrant tribes, moving forward in time from the Ice Age, traveled throughout the Americas in search of food and places to live safely through the changing seasons. Over

time, as immigrants from throughout the world traveled and settled in North America, the homeland food traditions they knew mingled with culinary discoveries they learned from Native Americans as well as from arrivals from other countries. From colonial settlements in New England, Florida, and California to today's California cuisine and fusion, food exploration has been part of the American experience. Nearly every world food can be grown here, and with that success has come the inevitable American love affair with food enjoyment and experimentation.

Early America

As more temperate climates evolved, desert cultures began to form in the southwestern region of North America, where people searched the wild land for seeds, grains, nuts, roots, and anything else edible. More eastward in the country, inhabitants gathered assorted nuts, fruits, berries, and animals from the abundant forests and prepared them with local herbs and leaves for seasoning. Those close to water or on the sea collected fish, mollusks, clams, and other shellfish, which they dried to feed their tribes through cold weather.

In time the stability and security of agriculture emerged. Close examination of evidence in caves and early grave sites reveals that regional foods were carried and used from place to place. Variety was endless, just as the foods available in America have endless variants today. Centuries passed, and the cultivation of staples such as corn, squash, and beans began to spread over the continent. In Bat Cave, New Mexico, tiny cobs of corn (called maize) were found and thought to have been there since around 3600 B.C.E. Millennia later, at the time Columbus and other Europeans arrived, blue, red, and black corn was being cultivated all over North America.

Early settlers, in both northern and southern colonies along the eastern seaboard, learned to survive on new, unfamiliar foods. Two universes of culinary ingredients, British and Native American, were combined to provide survival. There were no stores of wheat or oats, so the early colonists learned to pound corn, mix it with water, and cook it until a meal called "samp" (a name coined after a Narragansett word) was produced. In the decades that followed, cattle were brought from Britain, and butter and milk supplemented

the simple corn porridge. The result was one of the first cross-ethnic foods in America—a mix of English and Native American products. Soon the newcomers learned to grow corn, find wild game, and grow a variety of squash and beans. Over those first centuries, the British arrivals learned to work the land and in time grew grains, vegetables, a variety of fruits, and other familiar foodstuffs from their homeland. They gathered native fruits and berries and learned methods of preparation and preservation from the Native American inhabitants.

International Influences

By the mid-1700s, there were scattered settlements of people from Europe, and along with them came their culinary traditions. Though not as numerous as British immigrants, there were Irish, Scandinavians, Spanish, French, Germans, Italians, Africans, and Asians present in North America in the earliest centuries. Ethnic enclaves were established, and traditional foods were both treasured and shared. The first Africans came to these shores in 1565 when they helped establish a colony in St. Augustine, Florida. The first Africans to arrive in the English North American colonies came in 1619 and brought with them memories of the tastes and flavors of Africa, such as okra, yams, plantains, millet, and aromatic spices. They adapted what they could find in the Americas to suit their culinary needs, but over the next centuries those foods were also brought to America.

As exploration and settlements expanded across the North American continent, pushing the frontier farther west, culinary boundary crossing became more and more prevalent. Americans, nearly always seeking new experiences and opportunities, soon gained a vision of what could be built and gained by utilizing the broad range of international cuisines present and available. Entrepreneurs provided and fed not only themselves, their families, and their own countrymen but soon discovered both commonalities and unique differences in the culinary traditions within the grand mixture of people from around the world. The blending of food traditions and both common and exotic flavors has led to the multicultural cuisine Americans can find in nearly every city today.

Americans declared themselves to be an independent nation in the late 18th century, and slowly over the 19th century the robust American identity emerged. The culinary traditions didn't disappear into an unidentifiable melting pot. Most groups—ethnic, religious, and even regional—maintained precious traditions from their ancient origins. As the industrial age progressed and technologies such as meat processing, canning, other types of food preservation, and transportation improved, entrepreneurial experimentation and widespread marketing began. Often the pleasing and healthful tastes from traditional cultural foods, perhaps the other's other, became well known and widespread. For instance, yogurt has become a national food favorite in the United States; its popularity in the United States began on a humble Armenian dairy farm in Massachusetts sometime during the 1950s.

Historian Joel Denker told the story of an Armenian family—Sarkis Colombosian, his wife Rose, and their two sons Bob and John—who marketed their yogurt among people of their Middle Eastern community. The Colombosians realized that they were producing more milk than they could use or sell, so they decided to make and sell yogurt, a fermented product used by Old Country nomadic herdsman that was much easier to transport than fresh milk. On their dairy route the dairy farmers had Syrian, Lebanese, Greek, and Armenian neighbors who purchased their yogurt. Soon their product began to be marketed by local ethnic food shops, and then health food shops picked up the product. Under the shortened name of Colombo Yogurt, it was soon sold in supermarkets. After Sarkis died, the two sons inherited the business, added fruit preserves to the bottom and top of the individual cartons of yogurt, and in 1993, General Mills acquired their business. Yogurt, a Turkish word meaning “to thicken,” has since become one of the most popular foods in the United States.

Regional Foods

Spicy foods of the southwest United States have been used there for centuries. Ingredients include chilies, tomatoes, seasoned beans and rice, roast pork, beef, and traditional corn tortillas. Those and similar foods made their way there through the corridors of South and Central America and

Mexico long before Columbus and the other Spanish explorers arrived. In the last 50 years or so, those flavors have sprung up all over America and are served routinely in many private homes and restaurants that range from drive-through fast food shops to elegant restaurants. Authentic Mexican cuisine is usually not as spicy as the foods served north of the border, but regardless, many on the U.S. side seem to prefer adding copious hot sauce or dried chilies to whatever appears on their plate.

There are regional foods cherished in many parts of the country and adapted to various ethnic recipes. Foods range from Maine lobster (boiled, broiled, or baked) and Boston or Manhattan clam chowder (white or red) to crab shacks along the East Coast where seasonal crab (steamed, boiled, or in cakes) can be enjoyed to shrimp from the Gulf Coast (deep-fried, boiled, barbecued, served with delicate French or Asian sauces) to Mississippi grits, to salmon and halibut (smoked, planked, baked, or pan-fried) from Oregon, Washington, and Alaska. Methods of preparation, including delicate side dishes flavored with spices from faraway places and influenced by various ethnic groups, have led to endless variety. Sauerbraten and wienerschnitzel in Michigan can be as fine as any prepared in Germany and Austria. Delicately flavored French cuisine can be found in restaurants in New Orleans, home kitchens, creperies around the country, and specialty restaurants often found in elegant hotel dining rooms. Squid in a buttery ink sauce (*chipirones en su tinta*), a Basque specialty, is served in the mountains of Idaho, and one can find savory Vietnamese dishes at a restaurant in downtown Provo, Utah.

From Simple to Complex Foods

Today, American chefs and kitchen experimenters can find nearly every common food ingredient on the planet in one specialty shop or another. Ethnic grocers offer food ingredients imported from almost every corner of the world. In the colonial days of America, potatoes, corn, tomatoes, peppers, and peanuts were exported from the colonies to Europe, Africa, and Asia. The reverse was occurring also. From Europe and Africa came chickens, hogs, cattle, and sheep, as well as seeds for food crops such as rice, a wide range

of vegetables, and endless varieties of herbs and spices. For centuries, foods for the majority of Americans, mostly rural, were simple and based on what could be caught or grown in the region. Urban foods were also plain except for some hotel restaurants and inns where more exotic dishes could be prepared and served. Protein and dairy products in the land-bound regions came primarily from the farm animals. Fresh produce was enjoyed only in the warm months, and root vegetables like potatoes, carrots, and onions were carefully stored. Fruit was dried or preserved in honey or sugar.

Over time, American popular foods have been strongly influenced by Asian immigrants. It is estimated that by the mid-1800s, there were nearly 35,000 Chinese immigrants in the United States. Today, considering all Asian groups, the population is estimated to be nearly 2.5 million. Though xenophobic Americans initially did not make Asians feel welcome, the Americans did embrace them as menial workers and laborers. Chinatowns emerged in many large cities and, though generations have passed, the best Chinese meals in the United States are still to be found in the ethnic restaurants of Chinatown. Americans gradually adopted many of the traditional Chinese foods, and in contemporary America, Chinese and other Asian restaurants abound. Popular Chinese restaurant foods have been largely adapted for American tastes, but from simple soups to meat, poultry (including Peking duck), and seafood dishes, with myriad vegetables and dumplings followed by a fortune cookie (invented in California, by the way), the Asian flavors remain very popular.

Japanese workers arrived later in the 19th century, and they also brought delicious food traditions with them. Popular today are sushi and any number of quickly prepared Japanese foods. Filipino sailors arrived in California as early as 1587, but their first lasting settlements were in the bayous of Louisiana. There are ethnic enclaves of Filipinos still present in Louisiana, and using a term from a time past, they refer to themselves as Pinoy or Pinay—perhaps meaning Filipino Americans. Using the term as an adjective, one might hear a cook say that a dish is prepared in the Pinoy way, meaning a combination of Filipino- and Louisiana-style down-home cooking.

European immigration was numerically highest in the decades between 1880 and 1920. People from northern, southern, and eastern Europe brought with them their culinary traditions and enriched the bland American diet forever. Stereotypical American meals like a midwestern dinner of beef and potatoes with a salad, a few other vegetables, and dessert, or in another region of the country, simple staples like ham, collards, cornbread, and fruit pie (now labeled soul food) served sometimes in southern African American homes are steeped in tradition and remain preferred dinners for many. Even so, it would not be unusual for that midwestern salad dish to include beets (Russian) and sour cream (eastern European), or for the soul food dinner to include rye rolls (northern European) and cream puffs (French) for dessert, if someone requested them.

Origins and Influences

Floods of immigrants at the turn of the 20th century brought with them delightful recipes and memories of foods popular in their homelands. Some of these are still labeled “ethnic foods” (if there is any real meaning to such an ambiguous term). Foods that are popular in the United States today come from many origins; for instance, from the Russian Jews of eastern Europe, borscht, cabbage, dark breads, and dill-flavored sour cream mixed or on the side of raw cucumbers or other fresh vegetables; from the Italians, tomato sauce, pastas, garlic, grated cheeses, pizza; from the Greeks, olive oil, feta cheese, fresh vegetables, honey, walnuts, and plentiful fruit, including lemons; from the Czechs, dumplings, rich soups, fish with potatoes, stews, rich pastry; from the Germans, cookies, coffee cakes, breads, beer, jam omelets, marinated meat; and from the French, sauces, baguettes of bread, cream-filled pastries, lamb stew, and delicate salads; from northern Europeans, milk-based soups, root vegetables, and pork.

Food lines between ethnic groups blurred over time; for instance, immigrant European workers on the Upper Peninsula of Michigan adopted meat-filled pasties from the original Cornish immigrants and claim them as their own. These days nearly everyone in the United States eats a bagel now and then—or a fortune cookie—or a slab of pizza. Asian, Indo-Indian, African, Middle

Eastern, Caribbean, Mexican, Central and South American ingredients (and more) are now commonly found in grocery markets.

By the 1950s and 1960s, preservation and processing methods had improved and almost guaranteed the safety of both fresh and processed imported foods. Emphasis on locally grown foods was at a minimum. Grocery stores throughout the nation carried imported foods from canned lychees to escargot (snails) to fresh mangos year-round. Themed restaurants became more common, and it was common (as it is today) to get carry-out from an Asian restaurant, pizza or calzones from an Italian-themed restaurant, and Kosher sandwiches from a delicatessen. These are only a few examples, and though these emerged from specific ethnic groups, they were (and are) perceived as American foods.

Many of these foods have become so popular that they are now available in the frozen food aisles of most grocery stores. From Polish pierogies (meat-filled dumplings) to spicy Indo-Indian bean and grain mixtures, representative cultural foods have been processed, inspected, and made available to the American public. Concern about the lack of fresh, locally produced foods became an issue by the 1970s, and a food revolution began to take place. It was not intended specifically to educate the public about international food origins but to educate the public about more healthful eating. To enhance the shelf life and flavor of many food products, industrial agriculturalists, agribusinesses, and food processors add various chemicals (additives and preservatives) to most raw ingredients. There are cautionary tales and myriad examples of possible ill effects of these additives.

The Slow Food Movement

Using knowledge gleaned from food experts, Alice Waters, more than any other one individual, became the figurehead for what would become known as “California cuisine” and its demand for locally grown, seasonal, organic foods. Before Waters’s influential example and popularity, most restaurants depended on processed products, that is, quickly prepared convenience ingredients that had been canned, dried, or frozen. In her university undergraduate years, Waters went to France for a study-abroad program and became enamored of

Street vendors prepare Italian food at the annual Feast of San Gennaro in Little Italy, New York City, September 8, 2004 (left); a vendor prepares coconuts for sale at Seattle's Chinatown International District Night Market, August 4, 2007 (right). In the United States, with its many agricultural regions, food is represented from nearly every country. America maintains a rich tradition of authentic cultural foods, fusions, and experimentation with the tastes, colors, and textures of the multicultural world.

the French style of cooking and eating. She recognized the high flavor of fresh garden vegetables and lightly prepared fish and meat dishes. When she returned to the United States, she practiced her cooking, continued researching, and in time opened her first restaurant called *Chez Panisse* in Berkeley, California. Waters taught others that the freshest vegetables and other ingredients had the finest flavors. Another twist to the food, now often referred to as “fusion” style, are combination recipes made of fresh, locally grown organic ingredients. The varied ingredients—vegetables, fruits, meats, or seafood—are mixed for taste rather than by the tradition of their country of origin. Consequently, Waters’s restaurant was voted one of the top 25 in the United States by *Playboy* magazine, and it has also received many other significant awards and recognitions.

Fusion Foods and International Foods Today

American taste for foods from around the world has been enhanced by the fusion food movement, which emerged by way of the still popular California cuisine. Asian fusion restaurants have become popular in many parts of the United States, and the foods served cannot be categorized as any one particular cuisine style. In fusion foods, the form of one cuisine may be prepared with ingredients familiar to another cuisine or region. A roast turkey breast (American origin) served with a Mediterranean sauce of lemon juice and capers and then seasoned further with Asian chili sauce is a typical example. Another main dish might be a pizza covered with Mexican style ingredients such as refried beans, pepper jack cheese, and salsa.

From inexpensive drive-through ethnic-identified restaurants, where foods cater to American

tastes, to high-end restaurants with trained professional chefs who prepare both fusion or authentic cuisines with their own creativity as well as recipes and inventions from around the world, Americans are able to find representative food from just about every country. The United States began centuries ago with multiple tribes of migrating Native Americans. It has become a bustling country of immigrants and descendants from around the world longing to fulfill the American Dream and trying to survive on their journey to fulfillment. This country, with its many agricultural regions, is able to produce nearly every food imaginable, and it maintains a rich tradition of authentic cultural foods, fusion, and continuing experimentation with the tastes, colors, and textures of the multicultural world.

Food Processing and Ethnic Diversity

Food processing and food manufacturing are categories of industry involved in the transformation of ingredients or food products into other food products. It involves everything in the chain from the production of animal feed to the slaughter of livestock to the packing of meat to the production of frozen TV dinners.

Ethnic diversity has been important to the food processing sector, both in the workforce and in the customer base. In the 19th century, the food processing industry developed in the United States at a greater pace than in other countries, which was due both to the greater means (the United States had become the center of the Industrial Revolution and had ample labor) and greater need. Other than the drying of basic ingredients such as grains, beans, fruits, and spices, most of the earliest food processing companies were meatpackers either attached to or working in conjunction with local slaughterhouses.

Growth of Ethnic Food Processing

Until the meat-shipping trade in Lake Michigan began in the 1830s, most processed food was prepared for the local market. It was sold in open-air markets, often in ethnic enclave neighborhoods, or peddled door-to-door, either by the maker or by a third-party peddler. Such markets were established throughout the country; the Colombo market, for instance, was established by Italian immigrants in San Francisco in 1874. The California Fruit Canners Association grew directly from Colombo market vendors 25 years later, and in 1916 it began selling products nationally under the Del Monte brand name.

This changed quickly as the country spread out, populated by waves of immigrants who worked in food processing factories and moved west to settle the country. In some neighborhoods, door-to-door peddling and street vending continued as well, and in some places have become part of the local tradition. In Chicago, Mexican American street vendors sell *elote*, sweet corn with mayonnaise and grated cheese; in San Antonio, the "tamale ladies" sell tamales door-to-door around Christmas time; in New York City,

Middle Easterners and Jewish vendors sell falafel from street carts; in Cincinnati, German Americans sell sausage balls and sauerkraut; and in Boston, Greeks sell gyros. The ethnic foods of immigrant communities have become distinct parts of cities' identities.

Canned goods and other processed foods were vital supplies for westward-migrating families. In combination with the use of railroads to bring goods to distant domestic markets, food processing allowed for the growth of increasingly larger commercial farms. But the industry also served the country's new immigrant populations and increasingly diverse ethnic communities. Much as local butchers near Italian neighborhoods would prepare *porchetta* (a stuffed pork dish) for families to bring home and roast, companies began producing canned and jarred spaghetti sauces.

The availability of these prepared foods, originally aimed at the immigrant families already accustomed to them, led in turn to their popularization among other American families. German foods were popularized first; bratwursts and hot dogs produced by meat processors quickly became assimilated, alongside packaged sauerkraut, bottled beer, canned pickles, and vinegar. Even as turn-of-the-century nutritionists tried to Americanize the eating habits of first- and second-generation American households, native-born Americans were rapidly adopting the new foods these immigrants had introduced.

By the 1930s, for instance, the Ragu brand of spaghetti sauce, which was first produced in the Rochester home of the Cantisano family, was marketed across the country. Spaghetti in tomato sauce became a household staple among families who had neither grown up with it nor prepared it themselves. Dried Italian pastas were similarly popularized, as fresh noodles had always been a staple food in most of the country. Similar processes popularized Mexican cuisine in predominantly non-Hispanic parts of the country, as companies that produced products originally for the Hispanic populations of Texas, California, the southwest, or migrant worker communities throughout the country soon began marketing them to a nationwide audience. The growth of the advertising industry in the late 19th century, in conjunction with the growth of magazines (which provided advertising space) and later

radio, helped tremendously with the transmission of food trends.

Work in the food processing sector also provided jobs to recent immigrants, whether as entrepreneurs starting their own companies to produce ethnic foods for their community or as part of the larger labor force necessary to fuel the industry. In Chicago, Polish, Italian, and Hispanic immigrants found work in the many meatpacking plants, which processed the beef delivered by rail from Texas, Kansas, and other ranching regions. Greeks, Lithuanians, and European Jews soon joined the ranks of these plant workers.

One of the most significant innovations in food processing was introduced by Moravian immigrant Charles Fleischmann, who introduced commercially made yeast to the country for the first time at the Centennial Exposition in Philadelphia in 1876. Prior to that time, bread in the United States was always made with sourdough, a long process using bacterial fermentation and the naturally occurring yeasts found in the flour. Commercial yeast allowed for greater control and consistency, allowed home cooks to bake bread with much less preparation time, and was a necessity for the commercial baking industry. Yeast is still sold today under the Fleischmann name.

In the early 20th century, the spread of Chinatowns and the growing Chinese American middle class created a demand for both Chinese imports and locally produced Chinese ingredients. Numerous companies like Chicago's Hong Kong Noodle Company (established in 1914) were formed to produce food goods for the Chinese American market, as well as bakeries producing fortune cookies, almond cookies, and moon cakes.

Within the food processing workforce, the number of Hispanics working in food processing fell from 2005 to 2010, after rising rapidly from 2000 to 2005. The exact reason for this is unclear, but there is a decent chance that the food manufacturing workplace raids of 2006 to 2007 by U.S. Immigration and Naturalization Services, followed by I-9 audits of the meatpacking industry, substantially reduced the number of undocumented immigrants employed in the sector. Further, the recession that set in with the 2008 financial crisis may have made food processing jobs attractive to non-Hispanic workers who had otherwise avoided the industry.

Food Processing Firm Ownership

Data on demographic and economic information pertaining to American businesses is compiled as part of the Survey of Business Owners (SBO), which is conducted roughly every five years. The deadline to submit responses for the 2012 SBO was extended into mid-2013, delaying the tabulation, compilation, and publication of derived data. The most recent data available is from the 2007 SBO. As of that survey, the overwhelming majority of food processing companies, about 80 percent, were owned by non-Hispanic whites. Hispanics of any race owned about 7 percent of companies, blacks owned about 5.5 percent, and Chinese Americans owned about 2 percent. No other group controlled more than one half of one percent of food processing companies.

Football and Ethnic Diversity

In the 1800s, the game of football evolved from a modified London football college game to an American game of blocking or interference between players. On the other hand, American football off the field did not easily transition from all Caucasian players to racially diverse players.

Professional football did not see racial integration until 1904, but American society continued to fight for or against racial equality.

The National Football League (NFL), as it is known today, was originally a product of an idea spawned by a well-known Native American and Olympian, Jim Thorpe, and a Caucasian, Leo Lyons, in 1920. These two men formed a regional football network that featured teams representing the major Great Lakes cities. The impetus of this new sport was to be equally as popular as baseball. As the game became more popular, its impact had a wide-reaching effect on the ethnic and social landscape of the sport and of society.

Expansion and Ethnicity

In 1920, the American Professional Football Conference, which originally included only teams based in Ohio, later became known as the American Professional Football Association. It was led by Thorpe for the first year of its existence. As this league expanded to include more major cities, the number of ethnically diverse players increased. Numerous teams had players representing not only the Native American community, but also the African American, Asian, and Jewish communities.

Alfred Miller was the first Jewish player in the National Football League, playing halfback and quarterback for the Boston Bulldogs. Jewish-born Benny Friedman revolutionized the game by being the first quarterback to throw first and second downs instead of the traditional third down. Ahmad Rashad is one of the most notable Muslim football players, a wide receiver with the Minnesota Vikings. Thorpe, the NFL founder and an Olympian, was Catholic.

Teams found diversity represented in many positions. The Carlisle Industrial Indian School was opened in 1879 for Native American children. This boarding school catered to Native American youth by educating them and creating a successful football program. Thorpe was a player at the school, and in 1912 it won the national collegiate championship. Players representing 10 Native American midwestern tribes formed the Oorang Indians team in 1922. In 1927 and 1928, Asian Americans Walter Achiu, a running back and defensive end, and Arthur Matsu, a quarterback, were both players for the Dayton Triangle, now known as the Detroit Lions. Rock Island's Robert Marshall was the first

African American to appear in an NFL game in the early 1920s. Other African Americans such as Fred Slater (defensive tackle), Paul Robeson (running back), Fritz Pollard (halfback, quarterback, running back), and Jay Williams (running back) were standout position players.

Nine African American players were removed from the league. Once Carlisle closed its doors in 1918, so did the NFL, to both Native American and African American players. With the removal of nine African American players in 1926, followed by the removal of African American players Ray Kemp and Joe Lillard in 1933. It would be another 13 years before another minority player took the field. The league became predominantly Caucasian as diverse players were not selected.

College Football

In the south, African American college football players were excluded from playing at any white institutions. Most of them played at Grambling State University, Jackson State University, and Prairie View State University. Even as schools in the Southeastern Conference (SEC) and Atlantic Coast Conference (ACC) begin to sign African American players, the struggle became difficult for players because many people did not want to see change in their all-Caucasian college football teams, but teams slowly became more diverse.

In 1963, Darryl Hill became the first African American college football player in the south and experienced many forms of racism during his time at the University of Maryland. Furthermore, the famous USC-Alabama game on September 12, 1970, ushered in more historic moments of change for football. An integrated institution, the University of Southern California (USC) was a football powerhouse, and Coach Paul Bryant of Alabama wanted to play their team. This game resulted in the first integrated football team playing at the University of Alabama, which convinced the Alabama institution to recruit African American players.

As southern college football teams begin to add more African American players, certain positions on the team continued to be held by Caucasians. The quarterback's role on the field was to be a leader and responsible for calling the signals or plays. Many people felt that no African American male could play this position. However, the number of African American quarterbacks increased in

professional football after some college players were seen playing at Ivy League schools. Rod Plummer, Rob Foster, Marty Vaughn, and Dennis Coleman played quarterback at some of the most prestigious schools in the country, including Princeton, Harvard, and Brown universities. Ultimately, the placement of African American quarterbacks became widespread in major college football programs.

Desegregation and the NFL

The National Football League found itself drafting and signing mostly Caucasian players between 1933 and 1946. Most of the ethnically diverse talent was either engaged in military action or not participating in the sport. In 1946, the Los Angeles Coliseum forced integration upon the then Cleveland Rams. The venue required the team to integrate in order to utilize its facility. African Americans Kenny Washington (running back) and Woody Stode (offensive end) signed with the Rams and became the first minority players to sign a contract after World War II. Other teams within the league soon began to integrate. Under pressure from the John F. Kennedy administration and to meet a precondition of occupancy of D.C. Stadium, renamed Robert F. Kennedy Stadium, the Washington Redskins was the last team in the National Football League to integrate in 1969.

The American Football League (AFL), the emerging rival league to the National Football League, offered players from historically black colleges and universities an opportunity to play professional football. This league began new franchises in cities that did not have teams affiliated with the NFL. Many of these gifted players had been unnoticed by the NFL and were now being showcased by their new teams. The American Football League offered contracts that paid these players higher salaries than the NFL. Thus, a bidding war began when drafting players for both AFL and NFL teams.

The Impact on Ethnicity

The American Football League not only sought players from the traditional black colleges, it also introduced the world to other talented minority players. Tom Flores was the first Hispanic quarterback with the Oakland Raiders. An 18th-round pick, Hispanic Joe Kapp, was drafted by the Washington Redskins in 1959, but was never

contacted by anyone from the team. Mexican American Tom Fears, drafted in 1945 by the Los Angeles Rams, is credited as being the first wide receiver in the modern era of the game. Jim Plunkett is not only the first Mexican American player to win the coveted Heisman Trophy but also claims the honor of being the only player of Hispanic ancestry to be drafted as the first overall pick in the NFL draft by the then American Football League's Boston Patriots.

Diversity and Ethnicity in NFL Players and Coaching

The average professional football player earns \$906,000 a year as measured by 2010 U.S. Census data. Within the industry of professional athletics and related services, such as agents, broadcasters, sports writers, and television industry professionals, there are over 1,393,540 employees. With all of the numerous diversity programs under the NFL umbrella, the data show this industry only employs 5,823 Native Americans and 63,414 Asians.

As for the players themselves, 67 percent are African American, 31 percent are Caucasian, 2 percent are Asian, 1 percent are Latino, and 1 percent are international. Most of the quarterbacks in the league are Caucasian (83 percent), as well as punters and kickers (95 percent). Running backs and tight ends are predominantly black (85 percent), as are the defensive front-line position players (75 percent).

Fritz Pollard is considered the first African American to coach a team with the American Professional Football Association. He coached the Akron Professionals in 1921 and the Hammond Professionals in 1925. In the modern era of the game, Art Shell was the NFL's first African American head coach with the Oakland Raiders. In 1967, Tom Fears was the NFL's first Hispanic head coach with the expansion team the New Orleans Saints; however, Tom Flores is the first Hispanic head coach to win the Super Bowl twice with the same franchise. As the assistant head coach of the Chicago Bears, Lloyd Lee was the NFL's first Asian American to coach in a Super Bowl.

NFL Commissioner Paul Tagliabue appointed a diversity commission in 2002 that generated what is now called the Rooney Rule, which requires each team to interview at least one minority candidate for a head coach or senior front office

position. With the enforcement of this rule, teams are now hiring a record number of minorities and women in senior management roles, followed by more diverse head and assistant head coaching positions. The total number of diverse employees at or above the vice president level increased by 30 percent, from 20 in 2010 to 26 in 2011. Yet, all 32 of the leagues are owned by Caucasians.

Fort Laramie, Treaty of (1868)

The Treaty of Fort Laramie of 1868 was an agreement between members of the Lakota, Yanktonai,

and Dakota (Sioux) and the U.S. government. The treaty guaranteed the Lakota ownership of the sacred Black Hills (Paha Sapa) and established the 26-million-acre Great Sioux Reservation on Lakota land (all of present-day South Dakota west of the Missouri River). The treaty also called for the abandonment and removal of all military forts along the Bozeman Trail in Powder River Country and closed that area to any further military intrusions or white settlement, calling it “unceded” Indian territory, which was reserved for hunting and for those who chose not to live on the reservation.

The treaty was the result of a successful war waged against the United States by the Oglala Lakota leader, Red Cloud (Makhpyia-luta), known as Red Cloud’s War or the Bozeman War, from 1866 to 1868 throughout the territories of Montana and Wyoming over control of hunting territory in the Powder River Country (north-central Wyoming). Eight years after the U.S. Congress ratified the treaty, the U.S. government violated its terms when it took Lakota land, including the Black Hills.

Over the last several centuries the 1868 Fort Laramie Treaty has remained an important document, particularly in the struggle over native rights and land claims as evidenced by the ongoing Black Hills land claim by the Sioux Nation and the activities of the American Indian Movement. In the *United States v. Sioux Nation*, the U.S. Supreme Court determined that the government had illegally seized the land and was required to pay restitution in the amount of over \$100 million. This was a landmark case as its ruling established the legal basis for compensation in other Indian land claims.

Loss of the Black Hills

In 1874, George Armstrong Custer led a military expedition through the Black Hills and discovered gold. One year later the Newton-Jenney geological party conducted a detailed survey of the Black Hills. After gold was discovered, prospectors and settlers also began encroaching upon Lakota land. These kinds of activities were illegal under the 1868 Fort Laramie Treaty and the United States was supposed to help prevent them. Instead, in September 1875 President Ulysses S. Grant attempted to buy the Black Hills, but the Lakota

refused to sell land that was sacred. That November, the Indian Bureau ordered all Lakota on “unceded” land to confine themselves to the Great Sioux Reservation by January. This was another violation of the Fort Laramie Treaty. In early 1876 the U.S. government launched a military campaign against all Lakota unwilling to comply.

What resulted was a series of campaigns and battles between the United States and the Sioux, known as the Great Sioux War. The Battle of Little Bighorn, which took place in southeastern Montana in June 1876, is infamous in American history as the battle in which half of the 7th Cavalry, along with Custer, died in a crushing defeat by the Sioux (led by the Oglala Lakota Crazy Horse and the Hunkpapa Lakota Gall), the Cheyenne, and the Arapaho. Ultimately, the United States defeated the Sioux, and in 1877 Congress approved a law that changed the terms of the 1868 Treaty of Fort Laramie. Although the Sioux would still receive the annuity payments negotiated in that treaty, the size of the Great Sioux Reservation was reduced, three roads were to be constructed through it, and free navigation of the Missouri River was also authorized.

United States v. Sioux Nation

Throughout the 20th century Sioux (Lakota) leaders have filed a series of cases against the U.S. government, demanding reparations for the illegal seizure of Sioux land guaranteed under the 1868 Treaty of Fort Laramie. In 1946, Sioux leaders received a full hearing through the Indian Claims Commission (ICC), which was created by Congress that same year to adjudicate unresolved Indian land disputes. In 1975, the ICC ruled that Congress’s 1877 law, through which Sioux land was obtained by the U.S. government, was unconstitutional and therefore the land seizure was illegal. The ICC further ruled that the Sioux were owed the estimated value of the land in 1877 (about \$17 million) plus interest. The U.S. government appealed.

On June 30, 1980, the U.S. Supreme Court ruled in *United States v. Sioux Nation* that the Black Hills were unlawfully seized by the government and that the monies never paid to the Sioux were now due, along with interest accrued since that time. Maintaining that the Black Hills are sacred land and important to their communities today, the Sioux refused to accept payment (now over \$400

million) and instead have continued to pursue the return of their land, guaranteed to them under the 1868 Treaty of Fort Laramie.

442nd Regimental Combat Team

When the Imperial Japanese Navy attacked Pearl Harbor on December 7, 1941, President Franklin Roosevelt issued Executive Order 9066, and approximately 120,000 Japanese immigrants and Americans on the west coast were interned because they were regarded as enemy aliens. To challenge discrimination against Japanese Americans and to prove their loyalty to the United States, Nisei (second-generation) Japanese American men joined the U.S. armed forces. Because Japanese Americans' loyalty to the United States was questioned, a combat team comprised of only Japanese Americans was organized, and that was the 442nd Regimental Combat Team (442nd RCT). Nisei Japanese American men fought bravely for the United States and proved their dedication to the country. President Harry Truman praised the team and said "you fought the enemy abroad and prejudice at home and you won." Their heroic fight in World War II led to the liberation of Japanese American internees from internment camps,

empowered Japanese Americans, and later made the U.S. government officially apologize for putting Japanese Americans in internment camps.

Formation of the 442nd

According to nationality law, any person born on U.S. soil is an American citizen. However, Japanese Americans became enemy aliens in the United States regardless of their American citizenship. They were not eligible to serve in the U.S. armed forces.

Japanese Americans in Hawai'i were not interned as were Japanese Americans on the mainland because they were dominant in numbers in Hawai'i and were an indispensable part of the islands' economy. They had worked for the war effort even before the Pearl Harbor attack, but they were also regarded with suspicion and ordered to leave war duty in 1942. The dismissed Nisei Japanese Americans petitioned Lieutenant General Delos Emmons to accept them again for the war effort. Emmons allowed them to work for the armed forces in 1943. These Nisei Japanese Americans in Hawai'i comprised the 100th Battalion, were trained at Camp McCoy in Wisconsin and Camp Shelby in Mississippi, and were sent to battlefields in Africa and Italy. They later joined the 442nd RCT, which was comprised of enlisted Nisei Japanese Americans from Hawai'i and Nisei Japanese Americans from the mainland, who had been interned.

When the U.S. government changed its policy from excluding Japanese Americans from the armed forces to having them serve in these special military units, they required the Japanese American internees to answer a loyalty questionnaire. The questions asked Japanese Americans if they had an unconditional loyalty to the United States and abandoned their ties to Japan. Those who answered "yes" to the question were allowed to serve the U.S. armed forces, but there were people who could not answer "yes" after experiencing their unjust treatment by the U.S. government. The questionnaire caused a rift in the Japanese American community.

Battles in the European Theater

The 442nd RCT was sent to fierce battlegrounds in Europe. One of the fiercest battles was the rescue of the Texas battalion, in which 211 Texan

soldiers were surrounded by German soldiers; the 442nd RCT succeeded in rescuing the Texans at the cost of 800 casualties. The team's success and valor was highly praised and circulated in the media, and the team's motto "Go for Broke" enhanced the image of Japanese Americans. However, discriminatory treatment of the 442nd RCT continued. For example, when the team liberated the French town of Bruyères from German troops, they were not permitted to join the victory parade. The 442nd RCT released Jewish inmates from the Dachau concentration camp in Germany but this fact was not disclosed until 1992.

The 442nd RCT was rewarded for its courageous fight by receiving 18,143 individual decorations, including 21 Congressional Medals of Honor, 52 Distinguished Service Crosses, 560 Silver Stars, 4,000 Bronze Stars, and 9,486 Purple Hearts. The team became the most decorated unit in the history of the U.S. armed forces.

Aftermath of World War II

The United States fought World War II for freedom and democracy. Veterans of the 442nd RCT wondered why they had to docilely accept their second-class-citizen status back in the United States after fighting for freedom and democracy and sacrificing their lives. Once-silenced Japanese Americans had started voicing their rights.

In Hawai'i, veterans of the 442nd RCT ran for office in the 1952 territorial election. Their Democratic Party won the election after many years of white Republican domination of the islands. This political change initiated by Japanese Americans is called the Democratic Revolution, and it contributed to making Hawai'i a multicultural society where there is no racial/ethnic majority. Daniel Inouye, one of the veterans who joined the Democratic Revolution, later won a seat in the U.S. House of Representatives in 1959.

On the mainland, motivated by the civil rights movement, Sansei (third-generation) Japanese Americans started the redress movement. They demanded the government's official apology and reparations for illegal internment of Japanese Americans. Many former internees felt the experiences and shame of internment, and they broke the silence and testified against the wrongs of internment. In 1988, President Ronald Reagan signed a bill to award \$20,000 in reparations to

surviving former internees. In 1991, President George H. W. Bush made an official apology on behalf of the United States for interning Japanese Americans.

Postwar Japanese American political gains would not be achieved without the sacrifice of the 442nd RCT. Fighting against prejudice and discrimination, the 442nd RCT played a significant role in changing Americans' biased views against Japanese Americans, clearing the tarnished status of Japanese Americans, and, most importantly, enriching multiculturalism in the United States.

Freedmen's Bureau

The Freedmen's Bureau was the most comprehensive relief agency in the history of the United States. Established on March 3, 1865, by the U.S. Congress, its mission was to alleviate physical suffering, provide legal justice and education, and redistribute southern lands to former slaves freed by the Emancipation Proclamation (1863) as well as to white refugees who sided with the

Union. Before its work ended in 1872, the bureau spent \$5 million for schools and coordinated with northern aid societies to employ 9,300 teachers, instruct 247,000 students, and build 4,000 schools throughout the southern and western United States. The educational work of the bureau provided the foundation for the beginning of a public school system in the south.

Beginnings

The Freedmen's Bureau of Refugees, Freedmen, and Abandoned Lands was based on the Port Royal, or Sea Island, Experiment. On November 7, 1861, the U.S. Navy fleet and U.S. Army captured Port Royal Sound, South Carolina, and the adjacent Sea Islands of the Beaufort District. During this military action, the Beaufort District planters abandoned most of their property—including nearly 10,000 slaves on island plantations—and evacuated inland.

The political status of the slaves was unclear. Still considered to be property, they were declared contraband of war and placed under the jurisdiction of the U.S. Department of the Treasury. Treasury Secretary Salmon P. Chase sent Edward L. Pierce to Port Royal to investigate and recommend action to the federal government regarding the contrabands. Pierce, a captain in the Third Massachusetts Regiment, had earlier put former slaves to work building entrenchments at Hampton, Virginia. This was the first instance of employing former slaves to do military work for the U.S. Army.

Simultaneously, Reverend Mansfield French of the New York-based American Missionary Association (AMA), which was founded in 1846 as a Protestant and abolitionist organization, was sent to Port Royal to determine what assistance the AMA could render the former slaves. Both Pierce and French arrived at Port Royal in January 1862

A print from the July 25, 1868, issue of Harper's Weekly shows a Freedmen's Bureau agent standing between armed groups of southern whites and freedmen, or freed slaves. During the Reconstruction Era in the United States, the Bureau, initiated by President Abraham Lincoln in 1865 and intended to last for only one year after the Civil War, continued to aid distressed freedmen until 1872.

in order to institute a joint effort between philanthropic organizations and the federal government that would serve in a custodial role for the contrabands. The heart of the "experiment" was to use the contrabands to harvest and process the valuable Sea Island cotton. In February 1862 Pierce returned to Boston and began actively recruiting volunteers to go south to the Sea Islands in order to assist the effort.

Philanthropic organizations and religious missionaries provided food, clothing, medical help, and education to the effort. The National Freedmen's Relief Association in New York collected donations and enlisted volunteers to assist as well. In March, Pierce was placed in charge of the freedmen and plantations on the islands, along with nearly 60 teachers and superintendents, who established schools and advocated the formation of freedmen's aid societies. The partnership between the federal government and various philanthropic agencies to carry out humanitarian enterprises among the Sea Island blacks continued throughout the Civil War.

After 1861, slaves gravitated to the protection of the Union troops. General Ulysses S. Grant and Union army chaplain John Eaton contributed to the eventual formation of the bureau when Eaton took charge of unemployed blacks in November 1862. He opened a contraband camp at Grand Junction, Tennessee, and put blacks to work in the cotton fields. Governors of northern states, eager to keep the freed people in the south, sent money for food and clothing in order to keep former slaves on southern plantations. Influenced by northern abolitionists and humanitarians, the early emphasis was on improving the condition of the contrabands rather than exploiting their labor.

The emphasis changed from charity to the production of cotton and other crops because of philosophical concerns that former slaves needed to become self-sufficient. Under the authority of the federal Direct Tax Act of 1862, most of the Sea Island plantations in the Beaufort District had been seized for nonpayment of taxes. Leaders of the Port Royal experiment lobbied the federal government to redistribute this land to the freedmen. Of the 101,930 acres seized, the freedmen purchased approximately one-third in small parcels. This practice would ultimately lead to

the sharecropping system, which was nearly as exploitative as slavery itself.

Expansion After Emancipation

On January 1, 1863, President Abraham Lincoln issued the Emancipation Proclamation, which officially freed the contrabands of the Sea Islands along with all other slaves in Confederate states. Since contrabands would no longer be returned to their owners, the scope of the relief effort grew exponentially. Many people were recruited to support the army as teamsters, cooks, hostlers, and laborers who accompanied the troops as they worked their way through the south.

To meet the challenge, the federal government established the Freedmen's Bureau of Refugees, Freedmen, and Abandoned Lands to deal with humanitarian problems at the close of the Civil War. The bill creating the bureau was passed in 1865, but it was argued that the bureau belonged in the War Department because the freed people needed protection. The abandoned lands were then moved from the control of the Treasury Department to the War Department. The bureau was to supervise and manage all abandoned lands and exert control over all matters relating to refugees and freedmen. The commissioner of the bureau was Oliver Otis Howard, an army general from New England. He had been introduced to the schools for freed persons in Beaufort and was impressed by the teachers and earnest students.

Eleven assistant commissioners who worked for the bureau played a powerful role in the Reconstruction of the south. Following the Port Royal model, the agents promoted education, philanthropy, and paid labor. Feeding the refugees was the first issue, and the bureau initially had no appropriations for this task. The bureau also had to manage the abandoned land and properties, some of which it sold for income. Millions of slaves had been forbidden to learn to read and write by slave codes that were established in every southern state. Although many were skilled artisans, others were wholly dependent upon the plantation system. White refugees who had supported the Union in the conflict lost land and employment and were displaced as a result of the war's devastation.

Beyond humanitarian efforts, early major functions of the bureau were the supervision of labor,

reunification of black families, and provision of education and justice. The agents expanded their reach, helping blacks to write or read letters and newspaper advertisements for lost kin. Although wives and husbands were sometimes reunited, it was more difficult to locate missing children who had been sold off to other plantations. Bureau agents also performed marriages of black men and women who were living together but had not been considered legally married. Under slavery, marriages were considered to be illegitimate by slave owners, and black families were fractured when someone was traded away to another plantation.

Although the prospect of "Forty Acres and a Mule" initially gave the freed persons hope, it was quickly thwarted. By December 1865, President Andrew Johnson, a southerner from North Carolina, had restored the abandoned lands to the Confederate owners, depriving the bureau of income or the ability to redistribute land. Johnson was a Jacksonian Democrat who believed in states' rights and thought the bureau was hindering his Reconstruction program. Radical Republicans were furious about Johnson's conciliatory stance toward the south and his failure to advocate the rights of former slaves. Meanwhile, southerners bitterly resented the bureau and considered the south to be occupied by a foreign government.

Education as a Legacy

By 1865, bureau agents who were concerned with the welfare of the former slaves had already begun to pin their hopes more on education and politics. Howard considered education of the freedmen, both children and adults, to be "the true relief." Early in the war, chaplains and other soldiers had helped the contrabands learn to read. The agents of the northern aid societies followed. Howard stressed the need for schools, but since there was no allocation for them, the bureau had to rely on the aid societies to raise money and pay teacher salaries. The bureau let aid societies use its buildings for schools and provided transportation for teachers and books. The bureau then rented its buildings to the aid societies and used the rent to pay teachers.

But philanthropic organizations were beginning to lose interest, and aid would soon end. In all, by January 1865, about 750 people were

teaching about 75,000 black children in the areas of the south then occupied by Union armies. To African Americans, literacy seemed to belie the white message that blacks were merely beasts of the field. Some white planters went along with teaching former slaves to read and write, and Howard believed the planters would be placated if schooling included moral and religious training. Other whites, however, feared the teaching of ideas of social equality and thought the teachers were trying to remake the south in the image of New England. Some of the white violence toward teachers was about property: whites burned buildings that had been confiscated and were being used for schools. Although the arson was an attack on teachers, it was also retaliation for losing their land.

Toward the end of 1865, there were 799 men working for the bureau. In 1866, the bureau's charter was extended for two years. Its jurisdiction expanded to all loyal refugees and freedmen everywhere in the United States, and its appropriation increased to nearly \$7 million. More than half was allocated for clothing and rations for the freedmen. There was also \$500,000 for the rental and repair of school buildings and asylums, and the commissioners were directed to provide schoolhouses to benevolent societies that would support teachers.

The bureau also established courts, founded a bank, and tried to mediate labor relations. Various types of court systems operated in the former Confederate states. After emancipation, the federal government extended military protection and military jurisdiction over all cases in which persons were discriminated against because of race. The mission of the bureau's courts was to adjudicate difficulties arising between blacks and whites in places where the civil courts were interrupted and did not admit black testimony. Bureau agents were supposed to aid the freedmen with their cases and often acted as judges.

Beginning in 1866, the bureau's claims division took on the responsibility of filing claims for back pay and pensions of black soldiers who had served with the colored troops. The bureau also assisted with voter registration as a result of the Voting Rights Act of 1867, which gave black men over the age of 21 the right to vote. The bureau set up registration districts, recommended people

for registrars, and provided information to eligible voters. The bureau was criticized for going after Republican votes, and the agency was perceived as having a Republican agenda. President Johnson was opposed to the Republicans and the bureau, which he saw as helping keep radical Republicans in power.

The freedmen's bank was chartered by Congress as the Freedmen's Savings and Trust Company. It operated for nine years (until 1875) in 34 branches in every state of the south and in New York, Pennsylvania, and the District of Columbia. Legally, the bank and the bureau were separate entities, but they worked closely together to promote economic development. Blacks were encouraged to make deposits in the bank as part of the effort to help them develop economic independence.

Labor relations were always problematic. Freedmen became disillusioned with the contract system because they did not think they received fair compensation for their labor. The planters believed they no longer needed the bureau.

Demise and Lasting Influences

By March 1869 the Bureau had helped build 630 schoolhouses. Over the next three years, it spent \$1 million for buildings. In a policy often used by philanthropic organizations, matching funds were required. Blacks were encouraged to contribute labor, aid societies provided land, and the bureau finished the task of constructing schools. Since there was no standard curriculum and teachers were often poorly trained, Howard proposed to the societies that they open normal schools and colleges for blacks throughout the south. The mission of the normal schools was teacher preparation. Howard also urged the Peabody Education Fund (1867–1915) to support normal schools.

In March 1867, Congress chartered Howard University, named for Oliver Otis Howard. The money for the land came from the bureau. By 1871 there were 11 colleges and universities and 61 normal schools in the nation intended for blacks that would have a long-lasting impact on black education. The curriculum would become contested, however. Black leader Booker T. Washington of Tuskegee Institute advocated vocational training, while black intellectual W. E. B. Du

Bois pressed for civil rights and a classical-liberal curriculum.

By 1869, the number of people employed by the bureau had dwindled to 158. The bureau closed on January 1, 1869, except for its educational work and the collection and payment of veterans' claims. It began to withdraw its forces from the south. For all practical purposes, the bureau ceased operations in March 1871 due to a lack of appropriations.

Conflicting Mission

The Freedmen's Bureau had a tall order to fill: it was charged with nothing less than repairing the southern social and economic order; encouraging white planters to revive their farms; urging black workers to accept available jobs; monitoring contracts between landowners and workers; and pressing both groups to treat each other as employers and employees, not owners and property. Changes in the economic order between whites and former slaves required a redefinition of social relations, but the bureau exacerbated race relations because it was too politicized. White southerners saw the bureau as an extension of the Union's dominance and resented the fact that it was garnering Republican votes by enfranchising the freedmen. The army's provost marshals were more sympathetic to the former slave masters than to the freedmen and teachers. Union soldiers often had too much race prejudice to make good agents, and most Union veterans had little or no interest in the bureau.

The northern teachers were considered to be political missionaries who would educate blacks out of their place and indoctrinate them with New England ideals. The enormity of the literacy task is demonstrated by the fact that it is estimated that only one-tenth of African Americans of school age had attended school while under the charge of the bureau. Nevertheless, the bureau's efforts furthered the cause of literacy in the south for both blacks and whites. Although the bureau did not create black public schools as institutions, it had nurtured their development and dissemination. Whites would soon follow with their own—and separate—schools.

Freedom Riders

Africans and African Americans were treated as second-class citizens through the institution of slavery in the United States, and later the Jim Crow laws that legalized racial discrimination. Instituted during the Reconstruction period following the U.S. Civil War and emancipation of slaves, these laws served to systematically oppress African Americans for another 100 years. The civil rights movement began in 1954, following the U.S. Supreme Court's decision in *Brown v. Board of Education of Topeka*, which outlawed separate but equal education in order to end racial inequality in the United States and improve the conditions of blacks.

A central but often overlooked part of the civil rights movement are the Freedom Rides, a term that refers to the nearly seven-months-long activist campaign to desegregate interstate bus depots and train stations in the southern United States. Approximately 400 men and women known as Freedom Riders took part in this interracial

movement, risking life and limb and enduring jail time in order to create a more equal world.

The first Freedom Ride actually predates the civil rights movement, dating back to 1947 when members of the Congress of Racial Equality (CORE) and the Fellowship of Reconciliation joined to challenge *Morgan v. Virginia*, a U.S. Supreme Court ruling that desegregated interstate travel on buses and trains. An interracial group of 16 blacks and whites took a bus ride through the upper southern states to test the ruling's enforcement. Known as the Journey of Reconciliation, this first Freedom Ride garnered little attention. Thirteen years later, the tactic was revived after the 1960 *Boynton v. Virginia* ruling extended *Morgan v. Virginia* to the desegregation of all interstate terminal accommodations (depots, restaurants) and James Farmer, the national director of CORE, saw an opportunity.

The purpose of the 1961 Freedom Rides was to protest the practice of segregation and actualize the decision in *Boynton v. Virginia*. Using the Journey of Reconciliation as its model, this time an interracial group would board southbound buses in order to integrate station restrooms, waiting areas, and restaurants. During scheduled stops, the Freedom Riders would depart the bus and enter "white" and "colored" areas contrary to where they were supposed to go, or would sit together in segregated areas. In contrast to other acts of civil disobedience, the Freedom Riders were not breaking a single law. Instead, they hoped their acts of integration would incite southern racists to react, causing the Justice Department to uphold the law. Since CORE members practiced the Gandhian activist principles of nonviolence, they would not fight back if attacked.

CORE began the process by alerting the appropriate people of the group's upcoming plans to commit civil disobedience. In April 1961 they sent formal letters to U.S. Attorney General Robert F. Kennedy and the Justice Department, President John F. Kennedy, and the Federal Bureau of Investigation (FBI). They also notified the two bus companies, Greyhound and Trailways, of the upcoming Freedom Ride. These letters were never answered. A few weeks later, the group gathered on May 3, 1961, at a Chinese restaurant in Washington, D.C., to discuss the plan. Participant John Lewis and other attendees would later refer to

this dinner as “the last supper,” as the following morning they were embarking into the unknown.

On May 4, 1961, a group of 16 blacks and six whites boarded one Greyhound and one Trailways bus and departed for Birmingham, Alabama. As planned, the Freedom Riders boarded the buses and sat in integrated seating patterns, an act considered criminal through much of the southern states.

Anniston Bus Burning and Birmingham Riot

The initial legs of the trip were mostly uneventful for the Greyhound bus, and it continued southward, due to arrive in Birmingham on Mother’s Day, May 14, 1961. However, the bus ran into serious trouble in Anniston, Alabama. When the Greyhound bus arrived as scheduled in Anniston, it was met by an angry crowd of about 50 who yelled, “dirty communists” and “sieg heil!” while it slashed tires and broke windows in a 20-minute-long siege. Eventually the bus departed the station in search of safety, but members of the mob—such as Klansmen (none wearing hoods or robes) as well as other citizens, still in their Sunday best—trailed the damaged bus. A firebomb was thrown through the window, filling the bus with smoke and trapping many of the riders inside. A gas tank explosion momentarily broke up the crowd, allowing a few riders to escape out the door. Other frantic riders fled the bus through windows. Escape offered no relief from the threat of injury and death, as the Freedom Riders were summarily beaten with fists, chains, and bottles. Only a second fuel tank explosion and waning shots fired by a recently arrived highway patrolman put an end to the scene. The image of the smoldering bus has since become an iconic picture.

Meanwhile, the Trailways bus experienced trouble from the start. Before the bus left the station, several menacing Ku Klux Klansmen bought tickets and boarded. After boarding they harassed the Freedom Riders and demanded they sit in segregated seating. When the riders refused, the Klansmen attacked Charles Person and Herman Harris. These men were brutally beaten, along with James Peck and Walter Bergman, who came to their aid; all four were then dragged to the back of the bus and their near-lifeless bodies thrown over the seats as the bus continued on.

When the bus arrived in Birmingham, the four injured men had regained consciousness. Despite already suffering one attack, as bus captain of this leg Peck was first off the bus along with Person. At this time, the fate of the other bus was unknown and the men were unaware of the ambush that awaited them and the other Freedom Riders. Almost immediately a racist mob descended upon the Freedom Riders, with Peck and Person bearing almost unimaginable beatings. Other activists were also brutalized and beaten for more than 15 minutes before “help” arrived.

As prearranged with local police officers and officials, the Klansmen and white supremacists were to be left unbothered so they could enact their deadly mission. When later questioned about the lack of a police presence, Eugene (Bull) Connor, the commissioner of public safety in Birmingham, Alabama, replied that police officers were home celebrating Mother’s Day with their mothers.

Next Steps

After witnessing the violence and brutality of the events in Alabama some wondered if the Freedom Rides should be halted. However, others feared that ending the rides would legitimize mob rule and violence as viable tactics to maintain white supremacy and circumvent federal law. Among these was Diane Nash, a key organizer, who dispatched a new group of Freedom Riders to the south. A call was also issued to CORE, the Student Non-Violent Coordinating Committee (SNCC), and the Southern Christian Leadership Conference to recruit more Freedom Riders and organize rides.

The next bus ride departed on May 20, 1961, with 21 Freedom Riders on board. This ride began differently; because of the preceding violence, Robert F. Kennedy did not ignore the Freedom Riders this time and negotiated with the governor of Alabama, James Patterson, to provide an escort. The pretense of protection was short-lived as the escorts abandoned the bus, leaving the riders to fall prey to the waiting, bloodthirsty mob. Many male and female activists were beaten with lead pipes, baseball bats, and Coke bottles in the savage attack, yet when medical help was summoned they learned that all the ambulances were broken down.

Meanwhile, FBI agents present at the scene took notes instead of intervening.

“Jail, No Bail”

Following three well-publicized bloody events, the Kennedy administration now turned its attention to preventing another violent, racial altercation. Robert F. Kennedy struck a deal with Mississippi Senator James O. Eastland with the purpose of preventing more photographs and mob violence in general. The Kennedy-Eastland agreement ensured the safety of Freedom Riders while on the bus, in exchange for the riders’ arrests upon arrival in Jackson, Mississippi. The plan went off without a hitch, and the arriving activists were booked on charges of “breach of peace.” Jackson, Mississippi, soon became a destination point for many Freedom Riders, and these activists were also arrested. By mid-September, close to 350 activists would be imprisoned in Mississippi “breach of peace” violations.

At this point the detained activists turned to a “jail, no bail” strategy taken straight from Gandhian teachings, opting to remain in jail. This method highlights the Freedom Riders’ principles of personal sacrifice and noncooperation with the institutions under attack in order to achieve social change. The local jails quickly overflowed and the riders were transferred to a maximum-security prison, Parchman Farm, where conditions proved to be inhumane. To keep up their resolve, the Freedom Riders sang freedom and protest songs from their cells, an act that enraged the prison guards. Others also engaged in a hunger strike.

The Role of the FBI

Under J. Edgar Hoover’s leadership the Federal Bureau of Investigation (FBI) played a critical role in the civil rights movement, specifically in surveillance of activists and key leaders. Until events in the civil rights movement forced the issue, President Kennedy was reluctant to publicly support racial equality for fear he would alienate key southern supporters. Hoover was able to influence Kennedy and make a case for the need for surveillance of social activists. Attorney General Robert F. Kennedy, also supported FBI surveillance as a good strategy for managing the growing unrest.

In early 1961, President Kennedy sanctioned the FBI to spy on civil rights activists and collect

systematic surveillance on the Freedom Rides, including scheduled stops. Some of this information would wind up in the hands of the Birmingham police, some of whom were connected to the Klan and could have been dispatched to prevent the Anniston and Birmingham riots. Instead, police officials in both places remained conveniently absent from the scene as Klansman brutalized the riders.

Outcomes of the Freedom Rides

On May 29, 1961, Robert F. Kennedy petitioned the Interstate Commerce Commission (ICC) to create and enforce national regulations guaranteeing the right of all individuals to travel without being subjected to discrimination. On September 21, 1961, the ICC banned segregation in all facilities that served interstate travelers, with the law taking full effect on November 1, 1961. While some forms of segregation would remain for another three years, these actions marked a huge achievement toward racial equality.

Forty years later, some 35 Freedom Riders, including four of the original 13, marked the 40th anniversary by retracing the route from Atlanta, Georgia, to Anniston, Birmingham, and Montgomery, Alabama. This time instead of angry mobs, the mayor of Anniston presented the Freedom Riders with a key to the city, and stops included a visit to Birmingham’s Civil Rights Institute. However, John Lewis, a former Freedom Rider and longtime member of the U.S. Congress, cautioned that American society still had much work to do.

Ten years later, in May 2011, President Barack Obama issued a presidential proclamation to celebrate the 50th anniversary of the Freedom Rides. In this proclamation President Obama praised the Freedom Riders for their bravery and sacrifices in pursuit of the rights African Americans now enjoyed. Perhaps the Freedom Riders are best remembered as being a group of everyday, ordinary men and women from all walks of life who believed so strongly in the idea of racial equality and the right to live one’s life without discrimination that they risked their lives for the betterment of society.

Freedom Schools

Freedom Schools were set up during the civil rights movement as a response to persistent racial injustices in education faced after the U.S. Supreme Court decision in *Brown v. Board of Education of Topeka* (1954). The most significant creation of Freedom Schools occurred during Freedom Summer in 1964, when hundreds of northern activists collaborated with southern communities to run these schools in over 40 black towns and cities in Mississippi, educating more than 2,000 students.

Freedom Schools provided the communities they served with a free education while pursuing the dual purpose of politicizing the communities' thought and supplementing their standard public

schools. The legacy of Freedom Schools is today evident in a range of educational institutions from charter schools, which share their mission, to nonprofit organizations and national summer programs that aim to supplement the education of black students.

Education and Civil Rights

The 1954 *Brown v. Board* decision outlawed segregation in public schools, legally ending the "separate but equal" doctrine established decades prior in the 1896 *Plessy v. Ferguson* Supreme Court ruling. The *Brown* decision set off a wave of negative reactions from citizens opposed to its aim of racially mixed public schools throughout the United States. Freedom Schools in places like Prince Edward County, Virginia, were set up after local public school officials closed all schools from 1959 to 1964 rather than desegregate. Elsewhere, activists in cities such as Boston utilized Freedom Schools to protest public school segregation as over 10,000 black and white students in Boston staged "stay-outs" of Boston public schools in 1963 and 1964 to attend 34 Freedom Schools that had been set up throughout the city.

Mississippi was already at the center of the civil rights movement because of a number of major events that occurred there before Freedom Summer. In 1955, Mississippi was the site of Emmett Till's murder, in which the 14-year-old was brutally maimed and killed while visiting his uncle in Money, Mississippi. In 1962, the Mississippi National Guard had to be federalized and brought into Oxford, Mississippi, to quell a full-blown riot when James Meredith, a black man, was personally escorted by U.S. Department of Justice marshals and attorneys in order to register as the first black student at the University of Mississippi. In 1963, the murder of National Association for the Advancement of Colored People (NAACP) Field Secretary Medgar Evers sent shock waves throughout the nation when he was gunned down by his boastful assassin, Byron de la Beckwith, as Evers arrived home to his family in Jackson, Mississippi, one June night.

All these events made Mississippi a focal point of the civil rights movement and the primary destination of organizers from the north who wanted to make a positive impact on racial progress. Organizations such as the NAACP, the Student

Non-Violent Coordinating Committee (SNCC), Congress of Racial Equality (CORE), and the Southern Christian Leadership Conference (SCLC) planned a major undertaking scheduled for the summer of 1964, known as the Mississippi Summer Project, or Freedom Summer, in an effort to register as many black voters as possible in Mississippi after decades of systematic exclusion from the political process. Freedom Schools would become an integral part of this daunting and dangerous effort.

Schools Before Freedom Summer

Before Freedom Summer, a version of Freedom Schools was used in Mississippi in 1961 by the legendary activist, organizer, and educator Bob Moses. Moses and other SNCC workers set up classes that summer to prepare black citizens in McComb, Mississippi, to register to vote. A number of these students were subsequently expelled from their local high school and SNCC established Nonviolent High in order to instruct the students in subjects that they were missing.

The idea of Freedom Schools being used more broadly in Mississippi as part of Freedom Summer can be attributed to Charles Cobb, a SNCC worker who proposed the idea in December 1963. Staughton Lynd, a highly regarded white activist and professor at Spelman College, was selected to direct the Freedom Schools. He chose a black codirector, Harold Bardonille, who was a graduate student in sociology at Atlanta University. Bardonille visited Mississippi in the months before Freedom Summer and promptly quit the project, believing that the activists' lives would be in danger if they went forward. Lynd, however, persisted.

In March 1964, a curriculum conference was held in New York City, which brought together over 50 educators. The conference predominantly dealt with several critical questions: Why were conference participants working in Freedom Schools? What was the Freedom Movement? What did the majority culture have that African Americans wanted or did not want? And what did African Americans have that they wanted to keep? Curriculum-writing groups were set up under the categories of leadership training, remedial academics, contemporary issues, and nonacademic activities. From these categories came the three

sections of the Freedom Schools' curriculum: the academic curriculum, citizenship curriculum, and recreation curriculum.

In June 1964, a weeklong orientation for the 280 volunteers who would serve as Freedom School teachers was held in Oxford, Ohio, at Western College for Women (now part of Miami University of Ohio). The orientation had multiple parts, including discussions of the political and economic conditions of Mississippi, the segregated system of education in the state, and instructional techniques meant to open the minds of their students to the curriculum being offered. Significant time was also spent counseling teachers on the struggles and dangers associated with their work.

The disappearance of James Chaney, Andrew Goodman, and Michael Schwerner heightened fears when the three civil rights workers were later found to have been killed while investigating a Ku Klux Klan arson of an African American church that had agreed to host a Freedom School classroom. Chaney, Goodman, and Schwerner were previously in attendance at the Ohio orientation.

Freedom Schools in Practice

The first group of Freedom School teachers began arriving in Mississippi at the end of June 1964. While canvassing for students proved to be an integral part of the teacher experience, the schools were much more successful than anticipated. Although expecting to establish only 21 schools for 1,000 students, over 40 schools were created for more than 2,000 Mississippians. The target group was originally intended to be 10th- and 11th-graders, but students as young as four ended up attending classes, sometimes sitting with elderly members of their community who also sought the instruction of Freedom Schools.

As demonstrated by the murders of Chaney, Goodman, and Schwerner, the location of Freedom Schools was a point of contention in local communities. It was not uncommon for a pastor of a black church that had previously offered space to host a Freedom School to rescind permission because of local dangers. Thus, Freedom School classes were held in a variety of nonstandard locations, including parks, residential homes, under trees, and in boldly sympathetic churches.

Freedom School scholars cheer in preparation for painting display panels for a 900-foot walkway at the new Martin Luther King, Jr. Hospital in Los Angeles, California, August 2011. The student artists were drawn from several Freedom Schools, a six-week summer literacy program in the Second District of Los Angeles County. As part of the curriculum, Freedom School students illustrate their comprehension through arts, crafts, dance, sports, and music; read books; go on field trips; and engage in community service. In 1963, activist Charles Cobb proposed a network of Freedom Schools, the legacy of which is seen in a variety of contexts today.

Freedom Schools in Mississippi opened in the first week of July 1964. They bore some similarities to public schools but for the most part were dramatically different. Freedom School classes were organized to give each student a voice in discussions and to minimize, if not completely remove, the role of the teacher as the primary controlling force in the learning process and classroom context. Additionally, the work of the professional educators at the New York curriculum conference in March was dramatically modified once Freedom School teachers reached their sites. Thus, the curriculum became much more adaptive to local conditions and the intellectual desires of students.

In August a culminating conference was held in Meridian, Mississippi, the day after the funeral of Chaney, a Meridian native and resident. Three student representatives and a coordinator were sent to the conference from every Freedom School site. At the same time as the conference, the Mississippi Freedom Democratic Party was holding a convention in Jackson. Despite being excluded from the Jackson meeting, participants at the Meridian conference exercised the knowledge and

skills they learned during the Freedom Schools sessions in July to develop a political platform to be presented to the Mississippi Freedom Democratic Party, the state of Mississippi, and the nation as a whole. This was perceived to be the major achievement of the Freedom Schools: empowering local blacks to be organized, knowledgeable, and vocal in the political arena.

Local and National Impact

The impact of the Freedom Schools was widely felt. Local residents in the communities where Freedom Schools operated were positively impacted as self-advocacy skills were coupled with major federal civil rights legislation in 1964 and 1965. This gave a voice to a large segment of the Mississippi populace that was previously silenced politically and enabled the emergence of black elected officials in many of the state's majority black towns, cities, and counties.

Many local organizations were set up in the wake of the Freedom Schools, ceasing widespread operation after the Meridian convention. One such organization was the Mississippi Student

Union, a group of teenagers, which, while established prior to Freedom Summer, worked afterward to continue to support the aims of the Freedom Schools. The Mississippi Freedom Labor Union was established in January 1965 at a Freedom School discussion and was comprised of day laborers and domestic workers.

Finally, a number of schools used the Freedom Schools model as their guide after the summer of 1964. One such school was founded in New Haven, Connecticut, by Staughton Lynd himself. During the summer of 1965, Freedom Schools were set up throughout Mississippi, but at no time did they reach as many students in as many communities as they did during the summer of 1964.

Legacy and Influence Today

The legacy of Freedom Schools can be seen in a variety of contexts today. One such context is the range of summer and year-round programs that bear the “freedom school” name or model their practices or purpose after the Freedom Schools of the 1960s. These cover a wide range of educational offerings and geographic locations spanning from coastal areas such as Los Angeles and Philadelphia to the U.S. heartland in St. Louis and Chicago. Perhaps the most prominent national Freedom Schools program comes from the Children’s Defense Fund, which in 1992 established a national model for people interested in founding and operating Freedom Schools.

A second marker of the influence of Freedom Schools can be seen in the original intent of the charter school movement, in which local communities were given the ability to run more scholastically innovative and flexibly operated schools. These schools, like the Freedom Schools of Mississippi, were meant to provide an alternative to the substandard schools most students were forced to attend. A number of major charter school operators, such as the Knowledge Is Power Program (KIPP) network and the Uncommon Schools network, link their work to social justice pursuits that regard educational inequities as the major civil rights issue of the day, explicitly linking a quality education with freedom. The impact of Freedom Schools continues through these and other means.

French Americans

French Americans are one of the oldest ethnic groups in American society, having progressively formed an identity since their first arrival in America in the 16th century. Today, according to the 2010 U.S. Census, 9.3 million Americans report being of French ancestry, while only 152,000 U.S. residents were born in France. Although not one of the most culturally visible or demographically significant of the American groups, French Americans have developed a unique culture, shaped by a prolonged history of immigration.

Despite a relatively small number of immigrants in comparison with other groups, the French have had a disproportionately large impact on American society and have played a crucial role in American history from the earliest colonial stages. However, French Americans remain one of the least documented American ethnic groups: few works have been devoted to the group, and most amalgamate French Canadian ancestry with

French ancestry. This is further complicated by the fact that early migration patterns are not always easily categorized—such is the case of the Cajuns, the Acadians who left France to settle in the area that is now part of both present-day Maine and Quebec, and then migrated south to Louisiana. French Americans are defined here through the more direct path of American residents of French ancestry and their descendants; for more details on Canadian Americans, see the related article.

While the group can sometimes be explained through waves of immigrants fleeing sporadic religious, political, or economic hardship in France—as was the case for the Huguenots under the revocation of the Edict of Nantes, the émigré of the French revolution, or the 19th century French fleeing rural hardships—it can more generally be understood as a heterogeneous migration of individuals, trying their luck in varied pursuits in America. Consequently, members of the group frequently assimilated culturally, and the group is relatively heterogeneous.

Geographically, French Americans are dispersed throughout the United States. Early French migrants have traditionally settled in northeastern regions of New England, as well as in Louisiana; both regions still have well-established French American communities. Newly arrived migrants, however, settle largely in urban areas, particularly in New York or California.

Early Exploration

The first published appearance of the term *America* was in France in 1507, in a cartographer's treatise written in Saint-Dié-des-Vosges. Yet the French experience in America formally began with Verranzo's 1524 exploration of the eastern coast for French King Francois I. Under commission from Francois I, Jacques Cartier then penetrated the continent through the Saint Lawrence River on his second voyage. In the area comprising the present-day United States, French colonies were established at Charlesfort, South Carolina, in 1562, and Fort Caroline, Florida, in 1564. However, early settlement of the continent proved ill-fated as the colonies were abandoned because of poor internal leadership, lack of supplies from France, or conquest by other European powers. Some security was brought when Louis XIV recognized New France as a royal province in 1663.

The subsequent colonial infrastructure, although relatively minimal, allowed for more reliance on the fur trade managed by the *coureurs des bois* and the *voyageurs*, this in turn profited French interests by pushing the frontier westward and southward.

French Jesuits represented a powerful religious and politico-cultural force in the early French exploration, settlement, and colonization of North America. The Jesuits succeeded, albeit with only temporary success, to infiltrate the Native American tribes, to convert them to Catholicism and their allegiance to France. The earliest missions, between 1609 and 1625, were established in the northernmost regions of New France: Acadia, the Great Lakes, and the banks of the Saint Lawrence River. By the second half of the 17th century, however, relatively stable French Jesuit missions operated in Illinois and Wisconsin. The success of the French Jesuits may be attributed to their recognition of the tribal customs and understanding of Native American communities, an approach that contrasted strikingly with that of the English or the Spanish. Jesuit missionary Jean de Brébeuf, for instance, recommended that the French missionaries dress and eat as the Native Americans, and missionaries commonly learned the native languages, extended their diplomatic efforts to manage intertribal conflicts, and familiarized themselves with social matters. Far from viewing them as savages, the French approached the Native Americans as lost souls seeking, first, salvation and, second, subsequent cultural assimilation into French societal values. In exchange, Native Americans sought the benefits of allegiance to France—an allegiance that would help consolidate the territorial claims of France and the further settlement of New France.

Religious Emigration

The uprooting of the French Protestant community by the *ancien régime* created a Huguenot diaspora, which was partly present in North America. The royal intolerance of Protestantism, which had already displayed itself by 1610 under the influence of Cardinal Richelieu, was greatly amplified during the reign of Louis XIV. In 1685, Louis XIV revoked the Edict of Nantes of 1598. The revocation severely restricted protestant religious freedoms and had the intended effect of

dramatically reducing the presence of Protestantism in France. The policies limiting Protestant institutions, including temples and schools, combined with a campaign of violence that was perpetrated by the royal *dragonnades*, forced many Protestants to either convert under duress or seek exile in both the Old and New World. Among the destinations for emigrating Protestants in the Americas were New York, New Rochelle, New Paltz, Salem, Virginia, and South Carolina.

The number of French immigrants to America who fled religious persecution is unknown and is contested among 20th century historians. Jon Butler's *The Huguenots in America* consolidates multiple primary sources including census figures and naturalization lists to estimate that the number of Huguenots who immigrated by 1700 was in the realm of 1,500 to 2,000. Similarly contested is the rate of assimilation of the Huguenots into New World society. While many southern French Huguenots immigrated to French America, others immigrated to the English or Dutch colonies. Thus, in 1658, some northern French settled in Dutch Kingston, while others settled in Staten Island or Salem. Butler advances the thesis that the Huguenots integrated their colonial communities with a fair degree of detachment from their immigrant peers.

There was no strong or centralized form of worship or strongly organized New World French Protestant institutions. The immigrants intermarried and, by the mid-18th century, many second- or third-generation immigrants had assimilated into Catholicism. Contrary to this view, Robin Gwynn's *Huguenot Heritage* and Catherine Randall's *From a Far Country* propose that the Huguenots either assimilated slowly or that they never assimilated, respectively. The later view supposes that the French Protestant influence on both colonial and postrevolution America is highly significant.

From the social, political, and theological history of French Protestant immigration can be traced the Protestant work ethic and the potential for self-reinvention. The genealogy of some of the individuals who have shaped U.S. history can be linked to early French Americans: Martha Washington, Paul Revere, and Alexander Hamilton are all descendants of this wave of French immigration.

The Politics of Empire

Political developments, in both France and its empire, can be seen as having principally motivated French emigration from the end of the 18th century to the mid-19th century. Periodic immigration during this period should be considered simultaneously to the larger colonial context of territorial gains and losses, with their macro- and microeconomic and political causes and consequences. Although, on the whole, French immigration is rarely divided into waves due to the relatively minor magnitude of its collective phenomenon and the independent nature of its individual immigrants, four periods of 18th and 19th century political instability can nonetheless be seen as having promoted French immigration to America and the continuous formation of the French American identity.

First, the French Revolution encouraged noblemen, *les émigrés*, to flee the guillotines and seek refuge in the New World. Second, the 1791 slave revolt in Saint Domingue, in which the white population found itself outnumbered ten-to-one by slaves, as well as the independence of Haiti, forced thousands of surviving French plantation owners to flee to Louisiana and Cuba. Third, Napoleon's conquest of Spain, which led to anti-French riots across the Spanish world, instigated the emigration of 2,500 whites and 5,000 blacks from Cuba to New Orleans in 1809. Finally, the unrest of the Bourbon Restoration motivated both immigration and emigration between the United States and France.

By 1763 the extent of France's colonial possessions in the Western Hemisphere had largely diminished. The loss of Louisiana to Spain with the 1762 Treaty of Fontainebleau and the transfer of Acadia, Canada, and Cape Breton to England with the 1763 Treaty of Paris marked the loosening of the colonial grasp of France in the New World. Yet the French presence in America was sustained by immigration responding to political instability abroad, and the sometimes forced, sometimes voluntary, integration of immigrants into a heterogeneous French America.

Nineteenth-Century Immigration

Before 1819, precise figures regarding immigration of the French to the United States are almost nonexistent. It was only in 1819 that a law forced

ship captains to provide their passenger records at the port of arrival. Additionally, it was not until 1908 that returns were taken into account in the estimates, skewing figures particularly for small groups like the French.

Despite the lack of formal immigration records, it is possible to establish that a great wave of emigration from France occurred between 1817 and 1818, a few years after the abdication of Napoleon Bonaparte. At the time, demographic pressures, particularly the overpopulation of French rural areas and the scarcity of resources, forced many Frenchmen to leave their homeland and seek opportunities abroad. When large cities could no longer absorb the incoming population, due to a slowing industrial sector, some decided to emigrate from France and, while most tried their luck in the French colonies, some left for the United States. Furthermore, regional policy may have lessened national ties and encouraged emigration: some regions such as the Basque country, the Pays de Caux (now the Havre), Aveyron, and Champ-saur still practiced a custom of impartial inheritance, contrary to the rest of the county, where inheritance was shared equally among the children. Consequently, younger siblings in the family were more likely to emigrate than the elder child who may have been managing family estates.

To these domestic conditions were added international conditions that promoted immigration toward the United States. During the French Revolution of 1848, which established Louis Napoleon Bonaparte (or Napoleon III) as head of the Second Republic, many Frenchmen decided to leave, not only in order to avoid the economic crisis in France but principally to seek their luck in the California Gold Rush. French immigration to the United States also occurred at the beginning of the 1870s, when France lost the Alsace and Lorraine regions in the Prussian war. A large number of people chose to leave the regions in order to avoid Prussian rule. While most fled to the neighboring regions, the French colonies, or to Paris, a sizeable number of Alsacians, principally Jews, chose to immigrate to the United States.

According to the U.S. Census Bureau, French-born U.S. residents increased from 54,069 in 1850, to 109,870 in 1860, and 116,402 in 1870; more than doubling the number of French-born

residents in 20 years, and this in spite of returns. Between 1820 and 1870, an estimated 245,812 French citizens arrived in the United States, but many returned to France. Emigration slowed during the last two decades of the century and was characterized mainly by individual initiatives. The number of French emigrants remained constant during the remainder of the 19th century, reaching 104,197 by 1900. Until the 1850s, migrants arrived from many regions of France but became more urban and politically motivated after 1848. By the end of the century, they were more rural, came from a more limited number of regions, and had interests that were more characteristic of their region of origin.

The Twentieth Century and Beyond

Although a sizable French American community was established by 1900, counting 104,197 individuals according to the 1900 census, the group's growth and cohesion would be limited by the series of wars fought by France. World War I strongly reduced French immigration, to the point that Basque immigration almost completely stopped. Following the war, French emigration was discouraged as the reconstruction created a great demand for labor in France that was satisfied only with great difficulty, due to the human loss from the war and a decrease in population growth that France had been experiencing since the 19th century. By the time that the French reconstruction had almost been completed, the United States limited immigration from France through the Immigration Act of 1924, by which only 3,000 French immigrants were allowed per year. World War II, however, saw an increase in French immigrants seeking a safe haven from the rise of Nazism in Europe.

Although France did not experience as much of a brain drain toward the United States as did England, the 20th century did see many notable intellectual, artistic, and entrepreneurial additions to the French American group. Among these, one can count the sculptor Gaston Lachaise, musician Edgar Varese, designer Raymond Loewy, painter Amedee Ozenfant, as well as multiple Nobel Prize winners.

Cultural consciousness was stimulated by a series of diplomatic crises between the United States and France. The unpopularity of the

Vietnam War and, to a lesser extent, President Charles de Gaulle's commentary on North American politics in the 1960s, as well as the 2003 Iraq War, brought into question the allegiances, sensitivities, and identity of the French Americans as a group that is distinct from the French and the Americans. The strengthening of the French American identity was particularly evident during the first half of the 20th century, during which bilingual elementary schools, Catholic institutions, and various other social grassroots organizations were formed. The awareness of the group became less pronounced during the second half of the 20th century, however, as many French American institutions closed and the impact of the French language in the United States trailed behind Spanish because of Hispanic immigration.

By the end of the 20th century, French Americans continued to form a group of relatively similar size to that at the start of the century. The 1980 census found that 120,000 French Americans lived in the United States, largely in urban areas, particularly in California and New York.

Contributions and the Contemporary Scene

Following the Guizot Law of 1833 and the Jules Ferry Laws of 1881 and 1882, which made secular primary education accessible to all French citizens for free, French emigrants were generally educated, making their assimilation into American society relatively smooth and swift. Today, French Americans tend to be wealthier and better educated than the average American population. For instance, in 2010, according to the U.S. Census Bureau, less than 8.4 percent of the French American population did not complete high school, compared to 14.4 percent for the national average, and 33.3 percent of French Americans had some college education, compared to 28.9 percent for the national average. In the same year, they had a median household income of \$52,483, compared to \$50,046 for the average population.

Although French Americans have settled in every state of the United States, newer immigrants have generally settled in regions other than the traditional French American bastions. According to the 2010 census, French Americans born in France reside principally in the District of Columbia (17.4 percent), followed by Florida (6.8 percent), New Jersey (6.5 percent), California (6.4

percent), Hawai'i (6.2 percent), Maryland (5.4 percent), and New York (5.3 percent). A similarly large proportion of this group resides in Puerto Rico (17.7 percent). These choices in destination contrast strongly with the traditional areas of French immigration. Nonetheless, French Americans continue to account for a significant proportion of population of these historical regions: Louisiana (15.1 percent), Maine (17 percent), New Hampshire (16.5 percent), Vermont (15.5 percent), Rhode Island (12.5 percent), Massachusetts (8.4 percent), and Connecticut (6.4 percent). Despite these geographical concentrations, however, French Americans are, on the whole, dispersed throughout the United States: 25 percent are in the northeast, 23 percent are in the midwest, 33 percent are in the south, and 20 percent are in the west.

Continued Influence of French Americans

Culturally, French Americans have maintained their influence through organizations and grassroots associations despite relatively minor immigration from France. In order to keep in touch with developments in the old country and to provide local news adapted to their audience, a number of French American newspapers have appeared in the United States. As early as the 18th century, periodicals such as the *Courier de Boston* and Philadelphia's *Courier de l'Amérique* appeared. Other newspapers were soon published: *Le Courier des Etats-Unis* in New York, *L'Echo de l'Ouest* in San Francisco, *L'Union Nouvelle* in Los Angeles, and *L'Amérique* in Chicago. The 19th century saw the creation of multiple French American publications, particularly in Massachusetts and Louisiana. In 1889, the *New York Times* started publishing a weekly paper *Le Nouveau Monde*.

From the 19th century to the present day, French Americans have formed organizations that have attracted both French intellectuals and American Francophiles. In the United States, it became *de bon goût* to be able to speak and read French, as familiarity with post-Enlightenment French thinkers and philosophers was highly regarded. A notable example is the Alliance Française, which was established in several cities, including San Francisco in 1889, Chicago in 1897, and New York City in 1907. The organization now

promotes French culture and language through over 100 chapters in 45 states. The 2010 census reports that there are currently over 1.3 million U.S. residents who report speaking French at home.

The cultural impact of the French Americans has been much larger than could perhaps have been expected from their group size. The founding of cities, from St. Louis to New Orleans to Boise, can be attributed to French American history. As a group, French Americans have helped shape American society by contributing savoir-faire and expertise in numerous domains, from agriculture and trade, to medicine and art. They have influenced American life by bringing French food, fashion, and also the language itself to the United States. At the same time, through the varied backgrounds of their immigrants as well as the identity crises raised by the occasional diplomatic conflict, they have developed a cohesive French American identity.

French and Indian War

Fought from 1754 to 1763, the French and Indian War—known to some Canadians as the War of Conquest—was the North American component of a global conflict known as the Seven Years' War and involved members of French, Canadian, British, Anglo-American, and Native American societies. The Treaty of Paris ended the war in 1763, recasting North America's geopolitical scene and impacting the continent's cultural milieu.

The Seven Years' War reflected the growing imperial rivalry between Protestant Britain and Catholic France. In an ongoing series of conflicts, British nationalists critiqued French culture as inferior and corrupting and called on Britain to protect the safety and prosperity of overseas Britons. British and French commercial ambitions overlapped in the Ohio Country, where diverse interests competed. Tribes such as the Shawnee, Delaware, and Seneca had migrated to the area to escape Iroquois control, trading with New France and Pennsylvania while warding off speculators and squatters from Virginia. French forts constructed in 1753 and 1754 to link Canada and Louisiana and to supply Indian allies seemed to threaten Britain's coastal colonies. The Iroquois Confederacy also sought control of the region, hoping to reassert its dominance over former dependents and influence relations between European powers.

France and Britain mobilized in 1754 after a small Virginia force under George Washington, sent to evict the French from Ohio, instead surrendered to combined French and Indian forces. Britain's first official expedition fared even worse, General Edward Braddock's army suffering defeat by a smaller force utilizing Indian tactics and intelligence. Early French success relied on such alliances, Indian warriors attacking British backcountry settlements, while a 1756 French offensive captured several British forts.

Native American Support Diminishes

As independent allies rather than subjects, Native Americans pursued their own goals. Their support of the French wavered as gifts and trade diminished because of rising war costs and a successful British naval blockade, and as British officials recruited Indian allies. Ohio Indians deprived of

French goods turned to the British, while the formerly neutral Iroquois Confederacy shifted its support to the British in hope of maintaining its power over increasingly autonomous Ohio tribes. Conversely, the Cherokee ultimately withdrew their support from the British, despite committing 700 warriors to join British forces in 1758. Returning to find their territory invaded by British squatters and poachers, and themselves mistaken for enemies and attacked, the warriors retaliated, and war with South Carolina followed.

Wartime cooperation aside, the British and Anglo-American colonists hardly presented a unified front, localism and economic ventures pitting colonies against each other. Many British officials viewed colonial support as self-interested and dismissed American contributions to the war, but colonists comprised nearly half of Britain's 45,000 troops by 1758. The French, their 6,800 regular and 2,700 provincial soldiers outnumbered and their Native American allies dwindling, suffered a major defeat at Louisbourg in 1758 and lost Quebec in

1759. By 1760, three British armies converged on Montreal, forcing New France's surrender.

The war concluded in 1763 with the Treaty of Paris. In North America, Britain acquired France's claims to Canada and lands east of the Mississippi River, as well as Spanish Florida, while Spain received New Orleans and Louisiana.

Immense consequences followed for Native Americans excluded from negotiations. British officials treated even Native allies as conquered peoples, while traders and squatters seized on the peace to invade Indian lands. Nativist chiefs and religious prophets embraced a pan-Indian identity, arguing that Indians and whites had been created separately, and calling for the rejection of European culture and resistance to colonial expansion. By 1763 the local grievances of diverse Indian peoples culminated in Pontiac's Rebellion, a series of attacks on British forts and frontier settlements that forced the British to resume diplomatic gift-giving and attempt to control Anglo-American trade and settlement.

A late 1880s engraving depicts Louis-Joseph Montcalm de Saint-Véran trying to stop Native Americans from attacking British soldiers and civilians as they escape the garrison after the Battle of Fort William Henry on August 10, 1757, near Lake George, New York. To supplement his 7,000 troops, Montcalm, a French field commander, recruited about 1,800 Indian allies to besiege the fort, but they proved difficult to control and wound up attacking the British, killing and capturing several hundred men, women, children, and slaves.

For French colonists scattered between Canada and Louisiana, the official exchange of territory meant little. Often tied to Native American communities through marriage and residence, most remained in North America. Many leveraged their personal connections and experience with interior Indian tribes to fill positions in the British fur trade and in the diplomacy of the Spanish borderlands. Some departed for France or its colonies, but others moved to Spanish Louisiana, including St. Louis and New Orleans, and remained there when the United States acquired the territory in 1803.

Anglo-Americans, meanwhile, understood the victory to open new territories to settlement and trade. Separate colonies reverted to their independent ways, chafing against new taxes, restrictions on expansion and trade, and British garrisons they felt threatened their freedoms. Additionally, many Anglo-Americans felt betrayed by a British government determined to accommodate its new francophone residents and Native Americans, their displeasure helping shape a distinctly American cultural identity in the pre-Revolutionary years. Fear of raids and cultural differences often dissuaded Anglo-Americans from distinguishing between friendly and belligerent Native Americans, particularly on the frontier. In late 1763, the vigilante Paxton Boys attacked the Conestoga Indians on their Pennsylvania reservation, destroying farms and cabins before pursuing and killing the survivors. The incident reflected widespread Anglo-American attitudes that identified Indians as racially and culturally inferior.

Shifting geopolitical boundaries did not immediately recast North America's cultural makeup, as evidenced by the 8,761,496 respondents claiming French ancestry, and 2,042,808 claiming French-Canadian ancestry, on the 2010 U.S. Census. More significant was the war's influence on developing cultural identities, in particular, diverse Native Americans' embrace of pan-Indianism and Anglo-American colonists' articulation of an American rather than British identity. Each group claimed exclusive rights to control North America, marking the central issue of subsequent Indian-white relations.

French Canadian Americans

Nearly one million French Canadians immigrated to the United States from 1840 to 1930. They settled primarily in the northeastern United States, and their descendants today form the region's large ethnic population known commonly as Franco Americans. French-speaking Catholic immigrants from Canada not only helped diversify Anglo-Protestant New England and New York, but they also assisted in the industrialization of the country and in its development of social, welfare, and credit institutions, among other contributions. Until the middle of the 20th century, French Canadian Americans successfully fostered an intertwined identity that was ethnic and American.

Most French Canadians immigrated to the United States from the Province of Quebec, a province that has preserved its language and culture since the colonial era. French explorer Jacques Cartier claimed northern North America for France as the result of several voyages from 1534 to 1542. Not until Samuel de Champlain established an agricultural colony in Acadia (today's Nova Scotia) in 1604 and a permanent

settlement at Quebec in 1608 did French speakers migrate to North America. French explorers and fur traders as well as Catholic missionaries ventured far into the interior of the continent, establishing outposts on the Great Lakes and along the Mississippi River as far south as New Orleans. Nearly all migrants from France were Catholic, and most settled along the St. Lawrence River.

An imperial war between Britain and France, known in North America as the French and Indian War, resulted in the conquest of New France in 1760. Under British rule, French Catholics in North America lost their connection to France. The Quebec Act of 1774, a British security measure viewed as one of the Intolerable Acts by the American colonists, helped ensure the continuation of French Catholic lifeways while effectively preventing French Canadians from joining the American Revolution. The British North America Act of 1867, establishing the Dominion of Canada, provided French speakers with their own province, Quebec, within which they have since functioned as a nation within the nation-state of Canada and within which they have effectively preserved their language and culture.

During the 19th century, prior to 1840, most migrations of French Canadians to the United States constituted seasonal migrations for employment in agricultural, lumbering, and brick-making industries. A lack of access to arable farmland, resulting from natural population growth and landholding patterns, considerable unemployment, and the slower pace of industrialization in Quebec motivated more permanent migrations from the 1840s, and especially from the 1860s to 1930, after which date the United States imposed immigration restrictions on Canadians. In the late 19th and early 20th centuries, French-speaking Catholics migrated with family and friends in a chain migration to northeastern manufacturing centers such as Woonsocket, Rhode Island; Manchester, New Hampshire; Lewiston, Maine; Fall River, Massachusetts; and Cohoes, New York. Succeeding the Irish as the predominant source of unskilled labor after the Civil War, they sought waged work in textile mills and shoe factories and contributed to the industrialization of the country.

French Canadian Americans comprised as much as 60 to 70 percent of the population of

some northeastern cities by 1930. They formed ethnic communities called *petits Canadas* (little Canadas) with their own national churches and parish schools in order to preserve their French language, Roman Catholic faith, and French Canadian customs. They drew upon models, inspiration, and even personnel from Quebec to found their own newspapers, to create their own mutual aid societies, and to develop their own social welfare institutions, such as hospitals, orphanages, and old-age homes. French Canadian Americans launched the credit union movement in the United States by establishing in 1908 the first credit union in the country at Saint Marie parish in Manchester, New Hampshire, making a significant, though little-known, contribution to their host society.

Repatriation and colonization efforts on the part of the federal government of Canada and the provincial government of Quebec proved unsuccessful in motivating significant numbers of French Canadians to return to their country of origin. Naturalization campaigns organized by French Canadian elites who wanted their ethnic group to enjoy a proportionate share of power and resources in their communities effectively countered the repatriation efforts by homeland governments. French speakers in the northeastern United States nonetheless maintained close ties with their kin and kith in Quebec, often traveling to their cultural home during factory closings and vacations, to celebrate the feast day of Saint-Jean-Baptiste (the patron saint of French Canadians), to make pilgrimages to the shrine of Sainte-Anne-Beaupré, and to send their sons to the classical schools of Quebec. An integrated railway network facilitated not only their initial migration to the United States but also their return visits to Canada. These contacts with Quebec helped families to preserve their language and traditions, often beyond the third generation in the United States.

Facing Discrimination

In large part because they successfully preserved their ethnicity, French Canadian immigrants and their Franco American descendants faced considerable discrimination by nativists in the United States. The Massachusetts Commissioner of the Bureau of Statistics of Labor labeled them the “Chinese of the eastern states” in 1881, and

they became targets of the anti-Catholic and anti-immigrant organizations of the American Protective Association in the 1880s and 1890s and of the Ku Klux Klan in the 1920s. They also faced discrimination from their Irish coreligionists, who promoted assimilation, and they consequently engaged in heated disputes with the Irish Catholic hierarchy, most notably in Maine and Rhode Island.

Individuals of French Canadian birth and background wanted to become integrated but not assimilated into U.S. society. To demonstrate their Americanness, they began calling themselves “Franco Americans” around the turn of the 20th century; moreover, they learned English, became naturalized U.S. citizens, and voted. While Franco Americans enjoyed considerable success in municipal and state politics, they often did not exercise influence in statewide elections proportional to their numbers for most of the 19th and 20th centuries, a phenomenon that continues to puzzle scholars. In one notable exception, French Canadian Americans gained sufficient political strength to elect Quebec-born Aram J. Pothier governor of Rhode Island from 1909 to 1915 and again from 1925 to his death in 1928.

Numerous individual French Canadian Americans have made significant contributions to the business, sports, and cultural life of the nation, among other domains. In the early 20th century, William E. Aubuchon launched hardware stores in the northeastern states that formed one of the country’s largest chains. A major league second baseman, Napoleon Lajoie joined the Baseball Hall of Fame in 1937. Rudy Vallee, a singer and orchestra leader, gained his national reputation for radio, film, and Broadway performances from the 1920s to the 1960s. Novelist Jack Kerouac, still widely known and read, helped launch the countercultural beat generation in the mid-20th century. Author Grace (DeRepentigny) Metalious shocked and titillated the public with *Peyton Place*, her best-selling 1956 book that became a motion picture the following year and a long-running television series in the 1960s.

Over the course of the 20th century, French speakers of the northeastern United States increasingly abandoned their ethnic ties and became more integrated into U.S. society. The closing of textile mills and shoe factories from the 1950s

propelled many Franco Americans from industrial jobs where they often spoke French into service industries that required more fluency in the English language and more contact with non-Catholics; increasing numbers thus enjoyed some measure of upward occupational mobility. Due in large part to past discrimination suffered by parents, in many homes children became unilingual English speakers.

The advent of television, increasing intermarriage with non-Franco Americans, the closing of parish schools as religious women chose to serve in other ministries following Vatican II, and suburbanization that led to Franco Americans’ mixing with other ethnic groups as they left their inner-city ethnic communities also facilitated their integration. Today, while most Franco Americans appear to be assimilated Americans, there remain examples of French Canadian ethnicity in various cities of the northeastern United States, such as Lewiston, Maine, where one can still attend a French mass and participate in the annual Festival Franco-Fun.

Fugitive Slave Acts

The U.S. Constitution was created by people who were influenced by the times in which they lived. One of the most divisive issues at the Constitutional Convention was the question of slavery, yet it could not be easily avoided. Since the economy of six of the original 13 states was deeply dependent on slave labor to work large commercial plantations, none of these states would vote for a constitution that prohibited the practice. Similarly, if the new constitution legitimized slavery, the other states would probably vote against it. Either way, there would be no government.

In the resulting compromise, the final document did not include the word *slavery* at all. But there were matters related to slavery that, in some form or other, had to be addressed. One of these was the apprehension of runaway slaves.

The purchase of a slave was a costly acquisition. Owners wished to protect themselves against this financial loss. Consequently, without mentioning the word *slave*, Article IV, Section 2, of the original U.S. Constitution contained the following provision:

No Person held to Service or Labour in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or Labour, but shall be delivered up on Claim of the Party to whom such Service or Labour may be due.

Everyone knew who the “persons held to labor” were.

Fugitive Slave Act of 1793

Although the Constitution thus protected slave owners against the loss of their workers, the provision did not specify any particular process to assure its enforcement. This was particularly important for slave owners whose property was in states adjoining free states, where escape north was easier, or for those traveling in the free states who wished to take their slaves with them. This, of course, included the president, members of Congress, and other government officials whose duties required them to be in free states. The

answer was the Fugitive Slave Act of 1793, which was designed to make sure that owners could recover their slaves in any state regardless of local or state laws. Section 3 of the law stated that the owner or the owner’s agent could apprehend any suspected fugitive and bring him or her before an appropriate federal, state, or local court. There, upon presentation of oral testimony or written evidence that the person in custody was in fact a fugitive, the presiding court official was required to provide a written certification that would allow the owner or agent to return the fugitive to the state or territory from which the fugitive originally fled. This provided the legal process by which fugitives could be apprehended, identified, and returned.

As a means of enforcement, Section 4 of the act provided that anyone interfering with the process, attempting to conceal or rescue a fugitive, or obstructing the owner or agent in apprehending a fugitive would be fined \$500, then the equivalent of about twice the annual income of the average worker. The act was signed into law by President George Washington, who himself tried on two occasions to use its provisions to reclaim an escaped slave who was his servant while he was in Philadelphia.

Although Washington’s efforts were not successful, slave catching grew into such a profitable enterprise that not even legally free black people were safe. Since black people could not offer testimony in the courts, there are recorded instances of free people being sent into slavery when they could not provide proof they were legally free.

As the antislavery movement began to spread during the 1820s, northern free states increasingly made attempts to circumvent the 1793 law. In eight states this took the form of “personal liberty” laws that required a trial by jury before accused fugitives could be sent out of state. The purpose of this was to give sympathetic local juries an opportunity to declare the accused to be free and thus not subject to return, even in cases in which the accused was in reality a fugitive.

An important test case occurred in Pennsylvania where a slave catcher named Edward Prigg was convicted of violating state law by apprehending a woman within the state and taking her to slavery in Maryland. In 1842 in *Prigg*

v. Pennsylvania, the U.S. Supreme Court overturned the state court verdict on the grounds that the Constitution and federal law superseded any state law to the contrary. Yet, in rendering the verdict, Justice Joseph Story noted that state officials might exercise their authority to apprehend fugitives “unless prohibited by state legislation.” This phrase seemed to indicate that states might not be required to offer assistance in the search for or apprehension of fugitives. Some free states immediately began to enact laws prohibiting state and local officials from assisting slave hunters or using public jails to hold those accused of being fugitives. The result was that slave owners faced increasing difficulty in locating and reclaiming fugitives. Southerners grew increasingly angry.

The whole issue of slavery gained national attention whenever a territory applied for admission as a new state. Would it be free or slave? The question was one of great political importance because by the 1840s the nation was evenly divided, which meant parity in the U.S. Senate. That equality was threatened following the war against Mexico, which began in 1846. Under the Treaty of Guadalupe Hidalgo, the United States acquired immense territories in the southwest, including California, which already had a population sufficient in number to apply for statehood.

There was little doubt that it would enter as a free state because under Mexican ownership, slavery had been prohibited. But before this could happen, the south would have to receive some significant benefit in return for giving the north two more votes in the Senate.

The result was the Compromise of 1850, which provided for the admission of California as a free state and elimination of the slave trade in the District of Columbia, both of which appealed to antislavery advocates. Southern proslavery backers were placated with provisions that Congress had no authority to interfere with the interstate slave trade, the United States would assume the debts of Texas from the time before it became a state, the process of “popular sovereignty” would be used for the admission of other states in the area obtained from Mexico, and especially a stipulation that called for new and stricter fugitive slave laws.

Fugitive Slave Act of 1850

The Fugitive Slave Act of 1850 was designed to force northerners, under penalty of a fine of up to \$1,000 and imprisonment, to assist southerners in recovering fugitives. Under this act, law enforcement officials were required to assist slave owners or their agents in locating, apprehending, and holding for trial any alleged fugitives. They were also authorized to deputize citizens who were then required to participate in a posse or in other ways assist in the location and apprehension of alleged fugitives. Once apprehended, law enforcement officials were held liable for any escapes. In court, alleged fugitives were not permitted to testify in their own behalf, but owners or their agents were permitted to testify to ownership. Even more unpalatable to antislavery northerners was the provision establishing special courts to hear cases arising from the Fugitive Slave Acts, with judges paid a fee of \$10 if they certified the return of a slave to his or her owner, but only \$5 if the judge did not certify the person as a runaway slave.

Northern antislavery advocates were outraged, and even those who had previously held ambiguous feelings or were unconcerned became alienated because now they were being forced to participate in upholding slavery. Northerners increasingly came to believe that the government was being subverted by a “slave power conspiracy,” while state and local governments once again attempted to employ legislation or other methods to block enforcement of the new law. The Wisconsin Supreme Court declared the law unconstitutional, but its verdict was later overturned by the U.S. Supreme Court.

Abolitionists and other antislavery activists threatened to refuse to obey the law and stepped up activities to assist fugitives to reach safety in Canada, where there would be no question that they were beyond the reach of the U.S. legal system. Enrollment in antislavery societies increased, and abolitionists in particular became more aggressive in their attacks not just on the law but on the institution of slavery and on the south. The situation quickly became so critical that some southern political leaders threatened secession if the law were not enforced, and President Millard Fillmore warned that he would use the army to enforce the law if necessary.

Heated rhetoric continued to stir passions on both sides in subsequent years. The Fugitive Slave Act inserted an emotional imperative into the slavery issue for northerners who found that under its provisions they could no longer assume they would be immune from the effects of the controversy. Along with the *Dred Scott* decision in 1857, it was a major factor in energizing the northern antislavery movement in the years immediately preceding the outbreak of the Civil War, and thus made compromise all the more difficult.

The controversy drove a deep wedge not only between north and south but between pro-slavery and antislavery members of the major political parties. One immediate result of this was that Daniel Webster, a leading New England politician who was believed to be a serious candidate for president in the upcoming 1852 election, was passed over by the Whigs because his advocacy of enforcement of the Fugitive Slave Law antagonized the party's antislavery supporters. The Whig Party soon began to fragment between the northern antislavery wing, called Conscience Whigs, and the southern bloc of the party, which became known as Cotton Whigs.

With the formation of the antislavery Republican Party beginning in 1854, most of the Conscience Whigs migrated to the Republican Party. While southern Democrats favored the Fugitive Slave Act, discord similar to that among the Whigs split northern Democrats into moderates who favored compromise with southern Democrats and the antislavery faction that came increasingly to oppose compromise on the issue. This proved to be the initial wedge that eventually led the Democrats to nominate two candidates for president in 1860, Stephen A. Douglas of Illinois as a northern Democrat and John C. Breckinridge of Kentucky as a southern Democrat, dividing the Democratic vote and allowing Abraham Lincoln's election as the first Republican president.

Funds of Knowledge

The term *funds of knowledge* was coined by anthropologist Eric Wolf in 1966. He defined funds of knowledge to include such categories as caloric funds, funds for rent, replacement funds, ceremonial funds, and social funds as resources and knowledge that households manipulate to make ends meet in the household economy. Years later, in 1988, findings from an ethnographic study of households in the U.S.-Mexican borderlands by Carlos G. Vélez-Ibáñez and James B. Greenberg identified diverse and abundant funds of knowledge that existed within families in Mexican communities. Additionally, it was determined that households are self-sufficient and do not depend on the economic market for assistance and well-being. Instead of looking to the economic market for assistance, communities develop networks among households, and funds of knowledge are distributed socially and exchanged among households.

Funds of Knowledge in Education

As a result of Carlos G. Vélez-Ibáñez and James B. Greenberg's original study, other anthropologists, researchers, educators, and teachers, along with Vélez-Ibáñez and Greenberg, moved to examine how the concept of funds of knowledge can be applied to educational settings. Findings show that funds of knowledge are based on the belief that people are competent and have various levels of knowledge (skills, abilities, ideas, and practices), which they have historically developed and gained through their lived experiences. It is the bodies of knowledge that underlie the activities of students' households

and communities. Students' household members develop social networks that interconnect with other households in the community. It is these relationships that contribute to the various kinds of funds of knowledge that students possess and bring to the classroom.

Diversity and Learning

As a result of Luis C. Moll, Cathy Amanti, and Deborah Neff's work in extending funds of knowledge from an anthropological context to an educational context, the term has gained a great deal of attention as one way to disrupt discourses of deficit ideologies. Deficit ideologies blame the underachievement of students from diverse backgrounds on perceived deficiencies they believe are related to students themselves, their families, and their cultures.

Furthermore, they blame underachievement among these students on inadequacies such as home literacy practices, language skills (specifically in English), motivation, parental support, and self-concept. As a result, expectations and acceptance of low academic achievement becomes normalized. Most implicit in deficit ideologies is the idea that student achievement among students from diverse backgrounds is unrelated to schooling but rather related to their lives at home. Critics argue this is a result of schools failing to acknowledge the kinds of social capital obtained by students and their families from diverse backgrounds.

A New Framework for Educators

Funds of knowledge offer a new conceptual framework for informing effective practice to assist educators in meeting the needs of their diverse learners. The ideology behind funds of knowledge is that the best way to learn about students' lives and backgrounds is by focusing on practices that occur on a daily basis in students' households and by learning about what students do and how they articulate what they do in their homes and in their communities. The goal is to identify what students have versus what they do not have and to dismantle assumptions and stereotypes by learning about their students outside the classroom. Identifying unique student and family experiences and linking them to instruction are a key component of the funds of knowledge framework.

Educational Implications

Students bring with them a variety of experiences related to their cultures when they enter the classroom. Integrating culturally and linguistically responsive pedagogies has been found to increase student motivation, engagement, and academic achievement. A key factor in culturally and linguistically responsive pedagogy is that instruction must be connected to students' lives in order to engage them in their own learning in the classroom. The more teachers are able to tap students' prior knowledge, relate instruction to students' lives, and provide culturally and linguistically responsive pedagogy and meaningful lessons, the more engaged and motivated students will become in their learning. Building on what students bring to school, including their funds of knowledge, and on their strengths has shown to be effective because students are able to see their lives represented in the curriculum. Strategic application of students' cultural resources is an important way of supporting academic achievement among diverse learners.

Examples of how to integrate household funds of knowledge into the classroom include learning about families' literacy practices, both verbal and written; having continuous dialogue with students about their lives at home and their communities; asking students to bring in family and cultural artifacts to share with their peers; integrating activities that require students to share information about their families with their peers, for example, interviews and autobiographies; including activities that allow parents to meet each other and share their funds of knowledge during open house or back to school night; and inviting parents as guests to teach students about their occupations and/or funds of knowledge.

Examples of integrating community funds of knowledge into the classroom include student comparison and contrast of information about nutritious food from restaurants located in the community during a science lesson on nutrition. Discussing how nutrition is valued in their own homes and how it relates to the health of their family members can further enhance this activity. Another example would be students sharing what they have learned about politics, science, technology, and the economy when they listen to the discourses that take place among community

members and family members. In these scenarios, students learn critical thinking, how to articulate one's views, democracy, and how to examine the macro levels of the world in which they live and how it impacts the micro level of their worlds.

Critical Views of Funds of Knowledge

The funds of knowledge framework has been criticized for a lack of clarity on whose knowledge is incorporated into the framework. For example, is there a distinction between prior knowledge and funds of knowledge? Should students' schooling experiences and knowledge gained from school be considered funds of knowledge? Should funds of knowledge specifically focus on students' lives and worldview? The most cited knowledge found in the literature includes funds of knowledge from household members, teachers (for example professional and life funds of knowledge), students (for example language, cultural, musical, literacy, personal life experiences and household practices funds of knowledge), parents, and other adults who live in the students' communities.

Since it is recommended that funds of knowledge be used to dismantle deficit ideologies, critics also claim there is danger in stereotyping cultural or ethnic groups as a result of using culturally and linguistically responsive pedagogy in relation to funds of knowledge. The danger lies in teachers portraying groups as homogeneous and possessing fixed cultural traits. Culture is dynamic and a process that occurs in the lived contexts and practices of the students and their families. Culture is not static. Additionally, funds of knowledge might be misconstrued, with some households having more funds than others and contributing to the deficit ideology rather than disrupting it.

Funny Girl

Funny Girl is a 1964 Broadway musical, loosely based on the life of singer-comedian Fanny Brice. Buoyed by a score full of hit songs by Jule Styne and Bob Merrill, the musical established Barbra Streisand as one of the foremost performers of her generation. Streisand's performance defied stereotypes, presenting Brice as an intelligent, attractive, sympathetic, and amusing Jewish woman. The motion picture adaptation won numerous awards and was the top-grossing film of 1968.

The Fabulous Fanny

Brice was born Fania Borach on October 29, 1891, in New York City, to fairly affluent parents of Hungarian Jewish origin. She gained prominence performing comedic routines and songs

The musical *Funny Girl* is performed at the Brno City Theatre in the Czech Republic in September 2012. The play has been performed on many stages in many countries, but Barbra Streisand's appearance as Fanny Brice in the 1968 film version is most remembered. The musical is set in New York City prior to and following World War I. Fanny, a Hungarian Jewish star in the Ziegfeld Follies, awaits the return of her husband, Nick, from prison and reflects on their life together as their story is told in flashback.

like “My Man” and “Second-Hand Rose” in the Ziegfeld Follies sporadically beginning in the 1910s. Her film roles, recordings, and popular radio show only added to her fame.

American film producer Ray Stark, whose wife, Frances, was Fanny's daughter, commissioned a biography of Brice, *The Fabulous Fanny*, which he found to be wholly unsatisfactory. He next hired and fired a succession of a dozen screenwriters to draft a version of Brice's story that would make a suitable big-budget film. Stark decided to turn the only screenplay he liked, Isobel Lennart's *My Man*, into a musical at the suggestion of actress Mary Martin. Initially, composer Jule Styne and lyricist Stephen Sondheim, the songwriting team behind the similarly biographical musical *Gypsy*, were to create the score; however, Sondheim moved on to other projects, and Bob Merrill, known for pop songs like “Mambo Italiano” and “(How Much Is) That Doggie in the Window,” contributed the lyrics instead. With the score and libretto in place, Stark assembled a production team that, at

various points, included David Merrick, Jerome Robbins, Garson Kanin, Carol Haney, and Bob Fosse, to stage the musical. Anne Bancroft, Eydie Gormé, and Carol Burnett were all approached to play Fanny Brice, but none were seen as having the requisite combination of Yiddish theater humor, singing, and acting abilities.

Styne remembered Streisand, then only 19 years old, from her Tony-nominated performance in Jerome Weidman and Harold Rome's *I Can Get It for You Wholesale*. Streisand was already making a name for herself with her popular nightclub act, Grammy Award-winning debut album, and various television appearances alongside Johnny Carson, Judy Garland, Ethel Merman, Jack Paar, and Mike Wallace. Stark was impressed with Streisand's audition and offered the role of Fanny to her immediately.

Funny Girl on Broadway

Funny Girl opened on March 26, 1964, at the Winter Garden Theatre. Critics praised

Streisand, but other aspects of the show, especially the libretto, were much less well received. In fact, the Broadway opening was postponed repeatedly to allow time for rewriting. Even the score, which included the now-classic “People,” “Don’t Rain on My Parade,” “Cornet Man,” “I’m the Greatest Star,” “If a Girl Isn’t Pretty,” and “The Music That Makes Me Dance,” did not receive universal critical approval. However, the cast recording would go on to reach number two on the *Billboard Magazine* Top 200 Singles chart and be certified as gold by the Recording Industry Association of America. Over the course of the Broadway run, the cast included Sydney Chaplin, Kay Medford, Jean Stapleton, Johnny Desmond, Paula Laurence, Phil Ford, Bob Avian, and Larry Fuller. The musical went on to play 17 previews and 1,348 regular performances on Broadway; Streisand reprised her role for the 1966 West End production at the Prince of Wales Theatre in London.

The Film Adaptation

A movie version of *Funny Girl* went into development almost immediately. Though studio executives wanted Shirley MacLaine for the role, Stark insisted that Streisand should make her film debut as Fanny Brice. A host of directors, including Gene Kelly, Sidney Lumet, and Mike Nichols, were engaged before three-time Academy Award-winner William Wyler was signed to direct. Eight songs from the stage score were deleted in favor of five new ones and three from Brice’s repertoire. Making more than \$58.5 million in box office receipts, *Funny Girl* was the most successful film of 1968. Although Streisand received universal raves, the critical response to the film was lukewarm; purists complained that Streisand’s Fanny

hardly resembled the historical one, and that the libretto changed many facts about Brice’s life, never mentioning her career in radio, her first marriage, or her son. Nevertheless, Streisand went on to win the Academy Award for Best Actress (tying with Katharine Hepburn for *The Lion in Winter*) and the Golden Globe Award for Best Actress—Motion Picture Musical or Comedy. In addition, Lennart won the Writers Guild of America Award for Best Written American Musical.

Subsequently, a number of other well-known actresses and singers have essayed the leading role in *Funny Girl*, including Barbara Cook, Debbie Gibson, Lainie Kazan, Mimi Hines, and Heather Headley. A 2002 all-star concert, featuring Whoopi Goldberg, Jane Krakowski, Ricki Lake, Stephanie Mills, Ana Gasteyer, Sutton Foster, Lillias White, Kaye Ballard, Idina Menzel, and Bebe Neuwirth, was produced at the New Amsterdam Theatre, where Brice had performed decades ago in the Ziegfeld Follies.

Gadsden Purchase

The Gadsden Purchase, an 1853 land deal between the United States and Mexico, sought to resolve lingering boundary disputes created by the Treaty of Guadalupe Hildalgo that ended the Mexican-American War in 1848. But the purchase, engineered by a cabal of southern visionaries led by Secretary of War Jefferson Davis, later the president of the Confederacy, and James Gadsden, a South Carolina entrepreneur then serving as ambassador to Mexico, sought as well to ensure American access to the flatlands of the Mesilla Valley along the Rio Grande against the future development of a transcontinental railroad that would link the agrarian-rich markets of the south to the lucrative trade routes of the Pacific. Although that railroad would never be built, the purchase created a rich, culturally diverse enclave in what is present-day southern Arizona and southwestern New Mexico, a multicultural society that would flourish decades after the Civil War.

By the standards of far more ambitious land deals executed under the protocol of Manifest Destiny during the first half of the 19th century, the treaty that secured the Gadsden Purchase may seem modest—the administration of Franklin Pierce purchased 29,670 square miles (bound roughly to the north by the Gila River and to the south by the Rio Grande) for \$10 million (roughly

\$270 million in contemporary currency). What led to American interest in securing the land were persistent problems over a flawed boundary set after the Mexican-American War by territorial surveying teams and ongoing problems over a treaty provision that had guaranteed American monitoring of the border to interdict Native American raids, particularly from the Comanche and the Apache. That campaign to secure the border had proven ruinously expensive and the border virtually unsealable.

But what drove the Gadsden Purchase was more the potential to use the negotiated land as a site for the development of what was conceived as a transcontinental railroad system that would link southern farm markets to the Pacific, specifically, a train line running from El Paso in southwestern Texas to coastal San Diego. After the war, Gadsden, a career soldier who had become a powerful executive in a South Carolina railroad interest, spearheaded a grand project that determined the most promising line would include the disputed boundary property along the Rio Grande then under the control of the Mexican government.

Pierce, a senator from New Hampshire with southern sympathies as well as an ambitious pro-expansionist agenda, was elected president in 1852 and aggressively pursued settling the long-standing border dispute with the Mexican government as a way to acquire the Mesilla Valley. He sent Gadsden

A historical marker located just north of Casa Grande, Arizona, commemorates the Gadsden Purchase, a 29,670-square-mile area in present-day southern Arizona and southwestern New Mexico that was purchased in 1854 by the American ambassador to Mexico, James Gadsden. The purchase was the last major territorial acquisition in the contiguous United States.

to negotiate with the government of the dictator Antonio López de Santa Anna, who across nearly four tempestuous decades had been both the political and military leader of the Mexican independence movement. Although Santa Anna initially rejected the purchase, American negotiators underscored that if the Mexican government refused to sell, it would most likely face military aggression. Santa Anna agreed—the purchase was nearly universally decried in Mexico and Santa Anna would be removed from power within months. After significant modifications of the price by the U.S. Senate, the treaty went into effect June 30, 1854.

Until the closing decades of the century, when the transcontinental railroad system would reshape the west, the relatively narrow strip of land secured by the Gadsden Purchase remained one of the most forbidding (and dangerous) territories west of the Mississippi. After the Union army squelched a Confederate army presence in

the territory early in the Civil War, it abandoned the territory to its own devices. For decades, the region lacked reliable government oversight and stabilizing judicial control. By all rights it should have collapsed in anarchy. But drawing on its peculiar mix of ethnicities, the area survived, one of the earliest (and most successful) multicultural communities in America, forged from a rich mix of wealthy first- and second-generation Mexican families, first-generation European immigrants (largely German and Scandinavian), gentrified East Coast entrepreneurs, barely literate ex-slaves, and skilled plantation owners who had lost everything in the war.

The area relied on a kind of loose aristocracy of influential families, most of them Mexican, to give the region a quasi-political structure. In addition, given the constant threat from the inhospitable terrain and the relentless pressure from roaming Navajo and Apache tribes, who regarded both the Mexicans and the whites as invaders, the settlers had to forge a working alliance. Communication across the language barriers between Anglos and Hispanics was critical to the territory's very survival. In an era when, back east, immigrant ethnicities openly clashed in the streets over limited economic opportunities, here multiple cultures worked together, worshipped together, established a model bilingual education system together, and even married across ethnic lines to shape, over three decades, a rich homogenous cultural community that saw itself as a single entity set against the common threat posed by the region's tribes and by the climate.

The territory prospered, initially in agricultural industries, cotton and livestock, and later in a burgeoning mining industry, most notably coal, copper, and silver. With the completion of the railroad, however, a new wave of settlers, almost entirely white, demanded increased law and order and increased economic regulation (specifically grazing rights and water rights), all designed to favor them. Gradually, as the territories of Arizona and New Mexico moved to statehood in the early decades of the new century, the increasing presence of whites ended the region's revolutionary multicultural dynamic.

Gender/Sex and Ethnic Diversity

Although often used interchangeably in everyday language, gender and sex are not the same. Sex, usually clarified as biological sex, refers to the general state of being biologically male or female as defined by physical and genetic characteristics. Gender, on the other hand, is a social construct, which refers to concepts of masculinity and femininity as defined by culture. These describe the range of acceptable behaviors expected for both men and women in a society (gender roles) and how one identifies oneself as male or female (gender identity). Gender roles also describe the characteristics allowed in social relationships.

Biological sex, for the majority of individuals, is predominantly consistent with their culturally defined gender identity. Transgendered individuals experience a disconnection between their biological sex and gender identity, which impacts fulfillment of socially assigned and expected gender roles. Sandra Bem, a psychologist, suggested that gender identity exists along a continuum from masculine to feminine and is not simply two discrete categories. Androgynous individuals incorporate aspects of both masculinity and femininity into their personality and their behavior.

In 21st-century America, many individuals deviate from historically, culturally defined gender roles that limited the activities of both men and women. Currently, men are allowed to be nurturing caregivers of children, while women are able to be task-oriented executives in business. Since one's sex is biologically determined, it tends to remain consistent across diverse cultures, while gender expectations differ greatly. Sigmund Freud proposed "anatomy is destiny"; it has become increasingly clear that destiny and opportunity can vary depending on the society into which one is born.

Women as Second-Class Citizens

Historically, most societies tended to be patriarchal, with roles of leadership and power held by men. In fact, women and children were often considered property or chattel. Fathers had the right to arrange marriages for their daughters and secure a bride price from the groom or his family. Once married, women were the property of their husbands, who also controlled most, if not all, of their financial assets.

In the modern world, many societies are moving toward egalitarianism or equal roles for men and women. Yet there remain many societies in which women's lives remain controlled by men. Women may be forced to wear restrictive clothing; must be accompanied by male relatives in public; may have limited options for education or work; and may be financially dependent on husbands for food, shelter, and, ultimately, their very survival.

Gender Roles and Ethnicity

While traditional societies maintain gender characteristics over longer periods of time, it is apparent that societies may change their views regarding gender. "We've Come A Long Way Baby" reflects the changing gender expectations for women in America in the 21st century. Since America is multicultural, it would be reasonable to assume that gender definitions, expectations, and identities reflect the diversity of culture. Some of these gender expectations may be similar across cultures and some may be vastly different.

And while broad categories tend to be used to identify individuals of Latino, Asian, African, and Muslim/Arab cultures, within these groups there is often great diversity reflecting numerous subcultures. It is important to remember that every

individual is unique and may find certain aspects of their culture more important than others. Further, the individual is the best source of information about their culture.

Americanization of Traditional Gender Roles

More traditional gender roles tend to exist in many Eastern, African, and Latin cultures. Immigrants' and refugees' gender roles are often challenged upon arrival into the United States. For instance, sharing household duties, parenting responsibilities, verbalization of feelings and/or dual-earner households may not be relevant to some individuals as they struggle to maintain their traditional roles within a new society. In addition, polygamy—a marriage between more than two persons—continues to be recognized by many countries, mostly African and Muslim, throughout the world. American immigration laws may preclude all except the first wife and her children from immigrating with her husband.

As immigrant groups arrive in the United States, they may adopt certain Americanized views of women and maintain some traditional roles. For example, education of girls may be available in the United States but not in the country of origin. On the other hand, girls may still be required to marry, have children, and obey their husbands. The longer an immigrant group has been in the United States, the more likely they are to adopt some Americanized gender roles, creating newer forms combining both cultural expectations.

Various social factors encourage media exposure to less traditional gender roles via television, movies, music, and the Internet. Gender bending, which stretches the boundaries of traditional gender roles and gender identities, is part of modern culture. The American public education system exposes children, teens, and young adults to a variety of cultures and gender-role views that may be different than their parents'. Individuals raised and remaining in ethnic communities may retain more traditional cultural gender norms, while those who move to more heterogeneous communities or intermarry may abandon traditional definitions or create newer patterns.

Latino Gender Roles

Latino gender roles have been described as *machismo* for men and *marianismo* for women.

Machismo requires men to be dominant, virile, sexually competent, and independent. *Marianismo* describes the ideal woman as being submissive, chaste but sexually attractive to her husband, while being nurturing and subservient. Both definitions are simplistic and can be interpreted in different ways by the broader culture.

While some research suggests that traditional roles may be outdated in modern society, they continue to influence behavior and social expectations. Yet, while both terms have been used negatively to describe individuals displaying stereotypical gender roles, they may have positive effects on individuals and families. *Machismo* may cause men to sacrifice and work hard as providers. Latino men take their roles as fathers very seriously and may be extremely protective and more nurturing than those of other ethnic groups out of a desire to provide and protect. On the other hand, this work ethic may make them appear to be unavailable as they strive to provide. When Latino men have difficulty finding employment or are unable to provide adequately for their families, they may perceive themselves negatively. If unable to fulfill one aspect of their traditional gender role, such as a provider, they may demonstrate aggression, violence, or drinking.

The most important roles for women in Latino culture are wife and mother. Marriage and child-bearing are seen as integral parts of feminine gender roles. Latino women may define themselves through their family and children instead of as independent women or as part of a couple. The role of wife is secondary to that of mother. The emphasis on the wife's quiet submission and the husband's dominance may make it more difficult for Latino women to communicate directly and assertively with their husbands. They will put their children's needs before their own. This gender pattern, unfortunately, may also dispose them to domestic violence, as they are willing to tolerate abuse from their husbands, and even older sons, putting the needs of others before their own. In addition, domestic-oriented roles may isolate women from the broader U.S. community, impacting communication in English.

Yet there is evidence that traditional views of male and female roles are changing among Latinos in the United States. One recent study conducted by the Pew Research Center found that

younger Latinos were less likely to believe that fathers should have the final decision in family matters. Yet, there remains a large gender gap within the younger generation. Young men are twice (50 percent) as likely as young women (24 percent) to hold this view, while among the older individuals there was no appreciable gender gap.

Arabic and Muslim Gender Roles

For many Westerners, the terms *Muslim* and *Arab* are synonymous; they are not. Not all Arabs are Muslim nor are all Muslims Arabs. Muslims are individuals who practice the religion of Islam, while Arabic culture refers to those who dwell or own land in the Arab regions and speak Arabic. They may practice any religion they choose. Both the Arab and Muslim populations are relatively small in the United States, each less than 1 percent of the general population.

Arab individuals come from Middle Eastern societies. Differences in gender expectations in a family may create stress and adjustment in American society. In more traditional Arab American families, conflict may arise around dressing modestly, not socializing with children of the opposite sex or dating, and showing respect for elders in specific ways. Arab American parents may believe they should arrange their child's marriage to someone they feel is responsible and will be able to provide a good home for their child and grandchildren, contradicting the social norms within the United States of dating and picking one's own spouse.

Impact of Religious Codes and Stereotypes

In Muslim societies both men and women are expected to behave according to religious codes. Although religious texts may view men and women to be equal in human dignity, this may not be reflected in Muslim law. For example, in some countries, a Muslim woman may not have the right to choose a marital partner, get a divorce, maintain custody of her children after a divorce, own property, or drive a car. Interpretation of religious scripture identifies men as guardians over women, which has been used to justify unequal gender roles.

Traditional head coverings, veils, or burqas (the full body covering worn by some Muslim women) have served as political and civil liberty

issues in public places. Many women are willing to dress in such a fashion experiencing freedom from the coverings while others may see the clothing as evidence of subjugation and inequality. For some Americans, this identification of women as Muslim may result in stigma, bias, and even risk of violence after September 11, 2001.

While many Americans hold stereotypical views of Muslim American gender roles, American Muslim women may experience more freedom than in other parts of the world. In 2011, a Pew Research study found Muslim women compared with Muslims in other countries, most Muslim Americans are more supportive of emancipated women in society. Many believe women should be allowed to work outside the home and are qualified to hold political office.

African Gender Roles

Traditional African societies have clearly defined gender roles that were necessary for the survival of villages. Men were warriors and hunters, while women were mothers and farmers, responsible for cultivating land and growing domestic animals for food. Women educated children in the social, ethical, and moral values of the community, including the standards for proper gendered behavior. The community valued women's work. Polygamy was practiced throughout African societies. And while many African societies remain patriarchal, an increasing number of women can hold power as tribal chiefs and spiritual leaders and can own property. Some rights of inheritance are passed down through the female lineage.

Even today, throughout Africa, many individuals live in small villages without modern conveniences, potable water, or electricity, and eke out a survival living. In larger cities, contemporary African women are educated and empowered, similar to the United States. The traditional gender roles of women as wives and mothers have gradually changed as women have become increasingly involved in new roles, jobs, and relationships outside the home.

Of course, the immigrant experience of the early African Americans was different from those of other immigrant groups. Most came as enslaved people, forcibly removed from their homes in Africa and separated from their families and traditional culture. They were forced to adopt

gender-role expectations of early Americans. In contrast to other settings, as property, enslaved women had more value than men because of their ability to bear children, which as laborers or chattel brought wealth to slave owners.

Modern African American Gender Roles

Racism, urbanization, migration, discrimination, segregation, and immigration have profoundly shaped contemporary African American gender roles. Often the wives and mothers worked as domestic help to provide the family income, while their husbands had more limited opportunities for employment. In modern America, large numbers of African American children are being raised in single-parent, female-headed families. In such situations, women perform the gender roles expected of both mothers and fathers. Men who are raised in such families often have more respect for women, resulting in more gender-role flexibility.

Upper-class, modern Africans may arrive with opportunities, education, and socialization perspectives similar to contemporary Americans' about gender roles. On the other hand, poor African refugees, escaping wars, genocide, or famine, have had their traditional roles upended. Many female refugees have lost husbands, fathers, sons, and other male relatives and now find themselves responsible for themselves younger siblings, as well as their own children. Without men to protect them, they have had to become both protectors and providers. Many have experienced physical and sexual violence. Upon arrival in the United States, they become the heads of households, a new responsibility within a new culture, which advocates women's rights and equality. They are introduced to new employment and educational opportunities, which may be contradictory to their traditional gender roles.

Asian Gender Roles

Similar to other cultures, most traditional Asian societies had distinct gender roles for men and women, but these differ by country and culture. In addition, Asians practice many different religions, including Buddhism, Hinduism, Islam, Christianity, Sikhism, or something other. Within Asia, each religion holds differing views of gender roles. The interplay of culture and religion creates a myriad of perspectives on gendered behavior.

In the teachings of Confucius, men are responsible for women, who are expected to be passive and to nurture the well-being of the family. Chinese mothers form close bonds with their children, favoring the eldest son over her husband, for it is the eldest son who will care for his mother in her old age. According to Buddhism, no matter what limitations women might be thought to have, they are not to be limited in or excluded from Buddhist practice. In general, Hindus believe that males and females are born with different sexual natures and therefore should take different and complementary roles in marriage, sexual relations, and reproduction. The roles of women depend on the Hindu scripture being used and can range from equality with men to subservient or restricted. Sikhism views men and women as essentially equal. Throughout Asia, Christians and Muslims may or may not adhere to religious views of gender roles.

Changing Asian American Gender Roles

Over time, traditional gender roles among Asian Americans have changed and become more egalitarian, particularly among younger educated individuals with careers, similar to the general American population. Within some Asian American populations, there is pressure on first- and second-generation women to maintain the traditional culture, including gender roles, to pass on to future generations. Males are expected to care for parents, marry, and carry on the family name (as in many other cultures). Intermarriage has led to rapidly changing gender roles.

Refugees and immigrants from more traditional communities throughout Asia are also faced with the dual challenges of adjusting to a new culture with vastly different gender-role expectations. Many lived in peasant societies and conformed to traditional gender-role definitions. Wars and the cultural revolution forced many to flee their homelands and, upon arrival in the United States, face challenges to their traditional identities.

Gender and Law

Because of a history of gender inequality in the United States, some gender expectations are incorporated into law, for example, the Nineteenth Amendment to the Constitution gave women the

right to vote. And it was only in 1963, that the Equal Pay Act was enacted to establish that men and women be paid equally for equivalent work. But this legislation did not mean that men and women were treated equally.

Many subtle forms of discrimination operate to prevent women from having equivalent financial resources as men, and the “glass ceiling” continues to operate to prevent many from career advancement. In 2009, the Lily Ledbetter Equal Pay Act was passed to allow more rights in cases against past work-related sex discrimination. The Equal Rights Amendment to the U.S. Constitution failed to secure the required number of states to be ratified and has been introduced into Congress every year since 1982. This legislation simply states, “Equality of rights under the law shall not be denied or abridged by the United States or by any State on account of sex.”

Gender Roles and Violence Against Women

Throughout the world, many societies have gendered practices of sanctioned violence against women, including physical abuse, rape, disfigurement/maiming, and more. These practices arrive with immigrants and refugees to the United States. Men who wish to dominate women often use violence, or the threat of violence, to subjugate women.

Women who have been raped are seen as having shamed their families, are shunned or seen as damaged goods, and, as a result, are unable to secure a good marriage. Some cultures have incorporated this into their gender roles. Husbands and brothers may be sanctioned or expected to use physical punishment to control their wives, sisters, and daughters. Historically, in times of war, rape of women has been used by conquerors to demonstrate power.

*A burqa is an outer garment worn by women in some Islamic traditions to shield their bodies from the sight of men while in public. This concept is closely linked to *Namus*, an ethical category or virtue in Middle Eastern Muslim patriarchal society. It is strongly gender specific within a family, described in terms of honor, attention, respect, and modesty.*

Human Trafficking

Human trafficking is often perceived as a gendered crime. United Nations data about trafficking indicate that most victims are women and young girls. The majority experience physical or sexual violence during the trafficking. Vulnerable women and children are easily taken advantage of by traffickers throughout the world. They are often offered jobs or a chance to leave a life of poverty and deprivation.

Among poor families, fathers may sell their daughters to traffickers, needing the money to support their families while believing their child might have opportunities for a better life as promised by the trafficker. In some cultures, the social status of the family might make prostitution the life expectation for poor girls, whose income is required by the family. American children and young women are also at high risk for sexual exploitation.

Domestic Violence and Genital Cutting

Domestic violence has often been used as a means of controlling wives, and societies have different standards for which behavior is to be considered excessive and should result in punishment of the perpetrators. In some cultures, men have the right to conjugal intercourse with their wives and so marital or spousal rape is not recognized as a crime. In many countries, it is either ignored or still not considered a crime. It was only in the 1990s that all of the United States finally enacted marital rape laws, although many states still have exemptions.

Many cultures justify husbands' violence toward wives by blaming the victim. The women, who have been socialized within these cultures, will also blame themselves for doing something that caused the violence. Because of unequal status in society, this self-blame is often realistically related to fear of being alone, without shelter, food, and other resources for herself and her children.

Female genital cutting (FGC) is recognized internationally as a form of violence against women. Yet it is still being practiced despite laws designed to prevent it. This practice is not illegal in the United States for women over the age of 18 or if medically necessary. The practice is so widespread that many women enter the United

States already having had the procedure in their own countries.

Because of deeply held cultural beliefs, women continue to subject their daughters to FGC. There is no U.S. law protecting girls from being taken overseas to have the procedure in another country. Minor girls need to be protected if they are determined to be at risk, but many are willing participants because they believe it is important for their family and culture. It is a delicate balancing act to provide public health education in communities where this practice may be prevalent. The problem in the United States is balancing cultural sensitivity with determining whether adult women are willing or unwilling participants in practices that may create risks to their health. Adult women who do not wish to participate need to be protected by the fullest extent of the law.

Honor Killings

Honor killings are another cultural phenomenon brought to America by immigrants and refugees. There are hundreds, if not thousands, of women murdered each year in the name of family "honor." In the United States, no national or state agency attempts to collect data on any kind of "honor" violence, including murders. In many cases these killings involve the sexual behavior of girls and women. In contrast, men who engage in the same behavior may actually receive social approval.

Conclusion

As a nation made up of diverse cultures, American society has to deal with many differing views regarding gender. These views are constantly merging, evolving, and shifting. As a country, laws need to be established that protect individuals from discrimination or abuse on the basis of their sex, but laws may not change what people believe; they only provide guidelines to control civil behavior.

Generations and Ethnic Diversity

From the colonial era through the present, the immigrant has been a defining figure in one of the great national narratives about U.S. history and identity. According to this narrative, although the nation's ethnically diverse populations often share an immigrant past, the ethnic identities of the immigrant generation have, over a span of two or three generations, been supplanted by "American identity." This process of acculturation, according to the narrative, involves not only cultural assimilation into the European American "melting pot" but economic uplift as well, for example, into the arc of achievement, associated with the American Dream, from impoverished or working-class immigrant to the middle- or upper-class occupational success of later generations.

This narrative of achievement includes educational uplift as well, for example, in the case of immigrants and their descendants, from the non-English speaking outsider status of the newly arrived immigrant to the English-speaking and well-educated members of the second or third generations. Education here becomes synonymous not only with acculturation but also with professional success in the world of work.

On the one hand, today, as in the past, the myriad forces of acculturation seek to construct an American national cultural collective based on citizenship as well as other related factors, such as language (English). On the other hand, the immigrant past forms a foundational and cherished element of American national identity, as one sees, for example, in the wide variety of celebrations of ethnic cultures across the country, from Irish, Italian, and German to Mexican, Puerto Rican, and Cuban, as well as Asian, Middle Eastern, eastern

European, and many others. Perhaps more significant than these homages to a distant immigrant past have been the complex processes by which the ethnic identities of immigrants have persisted within American families through several generations and after. Despite, and in some cases because of, the forces of acculturation—which seek cultural uniformity and homogeneity—ethnic identities born of an ancestor from the “old country” may profoundly influence later generations of the foreign-born immigrant’s descendants.

Describing the intergenerational family histories of his characters, the American novelist William Faulkner famously said, “There is no such thing as ‘*was*’—only *is*. If *was* existed there would be no grief or sorrow.” Within families descended from immigrants, and especially for the second and third generations, Faulkner’s truism about how the remote past persists into the present applies in ways that Faulkner, given his generational distance from his European ancestors, could and did not explore.

But Faulkner’s distance from his immigrant ancestors, and his (white) European racial background, offer circumstances that underscore the important distinction between (white) European immigrant ethnicities and those many other non-European (nonwhite) immigrant ethnicities that, from the colonial period through the present, have contributed to U.S. history and culture. Although most European immigrant groups, such as the Germans, Irish, and Italians, faced discrimination upon arriving in the colony—or, later, in the United States—those of non-European origin, such as Asians and nonwhite Hispanics, who were identifiable as racially different due to their non-European physical appearance, faced a much greater burden of prejudice, often lasting generations.

The United States is a “nation of immigrants” in a limited sense, in that the ancestors of most African Americans were brought to the New World involuntarily as slaves, and American Indians had lived in the New World, including what is now the continental United States, for millennia when Europeans began to arrive in large numbers in the early 16th century. For those ethnic and racial groups descended from immigrants who were and continue to be stigmatized by racism and prejudice, the United States

is a “melting pot”—a term that, among scholars, is now largely outdated, which was popularized in the late 19th and early 20th centuries—also in a relative and limited sense.

As noted above, regardless of background, ethnic identities linked to an immigrant ancestor often form a meaningful and lasting heritage for second and third generations and even for the generations that follow. But for those ethnic and racial groups whose collective past includes memories, some very recent, of racial oppression, cultural identities linked to an immigrant ancestor may be especially immediate, offering both a reminder of the descendants’ ethnic or racial identity and an important source of resistance, in the form of group solidarity, to racism and prejudice.

Since the 1960s, scholarship in U.S. ethnic studies, a field born of the 1960s’ ethnic nationalist movements such as the Chicano movement, has overturned earlier assumptions about ethnic acculturation. In contrast to the melting pot, contemporary scholars and critics have offered other culinary metaphors to describe the intergenerational history of U.S. ethnic diversity, including “salad” and “bouillabaisse.” These figurations emphasize cultural immersion in American society without the loss of the “ethnic self,” a mixing that retains, absorbs, and transforms the “ethnic self.” They suggest the fundamental argument that *identity*, whether of the immigrant and his/her ancestors or of those who embrace an “American” cultural identity, has never been a stable, unchanging phenomenon but rather an ongoing process embedded in and defined by a complex set of sociohistorical and cultural processes.

Theories of Stuart Hall

As the cultural studies scholar and theorist Stuart Hall explains, “[I]dentity [is] . . . formed and transformed continuously in relation to the ways we are represented or addressed in the cultural systems which surround us. It is historically, not biologically, defined. The subject [individual] assumes different identities at different times, identities which are not unified around a coherent ‘self.’ Within us are contradictory identities, pulling in different directions, so that our identifications are continuously being shifted about. If we feel we have a unified identity from birth to death, it is only because we construct a comforting story

Three generations of a Dutch immigrant family wait to be processed after arriving in the United States at Ellis Island in New York City. America's immigrant past is a foundational element of the nation's identity, and it has been estimated that almost 40 percent of all U.S. citizens can count at least one ancestor among the millions who arrived through Ellis Island in its 60-year history.

or 'narrative of the self' about ourselves. The fully unified, completed, secure, and coherent identity is a fantasy." Ethnic identity is therefore always relative and unstable, even for recent immigrants to the United States who would appear to the casual observer to possess a coherent and unchanging "ethnic self."

Today, as in the past, immigrant populations themselves are formed and transformed in relation to the ways they are represented or addressed in the social and cultural systems that surround them. Through these relations they also form and transform "American identity." This all-encompassing term, which Hall and other scholars would consider both a "fantasy" and a "comforting narrative of the self" therefore, in the view of contemporary scholars of ethnic identity, becomes much less a prescriptive category than a denotation for a cultural and sociohistorical space within which multiple "American" identities continuously emerge, interact, and shift.

Hall's formulation of identity, which draws from and overlaps with the outpouring of theoretical and creative work produced since the

1970s by U.S. ethnic scholars and writers, sheds new light on key intergenerational processes such as acculturation, assimilation, and language practice. Rather than viewing intergenerational ethnic identities in the manner of melting pot theorists of the pre-1960s era, Hall's approach offers a method for identifying, analyzing, and appreciating the complexity of ethnic identities and particularly how these identities shift, evolve, and in myriad ways endure over generations.

Let us apply Hall's model, in the abstract, to families whose first-generation ancestors came to the United States from a foreign, non-English speaking country. Although this analysis may apply to all second- and third-generation families, whether of (white) European or non-European immigrant origin, let us focus on intergenerational families of nonwhite or non-European background, and particularly Asian Americans and nonwhite Latinos.

In order to understand ethnic identification within these groups over several generations, Hall's model would first examine the sociohistorical landscape, both early and recent, within

which immigrant groups and their descendants have lived. Beginning in the mid-19th century, when these two populations began to emigrate to—or to be “incorporated” through conquest into—U.S. society, Asian Americans and Latinos experienced racism and prejudice at almost every level of society. Because they were identified by their physiognomy as racially different from Europeans, until the late 1960s, when the civil rights movement succeeded in dismantling the segregationist (Jim Crow) juridical structure, both of these populations, like African Americans, were deemed innately inferior to (white) European Americans.

For much of the late 19th and early 20th centuries they were therefore subject to an array of discriminatory practices, from anti-immigration legislation barring Asians, specifically Chinese, from entering the United States to Jim Crow segregation that targeted Mexican immigrants and Mexican Americans in the southwest. While in roughly the same era, between 8 and 10 million (white) European immigrants arrived at Ellis Island, Asians and Mexicans were hardly welcomed as immigrants. Even for those first-generation individuals who sought assiduously to acculturate, the legacy of racial oppression inevitably became a part of the cultural or collective memory of their families and communities, shaping their sense of American selfhood far beyond the first generation.

Hall's model would underscore the ways in which ethnic identity evolves both within a given generation and within families and communities over generations, leading to a complicated set of relationships between and among members. For example, while one might expect the third generation to be far removed from their immigrant grandparents' ethnicity, often it is the third generation that seeks to recover and reaffirm a family's ethnic heritage, as one sees in the countless literary works about family history by third-generation authors.

At the same time, while Hall's paradigm would cite generational differences toward ethnic identification as evidence of how ethnic identities form and transform, it would refute the view that these differences are seamless or uniform. The loss or retention by later generations of an immigrant ancestor's ethnic identity depends on a number of social, cultural, and even economic factors,

though clearly the second and third generations are fundamentally different culturally from their immigrant progenitors. These differences lead to a variety of generational conflicts, many of them rooted in the instability and adaptability of the ethnic self, as Hall's model describes these processes. And yet something as simple as the degree of difficulty of learning or retaining a foreign language in an English-speaking country, for instance, a Chinese dialect as opposed to Spanish, can create a wide variety of ethnic identifications among second and third generations.

Intergenerational Family Experiences

When coupled with the innumerable other cultural, linguistic, sociohistorical, geographic, and economic factors that shape and inform the ethnic self, the permutations of “ethnicity” among later generations may appear to make a simple definition about generational distinctions impossible. But there are a number of parallel intergenerational experiences among U.S. ethnic families with a first-generation immigrant ancestor. Comparing the intergenerational family histories of Mexican Americans and Japanese Americans, to cite two examples, sheds light on the shared experiences of ethnicity among many nonwhite American families descended from immigrants.

Many Mexican American families with second- and third-generation adults can trace their history to the great migration of Mexicans to the United States that took place from approximately 1890 to 1930, when roughly 1 million Mexicans emigrated to the United States. Though some of these immigrants were well educated and some were political exiles, the majority, drawn to the United States by the labor needs of the rapidly growing agricultural industry in the southwest, worked as farm laborers. This meant that, beyond earning salaries that often left them in poverty, this immigrant generation had few opportunities to better themselves. They spoke Spanish at home, which meant that their U.S.-born second-generation children spoke this language before entering the U.S. school system.

Though raised ethnically Mexican at home, many of these second-generation Mexican American children attended schools where speaking Spanish was prohibited. Compelled to speak only English in public, they were in this way

expected to acculturate to U.S. cultural standards, which meant that, whether explicitly or implicitly, their Mexican ethnicity was stigmatized. In their formative years they experienced anti-Mexican racism and prejudice in all of its forms, including Jim Crow segregation. For members of this generation, the racial burden of being Mexican in a society that devalues Mexicans was traumatizing.

Unlike their immigrant parents, they led double lives: they were Mexican at home (private self) and American at school (public self). Though many members of this generation left their rural homes, attended college, and became successful professionals, many others were denied basic opportunities, beginning in the school system, because of the racism and prejudice of the era. Beginning in the 1940s and 1950s and culminating in the 1960s, it was the children of this second generation who, in a statement of both cultural pride and political protest, embraced the term *Chicano* as a self-identifier for third-generation Mexican American ethnic identity.

The generational distinctions among Japanese Americans, as well as their rural origin as farm workers, broadly parallel the intergenerational historical experience of Mexican Americans. Like Mexican immigrants, Japanese immigrants first arrived in the United States in large numbers in the late 19th and early 20th centuries. But, while Japanese immigrants (Issei, or first generation) and their second (Nisei)- and third (Sansei)- generation descendants, like Mexicans, faced racism and prejudice during the Jim Crow era, anti-immigrant legislation in the early decades of the 19th century that targeted Asian immigrants created a unique intergenerational history within the Japanese American community. Because the Immigration Act of 1924 had banned further Japanese immigration, within the Japanese American community an unusually well-defined set of generational identities emerged. The term *Issei* applied exclusively to those who had immigrated prior to 1924.

Quite unlike the Mexican American intergenerational experience, which was always influenced by geographic proximity to and continuing emigration from the old country, the Nisei and Sansei developed into distinct generational categories that would create a unique set of circumstances and tensions for Japanese American

families. Yet, like many other descendants of nonwhite immigrants, despite the distinctively virulent type of anti-Asian racism that they faced, the Nisei and Sansei would make the transition from the rural and largely working-class lives of their immigrant progenitors to middle- and often upper-class status. Yet their Japanese ethnic identity—as Hall would suggest, a product of their racial difference from European Americans as well as the history of racism directed at this group—continues in later generations to form and transform, even as it also shapes and enriches American cultural identity.

Genocide

From its inception, “genocide” has been a scholarly term. Invented by Raphael Lemkin—a Polish-born Jew, scholar, and lawyer who spoke nearly a dozen languages—in 1944, the term *genocide* was subsequently codified by the United Nations (UN). It has been a highly debated term in scholarly and political circles ever since.

It was the case of Soghomon Tehlirian that inspired Lemkin to first define, and then create global recognition for, what Winston Churchill called “a crime without a name.” On March 15, 1921, in Berlin, Germany, Tehlirian gunned down Mehmed Talaat in cold blood. Talaat, then Turkish minister of the interior, was one of the masterminds of the Armenian genocide of 1915 to 1923. The legal and moral conundrum that Tehlirian could and would be charged with the murder of one person while Talaat and his compatriots would not be charged with the murder of as many as a million people, guided Lemkin’s intellectual interests as well as his sense of justice. The incident initiated what was to truly be his life’s work.

After trying to warn the world about Hitler in 1933 and living through the 1939 German invasion of Poland, Lemkin provided the world with a term to describe the unspeakable. First defined in his 1944 tome, *Axis Rule in Occupied Europe*, Lemkin combined the Greek *genos* (race, kind, tribe) and the Latin *cidere* (to strike down, chop, beat, slay) to create the word *genocide* to kill a tribe.

Once defined, Lemkin worked relentlessly for political and legal recognition of his term. Lemkin’s years of lobbying, proposing, arguing, and drafting paid off when the United Nations formed the 1948 Convention on the Prevention and Punishment of the Crime of Genocide. Article II redefines genocide and its parameters on the global stage as follows:

In the present convention, genocide means any of the following acts committed with the intent to destroy, in whole or in part, a national, ethnical, racial or religious group as such:

- Killing members of the group;
- causing serious bodily or mental harm to members of the group;
- deliberately inflicting on the group conditions of life calculated to bring about its physical destruction in whole or in part;
- imposing measures intended to prevent births within the group; and
- forcibly transferring children of the group to another group.

In *Axis*, Lemkin considered genocide to be not only an act fixed in time but also a process with two phases: first destruction, then imposition. Implicit in the notion of process is the idea of logic, planning, and implementation; conscious and methodical efforts aimed to eliminate, in whole or part, another race or ethnic group. Though the 1948 Convention drew heavily from Lemkin’s initial definition in *Axis*, the United

Nations document fails to acknowledge his recognition of cultural and political genocide. This omission, conscious and tactical on the part of a global body seeking to create clear and diplomatic guidelines for this newly recognized crime, stands as a location for many volumes of subsequent scholarship and debate concerning the definition.

In 1959, Lemkin died, well before the United States, in 1986, joined countries such as Cuba (1949), Egypt (1948), Israel (1949), Pakistan (1948), and Russia (1949), to finally ratify the 1948 Convention. His legacy, however, is one of a vigorous scholar and assiduous human rights advocate and sets the stage for the whole of genocide studies today.

Many Scholars, Many Definitions

A first wave of genocide studies appeared in the late 1960s primarily as research on the Holocaust. Prompted by the desire to fully illuminate the details, as well as record the firsthand experiences of those who survived the horrors, Holocaust studies scholars provide methodological footing for the larger field of genocide studies. Their work can also be seen as political action against Holocaust deniers, those who challenge the severity and veracity of the Holocaust itself. Even so, tension exists between Holocaust studies scholars who, whether purposefully or not, position the Holocaust as a uniquely relevant genocide, and those who view the Holocaust as one among several genocides worthy of examination.

Comparative genocide scholarship arose in the early 1980s as a way to expand the work of Holocaust scholars and acknowledge the occurrence of genocides around the globe. Which events may be understood as genocides, how far back the definition can be taken before the 20th century, and what it means to compare events happening at different times and in different contexts are all areas of concern for comparative genocide scholars. One prime example of a debate regarding the official definition of genocide has to deal with how to label and categorize the atrocities and violence committed by the U.S. government against the Native American Indians.

Further afield, yet equally relevant in terms of working with definitions, are discussions that arise out of use of the term in conjunction with race relations in the United States. In a speech made only

a couple of weeks before his assassination, Martin Luther King, Jr., cited Hitler in order to argue that “the ultimate logic of racism is genocide.” How people use and understand the term *genocide* in ways that move beyond the legal definition have serious implications to discussions regarding such issues as violence in America today.

It is the clarity of the definition created by the United Nations 1948 Convention on the Prevention and Punishment of the Crime of Genocide that enables immediate and subsequent scholarly and political debate about the term. How to prove intent, and whether or not the killing must be “mass” in order to count as genocide become the exact areas of concern generating intense debate among scholars and may be understood as the constant in an area of scholarship that otherwise includes a wide range of disciplines.

Scholars such as Frank Chalk and Kurt Jonassohn (through a specific focus on “one-sided mass killing”) and Irving Louis Horowitz (by emphasizing the role of the state) have worked to tighten the definition, while those such as Israel Charny have made arguments that expand the definition as much as possible (all cases of massive loss of life are genocide). Helen Fein (developmental genocide, despotic genocide, retributive genocide, ideological genocide), Rudolph Rummel (democide), and Adam Jones (gendercide) are scholars who have worked to present an expanded taxonomy for the term in order to address what they perceive as gaps in the UN’s definition.

Prosecution and Prevention

Lemkin’s principal interest in defining genocide was to eventually see the creation of laws that would enable courts to prosecute offenders and exact justice for victims. His criticism of the Nuremberg Trials of 1944 and 1945, the military tribunal created to prosecute higher-ranking officials associated with the crimes of the Holocaust, prompted his intense interest to create international law discouraging governments and official state bodies to engage in any such behavior ever again.

Though it was his intention that the 1948 Convention on Genocide would enable international prosecution of individuals responsible for the mass atrocities associated with genocide, it would not be until the 1990s that the world would bear witness to trials prosecuted in international courts

dealing with crimes associated with genocide in former Yugoslavia and Rwanda.

In 1998, following an acknowledgment of the limitations of temporary courts established to prosecute context-bound crimes, the International Criminal Court (ICC) was established as a permanent body to address in an ongoing manner international issues such as genocide. Currently, 121 countries have signed the Rome Statute creating the court. In 2000, the United States signed, and subsequently withdrew, its support, though the Barack Obama administration is currently working to reestablish a relationship with the ICC.

Closely related to issues regarding prosecution are those of prevention. According to its Web site, the International Association of Genocide Scholars (IAGS), founded in 1994 as the Association of Genocide Scholars, “is a global, interdisciplinary, nonpartisan organization that seeks to further research and teaching about the nature, causes, and consequences of genocide, and advance policy studies on genocide prevention.” Through its journal, *Genocide Studies and Prevention: An International Journal*, online listserv, and international conferences, members of the IAGS engage in continuous conversations aimed not only at supporting their interests as academics but also at influencing politicians and policy makers regarding governmental decisions intended to acknowledge and prevent genocide.

Genocide scholarship has had some impact on public education in the United States. Though only five states (California, Florida, Illinois, New Jersey, New York) have passed laws requiring teaching the Holocaust in public schools, 24 states make direct reference to curricular connections through their social studies standards. Inclusion of the Holocaust as a topic for student consideration is common in middle school (grades 6–8) curriculum and reappears in connection to United States history requirements in high school.

The recent building of museums and memorials, most all of which are, to one degree or another, integrally connected with the work of genocide scholars, provides space for public conversation regarding our definitions and understandings of genocide. Worldwide, notable museums include the Apartheid Museum in Johannesburg, South Africa; Auschwitz–Birkenau State Museum in Oswiecim, Poland; Genocide Memorial Center

in Kigali, Rwanda; Hiroshima Peace Memorial Museum in Murambi, Japan; the Holocaust Memorial Museum in Washington, D.C.; Terror Háza in Budapest, Hungary; and the Tuol Sleng Genocide Museum in Phnom Penh, Cambodia.

Gentiles

The term *Gentile* has been used as a label of religious demarcation since ancient times. It is etymologically derived from the Latin word *gentilis*, “of the nations,” and is used by Jews to refer to all non-Jewish nations, sometimes with a negative connotation of outsiders or foreigners.

Ancient Rome and Judaism

In ancient Rome, Jews were separated from Gentiles by a variety of beliefs and practices. The official state Greco-Roman religion was polytheistic—worshipping multiple gods—and involved a set of practices governing everything from political appointments to market days and public holidays. Domestic and public spheres were closely linked in religious practices that encouraged respect and veneration for ancestors, for the state, and for the gods. The Roman regional authorities regulated the various religious cults tied to each god in order to ensure the security of the larger nation-state. As they took over new lands and peoples, the Romans found ways for conquered groups to maintain their former religious practices while also worshipping the Roman gods. Most cults and their practices were welcome in the Roman Empire, as long as they did not subvert the traditional order.

In this time, the Roman state viewed Jews as “atheists” because they believed in a single God who was not derived from the Greco-Roman pantheon. As a result, Jewish religious practices were often suppressed as subversive to the state. Roman Jews were conspicuously absent from state festivals and would not attend any form of worship except their own, since they viewed polytheistic practices to be the worship of false gods prohibited by the Ten Commandments given in the Torah. Jews were also exempt from military service and from paying the expenses associated with the state religion, as they sent an annual

temple tax back to their homeland in Palestine. Practicing Jews observed strict rules surrounding food preparation and consumption, avoiding certain foods altogether and also observing specific dietary prohibitions at particular times of year, tied to religious ritual practices. All of these practices separated Jews into a distinct community and differentiated them from other peoples living in Rome. These practices were officially permitted by the state but in practice led to hostility and popular disapproval.

The concept of Jewishness as a unique national identity, not only an ethnicity or religion, also caused internal tensions among Jews. These tensions led to the formation of sects within Judaism. Some subgroups wished to assimilate more fully into Greco-Roman culture than Jewish tradition strictly allowed. Others sought to reestablish a Jewish nation-state tied to the temple in Palestine, and they focused on maintaining distinctions as a nation set apart through the purity of their religious practice. This tension is reflected in the New Testament gospel writings, which mention various Jewish factions and their relations to the state.

Jewish Subgroups and Greco-Roman Society

The Sadducees were the most integrated into Greco-Roman society and served as the temple priests. The Essenes, by contrast, lived remotely as desert monks, wishing to remain as physically separate as possible from the Gentiles. Meanwhile, the Pharisees chose a middle ground between integration and separation, focusing their work on Jewish laws and ritual practices, trying to practice their ancient faith within a changing cultural context. The sect most antagonistic to the Greco-Roman state, the Zealots, sought to remove the Roman ruler from power and replace him with a Jewish king. Each of these factions had complex political relations with other Roman peoples and with Roman authorities. Under such conditions, “Gentile” was a word that could be used to insult other sects of Jews as inauthentic, as well as holding its previous meaning of distinguishing Jews from non-Jews.

Ultimately, the Zealots failed in their war against Rome, resulting in the destruction of the Jewish temple in Jerusalem in 70 C.E. After that time, the surviving Jews were primarily Pharisees,

and the rise of Christianity created new context regarding the use of the term *Gentile*.

Gentiles and the Emergence of Christianity

During the first century C.E., Jewish Christians were largely indistinguishable from other Jews except for their acceptance of Jesus Christ as Messiah. As the Christian faith spread throughout the region, however, the boundary lines that had distinguished Jew from Gentile began to shift. Many Jews dismissed Jesus as a false prophet or saw him as a holy rabbi but not as the Messiah. They viewed the Jewish Christians with hatred and disgust and persecuted the sect for proclaiming the resurrection of the dead, stoning its leaders publicly with state approval.

Meanwhile, non-Jews had also witnessed Jesus's public ministry and were attending Christian gatherings and worshipping beside Jews without observing the same ritual practices. It was no longer clear who was a Jew and who was a Gentile. The question of whether Gentiles could become Christians without first becoming Jews was of deep importance within the early Christian church. A leader in the Jewish Christian community, Paul of Tarsus (5–67 C.E.) began his life as a Pharisee and had a dramatic conversion to Christianity. Paul held the position that Christians need not be circumcised nor observe Jewish dietary laws. Those who disagreed with him and thought that all Christians should also observe Jewish law were known as "Judaizers." Under these circumstances, the term *Gentile* sometimes took on a pejorative tone. The Council of Jerusalem resolved this internal conflict in 50 C.E., and the decision that Christians did not have to adhere to most Jewish laws became known as the Apostolic Decree.

The early Christian communities had many such questions about their religious community boundaries. Markers of group membership were critical, since Christianity was a banned faith in the Roman Empire from the time of Jesus's crucifixion until the Edict of Milan in 313. Membership, if discovered, was a criminal offense, in some cases punishable by death. Also, the people joining the Christian cult were adults, who brought to Christianity both Jewish and Greco-Roman faith experiences, so conflicts over proper practice in the early household churches arose regularly.

Early Christian Use of the Term *Gentile*

As Christianity grew more distinct from Judaism in successive centuries, many former Jewish practices were altered or eliminated, but the practices of fasting as penitence and of abstinence from specified foods at certain times of the liturgical year remained. Christians began to use the term *Gentiles* among themselves to refer to pagans or non-Christians, again in an attempt to distinguish religious insiders from outsiders.

The publication of the King James Bible, written primarily for European countries with Jewish minorities, was the next event to affect the common usage of "Gentile." When the King James version was translated, scholars translated the Old Testament from Greek, the New Testament from Hebrew, and the Apocrypha from both Greek and Latin. The Latin term *gentilis* conflated the meanings of its root words in Greek (*ethne*) and Hebrew (*goyim*), which carried the varied connotations of "nations," "peoples," or "heathens," depending on the surrounding context. Another term from the Greek, *Hellen*, meant "Greeks" or "Greek-speaking people," but was mistranslated several times as "Gentiles" in the Authorized Version of the King James Bible. These errors were corrected in the later Revised Version. The end result was that the term *Gentiles* as it appeared in the King James New Testament began to refer specifically to Christians who were not Jews rather than to all non-Jewish peoples, including those in non-Western cultures.

Contemporary Use of the Term *Gentile*

The 19th century and the rise of the secular state led to further evolution in the use of the term *Gentile*, as new Jewish sects defined Judaism in nonreligious terms. Zionists viewed Judaism not as a religion, but as a nationality, and they sought the permanent establishment of the state of Israel as their highest goal. Bundists viewed Judaism as a peoplehood and saw European socialism as the most promising solution to the ills of Jewish people in Europe. The question of whether a Jew is a member of a specific nation, ethnicity, or religion remains under ideological debate. Each sect includes and excludes others from authentic Judaism by its use of the term *Gentile*.

In contemporary times, the term has also been used by Mormons to refer to non-Mormons.

Mormons believe in a literal and spiritual regathering of the nation of Israel and that their baptism brings them into that gathering. Thus, Mormons have sometimes referred to Jews as “Gentiles.” In this sense, a “Gentile” is a person who is not a member of one’s own church. As ever, the word can carry pejorative connotations, depending on how it is used to define a particular nation or people as outsiders to a specific religious tradition.

Gentleman's Agreement

The film *Gentleman's Agreement*, based on Laura Hobson's novel, was released in 1947. It was written by Moss Hart, directed by Elia Kazan, and produced by Darryl F. Zanuck. The film starred Gregory Peck (as Philip Green), Dorothy McGuire (as Kathy Lacy, Philip's fiancée), John Garfield (as Dave Goldman, Philip's friend), Celeste Holm (as Anne Dettrey, Philip's coworker), June Havoc (as Elaine Wales, Philip's secretary), Anne Revere (as Philip's mother), and Dean Stockwell (as Tommy, Philip's son). *Gentleman's Agreement*

has been identified as a groundbreaking film that highlighted covert discrimination. More specifically, the film focused on anti-Semitism (prejudice/harassment of Jewish people) as enacted by middle- and upper-class individuals. *Gentlemen's Agreement* also emphasized that individuals who take no action when discrimination occurs perpetuate prejudice.

The Plot

Philip Green is a reporter who recently moved to New York. His editor wants him to write a powerful article about anti-Semitism. Philip, who is not Jewish, tells everyone that he is Jewish and reports the reactions that he receives. Some individuals (Kathy and Dave) are aware of his true identity, whereas others (Anne and Elaine) only know him as Jewish. Kathy is most ambivalent about his Jewish identity status. In contrast, Anne is most comfortable and a constant source of support for Philip (and Dave).

Philip experiences various forms of mistreatment. He is never physically assaulted, but rather endures social derogations. For example, he is told that he is not permitted to list a Jewish form of his name (Greenburg) on the mailbox. When Philip attempts to check into a hotel that is restricted (does not allow Jewish guests), the staff refuse to allow him to stay. Philip is also indirectly affected by prejudice. For example, children make derogatory statements to his son Tommy and refuse to play with him. Dave stays with Philip while looking for an apartment or house. Dave, who is Jewish, indicates that he will lose a New York job because no one will rent or sell property to him. During this time, the men discuss the conditions that Dave, as a Jewish person, has faced for a lifetime. They agree that the most painful episodes are not the derision that they experience, but rather the derision experienced by their children.

Kathy owns an unoccupied home near New York City. When Kathy learns of Dave's housing problems, she does not offer the home to him. Philip is aware of the unoccupied home and is upset by Kathy's inaction. Kathy explains that there is a “gentleman's agreement” to not rent to individuals who are different (including Jewish individuals). She also explains that it is kinder to not expose Dave to an unwelcoming community.

Philip and Dave help Kathy see the ways in which she contributes to prejudice. She chooses to give the house to Dave and to challenge discrimination when it occurs.

Social Relevance

Gentleman's Agreement was emblematic of a genre known as problem/message films. Such movies directly portrayed social problems, explained injustices that perpetuated these problems, and identified individuals (via characters) who either exacerbated or tried to resolve problems. *Gentleman's Agreement* was somewhat unique in that it focused on only psychological forms of discrimination (such as derisive comments, declined hotel reservations). As Kathy and Dave noted, prejudiced individuals do not always state that they are engaging in discriminatory actions. Rather, such individuals simply keep the doors of opportunities closed.

The film also highlighted that discrimination is not limited to lower-class individuals or simply because of ignorance. Rather, *Gentleman's Agreement* portrayed that prejudice is intentional and common among middle- and upper-class individuals as a means to keep the "wrong kind" of people from entering their world. Thus, the "agreement" to exclude Jewish people is treated as subtle and ubiquitous. Elaine Wales (who is Jewish) participates in the agreement when she hopes that the publishing company does not hire Jews who will ruin the workplace. Thus, she represents in-group prejudice (by Jews toward other Jews).

The film does not shy away from the direct use of derogatory terms. Such terms are used by an intoxicated man toward Dave, the children toward Tommy, and Philip with Elaine Wales. In the first two situations, the terms are used derisively. In the last situation, the terms are used educationally. More specifically, Philip tells Elaine that all terms are equally wrong.

Throughout the film, there are arguments that prejudice is not consistent with American values. Given that the film was released only a few years after World War II, this inconsistency might have been more powerful than during other eras (such as the 1930s and 1950s). The film's persuasive strength was also seen in research during the late 1940s. The studies indicated that individuals who saw *Gentleman's Agreement* reported lower

negativity toward Jewish and African American individuals. Thus, there was an argument that message films could help change social attitudes and messages could be generalized beyond single groups.

The film is also consistent with parasocial contact principles. These principles suggest that (in contrast to in-person contact) individuals can feel less threatened and more open to diversity via exposure to media personalities and/or fictional characters. If people are exposed to individuals, such as actors Gregory Peck and Celeste Holm, and/or fictional characters, such as Philip Green and Dave Goldman, then they are more amenable to social messages. A similar argument has been made about the more recent prevalence of gay/lesbian characters and increased tolerance of gay/lesbian rights (such as civil unions and adoption).

Conclusion

Gentleman's Agreement is an important film as a psychological drama about the deleterious effects of prejudice and discrimination. The movie is equally critical of active and passive discrimination. Although the film focused specifically on anti-Semitism, the message (that prejudice is wrong) is generalized from religion to race and ethnicity (such as African Americans). *Gentleman's Agreement's* message remains relevant and some public screenings were scheduled for the film's 65th anniversary in 2012.

Gentlemen's Agreement (1907)

The Gentlemen's Agreement (1907) was an informal agreement between the governments of Japan and the United States that allowed the two countries to maintain face and temporarily avoid larger problems. The United States agreed not to pass legislation banning the immigration of Japanese and not to discriminate against Japanese already living in the United States, and Japan agreed to refuse exit visas to laborers who wished to enter the United States. It was referred to as "Gentlemen's Agreement" because it was negotiated through notes exchanged between Elihu Root, the U.S. secretary of state, and Tadasu Hayashi, Japan's foreign minister, rather than in a formal diplomatic treaty. The agreement eased tensions between the two countries for the immediate future, but it failed as a long-term solution.

Segregation of Japanese and Chinese

The United States and Japan signed a treaty in 1894 that opened immigration to the Japanese and guaranteed protection of their persons and property. Immigrants from Japan attracted little attention as a group for the first decade following this treaty. Anti-Asian sentiments were directed primarily at the Chinese. But the Chinese Exclusion Act of 1882 and the extension of its restrictions by the Geary Act in 1892 halted the legal immigration of Chinese into the United States. Congress made the exclusion of Chinese permanent in 1902, but Japanese immigration was increasing. By 1906, as many as 1,000 Japanese a month were entering the United States, and hostility toward Asians was redirected toward the Japanese. The Asiatic Exclusion League, organized in San Francisco in 1905, targeted the Japanese, pushing for legislation that would extend the Chinese Exclusion Act to include the Japanese. The league also worked to boycott Japanese workers and Japanese-owned businesses. The California press fanned the fires of discrimination with its Yellow Peril campaign.

On October 11, 1906, the San Francisco Board of Education adopted a policy that sent Japanese children who had previously attended public

schools throughout the city to "Oriental schools," where Chinese students had historically been segregated. Japanese parents protested. So did the Japanese government, arguing that such action violated the Treaty of 1894. President Theodore Roosevelt, who had received the Nobel Peace Prize earlier that year for brokering the Treaty of Portsmouth that ended the Russo-Japanese War in 1905, was not pleased with the situation in San Francisco. It threatened his foreign policy objectives with Japan, a growing military power.

The U.S. ambassador to Japan hastened to reassure the Japanese government that the United States would not discriminate against Japanese within U.S. borders. Roosevelt himself met with the Japanese ambassador on October 29, 1906, and shared with him passages from the address the president was preparing for Congress. In early December, the president delivered the speech to Congress, denouncing the school segregation in San Francisco and advocating legislation that allowed Japanese immigrants to apply for citizenship. Roosevelt and Secretary Root determined that negotiations with the Japanese to restrict immigration would be necessary to appease Californians, but the federal government also began preparations for a legal challenge that the segregation order violated the Treaty of Commerce and Navigation of 1894.

Roosevelt met with California's congressional delegation, some of whom had introduced bills calling for an end to Japanese immigration a year earlier. He also met with state legislative leaders and with San Francisco's mayor and school board in efforts to prevent the passage of anti-Japanese legislation that was certain to exacerbate Japanese resentment. In exchange for the president's promise to see that limits were placed on Japanese immigration and to withdraw the federal lawsuit, the California leaders agreed to allow most Japanese children to return to public schools, to apply any further restrictions on school attendance to all aliens rather than singling out the Japanese, and to hold off on state legislative action until after negotiations with Japan on laborer immigration were complete.

On February 24, 1907, Root and Tadasu Hayashi concluded the Gentlemen's Agreement in which Japan agreed to deny passports to laborers who wished to immigrate to the United

States and to recognize the U.S. right to exclude Japanese immigrants who had entered the United States on passports from other countries. On March 13, the San Francisco school board formally withdrew the school segregation order. The California legislature ended its session without passing anti-Japanese legislation. A final Japanese note dated February 18, 1908, capped the agreement.

A crisis had been averted, and the background saber rattling between the two countries ceased. But the number of Japanese in the United States continued to increase. The Gentlemen's Agreement allowed parents, children, and wives of Japanese laborers already in the United States to immigrate. According to the U.S. Census Bureau, there were 72,257 Japanese in the United States in 1900, 42 percent of them in California. Two decades later, that number had increased to 138,834, with 70 percent of them in California. Anti-Japanese sentiment did not disappear, and it found further expression in the Immigration Act of 1924. The act excluded all immigrants from Asia from entry into the United States, ending Japanese immigration until the Immigration and Nationality Act of 1952 repealed laws that excluded Asians from immigrating.

German Americans

In the 2010 U.S. Census, about 47.9 million people, 15.48 percent of those surveyed, indicated they were of German ancestry. No other group could boast such a high percentage of ancestry, with the Irish coming merely second (11.21 percent) and the English third (8.38 percent). With their immigration beginning in the early 17th century, Germans have constituted one of the most significant and influential demographic elements in America. Census data between 1820 and 2010 report a total of about 7.3 million Germans to have entered the United States, about 9.54 percent of the overall immigration.

Waves of German Immigration

The Germans who streamed into the British colonies since the late 17th century came from various principalities, stretching from the estuary of the Rhine in Holland up to the Alps in Switzerland, from Alsace in the west far into central Europe. Because of the existence of the Holy Roman Empire of the German Nation, a pre- or supranational conglomerate of numerous territories rather than a national state, German immigrants often identified along regional (e.g., Bavarian, Prussian, Saxon) or religious (e.g., Catholic, Lutheran, Jewish) lines rather than as Germans. In addition, they spoke a large variety of, often mutually unintelligible, linguistic varieties.

The first German settlement in colonial America was established in 1683 by 13 Quaker and Mennonite families from Krefeld. Led by Francis Daniel Pastorius, they founded Germantown, Pennsylvania, forming the nucleus of a group that would soon be called the Pennsylvania Dutch. In 1709, 13,000 Germans mainly from the Palatinate region in southwestern Germany immigrated to America because of overpopulation, heavy taxation, wars, and a very harsh winter. Some of them settled in New York's Hudson River Valley, others moved up the Hudson and Mohawk, while another group settled in Pennsylvania. Letters home as well as the activities of the so-called Neuländers triggered a stream of German migration until the 1750s.

Pennsylvania became the center of German settlement in the colonial period, with 33 percent of its population being German. Maryland, New

York, Virginia, and New Jersey also displayed sizable German communities. The majority of these early settlers were peasants who came from the Palatinate, Hesse, Baden, and Württemberg, traveled with family or village members, and belonged to the Lutheran or Reformed churches—although Mennonites and pietistic communities dissenting from mainstream Protestantism also figured prominently in the early period of German immigration.

Those migrants who lacked the money to pay for the transatlantic voyage became indentured servants, thus working off the fare paid for them by their employers over a fixed time period. The colonial period of German immigration was concluded by the settlement of about 5,000 Hessian soldiers, who had fought as mercenaries for the British in the Revolutionary War in the newly formed United States.

The second migration wave was inaugurated by the economic disruption caused by the Napoleonic Wars and the crop failures of 1816–17, which stimulated the migration of about 20,000 southwestern Germans to the United States. In the decades to come, the number of Germans entering the United States picked up steadily, peaking in the 1880s with 1,445,181 German arrivals, constituting 27.7 percent of the total immigration to the United States.

This second phase of German emigration can be subdivided into three periods. During the pre-industrial phase lasting to about 1865, German emigration expanded from the southwest of Germany, first to Hesse-Darmstadt, Hesse-Cassel, Franconia, Westphalia, Hannover, and Oldenburg, and subsequently into Mecklenburg and Pomerania. While this first period was dominated by peasants, the second phase, beginning after the U.S. Civil War and lasting until 1895, largely brought agricultural laborers from northern and eastern Germany.

The third period consisted overwhelmingly of industrial workers looking for monetary profit and seeking to return after a few years. Numeric upsurges in this period took place in the 1920s—in the wake of the economic disruption caused by World War I—and in the 1930s and 1940s, when approximately 100,000 political and Jewish refugees came from Nazi Germany. While the 1920s émigrés were mostly educated professionals, the

latter group was highly heterogeneous in terms of occupation but contained an unprecedented number of academics and businessmen.

The last great wave of German immigration to the United States took place after World War II and was dominated by well-educated war victims. From the 1970s onward, statistics have registered a strong decline in German immigration, with Germans making up less than 2 percent of the total immigration to the United States.

As the above periodization indicates, the reasons for migrating to the United States were manifold and intersected in complex patterns that differed regionally and individually. Most Germans migrated in response to European wars, economic deprivation, crop failures, and overpopulation. Many suffered from the inheritance schemes common in Germany at the time. According to the practice of impartible inheritance (*anerbenrecht*), only the oldest son would inherit his father's entire possessions. While this kept family landholdings intact, it left the younger sons without any land and made relocation to the New World attractive. Partible inheritance (*realteilung*), practiced particularly in the southwest of Germany, could also prompt emigration, as the land was parceled up in equal shares to all children regardless of their sex, making farming increasingly unprofitable over the course of generations.

German immigrants also left Germany for religious reasons. Dissenting pietistic Germans founded communities, such as Amana, Iowa, to escape religious persecution and to practice their religion freely. The Old Lutherans migrating since the late 1830s acted in protest against the unification of Reformed and Lutheran churches imposed by Prussia. In the 1870s, a good number of German Catholics left their homeland to escape Otto von Bismarck's *Kulturkampf* against the Roman Catholic Church.

Comparatively few Germans came to America for purely political reasons. The small group of "forty-eighters," including famous German Americans such as Carl Schurz, deserves mention, however, because of its influence on the formation of German America. These political refugees were highly educated intellectuals who fled after the failed revolution in Germany in 1848 because of their disappointment and their fear of reprisal for their involvement. In addition, both in the

19th and 20th centuries, Jews fled Germany to escape economic and social discrimination, or, after 1933, annihilation.

Dispersal and Occupational Patterns

Prospective German settlers arrived by ship in port cities such as New York, Philadelphia, Baltimore, and New Orleans. From there they continued their voyage inland either along the Mississippi, the Erie Canal, and the Great Lakes via steamship, or, from the 1840s onward, by railroad. They established widely dispersed but often stable communities whose location greatly depended on economic opportunity. The stability of their settlements mostly derived from their tendency to settle in clusters and to migrate in chains, connecting newer with older German settlements and with villages back in the Old World.

German settlements occurred most frequently in the mid-Atlantic, east north-central, and west north-central states. New York City was, in the second half of the 19th century, the third-largest "German" city following Berlin and Vienna. The midwest, in particular Wisconsin and Minnesota, with their newly opened farmlands and frontier cities, had the greatest proportion of German settlers in their populations. New England and the south did not attract a large number of German settlers. Only New Orleans had a sizable German community, and Texas was popular among Germans because of various colonization schemes (such as the Mainzer Adelsverein), ample land opportunities, and an agreeable climate. California became an option for German settlers after the gold rushes of the late 1840s and 1850s.

In the mid-1870s, about a third of those Germans indicating a profession upon their arrival stated they were skilled craftsmen, and one-quarter were peasants and unskilled laborers, respectively. By the end of the 19th century, the number of peasants declined while that of unskilled laborers and servants rose. Because of their specific skills, the occupations German immigrants entered in the New World matched the professional baggage they had brought with them from the Old World. Thus, in 1870, about 37 percent of those Germans employed worked in skilled professions, 27 percent in agriculture, 13 percent in transportation and trade, and 23 percent in professional and personal service.

Germans became particularly known for retailing of all kinds, food-related enterprises, and skilled crafts. They also figured prominently among musicians, tavern keepers, and barbers. Women were also part of the workforce but to a lesser degree than American women or women from other immigrant groups because of a firm belief among German Americans in bourgeois family values and patriarchal authority.

While Germans generally were of middling circumstances and advanced moderately, a few German Americans became known for their rags-to-riches ascendancy. John Jacob Astor became rich because of his involvement in the fur trade and his investments in real estate. Frederick Weyerhaeuser, a penniless youth upon immigration, became the lumber king of America. German Americans also dominated the brewing industry. Brewers such as Joseph Schlitz, Philip Best, Frederick Pabst, and Frederick Miller from Milwaukee and Theodore Hamm from St. Paul have been well known among beer drinkers.

Associational and Religious Life

The religious, regional, social, linguistic, and political heterogeneity of German settlers seeded a multifaceted community life, which often took place in virtually self-contained German neighborhoods. In these neighborhoods, German schools, churches, voluntary associations, labor unions, theaters, and musical societies, as well as a number of religious and secular festivities constituted the basis of an ethnically rich daily life, well documented, coordinated, and promoted by the German-language press, the largest and most-edited foreign-language press in the United States. The *New Yorker Staats-Zeitung*, one of the oldest and most widely circulated German-language papers in the United States, and George Brumder, who established a press empire in the second half of the 19th century, greatly contributed to the good reputation and success of this German-language press.

The churches were another pillar in the German communities. About a third of all Germans belonged to the Roman Catholic Church, while the remainder were mostly Lutheran, Reformed, or Evangelical, in addition to small numbers of Mennonites, Pietists, Methodists, and Jews. German Protestants and Catholics agreed on the necessity of preserving their language in the New

An illustration in the November 7, 1874, issue of Harper's Weekly, titled "From the Old to the New World," portrayed German emigrants boarding a steamer in Hamburg, Germany, to come to America. Between 1820 and World War I, nearly 6 million Germans immigrated to the United States.

World, the dictum being "language saves faith." While German Protestants organized a number of ethnically homogeneous synods (such as the Ohio and Missouri Synods) and conferences (such as the General Conference of German Baptists, German Methodist conference), German Catholics had to fight for their rights in a church dominated by the Irish. Consequently, debates ensued about the control of bishoprics, the use of the German language in church services, and the status of parochial schools, as well as the German Catholic Church's official policy toward alcohol consumption and the temperance movement.

Interdenominational conflicts did not, however, come even close to the gulf existing between church and club Germans, the latter being anticlerical, middle-class urbanites. One of the most

notable freethinking societies was the Turners, the followers of Friedrich Ludwig Jahn, who advocated a combination of physical exercise and liberal nationalism.

Ethnic Fragmentation

Heterogeneity among German Americans was both an asset and a liability. While it fostered the emergence of a vibrant and multifaceted German America, it simultaneously led to ethnic fragmentation and disunity and undermined durable panethnic formation. Such fragmentation was also a major reason for the German immigrants' inability to form a durable voting bloc and to exert a united powerful political influence. While the majority of Germans had long been committed to the Democratic Party, by the late 1850s the new antislavery Republican Party proved increasingly attractive to urban, freethinking Germans. Frictions among the various German groups also led to their unwillingness to support each other politically. Therefore, only comparatively few Germans were politically successful. Furthermore, politics was not seen as the noblest vocation by many Germans, a view that also contributed to their relative lack of political activism.

Panethnic Formation

Panethnic formation only took place when the German language, lifestyle, and culture were at stake. Points of contention included school language legislation, women's suffrage, and, most prominently, temperance. The temperance movement, promoting the moderation or complete abstinence in the use of alcohol, helped Germans to invent their ethnic identity and to heighten their ethnic consciousness. For them, the ethnocultural challenge of this movement threatened their cultural and associational life, in which sociable liquor consumption played a significant role. Considering the occupational patterns outlined above, it also endangered German livelihoods. Antitemperance activism drew Germans of most faiths, classes, geographical origins, and political affiliations together and helped them to realize their commonality in ethnic terms. The fight against temperance, however, proved eventually unable to eradicate the many internal divisions within the German community and to weather historical developments.

Ethnic Decline

The entry of the United States into World War I and the concomitant anti-German worries made the public expression of German ethnicity virtually impossible. By the fall of 1915, worries about the allegedly divided loyalties of German Americans had escalated into a nationwide “anti-hyphenate” campaign, which led to a restriction or elimination of German-language instruction; the censorship of the German press; the renaming of foods, streets, and towns; the burning of German-language books; and the erasure of cultural items signifying German heritage. Even physical violence, such as beatings, arrests, and a lynching, occurred occasionally. The war concerns also led to Congress’ revoking the charter of the German Americans’ largest and most influential organization, the Deutsch-Amerikanischer Nationalbund von Amerika (National German American Alliance of America), founded in Philadelphia in 1900 and having more than two million members in 1914.

In response to such harassment, discrimination, threats, and violence, many German Americans ceased their protests against war measures and relegated their ethnic heritage to the safe realm of the home or entirely renounced it. The Prohibition era (1919–33) made it difficult for German Americans to resurrect their ethnic identity invented in the 19th century. The relegation of alcohol, an essential ethnic marker, from the public sphere deprived many German American celebrations, meetings, and picnics of their traditional sociability and their cultural meaning.

World War I and the Prohibition era thus greatly hastened, if they were not largely responsible for, the transformation of German American ethnicity. A significant trailing off of immigration from Germany, the rise of the second and third generations of German Americans, and the lure of mass commercial and consumer culture also contributed to this transformation. The new, “subdued” German American ethnic identity that emerged in the course of the 1920s was based on modified cultural patterns and therefore was far more distant from its German origins.

Frederick C. Luebke even speaks of a “sort of cultural amnesia” befalling the generations of Germans growing up between the world wars. Speaking of amnesia might take it too far, but in

the 1920s and 1930s, German American ethnicity took on some of the facets that Herbert Gans ascribed to “symbolic ethnicity.”

Contemporary Scene

Over the following decades, German Americans continued to assimilate, their ethnic identity becoming ever more symbolic. World War II did neither provoke German American loyalty to the German cause nor cause another repression of German ethnicity. It instead overwhelmingly evoked shame of Hitlerism and anti-Semitism and led to a further disintegration of ethnic group consciousness. Even the arrival of political refugees did not inaugurate a long-term restrengthening of German associational life.

Since the 1950s, German America has been represented by numerous organizations seeking to promote the German language and German heritage. Most of these are located in cities with a high percentage of German ancestry. The Deutsch Amerikanischer National Kongress of Chicago (DANK; German American National Congress), for instance, founded in 1959, has a membership of about 800 and offers a wide variety of cultural and educational programs. Deploping the absence of representation of German America on the national level, individuals and delegates from various organizations founded the United German American Committee of the USA (UGAC) in Philadelphia in 1977; in 2006, the association was renamed the German American Heritage Foundation of the USA. This organization, with a membership of almost 18,000, opened an office in Washington, D.C., in 2004 and the German American Heritage Museum of the USA in 2010.
