About the General Editor

Carlos E. Cortés, Ph.D., is professor of history emeritus at the University of California, Riverside. Cortés serves on the faculties of the Harvard Institutes for Higher Education, the Summer Institute for Intercultural Communication, and the Federal Executive Institute. He has lectured widely throughout the United States, Latin America, Europe, Asia, and Australia on such topics as race and ethnicity; multiculturalism; intercultural communication; diversity in the media; multicultural, global, and bilingual education; Hispanic culture; Latin American and Chicano history; and the implications of diversity for education, government, and private business. A consultant to many government agencies, school systems, universities,

mass media, private businesses, and other organizations, he has written film and television documentaries, has appeared as guest host on the PBS national television series, *Why in the World?*, is the featured presenter on the *Video Journal of Education*'s 1994 training video, *Diversity in the Classroom*, and currently serves as Creative/Cultural Advisor for Nickelodeon's preschool series, *Dora the Explorer* and *Go, Diego, Go!* and as Scholar-in-Residence with Univision Communications. His most recent book is his memoir, *Rose Hill: An Intermarriage Before Its Time* (Berkeley, CA: Heyday, 2012). He also performs his one-person autobiographical play, *A Conversation With Alana: One Boy's Multicultural Rite of Passage*.

Introduction

America's multiethnic future has arrived. The 2010 census provided compelling evidence, documenting the dramatic racial and ethnic changes in the United States from 2000 to 2010.

During that decade, the African American population expanded by more than 12 percent, Asian Americans grew by more than 43 percent, and Hispanics experienced a 43 percent increase. Hispanics alone provided more than half of the country's growth during those 10 years. In contrast, the number of non-Hispanic whites grew by less than 2 percent, declining to less than two-thirds of our population. Clearly, the composition of our nation's multiethnic mosaic is undergoing a profound transformation.

Moreover, most projections suggest even greater demographic changes in the decades to come. Somewhere around the middle of the 21st century, non-Hispanic whites will cease to be a majority of the American population. When that moment arrives, the United States will have been transformed into a demographically pluralistic nation. That is, it will become a nation in which no single racial or ethnic group holds a population majority. In numerical terms, then, all Americans will be part of the minority.

These demographic realities raise a number of fundamental questions. As the United States becomes more multiethnic, in what ways will it also become more multicultural? In what respects

might ethnicity continue to be a significant part of the American story, with ethnic diversity and the flourishing of ethnic cultures deeply influencing the very essence of what it means to be "American?" Or in what respects might ethnicity decline as a major factor in American life, with ethnic cultures becoming mere historical curiosities?

This encyclopedia cannot offer definitive answers to these fundamental questions. However, we hope that it illuminates the possibilities of the future by examining the role of ethnicity in our nation's past and present.

In Search of Metaphors

During the last half century, in particular, many writers have tried to create a coherent narrative that tightly integrates ethnicity into the American story. Some of these efforts have involved capsulizing this process into a metaphor.

For decades one popular metaphor, the "melting pot," reigned supreme. According to this metaphor, people from diverse backgrounds came to America and melted into the proverbial pot. But there were variants of the melting pot story.

One of those variants held that these cultures essentially disappeared as they entered the pot, leaving behind few traces. In that version of the American story, the use of ethnic languages dwindled. Some ethnic surnames remained, although often shortened or Americanized. A few folkways

survived along with ethnic foods, traces of ethnic music, and smatterings of ethnic expressions. The search for ethnic heritage became a journey into the often-romanticized discovery of days of yore or the construction of family trees. According to this story line, ethnic culture largely became ethnic nostalgia as the melting process proceeded inexorably and virtually eliminated cultural distinctiveness.

Another variant of the melting pot story held that, while these cultures were disappearing, they added significant tastes and flavors to the pot's contents. Ethnic surnames populated telephone books. Ethnic restaurants flourished, primarily in traditional ethnic neighborhoods, while ethnic foods became omnipresent in supermarkets. Ethnic festivals spiced up community calendars. Ethnic words and expressions gained entry into the American English lexicon.

But whatever the variants of the melting pot story, they converged on one central theme. By and large, the story of American ethnicity was essentially the story of acculturation. Primarily a historical curiosity to be recognized and maybe nostalgically celebrated, ethnicity was to become a casualty in the unrelenting process of melting.

However, even as the melting pot was being extolled, at least by many Americans, the metaphor's flaws were being glossed over. In fact, in order for there to be a celebration of the melting pot, those flaws *had* to be glossed over because they revealed the limits and distortions inherent in that metaphor. In opposition, two alternative story lines emerged, narratives that proved to be highly inconvenient for melting pot enthusiasts.

The first alternative story line emphasized the fact that, while the melting pot was being celebrated, some ethnic groups were legally and structurally being denied entrance into the pot. This was particularly true for groups like African Americans, Native Americans, Asian Americans, and Latinos—groups whose predominant skin colors or other physical features set them apart from the white American norm. For the most part, ethnic groups perceived as racially different could not melt even if they wanted to.

Exclusionary practices were of many types. Laws and court decisions created and maintained segregation. People of some ethnic ancestries were barred from attaining American citizenship.

Three-fourths of the states had laws prohibiting specified types of interracial marriage. Some organizations and institutions closed their doors to those of certain ethnic heritages or religious affiliations. In other words, for some ethnic groups and for tens of millions of Americans, melting was never an option.

There was also a second story line that contrasted with the dominant melting pot narrative. Some groups refused to melt. Even as ethnic individuals acculturated to mainstream American life, the groups themselves maintained strong ethnic bonds and identities. Ethnic communities remained vibrant. Ethnic organizations became a source of group cohesion and pride. Even across generations, some ethnic languages not only failed to disappear but rather became the basis of rich new strands of American literature, music, and other creative forms.

As the 20th century progressed, the shortcomings of the melting pot metaphor became increasingly apparent. In the process, there arose the concept of multiculturalism. It ultimately became a principal competing framework for examining and telling the American story.

The 1960s brought the apex of the civil rights movement, with people of color demanding to be admitted to the full and equal rights of American citizenship. Simultaneously, that era brought a flourishing of ethnic pride movements. These developments vividly revealed that ethnic groups, particularly those that had been marginalized in American life, had developed resilient cultures and resolute historical memories, which they were not about to surrender.

At first scholarly and public attention was focused on the cultures and experiences of what were known as minorities and, later, people of color, such as Native Americans, African Americans, Latinos, Asian Americans, and Pacific Islanders. Soon European ethnic groups, mainly from eastern and southern Europe, joined the multiethnic chorus, proclaiming cultural survival, sometimes resistance, even in the context of relentless acculturation pressures.

Simultaneously, the melting pot was being challenged as a misleading symbol. Myriad terms began vying for metaphorical supremacy, terms such as *salad bowl*, *stew*, *mosaic*, *crazy quilt*, and *kaleidoscope*. Books on U.S. history

became increasingly attentive to the experiences of ethnic groups, not just ethnic individuals, as being vital to our nation's core narrative and self-understanding.

Multiculturation

As the 20th century entered its final quarter, two things became increasingly clear. First, in some respects the acculturation process, as capsulized by the melting pot metaphor, was still occurring. At the same time, however, both the melting pot metaphor and the traditional acculturation framework were proving to be woefully inadequate for capturing the totality of the ethnic experience in the United States.

Because of these two realities, I began using a different term to capture the dynamics of ethnic diversity within the American trajectory. That term was *multiculturation*, a conflating of the words *multiple* and *acculturation*. Far more than acculturation, the idea of *multiculturation* suggests the complexity of a multiculturally changing America, including the ways that America and Americans of all backgrounds have adapted, for better and for worse, to the growing presence of ethnic diversity. *Multiculturation* includes five major constellations of stories: individual, group, intragroup, intergroup, and societal.

Individual acculturation. There are hundreds of millions of individual acculturation stories. While each individual acculturation story is unique in some respects, these stories merge to create two basic narrative prototypes.

First, some people have allowed their ethnic cultures to lapse as they immersed themselves into the American mainstream. Moreover, children were raised with little attention to their ethnic roots and little emphasis on maintaining their heritage languages.

In contrast, other Americans have remained dedicated to their ethnic cultures and languages. They have done so even while acculturating to America, participating in mainstream American life, and demonstrating their national loyalty through such acts as spilling their blood on foreign battlefields.

Group acculturation. But acculturation is more than the collection of individual stories. It is also

the story of the ways that ethnic groups as a whole have adapted to America.

Each ethnic group has its own unique story. Some American ethnic groups have virtually disappeared, leaving only traces of their heritage, such as surnames, food practices, and limited fluency in ancestral languages. In contrast, other groups have vigorously maintained their ethnic cultures, including their languages, even as they adapted to, participated in, and contributed to American society.

Intragroup acculturation. No American ethnic group is a citadel of internal homogeneity. No matter how clear and stereotypically simple an ethnic group may seem when viewed from the outside, each ethnic group has its own internal complexity. Within each group lie important intragroup distinctions, often based on such factors as religion, language, class, caste, racial categorization, geographical origin, historical roots, mutual perceptions, and sometimes long-standing old-country animosities.

Such intragroup dynamics continue to play out in American society. Intragroup bridges have been built, while intragroup conflicts, sometimes imported conflicts, have erupted. Intragroup intermarriages have occurred, sometimes marriages unimaginable in their heritage countries. Intragroup acculturation has produced new cultural blendings, sometimes leading to the emergence of fostered-in-America ethnic cultures.

Intergroup acculturation. In a multiethnic United States, ethnic groups have had to acculturate not only to America at large but also to other ethnic groups. Sometimes this interaction has occurred as a result of ethnic groups living in adjoining, often competing, neighborhoods. At other times residentially integrated multiethnic communities have emerged.

Each new ethnic or multiethnic configuration has brought new intergroup dynamics as these groups mutually acculturate to each other. This process has not always been benign. Such factors as language barriers, cultural misunderstanding, racial animosities, economic competition, and dedication to defending turf have given rise to conflict. At other times, however, intergroup acculturation has led to mutual appreciation, cooperation, alliances, community building, and

intermarriage, resulting in ethnically mixed offspring who have carried the intergroup acculturation process down through the generations.

Societal acculturation. Then there is the acculturation of America itself. Ethnic diversity has brought profound changes to America writ large. Put another way, the United States has acculturated to ethnic diversity, for better and for worse.

Societal acculturation can be seen in laws and court decisions, which have ranged from opening doors of inclusion for the marginalized to reinforcing barriers of exclusion. It can be seen in advertisements, store signs, religious institutions, and government documents using various languages. It can be seen in companies that hire people with multiple language skills and cultural knowledge because of the special contributions they can make to the proverbial bottom line. It can be seen in changes in the nation's diet, as ethnic foods become mainstream and ethnic restaurants take root even in communities not usually thought of as multicultural. It can be seen in changes in American English, as ethnic words and expressions penetrate the language and become part of everyday conversation.

Yet, while the multiculturalization process has been inexorable, it should not be idealized. As with traditional acculturation, there has been an underside to multiculturalization. Mutual adaptation has sometimes involved segregation, the denial of rights, and the restriction of opportunities. Interethnic conflict and intraethnic tensions have erupted. Prejudice, discrimination, inequality, and power differentials have not disappeared.

The multiculturalization story, then, is a complex and dynamic one. It is a goal of this encyclopedia to shed light on this dynamic complexity.

Understanding America

This brings us back to questions that undergird this encyclopedia. As our multiethnic composition changes, how does this affect the nature of American multiculturalism? More broadly, how might these developments influence the nature of the United States itself?

This encyclopedia offers a variety of perspectives on these issues. It does so not by presenting a new, integrated American narrative but rather by providing myriad windows on American ethnicity—more than 900 articles totaling more than

1.3 million words. Moreover, in the online edition there are more than 350 photos and 100 video clips that illustrate and illuminate American multiculturalism.

This encyclopedia reveals that, throughout history, Americans of all ethnic backgrounds have become part of the American polity, participated in American society, and adopted the core elements of American culture. At the same time, tens of millions have blended the process of Americanization with the maintenance, in some cases the reinforcement, of their ethnic cultures. Moreover, the United States itself has changed in response to this multiethnic presence. One result, particularly in the last half century, has been the emergence of a robust, vital, sometimes controversial, still evolving American-style multiculturalism.

This encyclopedia is dedicated to providing greater clarity about the history, nature, and myriad dimensions of American multiculturalism. These articles contribute to a deeper understanding of the United States by addressing the following:

- Historical and contemporary dimensions of the constantly evolving American multicultural reality
- The myriad groups that comprise the American multiethnic mosaic
- The intersection of ethnicity and race with gender, sex, age, religion, class, sexual orientation, disability, and other facets of our society
- The complex interactions between ethnic groups and American institutions
- The dynamics of intergroup and intragroup relations
- The language, terms, and labels that are used in talking about diversity
- The varied, sometimes conflicting, perspectives and lenses used by analysts when addressing American multiethnicity

Choices

In the process of conceptualizing this encyclopedia and bringing it to fruition, many difficult decisions had to be made. Some arose from the enormous challenge of how to set limits on the encyclopedia's virtually limitless topic. The encyclopedia does not try to cover the entire diversity waterfront. Rather, it focuses on ethnicity and ethnic

groups, including those religious groups—such as Jews, Muslims, and Amish—whose American trajectories incorporate an experience that has been both ethnic and religious.

Even the title of the encyclopedia required making choices. As we use the word in this encyclopedia, “multicultural” refers to ethnicity and ethnic cultures, including those groups classified by the U.S. census as “racial.” We recognize that multicultural is often used more broadly to include other dimensions of American life, such as the cultures of women and men, religion-centered cultures, gay culture, various disability-related cultures, generational cultures, class-related cultures, and regional cultures. The list goes on and on. Rather than attempt to cover them all, we instead focus on ethnicity.

The encyclopedia does not ignore those other important sociocultural categories. Rather, we address them in terms of their intersections with ethnicity, not as isolated, self-contained topics. In this way we hope that the encyclopedia fosters a better understanding of intersectional complexities, not the simplicity—often the stereotypical simplicity—of merely gazing down cultural silos.

Themes

Even after deciding to focus on ethnicity rather than diversity writ large, we still faced the challenge of selecting more than 900 articles from the virtually endless list of possibilities arising from the richness of American multiethnicity. This meant choosing what to include and, conversely, what to exclude. We began by establishing a set of analytical categories.

Obviously, we would have articles on individual ethnic groups, about 200 of them. Even then we faced the challenge of titling these categories. In some cases, group names were obvious. In other cases, that was not so, especially when it came to groups with multiple labels, particularly when label preferences have changed over time or when group members themselves disagree about the preferred term. Should we say Latinos or Hispanics? How about Native Americans or American Indians? Ultimately, we had to make choices, which will inevitably displease those adamant about the “correctness” or superiority of their preferred terms.

Moreover, we wanted the encyclopedia to be much more than a catalog of individual ethnic

groups. We wanted it to be a book about multicultural America, including its historical development, contemporary nature, and future directions. To do so, we selected a number of major themes that then served as the basis for choosing our articles:

- Historical events and forces that have influenced the trajectory of American multiculturalism
- Governmental treatment of ethnicity, including major laws, treaties, and court decisions that have shaped American multiculturalism and intergroup relations
- Wars and other conflicts that have altered boundaries, disrupted cultures, and resulted in treaties that have modified or reinforced the nature of our nation’s multiethnic mosaic
- The tortuous story of immigration, including changing policies and practices concerning citizenship and naturalization
- The sometimes embattled relationship between education, particularly public education, and the various groups that make up multicultural America
- Selected elements of ethnic cultures—including languages, religions, organizations, and institutions—that have been particularly reflective of American multiculturalism and that, in some cases, have influenced mainstream American culture
- Intragroup diversity and intergroup relations, including intermarriage and the resulting challenges of multiethnic identity
- Intersections of ethnicity with selected social categories, such as age, generation, sex, gender, religion, class, sexual orientation, disability, and other aspects of American life
- Analytical frameworks and concepts developed by scholars in an effort to provide greater understanding of American multiculturalism
- Artifacts of popular culture—for example, books, motion pictures, theatrical works, and television shows—that have influenced public perceptions of ethnic groups, sometimes illuminating ethnic experiences, other times contributing to deleterious negative group stereotyping

Structure

To help readers gain a better grasp of the changing nature of American multiculturalism, the encyclopedia is structured in a somewhat nontraditional manner. It begins with a series of articles examining the 2010 census and the historical development of racial and ethnic census categorizations. This section provides a statistics-based overview of contemporary multiethnic America, suggests frameworks for interpreting the current and past censuses, and examines some of the decisions and controversies associated with designing and implementing the census.

Then the greater part of the encyclopedia delves into the intricacies of multicultural America. This includes articles both on individual ethnic groups and on broader themes that illuminate the complex story of American multiculturalism. In the online edition, these articles are further enriched by 100 video clips and color photos.

A decision was also made not to include articles on ethnic individuals—articles on ethnic groups alone number more than 200. Given the encyclopedia's limit on the number of entries, it would have been impossible to winnow down the list of the tens of thousands of ethnic individuals who would have deserved an article. Moreover, entries on specific people would have virtually eliminated almost all other articles, leaving this mainly an encyclopedia of ethnic groups and individuals, not an encyclopedia of multicultural America writ large.

We decided that the best way to deal with important ethnic individuals was to include them within the context of other articles. Therefore, the encyclopedia provides a list of people mentioned in those articles, with references to those entries in which the individuals appear.

Finally, the encyclopedia contains other important features. These include a Reader's Guide, a multicultural Chronology, a Glossary, a Resource Guide, and an Appendix of 2010 U.S. census statistics. In short, our encyclopedia provides an ideal avenue for entering the world of American multiculturalism and gaining a greater understanding of its past, present, and possible future.

The American Future

In some respects, *Multicultural America: A Multimedia Encyclopedia* is a snapshot of a moment in time. But in other respects it is also a motion

picture of a nation in process. On the one hand, it is a snapshot of the early-21st-century multicultural United States. That snapshot reveals our nation at the end of a chaotic decade that included the tragedy of 9/11, the growing visibility of the multilingual media, a superheated debate on immigration, and the election of our first president of African American ancestry. It is a snapshot made particularly vivid by the release of the 2010 census, with its revelations about the country's changing ethnic composition.

At the same time, the encyclopedia captures the United States in process. It explores our nation's multiethnic historical roots and their connection to the American present. Moreover, it reconsiders critical questions raised by the past and present about the American future:

- What continuities and changes can we expect in U.S.-style multiculturalism?
- In what respects will ethnic cultures continue to coexist with the common culture?
- In what ways will ethnic groups continue to enrich the nature of the United States while at the same time being modified by the power of the common culture?
- How can America adapt more constructively to the growing presence of multiethnicity?
- How can the nation more effectively address the remaining obstacles to full inclusion and the root causes of group-connected inequality?
- In what ways can healthy interethnic and intraethnic relationships be fostered, including new types of interethnic fusions?
- How can we forge a more powerful civic *Unum* while drawing on the richness of ethnic *Pluribus*?

These are some of the questions that confront America as we advance into the 21st century. We hope this encyclopedia will provide greater clarity in addressing these questions and will contribute to a better understanding of the unique, continuously evolving American multicultural experiment.

Chronology

ca. 15,000–20,000 years ago: People from Siberia begin crossing into the Americas on a land bridge in the Bering Strait; the reasons for this migration, which ended about 10,000 years ago when the land bridge was submerged under the ocean, remain unknown.

ca. 15,000 years ago: Native Americans were apparently living in the area of the La Brea tar pits in California, based on evidence of cuts found on animal bones preserved in the asphalt.

ca. 10,000 years ago: Clovis spear points, identified by their distinctive shape, are used in widely dispersed parts of the United States, including Maryland, Colorado, and Arizona; as this technology is believed to have been transmitted from person to person, some scholars take it as evidence that knappers (stone point makers) worked in common sites and learned techniques from each other.

ca. 4000 B.C.E.: Native Americans establish a distinctive culture in the Great Lakes region of North America.

ca. 600–700 C.E.: A large urban area is formed by people of the Woodland Culture near present-day Cahokia, Illinois; these settlements are characterized by complex organization and ambitious mound construction, and at its peak (around

1050–1250 C.E.) the population is estimated to have been around 10,000 to 30,000.

1492: Christopher Columbus embarks on his first journey to the New World; accompanying him is Luis de Torres, a Jewish interpreter.

1494: Christopher Columbus establishes the first European permanent settlement in the Western Hemisphere on the island of Hispaniola.

ca. 1500: An estimated 10 million Native American people are living in what will become the United States.

1508: Juan Ponce de León arrives in Puerto Rico; the following year, he is appointed governor of the island.

1511: Diego Velázquez de Cuellar is appointed governor of Cuba, and the *encomienda* system, giving the Spanish settlers land and Indian slaves, is established on the island.

1513: Juan Ponce de León arrives in Florida and explores the region.

1520s: Spanish explorers sail along the Gulf of Mexico and the southern Atlantic coast of what is now the United States.

1539: Hernando de Soto sails from Cuba to Florida and explores the southeast.

ca. 1550: An estimated 300,000 Native American people from over 100 tribes are living in California.

1565: Spanish explorers found St. Augustine, Florida, the earliest European settlement in North America.

1573: Members of the Franciscan order establish missions in Florida.

1585: Joachim Gans, a Jewish surveyor, accompanies Sir Walter Raleigh on an expedition to survey the Carolina coast.

1598: Livestock breeding is introduced in north New Spain (later the U.S. southwest) by Juan de Oñate, who establishes the city of Santa Fe, New Mexico.

1607: A group of merchants receive a charter from James I of England to found a settlement; they found Jamestown, Virginia.

1609: The first immigrants from the Netherlands arrive in the United States.

1619: Twenty African indentured servants arrive at Jamestown.

1620: The *Mayflower* arrives at America and the first European colony in New England is founded.

1624: Dutch immigrants found New Netherland, the first Dutch permanent settlement in the New World.

1624: Peter Minuit purchases the island of Manhattan from its Native American inhabitants.

1654: Jewish refugees from Brazil arrive in New Amsterdam; the Dutch West India Company allows them to stay.

1690: San Francisco de los Tejas, the first permanent Spanish settlement in Texas, is established.

1697: In South Carolina, four Jews become citizens.

1700: Spain begins settling Arizona.

1705: Virginia defines a “mulatto” as a person who is the child, grandchild, or great-grandchild of a black person.

1716: Spain begins settling Texas.

1738: Fort Mose, the first free black community in the United States, is established in Florida.

1752: An immigrant ship from the Netherlands arrives in Pennsylvania with only 21 of its original 340 passengers still alive; the remainder were dead from starvation.

1758: Founding of the first known African American church, the Bluestone Church, on a plantation in Virginia.

1767: Spain builds its first mission in California.

1770: The escaped slave Crispus Attucks is killed by the British during the Boston Massacre.

1775: Free black soldiers are allowed to enlist in the Continental army.

1787: The U.S. Constitution states that black slaves will be counted as three-fifths of a person for taxation and representation purposes.

1787: The African Free School is founded in New York City.

1790: U.S. Congress passes its first law regulating land sales with Native Americans.

1790: The first U.S. census is conducted, as required by the Constitution; persons are classified as white, other free person, or enslaved.

1790: The 1790 Naturalization Act establishes uniform criteria for becoming a naturalized American citizen: the individual must be a free white person, have lived in the United States for two years, apply for court approval, and take an

oath of allegiance if accepted; any of the person's children under age 21 are allowed to become citizens automatically.

1791: Thousands of exiles from France and Haiti arrive in the United States, fleeing the French Revolution and the Haitian slave uprising.

1793: The Fugitive Slave Act allows slave owners to reclaim their slaves, even if they are in non-slave states.

1793: Invention of the cotton gin makes cotton production on a large scale possible, thus greatly increasing the need for slave labor in fields in the south.

1794: The first AME (African Methodist Episcopal) church is founded in Philadelphia by Richard Allen.

1795: The United States and Spain sign the Treaty of San Lorenzo, allowing the United States to navigate the Mississippi River.

1798: The Alien Act gives the president the power to expel aliens considered to be dangerous.

1798: The Naturalization Act requires a person to live in the United States for 14 years before becoming a citizen; the previous requirement was five years.

1800: Free blacks are barred from entering South Carolina.

1803: The Louisiana Purchase brings large areas of formerly Spanish territory under U.S. control.

1804: William Wright begins transporting escaped slaves through Lancaster County, Pennsylvania, the first known activity on the Underground Railroad that helped slaves escape to freedom.

1806: In Virginia, freed slaves are required to leave the state within a year of gaining their freedom.

1808: The importation of slaves is outlawed by U.S. Congress.

1818: The Delaware Treaty is adopted; it stipulates that the Delaware Indians will give up their lands in Indiana and receive other lands west of the Mississippi River.

1819: The 1819 Steerage Act establishes standards to be met by ships bringing passengers to the United States.

1820: The decennial U.S. census begins collecting data on non-naturalized foreigners.

1820: The Missouri Compromise regulates slavery in the western regions of the Louisiana Territory: slavery is permitted south of the 36°30' parallel and in Missouri, and prohibited north of the 36°30' parallel.

1821: Sequoyah creates a writing system for the Cherokee language: the Cherokee syllabary.

1821: The United States purchases Florida from Spain.

1821–30: Over 143,000 immigrants arrive in America, including over 50,000 from Ireland and over 25,000 from England, Scotland, and Wales.

1822: David Moncock, a Native American, graduates from West Point.

1824: Liberia is established in Africa by freed U.S. slaves.

1824: Dartmouth College, a private school in New Hampshire, begins admitting black students.

1827: The *Freedman's Journal* is founded, the first African American newspaper, in New York City.

1829: The Mexican government abolishes slavery.

1830: A Mexican army led by Antonio López de Santa Anna defeats an army of Anglo Texans at the Alamo; however, six weeks later Anglo Texas troops are triumphant and declare an independent Republic of Texas. Many Mexican residents choose to leave for Mexico.

1830: U.S. Congress passes the Indian Removal Act, allowing all Native Americans to be forcibly removed from the United States east of the Mississippi River.

1831: The *Liberator*, an abolitionist newspaper founded by William Lloyd Garrison, begins publication in Boston.

1831–40: Over 599,000 immigrants arrive in America, the greatest numbers from Ireland (207,654), Germany (152,454), and England, Scotland, and Wales (75,810).

1832: The U.S. Supreme Court rules, in *Worcester v. Georgia*, that the federal government may regulate Indian affairs.

1835: The U.S. Postal Service is forbidden by President Andrew Jackson from delivering abolitionist literature in southern states.

1839: Ohio passes a law authorizing German-English instruction for children, making it the first state with a bilingual education law.

1839: Slaves being brought to America on the Spanish vessel *La Amistad* take over the ship and eventually win their freedom in a trial concluded in 1840.

1841–50: Over 1.7 million immigrants arrive in America, including 780,719 from Ireland and 434,626 from Germany.

1843: B'nai B'rith, a Jewish service organization, is founded in New York City.

1845: Michigan creates the position of immigration agent, an individual sent to recruit new arrivals from New York; it is the first state to do so, but many follow suit, particularly after the Civil War.

1845: Texas becomes a state.

1847: New York State establishes a State Board of Commissioners of Immigration, which is allowed to inspect incoming ships and quarantine those with infectious diseases.

1847: Louisiana adopts a law authorizing bilingual education in French and English, the second state after Ohio to officially authorize bilingual education.

1847: The potato famine in Ireland fuels the immigration of large numbers of Irish people to the United States.

1848: The Treaty of Guadalupe Hidalgo establishes terms following the defeat of Mexico in the Mexican-American War; it allows the United States to annex extensive Mexican territory and grants U.S. citizenship to approximately 75,000 Mexicans living in this territory.

1848: Gold is discovered in California, triggering a wave of Chinese immigration.

1848: The first Chinese immigrants arrive in San Francisco.

1849: The American Israelites, the first national organization of Jewish congregations, is formed.

1850: The decennial U.S. census includes categories of white, black, and mulatto for free persons, and black and mulatto for slaves.

1850: The New Mexico Territory authorizes bilingual education in English and Spanish.

1850: California imposes a tax on foreign miners, and enforces it primarily on Chinese miners.

1851–60: Almost 2.6 million immigrants arrive in America, including 951,657 from Germany, 914,119 from Ireland, and 423,929 from England, Scotland, and Wales.

1852: Harriett Beecher Stowe publishes *Uncle Tom's Cabin*; it becomes a best seller and helps consolidate antislavery sentiments.

1852: 195 Chinese contract laborers arrive in Hawai'i.

1853: The United States purchases a large part of what is now New Mexico and Arizona from Mexico as part of the Gadsden Treaty.

1854: In California, the court decision in *People v. Hall* establishes that Chinese cannot testify against white Americans in court; the law remains on the books until 1872.

1854: In Hawai'i, Chinese residents establish a funeral society.

1857: In *Dred Scott v. Sandford*, the U.S. Supreme Court rules that slaves remained the property of their owners even when residing in a nonslave state, and that African Americans are not American citizens.

1859: Following the creation of cigar factories in Florida, Louisiana, and New York City, many Cubans emigrate to the United States to work in them.

1859: San Francisco creates a separate school for Chinese children and they are not allowed to attend any other public school. In 1885 it is renamed the Oriental School, and Korean and Japanese students are also assigned to this school.

1861–70: Over 2.3 million immigrants arrive in America, including 827,468 from Germany; 607,076 from England, Scotland, and Wales; 435,697 from Ireland; and 126,392 from Scandinavia.

1863: President Abraham Lincoln signs the Emancipation Proclamation, declaring slaves in Confederate states to be free.

1863: The first African American regular army regiment, the 54th Massachusetts, attacks Fort Wagner (Charleston, South Carolina); the regiment and the attack on Fort Wagner are later dramatized in the Oscar-winning feature film *Glory*.

1864: The Fugitive Slave Act is repealed.

1864: During the Civil War, the U.S. Congress rules that black soldiers must receive the same pay as white soldiers.

1865: The Thirteenth Amendment to the Constitution is ratified, outlawing slavery and the

Freedman's Bureau to assist newly freed slaves is created.

1865: Chinese laborers are recruited to work on constructing the transcontinental railroad.

1866: One year after the conclusion of the Civil War, the state of Virginia defines a "colored person" as someone having at least one-fourth Negro ancestry.

1866: In Tennessee, the Ku Klux Klan, a white supremacist organization, is founded.

1867: Maimonides College, the first rabbinical school in the United States, is founded in Philadelphia.

1867: The average ship passage from Europe to the United States lasts 14 days.

1868: The Fourteenth Amendment to the Constitution is ratified, making black Americans citizens.

1870: The decennial U.S. census includes a category for Native Americans (American Indians) and Chinese.

1871–80: Over 2.8 million immigrants arrive in America, including 718,182 from Germany; 548,043 from England, Scotland, and Wales; 436,871 from Ireland; and 242,934 from Scandinavia.

1872: Yung Wing, a Chinese-born Yale graduate and naturalized U.S. citizen, organizes the Chinese Education Mission to bring Chinese students to study in the United States.

1873: Slavery is abolished in Puerto Rico.

1875: U.S. Congress passes legislation prohibiting prostitutes and convicts from entering the country; this is the first federal restriction placed on immigration, as prior to this time the matter had been left up to the states.

1877: Japanese residents in San Francisco form the Gospel Society.

1880: The U.S. government bans the Ghost Dance, a Native American belief system.

1880: Henry Flipper becomes the first African American to graduate from the U.S. Military Academy at West Point.

1881: The Tuskegee Institute is founded by Booker T. Washington to educate free blacks.

1881: In Tennessee, the first of many “Jim Crow” laws is passed, segregating state railroads.

1881–90: Almost 5.3 million immigrants arrive in the United States, including over 1.4 million from Germany; 807,357 from England, Scotland, and Wales; 655,494 from Scandinavia; and 655,540 from Ireland. This decade also sees the first large number of immigrants from Italy (307,309), Austria-Hungary (362,719), and Russia and the Baltic States (213,282).

1882: Chinese immigration is severely restricted by the Chinese Exclusion Act; Chinese laborers are prohibited from entering the country for the next 10 years, those who transported Chinese laborers to the United States are subject to fines or imprisonment, and Chinese laborers who had been in the country in 1880 or earlier are required to register and given certificates identifying them.

1882: Chinese Americans in San Francisco found the Chinese Consolidated Benevolent Association in San Francisco; a branch is founded in 1883 in New York City.

1882: In the peak year for immigration in the 19th century, 788,992 immigrants arrive in the United States, including 250,630 from Germany.

1882: Forty-eight steamship companies are competing on the Atlantic route from Europe to the United States; many establish prepaid ticket offices in the United States so people already in the United States can purchase tickets for relatives and friends in Europe to emigrate.

1882: In August, the Immigration Act prohibits the immigration of persons deemed unlikely to be

able to support themselves, including those with mental deficiencies.

1885: The Alien Labor Contract Law prohibits importation of foreign contract workers.

1886: The Jewish Theological Seminary is founded in New York City.

1888: Twenty-thousand Chinese reentry certificates are nullified by the Scott Act.

1890: The decennial U.S. census includes categories for white, black, mulatto, quadroon, and octoroon, as well as Japanese, Chinese, and Indian.

1890: The Wounded Knee Massacre takes place on the Lakota Pine Ridge Reservation in South Dakota.

1890: Mississippi passes a poll tax, requiring payment of a fee in order to be eligible to vote; this effectively removes most African Americans from the voting public.

1891–1900: Almost 3.7 million immigrants arrive in the United States, including 651,783 from Italy, 574,069 from Austria-Hungary, 505,281 from Russia and the Baltic States, and 505,152 from Germany.

1892: The federal immigration center on Ellis Island in New York Harbor begins processing immigrants; it will remain in operation until 1954.

1892: The Geary Act extends the Chinese Exclusion Act of 1882 for an additional 10 years.

1892: José Julián Martí y Pérez forms the Cuban Revolutionary Party (El Partido Revolucionario Cubano) in New York City; in 1895 he returns to Cuba to resist Spanish occupation.

1893: In Chicago, the National Council of Jewish Women is founded.

1893: In San Francisco, Japanese residents form the Japanese Shoemaker’s League, the first Japanese trade association in the United States.

1894: In *In re Saito*, a U.S. circuit court in Massachusetts declares that Japanese are not white and may not become naturalized citizens.

1896: The U.S. Supreme Court in the *Plessy v. Ferguson* decision establishes the principle that “separate but equal” accommodations do not violate the Constitution.

1897: The average ship’s passage from Europe to the United States takes only five days.

1897: Spain awards home rule to Puerto Rico and Cuba.

1897: In Hawai‘i, the Executive Council bans the importation of Korean contract laborers.

1897: The Yiddish-language newspaper *Jewish Daily Forward* is founded in New York City.

1898: In San Francisco, Japanese residents create the Young Men’s Buddhist Association.

1898: As part of the Treaty of Paris, concluding the Spanish-American War, Spain transfers Puerto Rico, the Philippines, and Cuba to the United States.

1898: Louisiana passes a grandfather clause limiting the right to vote to people whose fathers and grandfathers could vote in 1867, thus eliminating all African Americans from the pool of voters.

1899: Hawai‘i becomes a territory of the United States.

1899–1901: Following the Spanish-American War, the United States establishes a military government in Peru.

1900: Quarantine is imposed on San Francisco’s Chinatown after a bubonic plague scare.

1901: The Cuban constitution includes the Platt Amendment allowing the United States to intervene in Cuban affairs, and to maintain a naval base in Cuba; the amendment is repealed in 1934, although the naval base remains.

1901: U.S. citizenship is granted to members of the Five Civilized Tribes (the Cherokee, Chickasaw, Choctaw, Creek, and Seminole Indians).

1901–10: Almost 8.8 million immigrants arrive in the United States, including over 2 million from Italy, 2.1 million from Austria-Hungary, and almost 1.6 million from Russia and the Baltic States.

1902: Cuba declares itself to be independent of the United States.

1903: Persons who may be excluded from immigrating to the United States include unaccompanied children and persons with tuberculosis.

1903: Oscar Straus becomes the first Jew to hold a cabinet position, as the secretary of labor and commerce for President Theodore Roosevelt.

1903: In Hawai‘i, the first Korean workers arrive.

1905: Koreans in San Francisco establish the Mutual Cooperation Federation.

1906: In California, Japanese nurserymen form the California Flower Growers Association.

1907: With the informal “Gentleman’s Agreement,” the Japanese agree to limit immigration to the United States, and the U.S. government agrees not to prohibit such immigration outright.

1907: President Theodore Roosevelt signs Executive Order 589, prohibiting Japanese with passports from Canada, Mexico, or Hawai‘i to immigrate to the United States.

1909: W. E. B. Du Bois, Ida B. Wells, Mary White Ovington, Henry Moskowitz, and William English Walling found the National Association for the Advancement of Colored People (NAACP).

1909: In Hawai‘i, some 7,000 Japanese agricultural workers go on strike.

1910: The Angel Island Immigration Station opens in San Francisco.

1911–20: Over 5.7 million immigrants arrive in the United States, including over 1.2 million from Italy, 921,957 from Russia and the Baltic States, and 901,656 from Austria-Hungary.

1912: Hadassah, the Women’s Zionist Association of America, is founded by Henrietta Szold.

1913: The Anti-Defamation League is founded following the trial of Leo Frank, a Jewish factory supervisor convicted of murdering a 13-year-old-girl; Frank was lynched in 1915.

1913: In California, aliens ineligible for citizenship are prohibited from purchasing land or leasing it for more than three years; Arizona passes a similar law in 1917, as do Washington and Louisiana in 1921.

1916: Louis Brandeis is appointed to serve on the U.S. Supreme Court, making him the first Jewish member of the court.

1917: Federal law bans immigration by illiterates over the age of 16 and almost all Asian immigrants.

1917: In Hawai‘i, Syngman Rhee, who would later become the president of South Korea, founds the Korean Christian Church.

1917: Residents of Puerto Rico become U.S. citizens under the Jones Act.

1918: In California, Asian Indians form the Hindustani Welfare Reform Association.

1918: Asian veterans of World War I are given the right to become naturalized citizens.

1919: In Hawai‘i, the Federation of Japanese Labor is formed.

1921: U.S. Congress creates a system of national quotas, based on the percentage of foreign-born persons from each country who were residing in the United States in 1910.

1921–30: Over 4.1 million immigrants arrive in the United States, including 455,313 from Italy;

412,202 from Germany; and 330,168 from England, Scotland, and Wales.

1922: In *Takao Ozawa v. United States*, the U.S. Supreme Court determines that Japanese are not white and thus not eligible for naturalization.

1924: The Johnson-Reed Act sets a national immigration quota for each country at 2 percent of the foreign-born persons from that country recorded in the 1890 U.S. census.

1924: The Virginia Racial Purity Act establishes the famous “one drop” rule: any person with any African ancestry at all is considered black.

1924: Immigration from Asia is banned by the Oriental Exclusion Act.

1924: In Hawai‘i, 1,600 Filipino agricultural workers go on strike for eight months.

1925: The Filipino Federation of America is founded by Hilario Moncado.

1925: A. Philip Randolph founds the first predominantly black labor union, the Brotherhood of Sleeping Car Porters.

1926: Gertrude Bonnin founds the National Council of American Indians.

1929: The League of United Latin American Citizens (LULAC), the oldest Hispanic civil rights organization in the United States, is founded in Texas.

1930: The decennial U.S. census includes racial categories of white, Negro, Mexican, American Indian, Chinese, Japanese, Filipino, Hindu, and Korean, with other races to be written out in full.

1931: The Scottsboro Boys, nine black young men, are convicted of raping two white women; the convictions are reversed by the U.S. Supreme Court in 1932, on the grounds that the defendants did not receive adequate counsel.

1935: In *United States v. Creek Nation*, the U.S. Supreme Court orders that the U.S. government

must compensate the Creek Nation for lands seized over 100 years prior.

1940: The Filipino Federated Agricultural Laborers Association is chartered by the American Federation of Labor (AFL), a federation of labor unions.

1941: Japan attacks the United States at Pearl Harbor in Hawai'i.

1942: The Bracero program allows Mexican nationals to work as laborers in the United States on a temporary basis. In the first year, 4,203 workers participate in the program; in the program's peak year of 1959, 437,643 workers participate; by 1964, the last year of the program, the program dwindles to 177,736 workers.

1942: In February, Executive Order 9066 allows the internment of about 110,000 persons of Japanese descent, without regard to their citizenship status; the order is not officially rescinded until 1976.

1942: The Congress of Racial Equality (CORE) is founded in Chicago.

1943: Federal troops are used to end protests in Detroit, Michigan, by African Americans excluded from civil defense jobs.

1943: In southern California, Mexican Americans are attacked during the "Zoot Suit" riots.

1943: The ban on Chinese immigration is repealed.

1944: The United Negro College Fund is created.

1944: Large numbers of laborers migrate from Puerto Rico to the United States.

1945: The War Brides Act facilitates immigration by foreign spouses and children of American servicemen; a 1947 amendment allows Chinese American veterans to bring their brides to the United States.

1946: The Indian Claims Commission Act provides a means for Native American tribes to sue the U.S. government for lands taken from them.

1946: Jesús Toribio Piñero Jiménez is the first Puerto Rican native to be named governor of Puerto Rico.

1946: All Filipinos living in the United States are offered citizenship.

1947: In California, *Mendez v. Westminster* prohibits segregation of Mexican American students in schools.

1947: Jackie Robinson becomes the first black player in Major League Baseball.

1948: Brandeis University is founded in Waltham, Massachusetts; it is the first Jewish-sponsored, nonsectarian institution of higher education.

1948: President Harry S. Truman ends segregation in the armed forces with Executive Order 9981.

1948: The Displaced Persons Act allows the immigration to the United States of over 200,000 displaced persons, in addition to those allowed in under the national quotas; in 1950 the number of displaced persons allowed to immigrate increases.

1950: The African American diplomat Ralph Bunche is awarded the Nobel Peace Prize.

1950: Puerto Rico becomes a Commonwealth.

1950: Poet Gwendolyn Brooks becomes the first African American to win a Pulitzer Prize.

1952: The McCarran-Walter Immigration and Naturalization Act makes several key changes to U.S. immigration law, including establishing preferences for those with relatives already in the United States and eliminating race as a barrier to entry.

1953: The Refugee Relief Act, initially called the Emergency Migration Act, was passed by U.S. Congress. It allows more refugees to immigrate, independent of the national quotas.

1954: In *Brown v. Board of Education*, the U.S. Supreme Court rules that the "separate but equal" standard is unconstitutional.

1954: Medgar Evers files suit against the University of Mississippi after he is denied admission to the law school because of his race.

1954–58: An estimated 3.8 million Mexican descent are deported during Operation Wetback, an effort to crack down on undocumented workers.

1955: The Montgomery Bus Boycott begins when Rosa Parks is arrested for refusing to give up her seat on the bus; the end result is a 1956 ruling that segregation on public transportation is unconstitutional.

1955: The first Spanish-language television channel in the United States is established in San Antonio, Texas.

1957: The United States becomes the country with the largest Jewish population in the world.

1957: Martin Luther King, Jr., founds the Southern Christian Leadership Conference (SCLC).

1959: Hawai‘i becomes a state.

1959: Cuban migration to the United States increases after the Cuban Revolution.

1960: Racial segregation in Greensboro, North Carolina, is protested by lunch counter sit-ins.

1960: John F. Kennedy becomes the first Catholic elected president of the United States.

1961: The United States cuts diplomatic ties with Cuba.

1961: The Bay of Pigs invasion of Cuba, led by Cuban exiles trained in the United States, is a spectacular failure.

1962: Jackie Robinson becomes the first black baseball player elected to the Baseball Hall of Fame.

1962: Daniel K. Inouye is elected to the U.S. Senate from Hawai‘i, and Spark Matsunaga is elected to the U.S. Senate from Hawai‘i.

1962: The Migration and Refugee Assistance Act allows the immigration of more refugees.

1962: César Chávez and Dolores Huerta found the United Farm Workers Organizing Committee.

1963: Martin Luther King, Jr., makes his “I Have a Dream” speech in Washington, D.C., as part of the civil rights march on Washington.

1963: Civil rights leader Medgar Evers is assassinated by Byron De La Beckwith; after two trials ending in hung juries, De La Beckwith remains free until 1994, when a new trial results in his conviction of first-degree murder.

1964: Poll taxes are outlawed by the Twenty-Fourth Amendment to the Constitution.

1964: Voter registration campaigns in Mississippi are dubbed the Freedom Summer.

1964: The Civil Rights Act outlaws many forms of discrimination against racial and ethnic groups; Title VII of the act establishes the Equal Opportunity Commission (EOC) to monitor implementation.

1964: Martin Luther King, Jr., is awarded the Nobel Peace Prize.

1965: The Immigration Act makes several key changes to the rules governing immigration, including abolition of the national origins system, establishing a limit of 20,000 immigrants from any country; and admitting qualified immigrants in order of application. It also affirms the preference for those with relatives in the United States and with needed occupational skills.

1965: The Organization of American States (OAS) lifts its economic and diplomatic sanctions on Cuba.

1965: In Los Angeles, the Watts race riots result in over 1,000 injuries and over 3,000 arrests. The rioting lasts six days.

1966–73: About 10 percent of the population of Cuba emigrates to the United States.

1967: In *Loving v. Virginia*, the U.S. Supreme Court invalidates all state laws banning marriage between people of different races.

1968: The Black Panther Party is founded in Oakland, California.

1968: The Bilingual Education Act encourages school systems to include native-language instruction for children whose first language is not English.

1968: At San Francisco State University, students strike to demand programs in ethnic studies.

1969: At the University of California, Berkeley, students strike to demand programs in ethnic studies.

1970: Spanish becomes the most frequently spoken language other than English in the United States, replacing Italian.

1970: A protest in Los Angeles draws attention to the fact that Hispanics form a disproportionate number of the American casualties in the Vietnam War.

1971: The Congressional Black Caucus is organized.

1971: In Crystal City, Texas, the La Raza Unida Party is triumphant by winning a total of 15 city council and school board seats.

1974: In *Lau v. Nichols*, the U.S. Supreme Court mandates bilingual instruction for children with limited English language skills.

1975: Over 130,000 refugees from Vietnam, Cambodia, and the Lao Republic arrive in the United States.

1975: The Voting Rights Act Amendments permanently ban literacy tests as a condition of voting, and require that bilingual ballots be provided in certain areas.

1978: The U.S. Congress creates a uniform preference system for immigrants, and a worldwide annual ceiling of 290,000.

1978: The U.S. Supreme Court, in *Regents of the University of California v. Bakke*, determines that the practice of setting aside places at the Medical School of the University of California, Davis, for members of under-represented minority groups is unconstitutional.

1978: Large numbers of Vietnamese refugees, dubbed “boat people” because of their means of fleeing their country, arrive in the United States.

1979: The United States resumes diplomatic relations with China.

1980: The Mariel boatlift departs from Mariel Harbor in Cuba, bringing about 125,000 Cuban emigrants to the United States.

1980: On the decennial census, 11 percent of U.S. residents over the age of 5 report speaking a language other than English at home.

1980: The decennial U.S. census includes a question about Hispanic origin as well as a question about race.

1980: The Refugee Act increases the annual immigration ceiling to 320,000, increases the number of refugees admitted to 50,000 annually, and broadens the definition of “refugee.”

1986: The Immigration Reform and Control Act grants amnesty to persons who entered the United States illegally before 1982, and prohibits employers from knowingly hiring illegal immigrants.

1988: The Indian Gaming Regulatory Act permits gambling on reservations.

1988: The American Homecoming Act allows the children of American fathers and Vietnamese mothers to immigrate to the United States.

1988: Laura F. Cavazos becomes the first Hispanic to be appointed secretary of education.

1989: The United States agrees to pay \$20,000 in reparations to each of the surviving Japanese placed in internment camps in the United States during World War II.

1989: Mexico accounts for 37.1 percent of immigration to the United States, followed by El Salvador with 5.3 percent.

1990: The Immigration Act creates the category of “diversity visas” and increases the total number of nonrefugee immigrants to 675,000 annually.

1990: On the decennial census, 13.8 percent of U.S. residents over the age of 5 report speaking a language other than English at home.

1991: A Bureau of Indian Affairs inventory finds that 80 percent of federally recognized tribes base membership on blood relationships, with a range of half to 1/64th.

1991: An amateur videographer captures Los Angeles police officers beating a black suspect, Rodney King; the tape is widely publicized, and when the police officers are acquitted in 1992, race riots break out in Los Angeles. A group particularly damaged by the riots are Koreans who own many shops in the neighborhood where the riots occur.

1991: Black Entertainment Television (BET) becomes the first black-owned company traded on the New York Stock Exchange.

1992: The Chinese Student Protection Act allows Chinese students, in the United States between June 1989 and April 1990 following the Tiananmen Square protests of 1989, to become immigrants.

1992: A referendum in Puerto Rico indicates a preference for independence.

1992: The United Nations condemns the U.S. embargo on Cuba; in 1998, Pope John Paul II will also criticize the U.S. embargo.

1993: Toni Morrison becomes the first black American to win the Nobel Prize for Literature.

1994: In California, Proposition 187 bars illegal immigrants from receiving many government benefits.

1994: The North American Free Trade Agreement (NAFTA) comes into effect, eliminating tariffs among Canada, Mexico, and the United States over the next 15 years.

1994: Former football star O. J. Simpson is charged with murdering his wife and another man; the trial in 1995 highlights differing perceptions of black and white Americans and makes the term *jury nullification* commonly known.

1995: The Million Man March on Washington, D.C., is organized by Louis Farrakhan, head of the Nation of Islam, to draw attention to issues faced by the African American community.

1996: The Illegal Immigration Reform and Immigrant Responsibility Act creates several barriers to illegal immigration, including stricter procedures applicable to those who seek asylum, greater responsibilities placed on sponsors of immigrants, and revised regulations so it becomes easier to deport illegal immigrants. The act also increases manpower within the Immigration and Naturalization Service (INS), and authorizes creation of border fences to discourage illegal immigration.

1996: Access to public assistance programs is limited for legal immigrants in the first five years in the United States by the Personal Responsibility and Work Opportunity Reconciliation Act.

1996: In California, Proposition 209 bans affirmative action in education, state hiring, and public contracts; in 1997, the proposition is ruled constitutional by a California court.

1997: At 21, Tiger Woods becomes the youngest Masters champion and the first major championship winner of African or Asian heritage.

1997: The Latin Academy of Recording Arts & Sciences is founded, headquartered in Miami; the academy grants the first Latin Grammy Awards in 2000.

1998: In Jasper, Texas, a black man, James Byrd, Jr., is murdered by being dragged to his death by a truck.

1998: In California, Proposition 227 limits bilingual education.

1998: DNA evidence is released suggesting that Thomas Jefferson fathered a child with one of his slaves, Sally Hemings.

1999: In a highly publicized case, the 6-year-old Cuban Elián González, rescued off the coast of Florida during an attempt to immigrate (his mother dies during the attempt), becomes the center of an international controversy as relatives want to keep him in the United States while his father wants him returned to Cuba. Eventually, Elián returns to Cuba with his father.

2000: U.S. Congress passes a law to facilitate the naturalization of Lao nationals who had served with the United States during the Vietnam War.

2000: On the decennial census, 17.9 percent of U.S. residents over the age of 5 report speaking a language other than English at home.

2000: Venus Williams becomes the first black woman since Althea Gibson to win the singles title at Wimbledon, one of the four Grand Slam tournaments of tennis.

2002: Jennifer Rodriguez becomes the first Cuban American to compete in the Winter Olympics, winning two bronze medals in speed skating. In the same Olympics, Derek Parra wins a gold and silver medal in speed skating, becoming the first Mexican American to medal in the Winter Olympics.

2002: Halle Berry wins the Academy Award for Best Actress for her performance in *Monster's Ball*; she is the first black woman to win Best Actress.

2003: Voter ID laws are passed in Alabama, Colorado, Montana, North Dakota, and South Dakota; the laws are meant to prevent voter fraud, including voting by noncitizens, but are also believed to limit voting among the poor and disenfranchised, who may not have the required type of identification.

2003: Hispanics become the largest minority group in the United States.

2005: The American Community Survey estimates that 1.9 percent of Americans are of two or more races; the state with the highest percentage is Hawai'i, at 21 percent, while the state with the lowest percentage is Mississippi at 0.9 percent.

2007: The American Community Survey estimates that almost 38.1 million foreign-born persons are living in the United States, including 10.2 million from Asia, 5 million from Europe, 21.3 million from the Americas, and 1.4 million from Africa.

2008: The U.S. Department of Justice begins an investigation of Joe Arpaio, sheriff of Maricopa County, Arizona, on the charge of racial profiling.

2010: Arizona passes S.B. 1070, requiring law enforcement officials to determine the immigration status of anyone stopped for any reason (e.g., a traffic stop); it also requires aliens to carry their registration documents at all times.

2010: The American Community Survey estimates that almost 40 million foreign-born people are living in the United States, including 11.3 million from Asia, 1.6 million from Africa, 22 million from the Americas, and 4.8 million from Europe.

2011: Maryland and Connecticut join 10 other states that allow undocumented immigrants to pay tuition for college or university at the in-state rate.

2011: Alabama, Georgia, Indiana, South Carolina, and Utah pass laws similar to Arizona's S.B. 1070, requiring law enforcement officials to determine the immigration status of anyone stopped for another reason (e.g., a traffic stop); the Alabama law also requires schools to verify the immigration status of their students.

2011: Members of minority racial and ethnic groups make up a majority of U.S. births in the period ending July 2011, and one in nine U.S. counties have a majority of residents from minority racial and ethnic groups.

2012: In January, Jeremy Lin becomes the first Chinese American to be a starter on an National Basketball Association (NBA) team.

2012: In January, anthropology professor Theodore Schnur and colleagues publish a study in the *American Journal of Human Genetics* providing evidence of genetic similarities between native Americans and residents of Russia's Altaic region.

2012: In March, a Wisconsin law requiring photo identification (ID) to vote is found unconstitutional.

2012: In March, the U.S. Department of Justice denies pre-clearance of a 2011 Texas voter ID law; in August, a federal district court also denies pre-clearance of the law.

2012: In June, President Barack Obama issues a policy that grants two years of immunity from deportation to immigrants who were brought illegally to the United States as children; requirements include that they arrived in the United States before age 16, and are attending school, have graduated from high school, or have been honorably discharged from military service.

2012: In June, the U.S. Supreme Court rejects much of an Arizona immigration law, but allows one controversial measure to stand: the right of state law enforcement officials to question the immigration status of anyone stopped for any other reason.

2012: In June, a study by the Pew Research Center finds that Asians are now the fastest-growing category of immigrants, surpassing Hispanics.

2012: In August, the Republican Party adopts a platform that would deny federal financing to universities allowing undocumented immigrants to pay tuition at the in-state rate.

2012: In August, a federal district court in Florida rules that Florida residents who are citizens may not be charged tuition at the out-of-state rates due to the immigration status of their parents; a similar ruling in New Jersey determines that a student cannot be denied financial aid for higher education based on his or her parents' immigration status.

2013: In February, leaders of high-tech companies such as Mozilla and AOL organize a "virtual march for immigration reform" to push for reforms that make it easier for highly skilled immigrants to come to the United States.

2013: In February, the president of Emory University (Atlanta), James W. Wagner, sparks protests after he praises a compromise in the U.S. Constitution that allowed slaves to be counted as three-fifths of a free person.

2013: In March, a report from the Pew Hispanic Center finds that the digital divide between Latino Americans and white Americans is narrowing but that a more substantial divide exists between U.S.-born and foreign-born Latinos.

Part I: U.S. Census Essays

African American Categorization

Categorization of black community members refers to the specific terminology utilized to refer to or to talk with or about African American individuals throughout U.S. census history (e.g., slaves, Negroes, or blacks). The U.S. Census Bureau explains that one is considered black and/or African American if their ethnic origins can be traced to Africa. Typically, African American denotes someone who was born and raised in the United States and has black skin. The term *black*, however, comprises people from all areas of the black diaspora, including those individuals with ancestors who endured forced migration into the transatlantic slave trade. The categorization of the black and/or African American community has impacted both the historical development of multicultural America and the contemporary American multicultural mosaic.

Language used to refer to cultural groups today illustrates how historical and present categorizations have shaped and continue to mold perceptions of the black and/or African American community, for cultural members and nonmembers alike. As the current U.S. multicultural landscape grows into more tolerant and comfortable terrain for all cultural groups, it is vital to understand the ways in which racial categorization terms both enhance and hinder this effort. Examining past and current racial categorizations and their implications is central to analyzing the current multicultural landscape as it was impacted by the historical development.

U.S. Census Categorizations: 1790 to 1899

The sorts of questions asked by census-takers have evolved dramatically over the last 220 years.

In 1790, the U.S. census referred to blacks or African Americans as slaves or free persons. However, according to Dr. Brenda Allen, no category for race was listed on the first census. Specifically, as the head of household reported the number of individuals present, they specified whether someone was white and free, another free person, or reported the number of “slaves.” Names, other than the head of household, were not reported.

For the 1800 census, instead of reporting the number of free white males, the census requested that age be specified. For example, the name of the head of household was listed. Thereafter, the number of free white males and females was requested by age: under 10, between 10 and 16, between 16 and 26, between 26 and 45, and over 45. For the black or African American community members, the census asked for the number of each free person of color and the number of “slaves” of all ages.

The 1810 census repeated the 1800 census questions and only personally named the head of household on the form. No other changes were made.

The 1820 census also names only the head of household. However, it posed several additional questions and requested the following information: number of free white males between 16 and 18 years old; number of free persons, with the exception of Indians; number of persons not naturalized; number of persons involved in agriculture, commercial, or manufacture occupations; and number of colored persons.

The 1830 census was more specific. Age was reported in five-year brackets up to age 20. Thereafter, age was reported in 10-year increments. Members of the black or African American

community were categorized as slaves and the census differentiated between the number of male and female slaves and free black males and females. This census report also inquired about the number of deaf and dumb slaves, deaf and dumb free blacks, and blind slaves and free blacks. For black community members, age ranges were reported as age 10 or younger, between 10 and 24, between 24 and 36, between 36 and 55, between 55 and 100, and over 100.

The 1840 census added a question regarding the number of idiotic or insane slaves and idiotic or insane free blacks.

The 1850 census asked for the name of every free person or family member who lived in the household or occupied the residence. Under this section, the census inquired as to the color of the

free persons: white, black, or mulatto. The 1850 census also reported the number of slave inhabitants, including the name of the slave owner and the number of slaves. The census also asked slaves' ages, biological sex, skin color, whether they were free or fugitives, the number manumitted, and the number of deaf, blind, mute, insane, and dumb slaves. The 1850 census was the last one in which members of the black or African American community were listed as "slaves" on a U.S. census questionnaire.

The 1860 census asked the head of household to disclose the number of "slave houses" in a household. Between 1860 and 1870, many congressional changes occurred that impacted the 1870 census questions. In 1865, slavery was abolished with the Thirteenth Amendment, and

Three men in the doorway of a Chicago store owned by Charles F. Gardner, electrician and locksmith. At the time this photograph was taken, thought to be around 1899, it was the only "Negro" store of its kind in the United States. In 1900, the census began recording the names of black individuals even if they did not own their houses or live with white people, which was a significant development.

in 1868, the Fourteenth Amendment considered former enslaved people to be citizens. In 1870, the Fifteenth Amendment permitted black men the right to vote.

From the 1870 census onward, all persons were classified as free inhabitants. However, the census asked for descriptions. In 1870, the categories for African Americans were listed as colors. Occupational information was also requested. People were listed as belonging to one of the following colors: white, black, mulatto (one black and one white parent), Chinese, or Indian. This census marked a change for members of the black community by allowing free black male heads of households to list their name, if they had their own house. Before 1870, blacks were counted merely as number of slaves.

The 1880 census adopted the same questions as before but also inquired about the head of household's relationship to persons residing in his household. Specifically, whether they were his wife, son, daughter, servant, boarder, or other, and also asked general questions about education and health, such as whether one had attended school within the census year, if that person could read or write, and whether one was maimed, crippled, bedridden, or otherwise disabled.

Most of the 1890 census results were lost in a fire. However, the questionnaire survived and revealed more questions about racial categories, for individuals with African origin or black skin: black, mulatto, quadroon (one-quarter black), and/or octoroon (up to one-eighth black). The questionnaire also asked whether a person had served in the Civil War and which side they had fought for.

The 1900s to the Present

U.S. census questions in 1900, 1910, 1920, 1930, and 1940 did not include predetermined categories for racial categorization or color. Instead, persons were able to specify color or race themselves. The 1900 census also began recording the name of each person in the household.

The census in these years marked a number of changes for members of the black community. Starting in 1900, the names of all persons were recorded. This is significant, because even if black individuals did not own their houses, or lived with white people, their names were recorded from

1900 onward. Additionally, the 1900 U.S. census began asking for the birthplace of each inhabitant, as well as father and mother. For the black community, this information provided significant knowledge regarding their ancestors' forced passage through the transatlantic slave trade.

No racial categories were listed from 1900 to 1940. However, these categories returned with the 1950 questionnaire. Here, black people were specifically categorized as "Negro." The return of this categorization may be related to the "one drop rule," which formally designated anyone with African heritage as black if they reported "one drop" black heritage. The 1960 census continued to categorize blacks as Negro, though, as the years progressed, the census asked more demographic questions.

The 1970 and 1980 censuses inquired whether individuals were Negro or black and included a space for other race. The 1970 and 1980 census also asked about ethnic information, desiring to know one's origin or descent. However, the 1980 questions were specifically worded to gain ancestral information, while the 1990 census categorized African Americans as black or Negro and did not ask about ancestry.

The 2000 census categorized individuals with black skin as black, African American, or Negro. This questionnaire also permitted persons to check multiple boxes simultaneously. An open-ended box was included for individuals to list ancestry or ethnic origin. The 2010 census also categorized individuals with black skin as black, African American, or Negro, provided 15 racial categories, and permitted people to avow another racial category.

Future Communicative Implications on U.S. Cultural Mosaic

The mission of the census to provide a complete and detailed picture of the U.S. population makes some form of racial and ethnic categorization inevitable. Categorization is not an inherently bad thing. Scholars Ron Jackson and Rex Crawley explain categorizations denote the visible recognition of difference. Categories are useful to the extent that they provide information about that which was categorized. However, categories are not always positive or accurate. This problem is communicated through the utilization of specific

census categories like slave or Negro. The Census Bureau decided to drop Negro as a listed option for 2020. The racial categories are themselves infused with meaning. In this regard, categorizations are embedded with overarching generalizations about individuals or groups of people, which may be prejudiced.

Census designers continue to face a choice of which racial and ethnic groups to include on the form. Consequently, the census continues to push some racial identities to the foreground while moving others to the background. This communicates worth and value as much as the label used to symbolize a cultural group. This fact continues to be problematic. The choice of categories available, the ability to select multiple categories, the language used to describe categories, and the meaning embedded within chosen language all carry profound implications for the black community.

Since 1790, the number of racial categories offered on the form and the flexibility of those categories has increased. However, despite this apparent progress, it is unlikely that the census could ever offer a complete and exhaustive list of racial categories. A white person of South African descent, for instance, would have to decide whether to check the box for black, African American, and/or Negro. Immigration and interracial marriages suggest that the complexity of Americans' racial identities will continue to increase, casting further doubt on the ability of any list of racial categories to fully capture a citizen's identity.

What seems to be problematic is the inability the census has to provide a picture of the U.S. population without creating names, labels, and categorizations for cultures of people. As Mark Hopson explains, giving individuals the ability to define their own racial identity gives them a voice. This is important in the black experience. As our society becomes more diverse, it becomes imperative for individuals to avow their own racial and ethnic identities.

Age Distribution

The American population continues to grow older, with the median age exceeding 40 in many states and the number of older men, in particular, increasing. Age data has been well tracked over American history: it is one of the few pieces of information, along with sex, that was asked in the original 1790 census and has been asked on every census since. In the 2010 census, age data was derived from two questions: the age of the person, and the date of birth, with instructions to list babies as 0 years old if they were less than 1 year old. These instructions were added as of the 2010 census in order to reduce reporting problems for babies, whose respondents often listed their ages in terms of days, weeks, or months. Age information is used to implement and evaluate programs like the Equal Employment Opportunity Act, the Civil Rights Act, the Women's Educational Equity Act, the Older Americans Act, the Juvenile Justice and Delinquency Prevention Act, and the Job Training Partnership Act, as well as by the policy-making and service development bodies of the Department of Veterans Affairs, Department of Education, Department of Health and Human Services, Department of the Interior, and the Equal Employment Opportunity Commission.

American age groups are sometimes discussed in terms of specific generations or cohorts: it makes more sense to talk about trends common to the Baby Boomers, for instance, who were born during a population growth spike following the end of World War II, than it does to talk about the trends common to a specific age group, given the expectation that behaviors and trends will "follow" the Boomers as they age out of one group and into the next. The Depression

generation, for instance, experienced the peak of European immigration, two world wars, and the Great Depression, and grew up in a time when Americanization and acculturation were stressed; they have often retained certain attitudes and behaviors shaped by these experiences. All generational boundaries being fuzzy, they overlap with "the Greatest Generation," a term popularized by television journalist Tom Brokaw, who wrote about the generation that fought World War II and subsequently established mainstream mid-century American culture. Many of them were also active in the civil rights movement.

Some call the next generation the Silent Generation, those born at one of the lowest birth-rate periods in American history, from the Great Depression through World War II. They grew up during the peak of jazz music, the early days of rock and roll, the paranoia of anticommunist McCarthyism, the beginnings of the Cold War, and the beginnings of the drug culture, and tend toward social conservatism. The Baby Boomer generation followed, with the generational boundaries defined variously by different sociologists and historians, but accounting for the sizable increase in birthrate following World War II, both as a result of soldiers returning home and because of the return of American prosperity. Baby Boomers, one of the largest generations in American history, were active in the civil rights movement and the subsequent social-political movements of the 1960s and 1970s, mainstreamed the environmental movement, and popularized social cause involvement, spiritualism and alternative lifestyles, tolerance and individualism, feminism, and social improvements through government

programs, such as Lyndon Johnson's War on Poverty program. Many minority Baby Boomers were responsible for the early growth of ethnic and racial identity groups like the Black Panthers, the American Indian Movement, and the Chicano movement. The Asian American movement developed slightly later.

There is no consensus label for the next generation, which grew up in the disillusioned 1970s, amid the aftermath of the Watergate scandal, the height of antiwar sentiment with regard to the Vietnam War, rampant gasoline shortages and repeated energy crises, and witnessed many social activist Baby Boomers leave behind activism in favor of the "Me Decade," encounter groups, and yuppie-ism. This generation is generally considered predisposed toward cynicism and is also credited with the rise of born-again Christianity and a fervently conservative approach to the War on Drugs.

Generation X is well known, though there is great dispute about its generational boundaries. Beginning with Americans born in the mid-1960s, its boundary is either the late 1970s or the mid-1980s: first popularized in reference to Americans then in their early 20s in the late 1980s and early 1990s, it continued to be used in reference to "20-something" Americans for the rest of the decade. Generation X has alternately been called a generation of slackers and a generation of innovative entrepreneurs. It is the first generation in which single-parent households were common among all socioeconomic classes and the first generation to grow up with *Sesame Street* and other modern elements of childhood. The Millennials are the first generation to grow up with Internet access and will be similarly marked by the contraction of the job market following the global financial crisis coinciding with their arrival in the workforce.

Clifton Jackson, a resident of Noorvik, Alaska, a remote Inupiaq Eskimo village above the Arctic Circle, was the first person in the United States to be counted as the 2010 census began. He was a veteran of World War II, making him a member of the "Greatest Generation," and was 89 years old in January 2010. Age is one of the few categories to have appeared on every census since 1790.

The population in 2010 was 308.7 million, a 9.7 percent increase over 2000, similar to the 9.8 percent increase experienced from 1980 to 1990 but slower than the 13 percent growth experienced from 1990 to 2000. Of the respondents, 157 million (50.8 percent) were female, and 151.8 million (49.2 percent) were male. The male population grew slightly faster (9.9 percent growth) than the female population (9.5 percent).

Older age groups increased more quickly. The greatest growth was experienced by the 45–64 age group, which increased 31.5 percent due to the ongoing aging of the Baby Boomer generation (born 1946 to 1964). A full age group breakdown follows:

- Under 18: 74,181,467; 24 percent of the population, 2.6 percent growth
- Under 5: 20,201,362; 6.5 percent of the population, 5.3 percent growth
- 5 to 17: 53,980,105; 17.5 percent of the population, 1.6 percent growth
- 18 to 44 years old: 112,806,642; 36.5 percent of the population, 0.6 percent growth
- 18 to 24 years old: 30,672,088; 9.9 percent of the population, 13 percent growth.
- 25 to 44 years old: 82,134,554; 26.6 percent of the population, 3.4 percent decrease.
- 45 to 64 years old: 81,489,445. 26.4 percent of the population, 31.5 percent growth.
- 65 years and older: 40,267,984; 13 percent of the population, 15.1 percent growth

The median age of the country in the 2010 census is 37.2 years old, a historic high. The northeast was the oldest region (39.2), followed by the midwest (37.7), south (37), and west (35.6). The oldest states were Maine (42.7), Vermont (41.5), West Virginia (41.3), New Hampshire (41.1), and Florida (40.7).

The median age varied considerably by ethnicity. Non-Hispanic whites had a median age of 42 (40 men, 43 women). Foreign-born Hispanics had a median age of 38 (37 men, 39 women). Non-Hispanic Asians had a median age of 35 (34 men, 36 women). Non-Hispanic blacks had a median age of 32 (30 men, 34 women). Non-Hispanic persons reporting more than one race or a race other than white, black, or Asian had a median age of 23 (22 men, 24 women). Native-born Hispanics had a median age of 18 (17 men, 18 women).

Alaska Native Categorization

Alaska Natives include the various indigenous people of Alaska, a bit over 100,000 people including the Inupiaq, Yupik, Aleut, Eyak, Tlingit, Haida, and Tsimshian peoples, and several Northern Athabaskan cultures: the Ahtna, Deg Hit'an, Dena'ina, Gwich'in, Han, Holikachuk, Kolchan, Koyukon, Lower Tanana, Tanacross, and Upper Tanana peoples. Alaska Natives include Eskimos—the Inupiaq and Yupik—but are not limited to or synonymous with them.

Alaska Natives arrived in Alaska thousands of years ago, when Paleolithic Siberians crossed the Bering Land Bridge from Asia to the Americas. Russia claimed Alaska in the 18th century as part of its brief foray into colonizing the New World. Russians were the first Europeans to land on the northwestern American coast. The Russian colonial period was marked by slavery of the Aleuts, a wide fur trade, and the decimation of many populations exposed to Old World diseases to which they possessed no immunity. When the fur trade declined due to unsustainable hunting practices, Russia sought a sale and transferred its claim to Alaska to the United States for \$7.2 million in 1867.

Alaska Natives and U.S. Law

Because there have been no treaties between Alaska Natives and the federal government, the federal-Native relationship has been defined by statutory actions. When the United States first took over Alaska from Russia, the federal government did not initially deal with Alaska Natives at all. The 1867 Treaty of Cession, which transferred the lands to the United States, distinguished between “uncivilized tribes” and other “inhabitants of

the ceded territory.” These other “inhabitants,” by implication whites, were given citizenship in the United States and guaranteed “the free enjoyment of their liberty, property, and religion.” The uncivilized tribes, on the other hand, were “subject to such laws and regulations as the United States may, from time to time, adopt in regard to aboriginal tribes of that country.”

Those who were categorized as uncivilized tribes under American rule were for the most part those who had been classified as such by the Russian government. Federal Indian law was applied inconsistently at first, but only because of the general inattention of the government to Alaska. It was clear by the 1884 Organic Act (an early move toward statehood, which created Alaska as a judicial district with federally appointed authorities) that the federal government saw no legal distinction between the natives of Alaska and the natives of the rest of the country, and the issue of whether or not a Native was “civilized” proved relevant only in cases to do with school attendance.

The first federal actions that implied a difference between Alaska Natives and Native Americans were actually to the detriment of Alaska Natives. While federal treaties with Native Americans had accepted the premise that Native American tribes had claims of aboriginal title to large amounts of property—the acceptance of that premise being the very reason why federal recognition of tribal identity is legally important—the land laws enforced in Alaska admitted no such premise, and granted to “Indians or other persons” only that land “actually in their use or occupation,” meaning that while a tribe in the southwest might be admitted to own millions

of acres by ancestral right, Alaska Natives were acknowledged to own only the land they were actually putting to current use. This was an enormous difference, especially considering the size of Alaska, and implied a legally relevant difference between Alaska Natives and Native Americans.

Further, the judicial district of Alaska did not apply the body of federal law making up Indian trade laws until 1948; until that time, Alaska was considered separate from “Indian country,” and by extension, Alaska Natives distinct from American Indians. The Department of the Interior explicitly held, at least in the 19th century, that Alaska Natives did not have the same relationship with the federal government that Native Americans did.

Until 1905 no legal distinction was made between Native and non-Native residents for the purposes of federal educational services provided under the Organic Act. It was the Bureau of Education (now the Department of Education) that was responsible for providing education for Alaska Natives—as for all Alaskans—not the Bureau of Indian Affairs. There was also no Indian agency in Alaska.

In the 1886 case *In re Sah Quah* (1886), the Alaska federal district court ruled that Alaska Natives had almost no authority over themselves. The issue at hand was the practice of slavery by the Tlingits. The Tlingits argued that they were a sovereign entity and self-governing. The court ruled that they were dependent on the federal government and subject to the Thirteenth Amendment. Though the Department of the Interior later chose to interpret the decision narrowly enough that the prohibition of slavery was the only important part, the actual language of the decision makes it clear that the court did not consider the Tlingits to have any self-governing authority at all.

Later amendments recognized the discrepancy in land rights between Alaska Natives and Native Americans and authorized the Secretary of the Interior to designate Indian reservations in Alaska—and because Alaska Natives rarely organized as tribes as did Native Americans, they were allowed to organize under federal charters if they had “a common bond of occupation, or association, or residence within a well-defined neighborhood, community, or rural district”—allowing workers guilds and neighborhoods to apply for

the same rights as kinship-based tribes. By 1941, thanks to a drive by the Interior Department to encourage such organization, 38 groups had so organized. Interior established Alaskan reservations, including some of the region’s best fishing waters, now reserved for Native use exclusively, though when it attempted to prosecute illegal fishing by non-Natives, the Supreme Court struck them down and characterized the creation of the reservation as a “temporary” withdrawal, implying that Natives had no rights to permanent reserves, nor aboriginal title to the land.

In 1931, authority over Native relations in Alaska was finally transferred to the Bureau of Indian Affairs, which attempted to preserve Native fishing rights and the local reindeer industry. Native sovereignty, in matters where the federal government has not specifically ruled, was finally acknowledged, although as discussed, the courts seem to have felt that the sovereignty enjoyed by Native Americans was inapplicable to Alaska Natives.

Alaska Native Claims Settlement Act

In 1971, one of the most significant pieces of Native American legislation was passed: the Alaska Native Claims Settlement Act, which conveyed 45 million acres of land to Alaska Native regional corporations and a payment of \$963 million, in return for all aboriginal land claims in Alaska being extinguished. This was expected to resolve the problem of aboriginal land claims and to encourage economic development in Alaska. The matter of land ownership could no longer be left as vague as it had been in the previous 90 years: oil had been discovered on the Arctic coast in 1968, and the pipeline that was going to be built to carry it passed through lands that were under dispute. What might have taken decades or generations to resolve was settled in three years thanks to the importance of oil to the American economy. Settlement benefits were distributed to anyone with at least one-quarter Native ancestry.

One of the groups working to get the Alaska Native Claims Settlement Act passed was the Alaska Federation of Natives (AFN), which was founded in 1866 to advocate for Alaska Natives rights. Following the passage of the settlement act, the AFN was instrumental in providing assistance

to implement the act, see that those entitled to a portion of the settlement received it, and set up the regional corporations the act created. The AFN has continued as an advocacy and lobbying group since, helping develop the Alaska National Lands Conservation Act of 1980 and lobbying for changes to Alaska state laws in the interest of resource development and better health and education.

Classification

As with other racial groups, Alaska Natives have been variously classified in the U.S. census and other bodies of government data in different eras. In the early decades after Alaska was acquired, Alaska Natives were likely to be counted only if they lived in a white settlement—which was frequently the case with Native Americans as well, since nontaxed Indians (including Natives in this case) were not counted as part of the population for purposes of apportionment of Congressional representation. This changed in 1940, in part because of Supreme Court decisions that changed the taxation and citizenship status of Native Americans. For the most part, “American Indian or Alaska Native” has been one category, which beginning in 1960 was counted according to respondents’ self-identification.

While “Native Hawai‘ian or Pacific Islander” was recently separated into its own category, natives of South and Central America were folded into the “American Indian or Alaska Native” category, making accurate demographic information difficult and essentially requiring the assumption that those “American Indian or Alaska Native” respondents in Alaska are Alaska Natives, and those not in Alaska are other Native Americans—though given the number of Alaska Natives who have emigrated from Alaska to other parts of the Pacific Northwest, even this formulation is flawed. It is believed that about one-fifth of the Alaska Native population lives outside Alaska.

When the 1990 census allowed written responses to the race question, census data on Alaska Natives was expanded to include individual Alaska Native villages, though since this information was optional and not all opted to provide it, the result was incomplete. Census respondents who identify as “American Indian or Alaska Native” are asked to provide their tribe, and this question depends

on self-identification, without considering whether the tribe is federally or state recognized. Information on language use at home also provides some information on Alaska Native demographics.

Though race has been included in the census since 1790, the 1860 census was the first to separately enumerate Native Americans. Alaska Natives were first counted in the 1880 census and were usually categorized as American Indians. Beginning in 1940, they were listed as a separate group. In 1980 and 1990, Eskimos and Aleuts were considered separately.

The 2000 and 2010 censuses, following the 1997 requirement that federal agencies use a minimum of five race categories (white, black, American Indian or Alaska Native, Asian, and Native Hawai‘ian or Other Pacific Islander), generally stuck to those categories, providing the write-in

Native Alaskan women from an unidentified tribe selling handicrafts in Juneau around 1895. There are now at least 220 federally recognized Alaska Native regional and village corporations and 140,000 people with Alaska Native heritage.

line for additional information. 2000 also marked the first time that respondents could self-identify with more than one race (which continued in the 2010 census).

The problem with considering Alaska Natives and American Indians together, while it is helpful to Alaska Natives from a legislation standpoint, is the confusing data produced, such as the 2010 census report that Oklahoma is home to “the greatest numbers of American Indians and Alaska Natives,” when the number of Alaska Natives in that state is minuscule. Similarly, the report that the majority of “American Indians and Alaska Natives” live outside Native areas is misleading with respect to Alaska Natives, and is even conceived from a Native American–centric viewpoint, because of the surrender of sovereign land claims by Alaska Natives. Because Alaska Natives are outnumbered by Native Americans, population trends are cloaked by this aggregation. When reports are issued on population growth, on the

number of people reporting mixed-race heritage, on education and health, the data really reflects Native American trends, slightly heightened or dampened by Alaska Native trends.

American Indian Categorization

The number of American Indians inhabiting the territory now comprising the lower 48 states at the time Columbus arrived in the Americas is subject to widely varying estimates. The arriving Europeans brought not only their desire for land, but they also brought their diseases. The population of the first American Indians were decimated by these diseases to which their bodies had little resistance. What the population was after disease, genocide, and starvation took their toll is also open to speculation, and the actual population through the years has also been less than certain.

Due to many factors the U.S. Census Bureau has failed to produce an adequate basis for knowledge of the population of American Indians. The problems with defining race and determining which race a person may claim has created difficulties for an objective view of the true numbers of American Indians.

The American Indian population of the United States holds a place in U.S. history, culture, and law like no other group of people. The status of these descendants of the first inhabitants of the country is complex and requires a separate agency of the U.S. government and a multitude of federal regulation and laws. Being recognized as a member of a federally recognized tribe can have both cultural and economic benefits.

Beginning of the Census

The framers of the U.S. Constitution provided for a decennial census for the purposes of taxation and congressional representation. The first census was to be taken within three years after the adoption of the Constitution in 1787. American Indians were the only people whose race was

mentioned in the wording of the census. Whites and blacks were mentioned by inference. Whites were to be counted in full and slaves were to be counted at three-fifths of their actual number. The special status of black enslaved people was a compromise so that the southern states would have a higher population for congressional representation purposes. "Indians not taxed" was used to describe the only people who were to be excluded from the census.

The phrase was not defined but was clearly understood to refer to American Indians that lived in a tribal setting. Some had already left their tribal habitat and begun living in settings similar to whites, often in or near white settlements. Some who were not excluded were married to non-Indians. These people were not to be excluded from taxation and, therefore, would have been subject to counting in the census. Indian tribes were, for many purposes, considered sovereign nations. Having this status led to the treaties entered into between the United States and the various tribes. As members of these sovereign tribes, the numbers of American Indians were not considered to be significant for the purposes for which the census would be used.

For the most part from 1790 to 1840, only names of heads of households were given. The ages of other family members were then listed. For these same years, there are no reported results for the number of "taxed Indians." No instructions were given for counting or identifying Indians. There were no forms provided to the marshals who gathered the census information until 1830. It was almost as if Indians did not exist, according to the census. The first census in 1790 simply

required the name of the head of the household, number of free white males 16 and older; the same group, younger than 16; free white females and other free persons; and those who were enslaved. What few taxed Indians who were counted were recorded under the “other persons” category.

With the census of 1850 there was a new administrator. Congress had established a Census Board to oversee the conduct of the census. The superintendent of the census was given much leeway in conducting the count, and he reached out to the scientific community in designing a more effective census tool. The 1850 census was the first to list all family members in a household and to give some data for each individual, including a color category. Persons were listed as white, black, or mulatto. Indians were very infrequently designated. Some children of a black and an Indian parent were likely listed as mulatto. Enumerators were instructed to count Indians but given no direction as to where to include their numbers.

An Indian appropriation act in 1846 legislated the taking of a special census of Indians. Reports from this census included a summary of Indian populations gathered from the special census and various other sources, which were generally not based on the usual methods of census information gathering. The report, considered part of the 1850 census, was issued in 1853 and contained wording from the head of the Indian affairs agency that admitted that some of the figures given were only estimates. The questionable numbers were listed for the years 1789, 1825, and 1853.

In the 1860 effort there was no census schedule for Indians; however, federal marshals, who were the census enumerators, were instructed that if they determined that particular Indians lived apart from tribal authority and were taking advantage of the rights of citizens, these individuals were to be counted as a part of the total U.S. population. Such individuals were to be designated as Indians on the census forms.

The collection of the data was not consistent from state to state. California’s numbers included Indians and “half-breeds.” The total number of taxed Indians in this census was reported in a section titled “Civilized Indians by Age and Sex.” The number of taxed Indians reported for 1860 was just over 44,000. For most purposes, the

American Indians enumerated in this census were counted in the general population. This would be the last census in which this population was so slighted.

Throughout this period of history people were categorized by the census takers, sometimes with clearer direction than at other times. The perceptive abilities of the information gatherers, along with their biases and reporting skills were determinative in the accuracy of any resulting racial categorization. A gradual inclusion of racial subdivisions through the decades shows some of the concerns.

1870 to 1950

Beginning in 1870, the census agency gradually began to gather more information about the American Indian population. Despite the effort, racial categorizing throughout this period was subjective, based on the judgment of the enumerator. The 1870 census was the first census for which “Indian” was listed as one of the possible entries for “color.” Although this designation had been given before by enumerators, this was an official recognition of the need to count American Indians in a regular decennial census. The only ones who would be counted in the general population were “taxed Indians,” defined as those living near white communities. Those living on reservations and in remote locations were considered “Indians not taxed” and excluded from population numbers.

A separate schedule was also used for Indians. The final report listed those “sustaining tribal relations” as having a population of 357,981. Those “not sustaining tribal relations” were counted as members of the general population.

In 1880 specially trained and hired census takers replaced U.S. marshals. Legislative action had enabled the hiring 31,000 census takers for the 1880 census. The 1870 census employed 6,500 for this purpose. Use of the term *Indians not taxed* was eliminated. In fact, legislation in 1880 prohibited the counting of “Indians not taxed” in the regular decennial census. But the census agency was authorized to hire special census workers to count these omitted populations in special efforts. Legislation passed in 1889 directed the U.S. Census Bureau to count all the American Indians in the United States and to

distinguish those who were considered taxed and those who were not. This marked the beginning of each census ostensibly including all American Indians in each decennial count. This also was the first census to ask for the tribal status of American Indians.

American Indians residing on reservations were not as carefully reported in the 1880 census as they had been in the previous decennial. Detailed data was cumulated and given for the white population. The same cumulation was given for “civilized Indians,” Japanese, and Chinese, and blacks all under the “colored” category. The lack of more information on the Indian population in the 1880 census received criticism. Included were questions about style of dress, and whether the person made his or her living off the land or through those pursuits more in keeping with the white population.

The commissioner of Indian affairs, beginning in 1885, was required to submit a yearly census of the American Indians under the agency’s jurisdiction. Much of this data are from the population on reservations. This information was submitted to the Census Bureau. There were also special censuses of the Indian population carried out by the Census Bureau in subsequent years.

The 1890 census included an attempt to enumerate all Indians. The results were published in the general schedule and in a supplemental schedule. The definition of an Indian for this census required being full-blooded, acknowledged by a tribe or an Indian agency, or considered by their peers to be Indian. This definition expanded the class from previous censuses. No distinction was made between taxed and nontaxed in this census. The report even acknowledged there were those who claimed to be Indians, with little

A U.S. census taker, seated at right, recording the responses of this family of Winnebago Indians living in a tent in Wisconsin in 1910. Both the 1900 and 1910 censuses sought to find respondents’ percentage of “Indian blood,” and the 1910 census counted a person with any percentage of Indian blood as an Indian. The 1870 census was the first census in which “Indian” was an option for “color.”

justification, simply for the economic benefit to be accrued from the status. Even though racial status was reported on census forms by the census takers, it was determined that “Indians for revenue” presented a challenge for the census enumerators.

The racial categories for the censuses of 1900 through 1920 continued to include “Indian” as one of the responses. A separate schedule was provided for Indians in which more detailed information was elicited. In 1900 and 1910 the percentage of “Indian blood” was sought. This showed the increasing emphasis on blood quantum, or percentage in determining race. The 1910 census noted that if a person had any percentage Indian blood, he or she would be counted as an Indian.

All American Indians were given citizenship in 1924. In 1930 people of mixed white and Indian races were to be counted as Indians, unless the mixture of Indian blood was minimal or unless the community considered the person to be white. Some thought Indians were vanishing as a separate race and that each census might be the final opportunity for an accurate count. The numbers reported for this population reached their lowest point during this period. The estimated population of American Indians at the time Columbus discovered America ranges in the two to seven million range. By 1900, fewer than 250,000 were reported to be living in the United States.

The Indian Reorganization Act of 1934 encouraged American Indian tribes to organize themselves so that tribal membership rolls would be based on clearly established rules. This legislation sought to redress earlier efforts to dissolve Indian tribes. In 1940 the census began listing Eskimos and Aleuts separately in Alaska, whereas previously they had been counted as Indians. Also in 1940, the U.S. attorney general issued an opinion in which he determined that all Indians in the United States were “taxed Indians,” even though the census had ceased making the distinction.

In 1950, for the first time, “American Indian” was the racial designation used. In that same year, a determination was made to specially recognize a number of mixed race communities made up of people with Indian, black, and white backgrounds. These communities had locally recognized names and were to be counted as nonwhite and would

be listed in the “other race” category. This categorization led to a reduction in the American Indian population in areas where those communities existed. The population of American Indians, including Alaska Natives, was 357,499.

1960 through 2010

The latest period of census-taking is marked by the impact of the civil rights movement. The major shift began in the 1960 census, with a move to have most census forms filled out by respondents, instead of census enumerators. This meant that respondents would choose for themselves how to answer the question of race. This period of time is also marked by a great increase in the population of American Indians being reported.

This self-enumeration continued in succeeding censuses, and it is widely thought that this change in census procedures had a significant impact on population determinants for American Indians. Prior to self-enumeration, the classification of American Indians for census purposes was based on many factors. Often blood quantum was used to determine the percentage of American Indian blood a person had. The determination was often made based on the judgment of an enumerator. This could either be accurate or based on whim, color, living conditions, or even the spouse.

Sometimes American Indians would not want to disclose their status due to the possibility of discrimination or other perceived negative impact. Some who were American Indian had been classified as black or white. The move to self-enumeration put the onus on the individual to classify himself or herself.

Beginning with the advent of self-enumeration, the American Indian population began to show a rapid increase. It is widely believed that the increase in population numbers has been much greater than the natural population increase would allow. Population grows only by the excess of births over deaths, and by the excess over those migrating in over those emigrating out. Few American Indians migrate or emigrate, and the excess of births over deaths is not enough to account for the increasing census numbers over the last decades.

In 1950 there were just over 350,000 American Indians according to the census. These numbers include Alaska Natives as well, although they are

also counted separately. This number had grown to 508,000 in 1960 and to 792,000 by 1970. By 1980, the number had risen to 1,366,000. In 1990, the census reported almost two million. Clearly, the growth in population represented more than a biological growth in numbers. Many more American Indians were completing the census, and some were classifying themselves as American Indian who had not done so before. There are less negative connotations associated with being American Indian than in the past, and more positives. Some financial benefits are associated with the classification, but tribal laws determine who is classified as a tribal member. No such limits prohibit self-enumeration for census purposes.

For many, there is now pride in having American Indian blood. The later decades have seen a rise in movements of American Indian groups in proclaiming their heritage and their rights. The 1980 census, like those before it, allowed the selection of only one race. However, in 1980 and 1990, individuals could list multiple ancestries separate from their racial category.

In 1997 the White House Office of Management and Budget determined that the Census Bureau should allow multiple racial identities. This policy was instituted in the 2000 census. The policy was the result of growing numbers of multiracial people in the United States. Being able to claim only one race seemed confusing for those in the multiracial category. Groups representing multiple minorities opposed a single multiracial category, fearing the dilution of their numbers in the census figures. According to the rules for counting people who claimed more than one race, people who listed white and a minority race would be counted as the minority race since those were more likely to face discrimination, and their numbers seemed more important to report. This would mean that individuals who claimed to be white and American Indian would be counted for many purposes as an American Indian. This practice would tend to increase numbers reported for American Indians.

In 2000, approximately 2.5 million people categorized themselves as only American Indian or Alaska Native. However, over 1.6 million identified themselves as American Indian and one or more additional races. These numbers and the

changes in categorization in the census show the difficulties in comparing population figures from different censuses.

Over 500 tribes are recognized by the federal government. American Indians are asked to list their tribe's name on the census form. A person is free to list any tribe, even though they might not be officially enrolled as a member of that tribe.

The 2010 census showed an American Indian and Native Alaska population of 2.9 million for those who listed a single race. Again, as in the 2000 census, individuals could identify themselves by more than one race. Another 2.3 million listed American Indian or Alaska Native with one or more other races. The figures show a population growth of American Indians and Native Alaskans that is approximately the growth rate of the United States as a whole. Again the growth rates from 2000 to 2010 are far beyond what can be accounted for by biological growth. For the 2010 census, intensive outreach was done in the American Indian community, which could account for some of the large increase in population, since more individuals were probably reached than in prior years.

Conclusion

American Indians have been treated differently through the years in terms of counting them for the U.S. census. They were initially, for the most part, purposely not counted. Then they were counted sporadically, before they were counted regularly. They were counted as Indians based on their blood, their color, and where they lived. Others made the decision about how to categorize them and then they were allowed to categorize themselves. Finally, they were allowed to count themselves in more than one category. The Constitution first intentionally excluded most American Indians. Today, it has reached the point where millions of dollars are expended and maximum effort maintained so that every American Indian will be counted. Through all attempts at proper categorization for census purposes, inexactness and subjectivity have played a major role.

Ideas of race are always changing, but it seems to remain a social construct that means different things at different times in U.S. history. There have been times when American Indians were looked down on. More recently, there has been a

fascination with the romantic notion of the role of the Indian in the country's history. People hear stories about an American Indian ancestor and are willing to wear proudly the badge of American Indian. The question of who is an American Indian has many different answers. The census is not a perfect instrument. It is influenced by the times, by culture, and by people's ideas about themselves and others. Looking across the decades at the census numbers for American Indians, one has to use care and understand that the numbers do not mean the same thing for each census report.

Asian American Categorization

The United States has a decennial census, which means that every 10 years data is collected about its population. Historically, this information has been used to apportion representative seats within the U.S. House of Representatives, as mandated by the U.S. Constitution. Indeed, article I, section 2 of the U.S. Constitution says the following about apportionment:

Representatives and direct Taxes shall be apportioned among the several States which may be included within this Union, according to their respective Numbers, which shall be determined by adding to the whole Number of free Persons, including those bound to Service for a Term of Years, and excluding Indians not taxed, three fifths of all other Persons. The actual Enumeration shall be made within three Years after the first Meeting of the Congress of the United States, and within every subsequent Term of ten Years, in such Manner as they shall by Law direct.

In 1790 Thomas Jefferson, then secretary of state, oversaw the first U.S. census. Examination of that first census makes it painfully evident that it was a product of its time. Over the ensuing two and a half centuries, the process has not remained static. The questions asked, as well as the ways in which census workers collect data and enumerate citizens for the decennial census, have continued to evolve. For example, the first eight U.S. censuses included categories for individuals who were slaves or free colored. Meanwhile, American Indians and Chinese only began to be enumerated in the 1860 census, and that was limited: Chinese

were counted only in the state of California. It was not until 1870 that the Chinese began to be counted in the U.S. census. The 1890 census was the first time that the Japanese were included in the census. And, it was not until the 1950 census that Filipinos began to be counted.

Since the 1980 census, six detailed Asian response categories have been in use: (1) Asian Indian, (2) Chinese, (3) Filipino, (4) Japanese, (5) Korean, and (6) Vietnamese. In the 1990 census, an “Other” designation was added that complemented an Asian/Pacific Islander (API) category. In other words, census respondents could specify their API category.

Another fact that becomes clear when examining the history of the U.S. censuses is the difficult truth that the census has always had to deal with the public’s changing perceptions, attitudes, and social constructions of race, ethnicity, immigration, and citizenship. Until the 1950 census, respondents’ racial classifications were determined foremost by the observational judgment of the census enumerator and not by how they themselves would self-identify. This changed in 1960, when for the first time census data was collected by a combination of self-classification, interview, and observation by census enumerators. Some notable immigration scholars like Charles Hirschman have contended that most citizens would have classified themselves the same way as the census enumerators since race is very much a socially constructed phenomenon.

Contemporary Numbers

Understandably, the exact numbers of Asians in America at any given point in history are quite

difficult to ascertain since the U.S. census has changed continually since its origination in 1790. New questions continue to be added to the census, while old ones are changed or dropped, making them difficult to compare and contrast over time (longitudinally). Meanwhile, estimating the current Asian American population presents its own problems, since collection of detailed population data by Asian ethnic subgroup has been slow and has only recently become available. The 2000 census, for instance, marked the first time that it allowed for multiple classifications of race. Moreover, two reasonable questions can be asked: How does the census know if it is accurately capturing the population of Asians in the United States? And, how can pre- and post-1940 census data be accurately analyzed, since it was not until the 1940 census that statistical sampling—meaning

The 2010 census found that the Asian American population had grown in every region of the United States since 2000. As of April 2010, there were an estimated 17.3 million Asian Americans, making up 5.6 percent of the total U.S. population.

some citizens were asked more questions than others—began to be employed in census data collection? For all these reasons, accurate reporting on Asian Americans based on census data proves a challenging exercise.

Consequently, estimates of the number of Asians in America can be said to be approximate—especially since there are many Asians in the United States who do not wish to be counted or whose identities remain unknown. A significant number of Asians in America—no one has exact figures—are undocumented immigrants. Timothy Fong has written about how Hispanics (Latinos/as) tend to be the focus of media coverage on undocumented immigrants, while their Asian counterparts are spotlighted for being model minorities. This uneven reporting leads to the marginalization of Asian Americans and their further invisibility. According to Professor Fong, Asian Americans are racialized as model minorities but not as undocumented immigrants. This might be partly explained by the fact that some consider Asian Americans to be “honorary whites.” However, the general public’s naïveté about undocumented Asians in America is a cause for concern, especially since it has been estimated that of all the undocumented students who would qualify for the DREAM Act, one in ten would be Asian.

Another difficulty in estimating the number of Asians in the United States arises from the issue of whether or not Asian Americans and Asian Pacific Americans should be considered part of the same enumerated census group. Many scholars consider Pacific Islanders to constitute a different ethno-cultural and/or racial group than Asian Americans because of historical differences. This issue of whether or not Pacific Islanders should be categorized under the banner of Asian American remains salient, especially because many educational and governmental agencies continue to lump Asians and Pacific Islanders together, assuming they share some sort of affinity, despite social scientific research that demonstrates otherwise. According to Vicente Diaz, the practice of lumping Pacific Islanders with Asians remains a contested issue.

2010 Census and Asian Americans

Approximately 74 percent of the households returned their 2010 census forms by mail. To

count the remaining households, census workers walked throughout neighborhoods. The combined final tally indicated that the general population grew 27.3 million people, from 281.4 million in 2000 to 308.7 million in 2010. The official national population projection based on the 2010 census was released on December 21, 2010. According to its totals, Asian Americans constituted the fastest-growing racial group based on the estimate that there were 17.3 million Asians in America as of April 1, 2010. This number represents both respondents who indicated that they belonged to one Asian group and those respondents who indicated that they were Asian in combination with one or more other races. This figure indicates that 5.6 percent of all people in the United States identified as Asian (either alone or in combination with one or more other races). This is quite significant when one considers that the Asian population in the United States increased more than four times than the total U.S. population. The largest subgroups, according to the 2010 census, were the Chinese (4 million), Filipino (3.4 million), Asian Indian (3.2 million), Vietnamese (1.7 million), Korean (1.7 million), and Japanese (1.3 million).

Asian American Demographics

Notoriously, Asian Americans are often thought to constitute a homogenous group of overachievers. Stereotypes abound of Asians being hard-working, musically talented, and mathematically brilliant people who intend to assimilate into the dominant society as quickly as they can. The homogenization of Asian Americans has been a major obstacle for this diverse and heterogeneous population. It is important to understand that the Asian American population in the United States does not resemble a normally distributed population; it is bimodal in shape. This means that Asians are not equally distributed across outcomes. For instance, the poverty rate of Asian Americans is variegated. Indeed, although Chinese and Korean Americans appear to be prosperous, research points to the plight some experience. Jaime Lew has done considerable research in this area.

The geographic distribution of the Asian American population continues to be heavily concentrated in the western United States. The 2010 census indicates that 46 percent of Asian Americans

live in the west, 22 percent in the south, 20 percent in the northeast, and 12 percent in the mid-west. The Asian American population grew in every region between 2000 and 2010, with Asian Americans experiencing the fastest growth in the south. Nearly three-fourths of all Asian Americans live in the following 10 states, according to the 2010 census: (1) California, 5.6 million; (2) New York, 1.6 million; (3) Texas, 1.1 million; (4) New Jersey, 0.8 million; (5) Hawai'i, 0.8 million; (6) Illinois, 0.7 million; (7) Washington, 0.6 million; (8) Florida, 0.6 million; (9) Virginia, 0.5 million; and (10) Pennsylvania, 0.4 million.

Age, Gender, and Occupation

Roger Daniels provides an accounting of the Chinese American population by sex, citizenship, and sex ratio from 1860 to 1940 in his book *Asian America: Chinese and Japanese in the United States Since 1850*. However, there is a dearth of this type of research using 2010 census data. *Asian America* also provides tables with census data on Chinese Americans' age and sex distribution in 1920. For more current data on Asian Americans' age, gender, and occupation, the 2010 census indicates that the median age of the single-race Asian population was 35.4 years. Twenty-two percent of the single-race Asian population were under the age of 18 in 2010, while 9.4 percent were 65 or older. Twenty-nine percent of the single-race Native Hawai'ian and other Pacific Islander population were under the age of 18 in 2010, while 5.8 percent were 65 or older.

Future Trajectory for Asian American Enumeration

The census plays a critical role in the political apportionment process. Apportionment is important for the sake of distributing representation properly and fairly within cities and states. If representative seats are incorrectly apportioned, or apportioned unfairly, issues of political power become contentious. The issues at stake become readily apparent when one considers the trend for states to become color-blind, as can be seen in the states of Arizona, Nebraska, Michigan, Washington, and California. For instance, in 2010, Arizona abolished affirmative action as a result of Proposition 107. In 2008, voters in Nebraska passed Initiative 424, a constitutional ban that abolished

government affirmative action. In 2006, Michigan became color-blind, the result of Proposal 2. In 1998, Washington passed Initiative 200, which barred the state from using preferential treatment. California passed Proposition 209 in 1996, abolishing affirmative action. These states have become color-blind, but why have they done so?

California and Texas have both experienced the largest numeric growth of Asians. Therefore, it stands to reason that the ways in which Asians are enumerated in censuses becomes especially significant in those states, not only for Asians but also for the entire population. Do Asian Americans support color-neutral social and educational policies? Asian Americans' attitudes toward affirmative action should be examined further. Asian Americans, given their increased growth, will demand that politicians hear their requests since they represent an important constituent group and pivotal voting bloc. As an increasing number of young Asian Americans reach voting age and begin to cast ballots in state and national elections, it becomes increasingly important that their thoughts and opinions be heard and considered. As the Asian American Legal Defense and Education Fund rightly observes, redistricting is an opportunity to increase the political influence and representation of Asian Americans. But if done incorrectly, redistricting can also divide and gerrymander Asian American neighborhoods, resulting in diminished political representation and voting strength.

The history of censuses bears out the reality that the census is a product of its time. The census surely will continue to change and evolve, as it has in times past. However, the trajectory of Asians in the United States remains influenced by the model minority stereotype, as well as the older yellow peril stereotype, a holdover from the era of the Chinese Exclusion Act and Japanese internment.

Model Minority Stereotype

The questions that census respondents answer are an important consideration in understanding the data collected. But equally important to consider are the ways in which census data is analyzed. For instance, the Pew Research Center recently analyzed 2010 U.S. census data in a report titled *The Rise of Asian Americans*. It makes inaccurate claims that continue to feed the

model minority stereotype of Asians in America. The model minority stereotype constructs Asian Americans as extremely successful minorities who have achieved the American Dream through their hard work and perseverance. The report's title immediately elicits feelings that Asian Americans are doing something well. The report, which was based largely on 2010 census data, leads its readers to believe that Asian Americans continue to be what Robert Teranishi and others have called "super minorities." But Asian Americans are not super minorities. Asian Americans are very much like other racial, ethnic, and cultural minorities: they experience difficulties and discrimination, and they become disgruntled when structural and institutional barriers limit or prevent them from achieving their goals.

It should also be noted that there exists a history of violence, discrimination, and negative attitudes toward Asians in America. U.S. census data analysts might find that Asian Americans are doing extremely well, but the ways in which Asian Americans are enumerated, and the questions that they are asked, are significant given the fact that social psychologists have found that Asians have been deemed less American than whites or blacks. The Committee of 100, a group of influential Asian American leaders, conducted a survey that revealed that many Americans who would vote for an African American presidential candidate would not vote for an Asian American candidate. President Barack Obama may be a bellwether, and perhaps it will be many years before America has an Asian American in the White House.

Given that there are many biracial and multi-racial Asian Americans, it is imperative that their responses to census questions are parsed out. As time passes, many of them might not identify as being Asian, which would skew census statistics, causing a misleading reduction in the numbers of Asian Americans in the United States. According to Dixie Koo, Anthony Peguero, and Zahra Shekarkhar, this is feasible considering that Asian Americans may wish to distance themselves from being Asian because attitudes toward Asians are poor. Asian Americans' actual and potential voting power make them an important demographic of society. Understanding that America has felt ambivalently toward Asians, we can anticipate current stereotypes to continue and new ones

to form. This is also why census data collection included questions about respondents' experiences of harassment and racism. Gathering the data in a way that better facilitates cross-tabulation would also assure that nuanced differences could be better analyzed. The census has come a long way since 1790, but there is still much room for growth.

Category Controversies

The U.S. Census Bureau collects data on voting and registration. Formed in 1903, it is the government agency that oversees the U.S. Census and serves as the top source of information about residents of the United States. The most immediate result of the census, presently, is allocating or reallocating the number of representatives in the U.S. House. The history of the census is an interesting and controversial history of race and ethnicity in the United States.

Terminology

Defined by the federal Office of Management and Budget (OMB) and the U.S. Census Bureau, “race” and “ethnicity” in the U.S. Census are self-identification data items. This means that residents choose the race or races with which they most closely identify and indicate whether they are of Hispanic or Latino origin. (Hispanic and Latino are presently the only categories for ethnicity).

For census purposes, the OMB defines the concept of race as not “scientific or anthropological” and takes into account “social and cultural characteristics as well as ancestry,” using “appropriate scientific methodologies” that are not “primarily biological or genetic in reference.”

The race categories include both racial and national-origin groups. Race and ethnicity are considered separate and distinct identities; the question of whether a respondent is of Hispanic or Latino origin is a separate question. Thus, in addition to their race or races, all respondents are categorized by membership in one of two ethnicities—Hispanic or Latino and not Hispanic or Latino.

Promoting and Enforcing Civil Rights

Civil rights law and enforcement remain the motivation behind the development of the data standards. Among the changes related to civil rights law (which have been in effect since the 2000 census), is the instruction to “mark one or more races.” The OMB added that option after noting evidence of increasing numbers of interracial children and wanting to capture the diversity in a measurable way. It also received requests from people who wanted to be able to acknowledge their own or their children’s full ancestry rather than identify with only one group.

Before this decision, the census and other methods of government data collection asked people to report only one race. On its reasoning, the U.S. Census Bureau reports that “data on ethnic groups are important for putting into effect a number of federal statutes (i.e., enforcing bilingual election rules under the Voting Rights Act; monitoring and enforcing equal employment opportunities under the Civil Rights Act). Data on ethnic groups are also needed by local governments to run programs and meet legislative requirements (i.e., identifying segments of the population who may not be receiving medical services under the Public Health Act; evaluating whether financial institutions are meeting the credit needs of minority populations under the Community Reinvestment Act).”

2010 Controversies

Some groups continue to object to the counting of undocumented persons who are in the United States. Republican senators David Vitter and Bob Bennett tried unsuccessfully to add questions on

immigration status to the newest census form. Organizations such as the Prison Policy Initiative argue that the census counts of incarcerated men and women as “residents of prisons,” rather than of their preincarceration addresses, skewed political clout and resulted in misleading demographic and population data.

The 2010 census contains 10 questions about age, gender, ethnicity, home ownership, and household relationships. Six of the 10 questions are intended to be answered by each individual in the household. Current federal law has provisions for fining those who refuse to complete the census form.

The Hispanic/Latino Question

The federal government has mandated that “in data collection and presentation, federal agencies are required to use a minimum of two ethnicities: ‘Hispanic or Latino’ and ‘Not Hispanic or Latino.’” The Census Bureau defines Hispanic or Latino as “a person of Cuban, Mexican, Puerto Rican, South or Central American, or other Spanish culture or origin regardless of race.”

Use of the word *ethnicity* for Hispanics only is considerably more restricted than its conventional meaning, which covers other distinctions, some of which are covered by the race and ancestry questions. The distinct questions accommodate the possibility of Hispanic and Latino Americans also declaring various racial identities. In the 2000 census, 12.5 percent of the U.S. population reported Hispanic or Latino ethnicity and 87.5 percent reported not-Hispanic or Latino ethnicity.

Our most recent census, the 2010 census, included changes designed to more clearly distinguish Hispanic ethnicity as not being a race. That included adding the sentence: “For this census, Hispanic origins are not races.” Additionally, the Hispanic terms were modified from “Hispanic or Latino” to “Hispanic, Latino or Spanish origin.” Although used in the census and in the American Community Survey, “Some other race” is not an official race, and the U.S. Census Bureau considered eliminating it before the 2000 census.

As the 2010 census form did not contain the question titled “Ancestry” found in prior censuses, there were campaigns to get non-Hispanic West Indian Americans, Turkish Americans, Arab

Americans, and Iranian Americans to indicate their ethnic or national background through the race question, specifically through the some-other-race category. The Interagency Committee has suggested that the concept of marking multiple boxes be extended to the Hispanic origin question, thereby freeing individuals from having to choose between their parents’ ethnic heritages. In other words, a respondent could choose both Hispanic or Latino and Not Hispanic or Latino.

The Use of *Negro*

The term *Negro* is used in the 2010 questionnaire (“Question 9. What is Person’s race? . . . Black, African Am., or Negro”) as a choice to describe one’s race. U.S. Census Bureau spokesman Jack Martin explained that “many older African Americans identified themselves that way, and many still do. Those who identify themselves as Negroes need to be included.” The word was also used in the 2000 census, with over 56,000 people identifying themselves as Negro.

Census Challenges

Detroit Mayor Dave Bing held a press conference on March 22, 2011, to announce that the city would challenge the city’s census results. The challenge, led by the city’s planning department, cited as an example an inconsistency showing a downtown census tract that lost only 60 housing units but 1,400 people, implying that a downtown jail or dormitory was missed in canvassing.

New York City Mayor Michael Bloomberg held a conference on March 27, 2011, to announce that the city would also challenge his city’s census results, specifically the apparent undercounting in the boroughs of Queens and Brooklyn. Bloomberg said that the numbers for Queens and Brooklyn, the two most populous boroughs, are implausible. According to the census, they grew by only 0.1 percent and 1.6 percent, respectively, while the other boroughs grew by between 3 percent and 5 percent. He also stated that the census showed improbably high numbers of vacant housing in vital neighborhoods such as Jackson Heights, Queens, New York.

The District of Columbia announced in August 2011 that it would also challenge its census results. The Mayor’s Office claimed that the detailed information provided for 549

census blocks is “nonsensical,” listing examples of census data that show housing units located in the middle of a street that do not exist. However, officials do not believe the city’s total population will drastically change as a result of the challenge.

Census Data and Multicultural Research

The U.S. Census Bureau produces a wealth of valuable data on the demographics of the United States through its decennial federal census and intra-census statistical surveys like the American Community Survey. It has conducted 22 federal censuses since the first one in 1790, though comparing data across censuses often requires special care because of changes in data collection methods, terminology, and other factors. One controversial issue is the matter of who is counted in the decennial census, which serves as the official count of the population. Census data is used to provide official population figures that determine federal funding, special programs funding, and apportionment of electoral votes and congressional districts. Under current practices, the count is based on “usual residence”—a concept established in the first census, referring to the place that a given person sleeps most of the time—and counts all persons whose usual residence is a U.S. residential structure, including citizens, noncitizen legal residents and long-term visitors, and undocumented immigrants. Americans not resident in the United States are counted only if they are federal employees living overseas as part of their job or dependents of such (including the military).

Both the exclusion of other Americans living overseas, who still vote, and the inclusion of undocumented immigrants, who do not, are subject to particular criticism. Complaints have also been lodged about counting prisoners as prison residents, rather than as residents of their normal domiciles, and of imputing data (a method in statistics of substituting estimated values for missing data) when the occupation status of a housing unit is unknown, which may introduce a statistical bias.

Many of the complaints in all these areas have racial dimensions—the prison population is disproportionately nonwhite, as is the undocumented immigrant population—and there has always been a racial character to the census. When the census was first taken, whites and blacks were counted separately, and white men and white women were tabulated separately, because equal rights and significance did not accrue to every kind of person under the law at the time. Today, race and sex are tabulated for exactly the opposite reason: to assure equal rights and representation for all. Federal policy is dependent on an accurate picture of the American population, and funding and policy for numerous federal programs are impacted by the ethnic, racial, and gender breakdown of the American population.

The concept of race and ethnicity has changed drastically over the history of the census, which is necessary to keep in mind when using historical census data or comparing data from multiple censuses. The first census reported only whites, slaves, and “other free people,” which usually meant free blacks but could have included numerous other possibilities, albeit not present in the country in great numbers. More racial categories were added over time, in response to political concerns. Various gradations of multiraciality were added, beginning with mulatto, with quadroon and octoroon added later, all of which were at one point replaced with the “one-drop rule” that stipulated that anyone with any black heritage was black, regardless of percentage. The changing demographics of the United States from immigration and assimilation caused the addition of categories for American Indians, Alaska Natives,

Native Hawaiians, and Pacific Islanders. Racial categories were also expanded over time: originally, all Asians were categorized as “Chinese” but other nationalities were added later.

Contemporary Census Taking

After this lengthy expansion, the racial categories then contracted. The census today uses the five minimum categories required by the federal Office of Management and Budget: white, black, Asian, American Indian or Alaska Native, and Native Hawaiian or Other Pacific Islander. Respondents are allowed to select more than one race. In the 2000 census, respondents were allowed to answer “some other race” with space for elaboration; in 2010, they were not given that space in which to elaborate. This has drawn the ire of many Americans and groups representing them, including Hispanics, Arab Americans, Turkish Americans, Iranian or Persian Americans, and West Indian Americans, some of whom do not self-identify as any of the provided race categories. Though “Hispanic” has never been treated as a race category by the federal government, it has been viewed as one by a significant number of Hispanic respondents.

This shift in race categorization makes cross-census comparisons challenging. The other change is the shift from enumerator definition to self-definition in the matter of tabulating a respondent’s racial and ethnic identity. The reason for rules like the “one-drop rule” was that determining the race of the respondent was the task of the enumerator administering the census questionnaire. Enumerators from the local community were usually used; in one era, respondents with American Indian heritage, for instance, were allowed to be tabulated as white if they were generally accepted as part of the local white community, so long as the heritage was only a trace. Applying this guideline required the enumerator to be familiar with that local white community or, in some cases, to make inquiries.

Today, the idea of a federally appointed census taker making inquiries throughout town to determine the race of an American citizen for the purposes of a database is not accepted. This history of invasiveness may play a role in many people’s resistance to the census today. Undocumented immigrants, who are officially a part of the count, have a long history of underparticipation, but many American citizens either refuse to answer

some questions (in the 1940s, there was controversy over a question about income; in the 1960s, it was over the number of children born to adult women) or distrust the whole endeavor, despite the fact that the explicit purpose of the census is to ensure that everyone is properly represented in government. Resistance to answering the census is a factor to consider in weighing the accuracy of information, with some population segments more than with others.

Another is the matter of self-definition. Today, respondents gauge the accuracy of their answers. Race and ethnicity are explicitly defined as nonbiological phenomena, social classifications. Because of this, there are large numbers of people in the population whose racial classification has been presented differently in different census years. A man could easily have been listed as black in an early census, Hispanic in a later census, and multiracial (white and black) in the most recent census, in which Hispanic is no longer a race option.

American Community Survey

The decennial census is not the only survey conducted by the Census Bureau, nor the only useful one. The American Community Survey (ACS) is now sent to 250,000 respondents a month (which with follow-up in-person calls on some of those who do not respond amounts to about 2 million finished interviews per year) and has replaced the long form section of the decennial census. The ACS was first tested in 1996 and has been producing data since 2000, but it was only fully implemented in 2005. So there is as yet not a large body of historical ACS data to compare, though much of its data can be compared to that yielded by earlier censuses. Because the ACS is carried out continuously, it provides a constant stream of demographic information, from which it is easier to make projections than from the decennial censuses. The ACS is an experiment, a way of addressing the declining response rate to the decennial census. Some of those who object to the census also object to the ACS, pointing out that the Constitution calls for an enumeration of the population but does not require the level of detail that either survey provides.

The primary purpose of the decennial census is to provide an accurate count of the American people for the purpose of congressional

The 2010 census form was one of the shortest forms ever used. The Census Bureau fully implemented the American Community Survey in 2005 to replace the long-form section of the decennial census and now sends it to 250,000 people per year.

apportionment and legislative redistricting. The ACS is intended to measure social and economic characteristics of the American people and is not used as an official count of the population. The ACS today, and the long form decennial census going back to the early 20th century, provides information on age, sex, Hispanic origin, race, family relationships, income, food stamp benefits, employment status, industry and occupation, place of work and distance of commute, vehicles, health insurance coverage, marital history, fertility, grandparents as caregivers, ancestry (ethnicity), place of birth, citizenship, language spoken at home, educational attainment, veteran status, disability, and housing-specific questions such as the year the housing structure was built, the number of units, its rooms, bedrooms, kitchen and bathroom facilities, house heating fuel, telephone service, value, and rent (if applicable).

ACS data are released the year following their collection (decennial census data often takes much longer). ACS data is used by federal agencies like the Department of Veterans Affairs to evaluate the need for educational employment or health care programs for veterans, and by the Special Supplemental Food Program for Women, Infants, and Children (WIC) to determine its resource needs. Nongovernmental organizations like the Annie E. Casey Foundation use the ACS to monitor the well-being of American children, including metrics of child poverty, school enrollment and educational issues, and the children of unemployed or underemployed parents. State-level information about American residents born outside the United States is maintained by the Migration Policy Institute using ACS data.

Journalists rely on ACS data for stories about trends. State and local governments use the ACS to plan and prioritize the building and restoration of roads, bridges, and other infrastructure, and to project the need for new or expanded hospitals, schools, senior centers, and police and fire stations, in order to be able to provide basic services to the local community. From 2006, the ACS has included in its samples groups of the population living in group quarters such as college dormitories, nursing homes, and prisons. For this reason, ACS data from 2006 to the present is not comparable to earlier ACS data, particularly when dealing with impacted population groups like teenagers and the elderly. From 2008 on, three-year estimates have been made available for all geographic areas of at least 20,000 people; and from 2010 on, five-year estimate have been made available for all geographic areas. Most geographic areas receive only five-year estimates.

The major ACS data products provided by the Census Bureau are data profiles, which provide broad social, economic, housing, and demographic information; narrative profiles, which summarize the same information contained in the data profiles; selected population profiles, which focus on specific race, ethnic, or ancestry groups; ranking tables, which provide rankings for a given state (or Washington, D.C., or Puerto Rico) across 86 variables; subject tables, which go into more detail than the data profiles; detailed tables, which provide the most detailed data, cross-tabulated with ACS variables; geographic comparison

variables, which compare nonstate geographic areas across variables; thematic maps, which display ACS data online interactively; custom tables, which use specific rows of data from ACS detailed tables, selected by the user; summary files, which are comma-delimited text files that provide access to the detailed tables; and public use microdata sample files, which are used with SAS and SPSS software to provide access to ACS microdata. SAS software is a system developed by the Statistical Analysis System Institute for information retrieval, data management, data mining, forecasting, statistical analysis, and data warehousing. SPSS is a similar system of products developed and maintained by IBM, in use since 1968.

There are several main areas of caution in using ACS or decennial census data. Before blindly comparing bodies of data from different censuses or surveys, compare and understand their methodology, and determine how that may have affected the comparability of the numbers. Bear in mind that the ACS characterizes the population and is not designed to provide an accurate count of the population, either in toto or in geographical or demographic subgroups. Small differences between two estimates are as likely to indicate a difference in sampling methods, margin of error, or other sources of error as they are an actual statistically relevant difference. Annual fluctuations of data do not necessarily indicate long-term trends. ACS surveys since 2006 include populations not included from 2000 to 2005, which has a particular impact on data to do with young adults, the elderly, or any population groups represented by the imprisoned. Three- and five-year estimates are not estimates of a specific year in the series.

The ACS's period estimates, which are issued as one-year, three-year, and five-year estimates, describe the average characteristics of an area over the given period of time (always January to December). They are not calculated as averages: the one-year estimate is not an average of 12 monthly values, nor is a five-year estimate an average of five years or representative of any single one of those years. Single-year estimates are the most current, but multiyear estimates are less impacted by recent major changes (which may be good or bad, depending on the use for which the data is needed) and are available for a larger number of geographic areas. Sample estimates should also be examined with

their provided confidence interval in mind. A confidence interval is derived from the sample estimate and its standard error, and represents the degree of uncertainty about the estimate. Standard error is a measure of deviation of a sample estimate from the average of all possible samples.

Current Population Survey

The Census Bureau is also responsible for the Current Population Survey (CPS), which is provided to the Bureau of Labor Statistics every month and is used for various ends, including computing the unemployment rate and the monthly Employment Situation Summary. The bureau has been conducting the CPS since 1942, two years after its inception. The CPS is a statistical survey rather than a true count. Like the well-known example of the Nielsen television ratings system or the methods used in opinion polling, it focuses on a representative sample size (60,000 households) in order to generate an estimation of the whole.

The CPS focuses mainly on employment and differentiates between types of unemployment, including those who have been unemployed for a long period, those who have lost their jobs, those who are unemployed and over 25, those seeking full-time jobs, and those seeking part-time jobs. Employment figures are provided for the population by age, sex, race, Hispanic origin, marital status, family relationship, and Vietnam-era veteran status. The CPS reports are useful for examining employment trends, though they also provide a demographic glimpse of the population at a given time.

Demographics and Ethnic Diversity

Demographics are data pertaining to the characteristics of a population group, and, when used in such constructions as “the demographics of frequent Internet users,” refers to the set of statistics describing that population, including the age, gender, ethnicity, disability status, employment, and education level of that population. Demographic data can be as simple as age, sex, and ethnicity, or as narrow as creditworthiness, political affiliation, or car ownership. Demographics are used in all forms of public opinion polling, including polling of political and social trends, marketing and TV ratings (television advertisement costs are based more on the demographic watching the series during which the advertisement airs than on the raw rating), and focus group studies.

Various entities conduct surveys and polls that provide demographic data in which the ethnic diversity of the surveyed group may be examined. Of these, the U.S. census is the best known and the largest in terms of sample size, although even at its most in-depth, it is a shallower survey than many others. The census is conducted every 10 years, with results usually released within a few years. The goal of the census is 100 percent participation of the U.S. population and U.S. residents (including noncitizens), and the data are necessary in order to allocate electoral votes and congressional seats as well as to determine the funding of government programs that serve specific segments of the population.

Ethnicity and Race

Ethnicity is one of the only demographic traits that has been tracked in every census. However,

the way ethnic information has been collected and categorized has varied considerably, making comparisons between censuses difficult. The earliest censuses tracked free whites, slaves, and “all other free persons.” More specific ethnic and racial information was not necessary for the purpose of allocating electoral votes and congressional apportionment. In 1820, non-naturalized foreigners were also noted. Mixed-race individuals were tracked in 1850, and in 1860 Native Americans who had joined white society were tabulated. Detailed information on the African American community was not tracked until 1870, after the end of slavery, which was also the first census to begin tracking nationality. As immigration increased, new ethnic or race options were added to the census according to recent trends. The race options in 1890, for instance, were “white, black, mulatto, quadroon, octoroon, Chinese, Japanese, and Indian.” Today, only two of those would be included unaltered, and mixed-race individuals are no longer subcategorized so arcanelly.

For much of census history, census takers determined the race of each respondent. Today, race and ethnicity are self-reported. Differences in attitudes toward race impact the complication of comparing data from separate censuses for this reason. Definitions of race have also changed. Native Hawai‘ian and Other Pacific Islander has only been tracked as a separate race group since 1990, having been grouped with Asians in the past. Though it was once possible to check “Other,” with a write-in space for elaboration, in the race category this option has recently been removed, thereby drawing complaints from Hispanics who identified their race as Hispanic

or Latino (despite the official census policy that “Hispanic” is an ethnic, not racial, category) and from Arab, Persian, and Indian Americans who identify with none of the offered options.

Effectiveness of U.S. Census Bureau Surveying

For a time, the census used both a short form census, which all respondents completed, and a long form census, which was given to a small number (often about one-eighth of respondents) for more in-depth information. This changed with the most recent census in 2010, in which all respondents answered only 10 questions. The long form census has been replaced by the American Community Survey (ACS), now the second-largest survey conducted by the Census Bureau, consisting of a long-form survey sent to 250,000 households a month. This results in 30 million ACS responses per 10 years, comparable to the number of households who had previously been sent long-form censuses but on an ongoing rather than decennial basis.

The modern census has frequently been accused of (or admitted to inadvertently) undercounting certain populations, especially the poor, ethnic minorities, and illegal immigrants, in large part because of a reluctance on the part of those populations to participate. Efforts to correct this undercount in the form of outreach often meet with criticism from some conservatives, especially when it comes to counting undocumented immigrants (though participation in the census confers no rights or privileges). Further, prisoner advocacy groups like the Prison Policy Institute have argued against the practice of counting prisoners as residents of their prison, rather than of the addresses where they lived before incarceration, since this skews the demographic results of the ethnic groups with the largest incarceration rates.

The Census Bureau also produces the American Housing Survey, Consumer Expenditure Survey, Economic Census, National Hospital Discharge Survey, National Crime Victimization Survey, National Nursing Home Survey, Residential Finance Survey, and other surveys that include demographic information. For the Bureau of Labor Statistics, it produces the Current Population Survey, a monthly survey of about 60,000 households from which employment data for the country are extrapolated.

Data From Other Entities

Beyond the data provided by the census, there are other bodies of data provided by both public- and private-sector entities. The U.S. Census Bureau is one of the principal agencies of the Federal Statistical System—the group of agencies that provide data about the country—but not the only one.

The Bureau of Labor Statistics, in the Department of Labor, is the federal government’s principal fact-finding agency in the field of labor statistics. The National Center for Education Statistics provides education statistics with a focus on public school districts and comparisons with education in other countries. The National Agricultural Statistics Service provides reports on national demographic studies of the agricultural sector. The National Center for Health Statistics, housed in the Centers for Disease Control and Prevention, provides health and nutrition information about the American people.

The Energy Information Administration provides data on energy resources and usage. The Bureau of Economic Analysis (in the Department of Commerce) and the Economic Research Service (in the Department of Agriculture) provide economic data and demographics. The Bureau of Justice Statistics collects data about crime trends and demographics. The Bureau of Transportation Statistics produces data on transportation systems and usage, critical to planning the nation’s transportation infrastructure. The Internal Revenue Service’s Statistics of Income Division provides demographic data on Americans’ income. The National Center for Science and Engineering Statistics provides scientific data. And the Office of Research, Evaluation, and Statistics serves the needs of the Social Security Administration.

The BLS’s data is released in coordination with the Office of Management and Budget (OMB), an office within the executive office, which both provides data and guides policy related to the president’s preparation of the federal budget. The OMB has defined 1,098 statistical areas of the country for the purposes of its work, ranging from Micropolitan Statistical Areas, which are based around an urban area with a population from 10,000 to 49,999, to Primary Statistical Areas, which consist of a metropolitan area that is not part of another larger metropolitan area.

Pew Research Center

The Pew Research Center is a Washington, D.C., think tank (the third-largest in the city), formed in 1990 as the polling operation for Times Mirror, the company that owns the *Los Angeles Times*. It has since expanded and draws its funding now from the Pew Charitable Trusts, a nonprofit nongovernmental organization founded in 1948 to inform the public and improve public policy. The end goal of the demographic data generated by the Pew Research Center is to better inform policy makers.

Surveys and in-depth public opinion reports are grouped into seven ongoing topic-focused projects: the original project, the Pew Research Center for the People and the Press, conducting public opinion survey research on attitudes toward politics; the Pew Research Project for Excellence in Journalism, which surveys news coverage and trends in the media; Pew Research Internet and American Life Project, which researches issues related to the Internet and other technologies; the Pew Research Forum on Religion and Public Life, surveying religious practices and demographics; the Pew Research Hispanic Center, focusing on the Hispanic American population; the Pew Research Global Attitudes Project, chaired by former Secretary of State Madeleine Albright, examining public opinion at the international level; and Pew Research Social and Demographic Trends, which focuses on American daily life, family trends, wealth and income demographics, and other areas.

Pew reports have the luxury of being more specific in their focus than the data the census provides, though of course the sample size is not as comprehensive. The Pew Internet and American Life Project, for instance, has produced in-depth demographic studies of Internet usage, social media and networking, adult use of video games, the demographics and habits of Twitter

users, teenage communication habits and skills, cyber bullying, and “sexting.” Such reports can help shape policy or personal choices related to new technologies; studies of texting habits and Internet usage on smart phones impacted laws and public service announcements against texting while driving, for instance, while cyber bullying studies in the aftermath of several well-publicized young suicides have led to that threat being treated with a new seriousness.

Other think tanks occasionally produce in-depth polling reports as well, even if this is not their main focus, especially in order to show support for initiatives they advocate, or to generate data from which to extrapolate conclusions relevant to their area of interest. Notable think tanks in the Washington, D.C., area include the Center for American Progress, the Heritage Foundation, the American Enterprise Institute, and the Brookings Institution, which is both one of the oldest (established in 1916) and most influential.

Ethnic/Racial Group Data

Racial and ethnic categories are defined by the Federal Office of Management and Budget (OMB) and the U.S. Census Bureau. In the United States today, race and ethnicity are separate identities, and the only ethnic categories are “Hispanic/Latino” or “not Hispanic/Latino.” This practice of separating ethnicity and race, either in general or specifically in reference to Hispanic-ness, has been the subject of criticism by certain groups and members of the public. In the words of the instructions provided by the Census Bureau, today the racial categories in use “reflect a social definition of race recognized in this country and not an attempt to define race biologically, anthropologically, or genetically.” Rather than evaluating claims of racial or ethnic identity, answers depend on self-definition, a change that began in 1970. The Office of Management and Budget dictates a minimum of five race categories used by federal agencies: white, black, American Indian or Alaska Native, Asian, and Native Hawaiian or Other Pacific Islander. On recent census questionnaires, respondents have been allowed to select more than one race.

Considering race and ethnicity as completely separate identities is unusually American and has come under criticism by certain groups and members of the public. The OMB’s five minimum race categories, while dictated as a minimum set, has had the effect of removing Hispanic or Latino as a write-in race option, to which some had become accustomed. This has specifically been targeted for criticism, as has the lack of an option for Arabs, Persians, and other ethnicities who may not be comfortable identifying as white but do not fall into any of the other provided categories.

Early History of Ethnic/Racial Categories

Race and ethnic data have been collected by the census since the first official census in 1790, when the number of free white males, free white females, slaves, and “other free persons” were among the sets of data determined. The term *colored*, referring explicitly to race rather than implicitly through the question of slave status, entered the census vocabulary 30 years later with the 1820 census, which also asked about former slaves, a number of states having abolished slavery by that time. Due to growing nativist sentiments and the beginning of the wave of European immigration, the 1830 census added a question about non-naturalized foreigners, though it did not get specific about their ethnicity, focusing on the sheer number of immigrants rather than specifics about their origins.

Over the course of the rest of the 19th century, racial questions became much more specific, as the “colored” category was broken down into black or mulatto, and American Indians and “Chinese” (which included all Asians) were added as possibilities. Non-Chinese Asian ethnicities were added as races with the 1890 census, which added quadroon and octoroon as colored variants. “Hindus” (south Asian Indians), Koreans, and Filipinos were added as races in 1920.

1930s to 1950s

In 1930 a radical change was made in the way race was classified. “Mulatto” was eliminated, and in point of fact, in many ways the concept of multiracial heritage was eliminated, with classifications erring on the side of nonwhite: anyone with American Indian ancestry was considered

Indian even if their ancestry was predominantly white, unless he was accepted as part of white society; anyone with white or Indian and black ancestry was considered “Negro,” in accordance to the “one drop rule.” Mexican was added as a race, though prior to this time, and again in 1940, Mexicans had been classified as white.

The Japanese attack on Pearl Harbor on December 7, 1941 (marking the entry of the United States into World War II), happened to fall at a time when a decennial census had recently been conducted. The analytical work on the 1940 census had not yet been completed, but the attack provided the Census Bureau with a way to demonstrate its usefulness to government at a time when, coincidentally, it had been beset by internal bureaucratic disputes over just how useful it was and how necessary some of its more specific analysis. The statisticians in the bureau knew the

importance of statistical work during a modern war and knew that demonstrating the usefulness of their own work was a method of protecting their prestige and relevance in the field against the prestige that would accrue to the statisticians working in the temporary war agencies.

So it was that in February 1942, two months after the attack, hand tabulations on the Japanese American population were provided for the internment program that would send many of them to camps. The Census Bureau today maintains that, as ordered by the laws that govern it, it did not provide individual names and addresses. But it provided detailed counts of the Japanese living in very narrowly defined geographic areas, and the Japanese population at the time was a small and highly concentrated ethnic majority, not well distributed throughout the country. (The Census Bureau’s role in the war later reverted to a less

Women testing two types of data card tabulating machines created to speed up processing of statistics from the 1940 census at the U.S. Census Bureau in Washington, D.C., in December 1939. Some contend that detailed counts of people living in Japanese neighborhoods collected from the 1940 census assisted in the roundup of Japanese American citizens for internment after Pearl Harbor.

controversial one, using population data to determine the meeting of draft quotas, as well as recommending the location of military installations.)

Beginning in 1950, race was no longer referred to as “color” (though it briefly reappeared in 1960). Hawai’ian, part-Hawai’ian, Aleut, and Eskimo were added as race choices in 1960, acknowledging the natives of the 49th and 50th states.

1960s to 1970s

From the postwar era through the present, but particularly in the era of the civil rights movement and the activist movements that followed it, the work of the Census Bureau has been key in using statistics to guarantee an apportionment of educational opportunities, jobs, and voting rights to minorities. The lifting of the limits created by the National Origins Act and the Supreme Court’s reversal of the decisions that had claimed constitutionality in malapportioned legislatures made accurate counts of the country’s ethnic minorities more important than ever.

During the preparations for the 1970 census, the federal government—for the first time, many in the Census Bureau felt—acknowledged how much its many agencies had come to rely on accurate census data in the course of its functioning. The impact of an accurate count of particular populations, specifically, the urban poor and ethnic minorities, was explicitly addressed at the Conference on Statistics and the City in 1967, where social scientists and government officials met to discuss the importance of avoiding undercounts of these critical groups. At stake was the proper representation of the public as guaranteed by the Constitution and the Voting Rights Act, as well as correct apportionment of grants from federal programs.

Still, despite the motives, there has always been a tug-of-war at play in the Census Bureau and in the conduct of its census and design of its questionnaire. On the one hand, the more questions that are asked, the more data is produced—a good in and of itself—and the more complete a picture that can be constructed of the American public, the better the public may be served. On the other hand, there are two strong forces opposing the inclusion of a large number of questions on the questionnaire. First, as a pragmatic matter, the longer the questionnaire, the more likely some respondents will ignore it or fail to

fill it out completely; there may also be a literacy obstacle, for both native and non-native speakers. Second, there is a long history of members of the public becoming riled over the specificity or seeming invasiveness of one question or another. In the 1940s, questions about income were hotly objected to. In the 1960s, questions about a household’s bathroom facilities and about the number of children ever born to each adult female respondent similarly roused public fury. Questions about ethnic and racial background tend to be especially sensitive.

1980s

After the 1970 census, the bureau was accused by several ethnic minority activist groups of bias and underrepresentation, an accusation that to its credit, it took quite seriously, if albeit reacting defensively. Several advisory committees were formed, comprised of experts on minority statistics, in preparation for the 1980 census. The Committee on the Black Population for the 1980 Census met with black leaders in 1974. A Hispanic population committee convened the following year, followed by an Asian and Pacific Americans population committee. The Spanish Origin Advisory Committee (SOAC) wound up, in 1977, testifying in Congress when the Census Bureau did not use its recommendation to include a question on Spanish origin on the 100 percent schedule (the questions asked of all respondents), and on field procedures that the SOAC felt were insufficient to guarantee good coverage of Hispanic Americans. The recommendations of these committees, among others on nonethnic specialty topics, increased the cost of the 1980 census by \$406 million—roughly 40 percent of the final cost. The list of possible race options was expanded and a separate Spanish-origin question was added.

Currently, the census questionnaire includes an ancestry question—“What is your ancestry or ethnic origin?”—which replaces earlier questions about parents’ birthplaces. Ancestry relates to but does not dictate ethnicity. The sample questionnaire in the 1980 census replaced questions on parents’ birthplaces, which had been used since the period of European immigration in the 19th century, with a question on ancestry, which permitted the census to track the ethnic heritage of Americans whose ties to foreign countries

stretched back for multiple generations. It also clarified the idea of ethnic heritage, decoupling it from ancestors' nationality. The 1980 version of the question asked simply, "What is your ancestry?" The ethnic origin addition was added in 1990. Various examples are included in the questionnaire. When respondents list multiple ancestries, the Census Bureau records them ranked according to the order in which they are listed.

The inclusion of ancestry and self-definition information allows for a wider range of answers. For instance, in 2010, 103,091 Americans listed their ancestry as Cajun, an ethnicity that would not have been revealed by the parents' birthplace question and that indicates a more specific ethnic identity than ancestral nationality would.

The 1970s had seen a significant growth in the undocumented immigrant population. Such immigrants—indeed all immigrants, but especially the undocumented—had always presented a challenge to census issues, because they made for understandably reluctant respondents, and the general public often reacted with enmity to the idea of illegal aliens being "counted" in the same way as citizens. Still, the practical heart of the matter was that policy formulation and implementation was impacted by the presence of undocumented immigrants, and the more information could be had, the better.

The census was very invested in obtaining as accurate a count as possible. This proved, and has continued to prove, difficult. There was simply no way, politically acceptable to those in government, of persuading a significant majority of undocumented immigrants that it was in their best interest to answer census questions and that the information would not be turned over to the Immigration and Naturalization Service. The Roman Catholic Church refused to be enlisted to assist, and the government refused the suggestion many offered to grant amnesty to resident undocumented immigrants, in order to render their fears irrelevant. (The suggestion has been made again, with each subsequent decennial census.)

The question of how and whether to include undocumented immigrants in the census is often coupled with whether such immigrants should be counted for reapportionment purposes and for the distribution of federal aid; there is a real sense in which, as with pre-emancipation slaves, it is the

legal personhood of the undocumented immigrant that is at question here. Petitions to force the exclusion of undocumented immigrants for reapportionment purposes have been rejected by the courts on the grounds, among others, that the 1920 Congress considered their exclusion and decided against it.

In 1978, for the first time the Office of Management and Budget defined a set of federal standards for the collection, tabulation, and presentation of race and ethnic data for federal programs to which the Census Bureau among other agencies would be required to adhere. According to these standards, four race categories must be tracked: white, black, American Indian or Alaska Native, and Asian or Pacific Islander. The idea of Hispanicness as an ethnicity rather than a race was also affirmed.

1990s to 2000s

In 1997, the Office of Management and Budget instituted the five minimum race categories now in use by federal agencies, which were first applied by the Census Bureau beginning with the 2000 census: white, black, American Indian or Alaska Native, Asian, and Hawaiian or Other Pacific Islander. Though these five are a minimum—and agencies are free to add to the list—for the most part, agencies have opted not to exceed the minimum, which has made the list the object of criticism.

While federal policy holds that Hispanicness is an ethnicity, not a race, for instance, not all Hispanic Americans agree. Further, there are many members of ethnic groups like Arabs, Turks, Persians and Iranians, and West Indians who do not self-identify as white or any of the other listed options. One of the complainants has been the U.S. Commission on Civil Rights, a bipartisan agency established by Congress in 1957. It presented its complaints to Congress in a 2006 report, which pointed out the number of respondents in the 2000 census who, in elaborating their identification as "some other race," identified themselves as Hispanic. Many Hispanic respondents, in fact, opted not to answer the race question at all.

The American Anthropological Association (AAA) has complained about the OMB's categories for a slightly different reason, though acknowledging the problems the Commission on Civil Rights brings up. In the AAA's view, the concept of "race," especially as something separate from ethnicity, is

faulty and dates from a prescientific time. The concepts of race and racism are not separate; racial distinctions have for the most part been invented for explicitly racist reasons. Ethnicity, a primarily social category, has fewer of the negative associations of race and is acknowledged as a nonbiological phenomenon, while the concept of race carries biological implications, especially in a country with a history of adhering to ideas like the “one drop of blood” rule. The AAA’s recommendation has been not to expand the list of race options but to eliminate race entirely from census language, expanding the role ethnicity plays instead.

Family and Marital Patterns

There has rarely been a time in American history when family and marital patterns were not in flux. Since the middle of the 20th century, when it became more common for women to work and for both sexes to delay the start of their careers by spending more years in school, the general trend has been toward fewer first marriages, older newlyweds, and more nonmarried family formations. These trends vary somewhat according to race and ethnic group. According to the 2010 U.S. census and other federal surveys and statistics, the marriage rate is dropping in the United States, while unmarried cohabitation and childbearing and childrearing are on the rise.

National Survey of Family Growth (2012)

On March 22, 2012, the U.S. Department of Health and Human Services (USDHHS) released findings in its National Health Statistics Reports, “First Marriages in the U.S.: Data From the 2006–2010 National Survey of Family Growth (NSFG).” The study encompassed a nationally representative sample of 12,279 women and 10,403 men ages 15 to 44; the overall response rate was 77 percent (78 percent women and 75 percent men). The racial backgrounds of respondents were as follows: women: 6,156 (white), 2,723 (Hispanic), 2,412 (black), 988 (other), men: 5,275 (white), 2,406 (Hispanic), 1,752 (black), 967 (other). The survey was conducted through face-to-face hour-long interviews of individuals, not couples. The NSFG has been collecting data on factors affecting family formation, growth, and dissolution since 1973. The 2012 report focuses on first marriages.

Some of the NSFG findings are as follows: (1) Sixty-eight percent of unions formed between

1997 and 2001 began as cohabitations rather than as a marriage. (2) The percentage of women currently cohabitating with men in a sexual relationship rose from 3 percent in 1982 to 11 percent from 2006 to 2010. (3) Both men and women are entering first marriages later in life; the average age for men is 28.3 years of age while for women it is 25.8 years. (4) Marriages are not lasting “for a lifetime” or until “death do us part.” From 2006 to 2010 the probability of a first marriage lasting at least 10 years was 68 percent for women versus 70 percent for men. The probability that a marriage will last 20 years decreases to 52 percent for women and 56 percent for men. At 37 percent, black women had the lowest probability of marriage lasting for 20 years, and foreign-born Hispanic men had the highest probability at 70 percent.

Other findings are the following: (5) Both race and educational attainment play a significant role in the length of marriage: 78 percent of women with a B.A. degree were in 20-plus year marriages versus 41 percent with a high school diploma or GED, and 65 percent of men with a B.A. degree were in 20-plus year first marriages versus 47 percent with a high school diploma or GED. (6) The percentage of women who entered a first marriage decreased from 44 percent in 1982 to 36 percent from 2006 to 2010. During that same time period, the overall percentage of women cohabiting rose from 3 percent in 1982 to 11 percent. From 2006 to 2010, the racial breakdown of cohabiting women was 16 percent of foreign-born Hispanic women, 11 percent of white women, and 9.3 percent of black women. (7) The percentage of never-married women also rose from 34 percent

in 1982 to 38 percent in 2006–10 (55 percent of black women, 49 percent of U.S.-born Hispanic women, 46 percent of foreign-born Hispanic women, 39 percent of U.S.-born Asian women, and 34 percent of white women). These figures show a statistically significant difference between racial classifications. (8) Another significant factor predicting marriage versus cohabitation was educational attainment (37 percent of women without a high diploma or GED were married versus 58 percent with a college degree versus 63 percent with a master's degree or higher; 66 percent of men with a master's degree or higher were married versus 49 percent of men with a B.A. versus 41 percent with a high school diploma or GED). There is a reverse correlation for cohabitation: 20 percent of women without a high school diploma or GED were cohabiting versus 6.8 percent of women with a B.A. degree; 9.6 percent of men with a B.A. degree were cohabiting versus 13 percent of men with a high school diploma or GED. In sum, 64 percent of college graduates marry versus 48 percent of those with a high school diploma. (9) Finally, the NSFG reports that the majority of couples have cohabited before they marry (approximately 57 percent of women versus 60 percent of men (cohabited but did not marry); 96 percent of women and 93 percent of men (cohabited and later married). Note that the nationwide percentage of women cohabiting rose from 3 percent in 1982 to 11.2 percent from 2006 to 2010. Unfortunately the data for men was not collected in 1982. However, the nationwide percent of men cohabiting did rise from 9.2 percent in 2002 to 12.2 percent in 2006–10.

In sum, the NSFG shows that, nationwide, more couples are cohabiting, while fewer couples are marrying and fewer marriages are lasting over 20 years.

Child Trends Study (2011)

A 2011 study by Child Trends (analyzing 2009 National Center for Health Statistics data) found several developments: (1) Sixty-six percent of all children in the United States are born to mothers under 30 years of age. (2) The fastest growing group of new mothers is white women in their 20s with “some college education, but no degree”; this pool went from 11 percent in 1999 to 34 percent in 2009. (3) White women 20 to 30 years old with

a high school diploma or GED who had children outside marriage went from 21 percent in 1999 to 51 percent in 2009. (4) By the mid-1990s, 33 percent of children nationwide (across racial classifications) were born outside marriage. (5) By 2009, 41 percent of children nationwide (across racial classifications) were born outside marriage and 53 percent of children born to mothers under age 30 years are born outside marriage (73 percent of black children, 53 percent of Hispanic children, 29 percent of white children). (6) Most unwed child-bearing occurs within cohabiting households that include both parents. (7) Cohabiting households are less stable than married households, only 44 percent of cohabiting couples with children stay together until their child reaches age 10; 50 percent of all cohabiting relationships end within 18 months whereas 70 percent of marriages last 10 years and over 50 percent last 20 years.

U.S. Census (2010)

In 2010, there were 56.5 million total married households in the United States; 6.8 million cohabiting households (opposite sex); and 646,000 same-sex couple households. In addition, there were 5.1 million multigenerational households, 4.4 percent of the total (up from 3.7 percent in 2000). Thirty-three percent of all households included children under 18 years old, while 25 percent included adults 65 years and older. Seven percent of all U.S. married couples were interracial.

2010 U.S. census data indicates the following: (1) The incidence of new marriages was down by 5 percent from 2009 to 2010. In raw numbers, that equates to 4.4 million new marriages in the United States in 2009 versus 4.2 million in 2010 among all age groups. It has been theorized that the downturn in the economy was a relevant factor for the decline. (2) Barely one-half of all U.S. adults are married—a new all-time low. In 1960, 72 percent of U.S. adults were married; by 2010 this figure had dropped to 51 percent. (3) Adults were marrying at an all-time later age, women at 26.5 years old and men at 28.7 years old. Over the past 50 years, the age for first marriage has risen by six years. (4) The percentage of never-married adults had nearly doubled from 15 percent in 1960 to 28 percent in 2010; 61 percent of those who have never married state that they

Among the recent changes in family and marital patterns in the United States has been the increase in same-sex couple households and parenthood. The 2008 census found 565,000 same-sex couples raising 204,000 children.

would still like to marry someday. The decline of first marriage has been most significant among young adults. In 1960, 59 percent of young adults aged 18 to 29 were married; in 2010 that figure was 20 percent. The decrease in new marriages for this age group from 2009 to 2010 was 13 percent. Further, only 9 percent of young adults were married in 2010 versus 45 percent in 1960. However, it is unclear whether today's young adults are abandoning marriage or merely postponing it. As the numbers of those who have never married has risen, the numbers of those who have ever been married has declined. The ever married figure was 85 percent in 1960 but had fallen to 72 percent in 2010.

Additional findings include: (5) Similar to the NSFG findings, the U.S. census data shows a racial divide for marriage in this country (white, 2010: 55 percent married (down 7 percent from

2009), 1960: 74 percent; black, 2010: 31 percent (down 6.5 percent from 2009), 1960: 61 percent; Hispanic, 2010: 48 percent (up 1.1 percent from 2009), 1960: 72 percent). (6) The figures for ever married adults also differ along racial lines. In 1960, the percentages of ever married adults were statistically the same across racial categories. However, by 2010, the percentages were significantly different (55 percent of black adults had ever married; 64 percent of Hispanics; 76 percent of whites). (7) Nationwide, in 2008, 41 percent of births were to unmarried women (70 percent of black babies, 50 percent of Hispanic babies, 30 percent of white babies). In 1990, the nationwide figure was 28 percent. In 1960, the figure was 5 percent.

Regarding marital status, data indicated: (8) In 2008, 6.2 million U.S. households were headed by cohabiting couples who were parenting 4.3 million children (8 percent of Hispanic households, 5 percent of white, 5 percent of black). The total included 565,000 same-sex couples who were parenting 204,000 children. In 2010, the total number of cohabiting couples/households in the United States rose to 7.7 million (6.8 million opposite sex, 646,000 same sex). The total was a 1,500 percent increase since 1960 (and a 41 percent increase from 2000 to 2010). In 1990, 3 percent of all households were headed by unmarried cohabitants. In 2008, this figure had nearly doubled to 5 percent. The 2010 data would signal that the number had indeed doubled since 1990—from 3 to at least 6 percent. The group with the largest percentage of unmarried partner households was American Indians and Alaska Natives; 10.9 percent of those households consisted of unmarried partners. (9) Married couple households with children decreased by 5 percent from 2000 to 2010. During the same time period, unmarried cohabiting couple (opposite sex) households increased by 40 percent, nonfamily households increased by 16.3 percent, and same-sex couple households increased by 80 percent.

The 2009 U.S. census data further indicated that there were 25.8 million married couples with children under 18 years. Six percent of the fathers in these households were unemployed and 4 percent of the mothers (an increase from 3 percent and 2 percent, respectively, in 2007). Additionally, in 2009, of the 1.5 million households with unmarried cohabiting parents, 16 percent of the

fathers and 8 percent of the mothers were unemployed (an increase from 9 percent and 4 percent, respectively, in 2007).

In 2009, the percentages of children living with both of their parents according to their racial classification were as follows: 85 percent Asian, 78 percent white, 69 percent Hispanic, and 38 percent black.

Family trends varied considerably according to race and ethnicity. While two-thirds of American households were family households, for instance, 78 percent of Hispanic households were, compared to 64 percent of non-Hispanic white households. An even sharper distinction is seen between black and Asian households. While 60 percent of Asian households consisted of nuclear families (a husband and wife, with or without children), only 29 percent of black households did. In fact, about as many black households consisted of single mothers (30 percent) as of nuclear families, three times the share of households consisting of single-mother families in white and Asian communities. In every race group except Asians, the majority of households headed by a woman with no spouse present were single-mother households; with that exception, single mothers outnumbered unmarried women living alone or with non-offspring dependents.

Pew Research Center and *Time* Magazine Survey (2010)

In 2010, the Pew Research Center and *Time* magazine conducted a telephone survey of 2,691 adults; 39 percent of those surveyed responded that “marriage is obsolete.” This view differed across racial and educational lines (44 percent of blacks and 36 percent of whites; 27 percent of those with a B.A. degree and 45 percent of high school diploma holders). A similar survey in 1978 found that only 28 percent held that view.

The opinion that marriage is obsolete seems to depend on one’s current status. Thirty-one percent of married people responded that marriage is obsolete, compared to 46 percent of currently unmarried people, 58 percent of those who were never married, and 62 percent of currently cohabitating parents.

Gender/Sex

Sex, like age, is one of the few topics that have been the subject of every census since 1790. Data on gender is used to implement and evaluate programs like the Equal Employment Opportunity Act, the Civil Rights Act, the Women's Education Equity Act, and the Job Training Partnership Act and, in conjunction with age and race data, are important to the Older Americans Act, the Juvenile Justice and Delinquency Prevention Act, the Department of Veterans Affairs, the Department of Education, the Department of Health and Human Services, and the Equal Employment Opportunity Commission.

In the 2010 census, the population of the United States was 308,745,538, a 9.7 percent increase over the 2000 census, making it the third most populous country in the world. Unlike previous modern censuses, no long form was used, having been phased out in favor of the American Community Survey. The short form distributed to all households asked 10 questions, one of which was the sex of each person in the household. The number of men increased by 9.9 percent from 2000 to 2010, compared to the 9.5 percent increase of the previous decade. Women outnumbered men by 5.18 million, compared to 5.3 million in 2000, a male-female ratio of 96.7.

Although women continue to enjoy a longer average life span than men, the gap narrowed in the 2010 census, in which the ratio of men to women increased the most in the 65 and over age group. The recent growth in the male population is the first in the American male population since 1910, when women's life expectancies began to increase due to medical advances, especially those reducing the number of women who died giving birth.

Of the total population, 49.2 percent were male, 50.8 percent female. The median age of men was 35.8 years, while the median age of women was 38.5 years. The sex ratio at birth is about 105 males to 100 females, which has dampened the effect on the overall sex ratio of women's comparatively longer life spans. Historically, for the last 100 years there have generally been more men at younger ages, and more women at older ages as the male population experiences faster attrition.

The sex ratio continues to decline with age, reaching 100:100 around the 30s before women overtake men, and ending with a roughly 1:5 ratio of men to women. But the decline is less severe and more gradual than in 2000. In 2000, the age at which women outnumbered men 2:1 was 85. In 1990, it was 83. In 2010, it was 89, not only an increase over the previous census but a sharper increase than between that census and the one before.

The two groups in which females experienced higher growth than males from 2000 to 2010 were the Native Hawai'ian and Other Pacific Islander category, in which the male population grew by 25 percent while the female population grew by 25.1 percent, and the Asian American group, in which the male population grew by 32 percent while the female population grew by 33 percent.

But the margins by which male population growth exceeded female population growth varied considerably by race. Among respondents reporting a single race, the greatest difference in population growth rates was seen among white Americans, in which the male population grew

Detail of an illustration titled "Taking the Census" from the November 19, 1870, issue of Harper's Weekly depicts a census taker talking to a group of citizens. An individual's sex and age were some of the few topics that have been the subject of every U.S. census since 1790.

by 7.8 percent while the female population grew by 6.4 percent (82 percent of the male population growth rate). Among African Americans, the male population grew by 11.6 percent, the female population by 10.5 percent (90.5 percent of the male population growth rate). Among American Indians and Alaska Natives, the male population grew by 18.6 percent and the female population by 17.9 percent (96 percent of the male population growth rate).

One noticeable trend in this data is that the higher the population growth rate of the race group as a whole, the smaller the factor by which the male population growth rate exceeds the female population growth rate, to the extent that the two fastest-growing groups have faster-growing female populations. This also holds true when Hispanicness is considered: in the Hispanic population, the male population growth rate was 38 percent, while the female population growth rate was 36.3 percent (96 percent of the male population growth rate); in the non-Hispanic population growth rate, the male population growth rate was 5.4 percent while the

female population growth rate was 4.7 percent (87 percent of the male population growth rate).

The male-female ratio varies considerably, and among the five federally recognized race groups, the two with female-dominant growth rates are also the only groups with male-dominant sex ratios. The male-female ratio of the Native American and Other Pacific Islander population is 103.5:100, or 103.5 men for every 100 women. The American Indian and Alaska Native population ratio is 100.7:100. Hispanic Americans, which include all races, also have a male-dominant ratio of 107:100, while the non-Hispanic population has a male-female ratio of 95:100. White Americans had a male-female ratio of 98:100, Asian Americans had a ratio of 93.4:100, and African Americans had the lowest male-female ratio at 91:100.

Transgender Issues and the Census

Transgender is a term that has been adopted to replace or encompass a number of terms regarding individuals whose gender identity does not match their genetic sex. It is not a sexual orientation, and it is equally applicable to individuals regardless which gender they are attracted to.

"Transgender" has grown in popularity because of the number of individuals for whom terms like "transvestite" or "transsexual" are inaccurate, misleading, or otherwise unacceptable. Many transgender individuals have no interest in sex reassignment surgery, for instance—being transgender need not involve a rejection of one's genetic sex, only the possession of a gender identity not traditionally associated with that genetic sex.

The International Conference on Transgender Law and Employment Policy (ICTLEP) in 1992 defined "transgender" as an umbrella term, one that "includes transsexuals, transgenderists, and cross dressers," as well as those in the process of transitioning to a new gender presentation. Older literature often conflated these identities or ignored some of them, referring to transgendered individuals instead as "pre-op" or "nonsurgical" transsexuals. Other gender identity terms that have been embraced and that would fall under the ICTLEP's umbrella include genderqueer, androgyne, and bigender. The term *cisgender* has been coined as an antonym to refer to all those outside

the transgender umbrella, that is, those whose gender identity corresponds with their genetic sex.

Genetic sex refers to the biological sex corresponding to specific chromosomal genotypes: XY for males, XX for females. The term *transgender* is sometimes also used to include intersex individuals, who possess a different chromosomal genotype outside those two. Intersex individuals may be, and traditionally have been, raised as one sex or the other, and as adults they may choose that sex as their gender identity. But they may also identify as neither male nor female, as both, as “intersex” as a unique gender identity unto itself, or as other possibilities.

With many intersex individuals, it is not simply a matter of chromosomes marking them as different from the traditional view of sex as male or female; they may possess physical characteristics that simply do not accord as exclusively male or exclusively female. As with anyone else, this gender identity may also be fluid over time, and surveys have found that the gender identity of an intersex individual is independent of the individual’s sexual orientation. The terms *intersex* and *transgender* are not equivalent, but both refer to a circumstance in which the individual is neglected by a strictly traditional view of sex and gender and which, it is argued, is rendered invisible to the census.

A small number of countries have allowed responses other than “male” or “female” in response to the question of gender in official documentation, rather than forcing people to choose one or the other. As of 2011, for instance, Australian passports list a third option, “X,” typically to indicate intersex.

In the United States, although some cities and states have passed laws protecting transgender people from discrimination or providing means for them to legally change the gender identity displayed on official documentation, the Employment Non-Discrimination Act that would provide these protections federally has stalled and failed repeatedly in Congress since the 1990s. The 21st century has seen an increase in the awareness and

acceptance of transgender identity, beginning at the end of the 20th century, when the Parents and Friends of Lesbians and Gays (PFLAG) became the first national lesbian-gay-bisexual (LGB) organization to become transgender inclusive in 1998, the same year the Transgender Day of Remembrance was founded. In 2004 the first Trans March took place in San Francisco and the first all-transgender performance of *The Vagina Monologues* was staged. The first openly transgender person, Reuben Zellman, was accepted at the Hebrew Union College Jewish Institute of Religion in 2003 and he was ordained as a rabbi in 2010. Also in 2010, Victoria Kolakowski became the first openly transgender judge in the United States.

In 2010, the State Department allowed the gender category, otherwise permanent, to be changed on passports with a note from a physician—sex reassignment surgery is no longer required, as it once was. The following year, the Social Security Administration ended the practice of notifying employers when an employee’s stated gender on a W-2 form conflicts with Social Security records, which had outed individuals in the past. Federal courts have affirmed that discrimination due to transgenderedness falls under sex discrimination regulations, as has the Equal Employment Opportunity Commission as of 2012, though as mentioned above, this has not yet been made explicit legislatively.

Hispanic/Latino Categorization

Many Americans are unaware that the labels *Hispanic* and *Latino* are only very recent terms that have been used to classify a segment of the U.S. population. Many more Americans are not aware that the U.S. government does not consider Hispanic or Latino as a race. Instead, the government classifies Hispanics/Latinos as an ethnic group, whose members “can be of any race.” Such a definition may seem confusing or contradictory, which underscores the arbitrary and subjective nature of any attempt to classify people into socially constructed racial categories.

The 2010 census counted 50,477,594 persons of Hispanic or Latino ancestry, who comprised 16.3 percent of the total national population. One of the fastest-growing segments of the U.S. population, the number of Hispanic/Latino persons living in the United States increased 43 percent since 2000. However, the terms *Hispanic* and *Latino* do not refer to a single, unified group who share a common heritage. Rather, Hispanic and Latino are pan-ethnic terms that generally denote persons with either recent or historical ancestry from a Spanish-speaking society in Latin America or from Spain itself.

The largest specific Hispanic/Latino ancestry in the United States are persons of Mexican descent, who accounted for 63 percent of the total Hispanic/Latino population in 2010, followed by Puerto Ricans (who comprised 9.2 percent of all Hispanics/Latinos). Other significant Hispanic/Latino ancestries include Cuban (3.5 percent), Salvadoran (3.3 percent), and Dominican (2.8 percent). The geographic concentrations of various Hispanic/Latino populations tend to be highly localized, with the majority of the Mexican

American population residing in the southwestern states and the majority of Puerto Ricans and Dominicans living in the northeast. Most Cuban Americans have settled in southern Florida, with a sizable Cuban population also residing in northern New Jersey and the New York City area.

As the number of Hispanics/Latinos living in the United States has increased in recent decades as a result of both immigration and natural birthrates, interest in Hispanic/Latino population has grown (from the business community, religious organizations, educational institutions, the media and entertainment industries, and federal, state, and local governmental agencies). However, the various persons who are classified under these terms do not share a uniform phenotype, culture, language, or social history within the United States. One of the most perplexing questions that American society has grappled with for nearly a century pertains to the issue of categorizing its populations of Mexican, Puerto Rican, and other Latin American and/or Spanish-speaking heritages by race for official governmental purposes, such as census taking and antidiscrimination recordkeeping.

Historical Origins: Before OMB Directive 15

The United States annexed the present-day state of Texas in 1845. New Mexico, Arizona, California, Nevada, Colorado, and parts of Utah and Wyoming were annexed under the Treaty of Guadalupe Hidalgo, which ended the U.S.-Mexico War in 1848. The populations living in these annexed regions thus became the first Mexican American communities in the United States. The treaty guaranteed Mexicans living in these

territories the right to apply for naturalization to obtain U.S. citizenship—a right that prior to the Fourteenth Amendment had been limited to “free white persons” under the Naturalization Act of 1790. As such, the U.S. government *legally* classified Mexican-origin persons as “white,” although in specific local communities throughout Texas and other states, Mexicans were often *socially* regarded as nonwhite and “racially” inferior. Texas, a Confederate slave-holding state, had been settled in part by plantation owners from other regions of the south and the sociopolitical philosophy of Manifest Destiny in the 1840s helped give rise to the belief among Anglo-Saxons that Mexicans constituted a “mongrelized people” who had been biologically diluted by virtue of their “Indian blood.”

Immigration from Mexico to the United States remained low throughout the remainder of the 19th century, in large part due to the lack of sufficient railroads connecting the two nations until the early years of the 20th century. The Chinese Exclusion Act, passed in 1882, and the Gentlemen’s Agreement of 1907 virtually eliminated all immigration from China and Japan, respectively. Throughout the late 1800s, Chinese and Japanese immigrants comprised key migrant labor forces in the western states, particularly in California. The curtailment of immigration from Asia, stemming largely from racial and cultural fears and further reduced by the passage of restrictive legislation in 1917, 1921, and 1924, prompted the need for a new source of migrant workers to fill the void.

The first major wave of Mexican immigration occurred during the 1910s and 1920s, fueled by a combination of push-pull factors such as political upheaval stemming from the Mexican Revolution (1910–20), labor shortages in the United States during World War I (1917–18), and the growth of the mining, agriculture, and railroad industries in the burgeoning southwest. Nearly 900,000 Mexicans took refuge by legally settling in the United States during the Mexican Revolution alone. Between 1925 and 1929, an additional 238,000 Mexicans legally migrated to the United States, and Mexican track workers comprised 75 percent of the labor force for six of the major railroad companies in the southwest during the 1920s.

The 1930 census classified Mexicans as a separate, distinct racial group for the first and only

time in American history. Census takers were instructed to record all persons who had been born in Mexico, as well as U.S.-born citizens whose parents had been born in Mexico. The Census Bureau subsequently used this census information to attempt to retroactively estimate the population of the “Mexican race” living in the United States in 1910 and 1920. The designation of Mexicans as a separate race is intriguing, given that Mexicans had originally been categorized as “white” by the federal government.

Scholars of Mexican American/Chicano history and critical race theorists contend that this shift in the racial classification of Mexicans indicates a growing sense of nativism, xenophobia, or an even greater tendency to perceive Mexicans as an “Other” by the late 1920s. The establishment of a Mexican racial category on the 1930 census appears even more bizarre when one considers that among certain segments of the middle-class Mexican American populations of Texas and New Mexico during this era, the term *Mexican* was considered offensive and eschewed in favor of other self-identification labels such as *Latin* and *Hispano*, respectively. Mainstream ethnic organizations at the time, such as the League of United Latin American Citizens (LULAC) and others typically espoused a strong assimilation/Americanization agenda and advocated that persons of Mexican descent be classified as “white,” as was the case with Irish, Italian, and Jewish Americans. As a result of protests, threats of litigation, and general confusion, the Census Bureau dropped its categorization of Mexican as a “race” after administration of the 1930 count.

In 1898 the United States annexed Puerto Rico at the conclusion of the Spanish-American War. The Jones Act of 1917 conferred American citizenship upon all inhabitants of Puerto Rico, thus granting residents of the small Caribbean island free access to migrate to the U.S. mainland. By the 1930s, small but significant Puerto Rican communities had been established in New York City, with an estimated 67,500 Puerto Ricans living in the continental United States in 1930. Unlike Mexicans, however, Puerto Ricans were not identified and counted as a separate race.

From 1940 to 1960, the Census Bureau officially categorized Mexicans and Puerto Ricans racially as “white,” unless such persons were

“visibly Indian or Negro.” However, the 1940 census did seek to count the number of “white” persons whose “mother tongue” was Spanish. The 1940 census counted 1,848,024 “white persons of Spanish mother tongue,” which accounted for approximately 1.5 percent of the total U.S. population at that time. However, demographic scholars in more recent decades have asserted that the 1940 total of native Spanish speakers is most likely a significant undercount, even though at the time, census data was collected in person from workers who went door-to-door and directly asked questions to heads of households.

The 1950 census was the first to include Puerto Rico in its list of responses to its question that asked about nation of birth for immigrants and U.S.-born children of immigrants (despite the fact that Puerto Ricans were U.S. citizens at birth, Puerto Rico was a U.S. territory, and Puerto Ricans were not “immigrants”). That year, the census recorded 245,623 Puerto Ricans living in the continental United States.

The 1950 census is also significant because it utilized a rudimentary attempt to count the overall “Hispanic/Latino” (these labels still had not come into being by 1950, however) population by counting surnames. Using a list of numerous common Spanish and Latin American surnames, the Census Bureau counted the number of such surnames that appeared on the forms collected in Texas, California, Arizona, New Mexico, and Colorado. This methodology was highly prone to error, given that the only surname that appeared on the census form was that of the head of household; if the head of household had a Spanish surname, it was assumed that the other members of the household were also “Hispanic/Latino.”

Of course, this protocol discounts cases of Anglo–Mexican intermarriage that have long taken place in the borderlands region by which an Anglo wife would customarily take the surname of her Mexican husband. Likewise, a Mexican woman married to an Anglo man would have likely adopted her husband’s non-Hispanic surname, thus distorting the count. Furthermore, limiting this count to five southwestern states overlooked Hispanics/Latinos living in other parts of the country, such as Chicago and Michigan—both of which had sizable Mexican communities dating to the early decades of the 20th century

who were drawn to the region by employment opportunities in both industrial and agricultural work. The federal government did not officially discard the use of Spanish surnames as a means of enumerating the “Hispanic/Latino” population until 1980.

The 1970 Census and OMB Directive 15

By the 1970s, the Hispanic/Latino population in the United States had become quite diverse in terms of ethno-national ancestry, cultural and linguistic background, geographic concentration, and length of family history in the United States. Certain families in the southwest, particularly in Texas and New Mexico, had now resided in the United States for well over a century, dating back to the Treaty of Guadalupe Hidalgo, while Mexico had become a leading source of legal and undocumented immigration during the post-Depression era. At the same time, millions of Mexican Americans/Chicanos were the U.S.-born children and grandchildren of immigrants who entered the United States between 1910 and 1950.

At the same time, New York City boasted a large Puerto Rican population, and significant Puerto Rican communities had also been established in Philadelphia, Chicago, and throughout New Jersey. Between 1945 and 1970, approximately one-third of Puerto Rico’s population had emigrated to the mainland United States, either as a result of Operation Bootstrap, labor recruitment by U.S. employers, or to reunite with family members already living on the mainland. Fidel Castro’s Communist revolution in 1959 led to a massive influx of hundreds of thousands of Cuban refugees, with the vast majority taking up residence in the Miami–Dade County area.

Given this backdrop, the 1970 census was the first to attempt to count the entire Hispanic/Latino population throughout the entire nation, and it was also the first to classify Mexican Americans, Puerto Ricans, Cubans, and other persons of Latin American and Spanish-speaking ancestries under one category. However, the efforts to count the Hispanic/Latino population in 1970 were convoluted and only appeared on the two versions of the “sample” or “long form” of the census (which is distributed only to a small fraction of all households), as opposed to the “short form” of the census (which is distributed to all

households). Using the label *Spanish* in a manner akin to the way “Hispanic” or “Latino” is used today, one version of the long form asked respondents to select which, if any, of the following six criteria applied to them:

- Spanish origin
- Spanish surname
- Spanish language
- Spanish heritage
- Spanish-language surname
- Spanish birth or parentage

The alternate version of the 1970 long form census asked respondents to indicate, “Is this person’s origin or descent . . .” and the possible responses were the following:

- Mexican
- Puerto Rican
- Cuban
- Central or South American
- Other Spanish
- No, none of these

The differing versions of the long form census produced contrasting results, largely because subsequent scrutiny revealed that several hundreds of thousands of persons living in states such as Kentucky, the Carolinas, Georgia, Alabama, and Mississippi identified as “Central or South American” out of apparent confusion that this question was referring to the central and southern region of the United States instead of Latin America. Nevertheless, analysis of the sets of data from the 1970 census indicates that the “Spanish origin” population at the time was approximately 9 to 10 million persons. Approximately 20 percent of the “Spanish origin” in 1970 was foreign born.

The U.S. government officially created “Hispanic” as an ethnic category under Directive 15, issued in May 1977 by the Office of Management and Budget (OMB), that established racial and ethnic categories that were to be used by federal, state, and local agencies to monitor compliance with federal antidiscrimination and equal opportunity legislation. The four racial categories established under OMB Directive 15 included (1) white, (2) black or African American, (3) American Indian or Alaska Native, and (4) Asian or Pacific Islander.

In addition, the directive established “Hispanic” as an ethnic category whose members could be of any of the named four races (in 1997, the Office of Management and Budget modified its Hispanic category slightly to “Hispanic or Latino” in response to the growing popularity of the term as a label of self-identification, particularly in the northeast). Directive 15 officially defined a Hispanic as “a person of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish culture or origin, regardless of race.”

1980 to 2010: The Emergence of the words *Hispanic* and *Latino*

In accordance with the categories and guidelines implemented under OMB Directive 15, the 1980 census featured the debut of the “Hispanic” label. As in 1970, the 1980 census (and all others since) allowed respondents to freely self-identify their race and ethnicity, as opposed to previous decades in which the census taker would often conjecture the response to this question without asking the head of household and recording his or her data accordingly.

The 1980 census asked respondents to first indicate their race, followed by a question that asked whether or not they were Hispanic. This question specifically read, “Is this person of Spanish/Hispanic origin or descent?” Possible responses included the following:

- No
- Yes, Mexican, Mexican-Amer., Chicano
- Yes, Puerto Rican
- Yes, Cuban
- Yes, other Spanish/Hispanic

Given the confusion that “Central or South American” had caused during the previous census, this description was omitted from the 1980 census. Another major change in 1980 was the inclusion of the Spanish/Hispanic origin question on the short form of the census, which was distributed to 100 percent of households. Nevertheless, this question still generated a degree of misunderstanding, as a few hundred thousand non-Hispanic respondents circled the “Amer.” abbreviation on the “Yes, Mexican, Mexican-Amer., Chicano” line of the census. This led the Census Bureau to further abridge the label to

“Mexican-Am” on the 1990 form. The 1980 census recorded 14.6 million Hispanics in the United States, and projecting a surge in population growth over the next 10 years, the media at this time dubbed the 1980s the “Decade of the Hispanic.”

The Hispanic population diversified considerably throughout the Reagan-Bush years, fueled especially by the entrance of Dominicans, Guatemalans, Salvadorans, and Nicaraguans, among others. Since the late 1970s, civil wars between left-wing and right-wing military forces in various Central American nations created political chaos, environmental destruction, and human rights atrocities that prompted hundreds of thousands of displaced persons to seek refuge in the United States. Dominican migration stemmed primarily from the pursuit of employment and economic opportunities. Whereas the vast majority of Dominicans settled in the Boston–New York–Philadelphia region, Guatemalans and Salvadorans tended to settle in the Los Angeles area. Many Nicaraguans settled in Florida, where their anti-Communist struggle resonated with established Cuban refugees who had previously fled the Castro regime. By 1990, the Hispanic population had increased to 22 million.

Future Changes

Despite both the major and the subtle changes that have been implemented over the past 40 years in an effort to produce a more accurate count of the nation’s rapidly growing Hispanic/Latino population, criticism and dissatisfaction persist with the protocol by which persons are to indicate whether they are of Hispanic/Latino ancestry as well as their race. Critics contend that asking respondents (of any background) to identify their ethnicity, followed by another question that asks them to indicate their race causes confusion—particularly

among persons who are Hispanic/Latino. Indeed, many Americans find designations such as “non-Hispanic white” and “Hispanic black” contradictory and bemusing. Since 1990, Hispanic/Latino respondents have disproportionately identified as “some other race” on census forms.

With these considerations in mind, the Census Bureau is currently considering changing the way it collects data by race for the 2020 census. Specifically, a new proposal calls for a combined “race or ethnic origin” question that contains no mention of either word. The proposed question would read: “Are you . . .” followed by seven possible answers from which respondents would be asked to select:

- White
- Black, African American, or Negro
- Hispanic, Latino, or Spanish Origin
- American Indian or Alaska Native
- Asian
- Native Hawai‘ian or Other Pacific Islander
- Some Other Race or Origin

History of the Census

The United States was founded in a period that had a strong faith in enumeration, but enumeration was not unique to the republic. Political arithmetic described a policy of population management that took into account the quantification of the homeland's resources and inhabitants. It is not surprising, then, that the Constitution includes a provision for a decennial population count. From the start, this census showed signs of an interest in race. In its decennial enumerations, the census has reflected the changing attitudes toward race and difference; its earliest history is embedded in the history of slavery. Around the turn of the 20th century, it reflected a discomfort with the color line in its uncertainty of how to count mixed-raced individuals, and in its modern implementation, the census offers an expression of the nation's attitude toward diversity and pluralism.

First Enumerations

Political representation in the House of Representatives was determined proportionally to the population of each state. As a result of the so-called three-fifths compromise, the population of enslaved persons would be counted as 60 percent toward the total for that state. In addition, the same constitutional article specifies that "Indians not taxed" are not counted for political apportionment, meaning that Native Americans who lived on reservations or were not members of the civic bodies of the United States should not be enumerated.

In order to accomplish its constitutional task, it was necessary for the census to count only free persons and the enslaved, and anything else was

technically in excess. James Madison, who was on the committee that defined the scope of the census, wanted to distinguish free blacks from whites, men from women, and boys from men in order to understand the voting population. In fact, Madison also wished to include occupations so that members of Congress could better understand the nation; nonetheless, only the extra categories of race and gender were included in this first census.

The 1790 census, managed by the judicial branch, sent out federal marshals as enumerators who were instructed to count people in five categories: free white men over the age of 16, free white men under the age of 16, free white women, all other free people, and the enslaved. Determining racial classification was the responsibility of the enumerator. This enumeration counted 3.9 million Americans, of whom 3.1 million were white (80 percent), 59,000 (1 percent) blacks ("free colored"), and 0.7 million (18 percent) enslaved individuals.

The second census of 1800 counted free white males and females in five categories: younger than 10 years old, 10 to 16, 16 to 26, 26 to 45, and older than 45. The census also included the categories of other free persons, except for untaxed Native Americans and the number of enslaved people. An effort was made for a more ambitious social survey and Thomas Jefferson, among others, urged Congress to determine important statistics about the population's age, nativity, marital status, and occupation. These changes were not approved on the grounds that the Constitution did not provide the authority for this project but also because it was believed that the American people would resent this intrusion into their private lives.

The third census of 1810 enumerated nearly identical categories as in 1800.

The enumeration of the fourth census in 1820 was similar to prior censuses but added a sixth category to the count of the number of free white males (16–18); in addition, the “colored” and white people not naturalized. Free colored persons and enslaved persons were counted in four categories: less than 14 years old, 14 and 26, 26 and 45, and older than 45. There was also a category for “other.”

Expansion of the Census

As time went on, Congress slowly yielded to the pressure to gather more information from its decennial count. In 1830, the census used a pre-printed schedule for the first time. Free white men and women were counted in more exact categories: under 5 years of age, 5 and 10, 10 and 15, 15 and 20, 20 and 30, 30 and 40, 40 and 50, 50 and 60, 60 and 70, 70 and 80, 80 and 90, 90 and 100, and older than 100. Enslaved and free colored men and women were also counted in finer categories: under 10 years of age, 10 and 24, 24 and 36, 36 and 55, 55 and 100, and older than 100. In recognition of the public’s duty toward the disabled, an additional count was made of the ages of the blind and the deaf and dumb in two categories: white, or slaves and colored; and for three age groups: under 14 years, 14 and 25, and older than 25. For white people, a count was made to identify unnaturalized foreigners.

This attempt to quantify the disabled, however, became a disaster in the census of 1840, which some have labeled the “census of the insane.” The fifth census had very similar schedules as the census of 1830, except that there was an increased attempt to enumerate the deaf, blind, illiterate, feeble-minded, and insane by race and mode of support. Although perhaps coming from a noble motivation, the first returns of this census found free African Americans in the northern states to be beset by epidemic rates of insanity; the rate of insanity was found to be 11 times higher than in the south. Proslavery politicians used this information to contend that slavery was beneficial to the enslaved. In the debate that followed the 1840 enumeration, both sides of the issue argued the means used to obtain the facts and the conclusions that could be drawn from them.

These statistics reinforced the health model of insanity, which suggested that it was a disease brought about from vicious habits and uncontrolled passions. According to South Carolina Senator John C. Calhoun, this census proved that slavery was necessary for the health of the enslaved. When freed, he said, the slave proved to be “incapable of self care and sinks into lunacy.” However, Edward Jarvis, a founder of the American Statistical Association, suspected something was wrong with the figures. In towns where the census recorded no blacks, the figures also showed there were many insane blacks. Furthermore, the rate of insanity for whites was about the same in the north and the south. But while the rate of insane blacks in the north was wildly high, in the south, the rate of insanity among blacks was outrageously low.

The simple explanation to this 1840 disparity was that lay enumerators, with only a vague notion of what it meant to be insane, were performing the count. Social and economic definitions also conspired to create the inaccuracy. Insanity is most recognizable at institutions, and slave owners would not remand slaves to institutions if they could work, since the owner would have to pay the institution’s bill. Without taking this into consideration and without a strict definition of insanity and a means to measure its incidence, the model presented did not accurately represent the population. But as Calhoun’s speech demonstrates, once data were calculated and distributed, it was difficult to undo what had been done.

The 1850 census was the first time that the government counted mixed-race individuals. Along with counting numbers of blacks and whites, the seventh census added a third category of “mulatto.” As with the count of the insane of 1840, a specific definition of mixed race was not provided; enumerators were just told to indicate “b” for black and “m” for mulatto. The reason for this count was perhaps an effort to test beliefs about the inferiority of mixed-race individuals, given the growing sentiment of southern doctors like Josiah Clark Nott, who believed that human races were in fact distinct species. In this census, a special schedule for the enslaved listed each person by name, gender, age, and owner; whether they were black or mulatto; deaf, dumb, blind,

A mixed-race former slave sits for a photograph in her house near Greensboro, Alabama, in May 1941. The 1850 census had added a category for “mulatto,” the first time the census had identified mixed-race people.

insane, or idiots; the number of fugitives from the state; and the number manumitted. This census was the first time that the names of all members of a household were recorded; before then, only the head of household’s name was listed in the record.

The enumeration for the 1860 census was in many ways the same as in 1850, but the report was abbreviated because of the Civil War. This eighth report is somewhat infamous because the superintendent of this census noted that the statistics showed that the African American population was declining. Indeed, the population of the south during the history of the census had not been growing as fast as in the north, causing a

decrease in southern seats in the House of Representatives. Given the increasing interest in the Native American population, “Ind” was listed in the “color” column for Native Americans who have “renounced” tribal rule and exercise the rights of citizens. Although this census was the first time that Native Americans were counted, untaxed Native Americans remained uncounted. In this enumeration, 4.3 million (81 percent) were counted as white, 0.1 million (2 percent) were “free colored,” and 0.9 million (17 percent) were enslaved blacks. A count was also made of 41,725 “civilized Indians.”

Postwar Inconsistencies

The three-fifths compromise was no longer relevant after the Civil War; the second clause of the Fourteenth Amendment to the Constitution specified that members of the House of Representatives would be determined by a count of the “whole number of persons in each state, excluding Indians not taxed.” Nevertheless, the 1870 census continued to tally the population according to its standards of racial difference. The ninth census is notable because it lists the names of all African Americans, including their surnames and place of birth, making this enumeration an important resource for genealogical research.

In addition, the increasing number of Chinese immigrants (who had starting coming to the United States in 1850) caused the addition of “Chinese” (which included all east Asians) to the category of color. In 1882, the Chinese Exclusion Act would be signed into law, suspending Chinese immigration until 1943. Native Americans had been counted in 1860, but for this census, “Indians” was used for the first time as a category. The term *mulatto* was defined for enumerators; in this census, the instructions said the term meant “any person having a trace of African blood.” The instructions to marshals also admonished the enumerators that “important scientific results depend upon the correct determination of this.”

The 1880 census used a similar methodology, but for this enumeration, a special schedule for Native Americans was developed. Starting in 1880, the census was managed by the executive branch. In 1890, for the first time the census included the term *race*; previous census enumerations had used the word *color* instead. This, the

11th census, took a closer look at the category of “east Asians,” dividing this group into Japanese, Chinese, and others. This census attempted to define mixed-race individuals more carefully. Enumerators were told that “black” should be used to mean individuals with three-fourths or more black blood; “mulatto,” should indicate individuals who had from three-eighths to five-eighths black blood; “quadroon,” should be used to indicate individuals who had one-fourth black blood; and “octroon,” should be used to describe individuals who had any trace of black blood up to one-eighth.

The 1890 census is remarkable for several other reasons. Statistics gained from this census would become the quotas used in the Immigration Act of 1924, limiting the annual number of immigrants from each country to 2 percent of the number counted in 1890. In addition, punch cards were created from the schedules used in the field and tabulated by a machine created by Herman Hollerith. It is also significant because it did not attempt to gather data on westward expansion, inspiring Frederick Jackson Turner’s essay about the closing the American frontier, “The Significance of the Frontier in American History,” which he delivered to the American Historical Association in 1893. Many of the records of this census were destroyed in a 1921 fire.

The 1900 census was further modified, removing the category of mulatto. Enumerators were instructed to use “w” for white, “b” for black (which was described as “Negro or Negro descent”), “ch” for Chinese; “jp” for Japanese, and “in” for Native American (“Indian”). The 13th census in 1910 reversed some of these changes, including the count of “other” race and the code “mu” for mulatto. Although both the 1900 and 1910 censuses had separate schedules for Native Americans, the 1920 census did not. In 1920, Hindu, Korean, and Filipino were added to the “color or race” question. In the 14th census, it was reported that for the first time, more people were living in cities than in rural areas.

Toward a Multicultural Census

In the 1930 census, a eugenicist bent was used to again eliminate the category of mulattos, formally instilling the philosophy of hypodescent, the so-called one drop rule. In this 15th census, enumerators were told that “white” was to be used

only for pure-blooded individuals. In the situation of “mixed” individuals, they were to be classified according to the “nonwhite racial strain.” In addition, there were very explicit directions for determining race.

These descriptions, however, betray some confusion and inconsistency. A person with mixed white and black ancestry was to be classified as black. A black person who was mixed with Native American was usually classified as black, unless the Native American blood predominated and the person was accepted as a Native American. Mixes of white and Native American were scored as Native American, unless the percentage was small and the person was accepted as white in the community. A mixture of white and another race was to be classified as that other race. “Mexican” was listed as a race in this census only; all persons born in Mexico or having parents born in Mexico who did not seem to be white, black, Native American, Chinese, or Japanese were counted as Mexican.

All mixes with white, however, were reported as the same race as the parent who was not white. This enumeration can be thought of as the nadir in terms of its lack of sensitivity toward race. In this enumeration, 88.7 percent of the total population of 122.8 million were counted as white, 9.7 percent were counted as African American (“Negro”), 1.2 percent were counted as Mexican, 0.3 percent were counted as Native American (“Indian”), Chinese and Japanese were found to be 0.1 percent, while Filipino, Hindu, Korean, Hawai’ian, Malay, Siamese, and Samoan were found to be less than 0.1 percent.

For the 1940 census, Mexicans were returned to the category of white unless they were definitely Native American or some other race. The other choices in this 16th survey included Native American (listed as “Indian”), Chinese, Japanese, Filipino, Hindu, Korean, and other. For the 17th census in 1950, Hindu and Korean were no longer race choices; individuals who were not black or white had to choose from Native American (“Indian”), Japanese, Chinese, Filipino, and other.

Although the 1950 census removed the word *color* from descriptions, the word returned in the 1960 enumeration. In the 1960 census, for the first time “American Indian” instead of “Indian” was used; other choices were Japanese, Chinese, Filipino, Hawai’ian, Part Hawai’ian, Aleut, and

Eskimo. For this enumeration, computers were used in tallying. This census made a greater use of sampling: there was a brief count of every person in a dwelling by enumerators, and more detailed follow-up questions were left in every fourth home.

In the wake of the civil rights movement, there was a growing awareness of the increasing diversity of the United States. The 1970 census did have many similarities in the way it counted race to enumerations earlier in the century; for instance, it categorized individuals into white, Negro, Indian, Japanese, Chinese, Filipino, and other. These categories, however, were designed for self-identification of respondents, and the enumerator instructions listed many possible responses to help individuals determine the proper category. “Chicano,” “LaRaza,” “Mexican American,” and “Moslem” were tallied as white, while “brown (Negro)” could be considered as black for census purposes.

For the 1970 enumeration, forms were mailed to 60 percent of Americans in urban areas in the first effort to discontinue use of dedicated enumerators. Spanish language forms were enclosed in areas with high numbers of Spanish-speaking households. In this census, 87.5 percent of the population identified itself as white, 11.1 percent as black, and 1.4 percent as other. In 1980, census forms were mailed to 95.5 percent of the population because of the 1970 success. This enumeration divided the population into five groups: white (83.1 percent), black (11.7 percent), American Indian/Eskimo/Aleut (0.6 percent), Asian and Pacific Islander (1.5 percent), and other (3 percent).

The 21st census in 1980 had more than a dozen racial/ethnic categories for individuals to choose from: white, black/Negro, American Indian (print tribe), Eskimo, Aleut, Chinese, Filipino, Hawai‘ian, Korean, Vietnamese, Japanese, Asian Indian, Samoan, Guamanian, and other race. In addition, respondents were asked if they were of Hispanic origin, allowing them to indicate Mexican, Mexican American, Chicano, Puerto Rican, Cuban, and other Spanish/Hispanic. The enumeration in 1990 showed that the diversity of the United States was increasing. While those counting themselves as white had increased only by 6 percent, Asians and Pacific Islanders had increased by 108 percent; American Indians, Eskimos, and

Aleuts had increased by 38 percent; and blacks had increased by 13 percent.

Twenty-First Century

In 2000, for the first time, individuals could check more than one response for race, indicating their multiracial or multiethnic identity. The instructions clearly stated that a respondent could mark “one or more races,” and there was a choice of five races based on new 1997 definitions from the Office of Management and Budget (OMB): white, black or African American, American Indian or Alaska Native, Asian, and Native Hawai‘ian and Pacific Islander. The OMB standard did not allow for Hispanic or Latino to be selected as a race, but did permit an individual of “Spanish origin” to be designated. In addition, in 2000 there was an opportunity to select “some other race.” Based on these six choices, there were 57 possible combinations.

In 2000, if an individual wrote in something like “black,” “Afro American,” “Nigerian,” or “Haitian,” he or she was counted as black; if someone wrote in “Burmese,” “Hmong,” or “Pakistani,” they were tallied as Asian, and if someone wrote in “Tahitian,” “Mariana Islander,” or “Chuukese,” he or she was counted as “Native Hawai‘ian or Other Pacific Islander.” All that remained in the tally of “some other race” were responses that could not be incorporated into Office of Management and Budget categories, such as “Mexican,” “Cuban,” “Moroccan,” “South African,” or “Belizean.” Of the 281.4 million Americans counted in this census, 15.4 million (5.5 percent) identified themselves as “some other race” and 6.8 million (2.4 percent) selected two or more races. An overwhelming amount (93 percent) reported more than two races, however, chose just two. “White” and “some other race” was the most popular choice (32 percent), “white” and “American Indian and Alaska Native was second (16 percent), “white” and “Asian” was third (13 percent), and “white” and “black or African American” was fourth (11 percent).

Although the census bureau had announced in 2009 that it would attempt a count of same-sex couples, this was not realized. A Census Bureau spokesperson defended the use of the term *Negro*, which was still used on the question about race, indicating that older African Americans

sometimes refer to themselves this way. As was done since 1970, this census asked if each individual were of Hispanic, Latino, or Spanish origin. The race question, as in 2000, allowed individuals to choose more than one box.

In 2010, the census showed that of the increase of 27.3 million people since 2000; more than half was from the Hispanic population. Of the 308.7 million Americans counted in this census, 19.1 million (6.2 percent) reported themselves as “some other race” and 9 million (2.9 percent) selected two or more races. About three-quarters of the mixed-race group was split equally between four combinations: white and black (1.8 million), white and other (1.7 million), white and Asian (1.6 million), and white and American Indian or Alaska Native (1.4 million). Overall, the group of individuals selecting “Asian” as their race grew the fastest, at 43.3 percent over the number in 2000.

Plans under way for the 2020 census include operational changes, such as an option for Internet response, but there are also reports that the question regarding race needs to change. In 2010, the Census Bureau conducted an experiment to test reforms to the way the census asks questions about race and origin. The bureau posited that the use of the word *Negro* and counting Hispanic as an ethnicity while also asking respondents to choose a race has led to lower rates of response to the ethnicity and race questions (3.5 percent to 5.7 percent of respondents do not answer the race question, and 4.1 percent to 5.4 percent do not answer the question regarding Hispanic origin).

To test this theory, the Census Bureau sent a test questionnaire that combined the race and origin questions, among other proposed changes. In this experiment, the bureau found that non-response rates dropped to between 0.6 percent to 1.2 percent. Furthermore, the bureau found

that removing the term *Negro* did not reduce the number of respondents who identified as black. In focus group interviews after the experiment, Hispanics reported that the instructions on the standard 2010 race question prevented their racial self-identification. For 2020, the Census Bureau has also made a commitment to count legally married, same-sex couples.

Multiple Race Categorization

In 2000, the U.S. Bureau of the Census allowed for multiple race categorization for the first time. In all prior censuses, while the various races and ethnicities have changed over time, individuals were always required to check only one box. However, in the 1990s, several multiracial organizations advocated for a mixed-race option. The consideration of a multiracial category was not without controversy, however, as many interest groups expressed concern over shifting numbers. Because census data is used to determine compliance with civil rights legislation and the Voting Rights Act, a loss in population counts could have important consequences for some racial and ethnic groups. Multiple race categorization was developed as a compromise and was instituted by the Office of Management and Budget in 1997.

History of Race Mixture and the Census

The Census Bureau has tracked race and ethnicity since the first decennial census was collected in 1790. The way in which race and ethnicity have been counted has shifted over time with changing social and cultural understandings of race and ethnicity. For example, various questions to count American Indians and the Chinese were introduced in the 1800s. The 1890 census added the Japanese to its counts, and the 1900 census included an expanded questionnaire for American Indians. By 1930, the number of Asian groups specified increased, and “Mexican” as a race category was added that year when census takers collected the information. Notably, while the categories have changed considerably, race mixture has only occasionally been recognized in the census through the occasional use of the term

mulatto, beginning in 1850 (as well as the terms *quadroon* and *octoroon* briefly in 1890) and last used in 1920, in favor of a shift to the one drop rule or hypodescent.

Indeed, for most of the 20th century, no multiple race categories were used nor were many efforts made to do so. By the 1960s, increasing diversity through increased intermarriage and immigration alongside the civil rights movement pushed forward a public consciousness not only about race and ethnic identity but also the value of accurate data in analyzing inequality and discrimination. As a result, the 1960s also marked a shift in the value of racial classification data, as it was used to validate compliance with new civil rights legislation.

Efforts to Change the Census

Kimberly DaCosta notes that for the first time, the 1970 census allowed respondents to self-report race. Before that time, census takers were tasked with determining racial and ethnic identity, fostering the idea that racial categories served the purpose of recording individual self-identity. At the same time, because of the civil rights movement, racial identity had come to be understood as indicative of one’s political beliefs and solidarities. In anticipation of the 1980 census, in 1977, the Office of Management and Budget (OMB) issued Statistical Policy Directive No. 15, Race and Ethnic Standards for Federal Statistics and Administrative Reporting, which was intended to provide better indicators of discrimination by standardizing racial categories across all government agencies. In doing so, it mandated the use of only four racial categories in official data: American Indian

For most of the 20th century, no multiple race categories were used in the census. Multiracial families like this one helped lead the 1990s movement for recognition of the multiracial population.

or Alaskan Native, Asian or Pacific Islanders, black, and white. Hispanic was added as an ethnicity category, inclusive of all races, as a result of a hastily added subsample that tested the collection of Hispanic data in 1970, alongside the addition of an “other race” option. No additional changes (with the exception of additional national origin categories) were made until 2000.

In the interim period however, the OMB Directive No. 15 was subject to numerous challenges. It was the subject of several controversies, including complaints and lawsuits for undercounting minorities because of the mail-in system of the 1970, 1980, and 1990 censuses. In addition, a variety of groups began pressuring the OMB to disaggregate categories such as white or black, or move from one category to another.

The OMB, for its part, sought to avoid controversies and undermining civil rights enforcement while seeking to respond to criticism. It also had practical concerns about data analysis and the reliability of such counts that would include

new categories. The OMB had, in fact, considered several changes, including a multiracial option as early as the 1980s, when the concept of multiracial was just becoming popularized. Kim Williams notes that the proposal was made in 1988 and subsequently dropped in response to opposition from the Equal Employment Opportunity Commission and the Civil Rights Division of the Department of Justice. Because civil rights organizations had already charged that such undercounts were detrimental and that the inclusion of a multiracial category would add unnecessary complexity, OMB officials were wary of any significant change. In order to manage each group’s concerns carefully and avoid further controversy, in 1993, the OMB launched an extensive review of the racial category item.

In 1993, four proposals were made to amend the race portion of the 2000 census: the addition of a multiracial category, the addition of a Middle Eastern category, the shift of Native Hawaiians from the Asian and Pacific Islander to the Native American category, and the inclusion of Hispanic as a race category.

Multiracial Movement

In the 1970s and 1980s, several organizations were formed around the growing number of multiple-heritage families who wanted a space to organize around their experiences of exclusion and a lack of recognition within institutional contexts. Largely concentrated on the West Coast, most advocates were mothers who sought inclusion for their children. Multiracial activists argued that the current format of the census denied multiracials public recognition, as well as the ability to track discrimination against multiracial individuals. Kim Williams reports that in 1988, many of these local groups banded together to form the Association of Multi-Ethnic Americans (AMEA), whose primary purpose was to legally eliminate discrimination against multiracial individuals and families by adding a multiracial category to the census. Other groups, including Project RACE (Reclassify All Children Equally) and A Place For US, joined AMEA in its effort to change the census.

While multiracial organizations came together to form a movement under the premise that they were a minority group that deserved recognition

by the state, Kimberly DaCosta notes that their opponents treated multiracials as a statistical population, individualized, untouched by discrimination, and therefore not worthy of classification in the U.S. census. The divide touched off what proved to be a highly contentious debate.

Controversies and Debate: 1994 to 1997

As the multiracial movement advocates gained steam, many civil rights organizations expressed growing concern that a change that would lead to a multiracial category was not only unnecessary but would also fundamentally alter the minority population count. The results of such an undercount could potentially reduce their political power and would undermine existing civil rights protections. In particular, employment discrimination and enforcement of the Voting Rights Act relied heavily on race counts. These concerns were not specific to any one racial group, as the National Association for the Advancement of Colored People (NAACP), the Asian American Legal Defense and Education Fund, and the National Council of La Raza (NCLR) expressed their opposition to the proposal of a mixed-race category.

Kim Williams found that different formats for the counting of multiracials were endorsed by different groups and seemed to provide the best route for compromise. Project RACE wanted a stand-alone box, while AMEA sought enumerated categories within a multiracial designation, a format endorsed by many Democratic legislators, and ultimately, the NAACP. The OMB, for its part, in 1994, moved forward with its decision to conduct open comment hearings, as well as a review and test of different options for collecting data on race and ethnicity. This additional allocation of resources for data collection and analysis from 1995 to 1996 indicated the seriousness of the proposal, sparking additional opposition from various civil rights organizations. By 1995, the issue became subject to public debate and was discussed in several national media outlets. However, by the end of that year, the OMB's tests indicated that the addition of a multiracial category would impact Asians, American Indians, and Pacific Islanders but not affect any group in a statistically significant way.

Kim Williams argues that by 1997, with a switch of the House of Representatives to Republican

control, several conservative Republicans, including Newt Gingrich and Thomas Petri, jumped into the multiracial box controversy, pushing forward the multiracial category effort. Unlike congressional Democrats, however, who expressed concerns over compliance with civil rights legislation, conservative Republicans did so in an effort to undercut the collection of race data, and by extension, race-conscious policy.

Resolution: The 2000 Census

In 1997, the Interagency Committee for the Review of the Racial and Ethnic Standards (Interagency Committee), which oversaw the revisions to OMB Directive 15, recommended that the stand-alone multiracial category be rejected in favor of the option to mark one or more races. The NAACP and other civil rights groups accepted this recommendation, although some groups that were more heavily impacted petitioned the decision. Ultimately, however, these petitions were ignored, and the OMB issued a new directive on October 30, 1997.

The 2000 census created six categories: white, black or African American, American Indian or Alaska Native, Asian, Native Hawai'ian or other Pacific Islander, and some other race. Notably, individuals were free to check one or more of any racial category. The six categories result in 63 combinations of racial identity. Hispanic was to continue being counted as an ethnic group, in which one could be a member of any race, meaning that 126 identifications were now possible.

This move did not completely close the door on census controversies—none of the other proposals were considered, and therefore some issues such as the categorization of Hispanics remained unresolved. Additionally, some multiracial advocates were dissatisfied with the rejection of a multiracial category. Moreover, new concerns were raised over the tabulation of the new data. The OMB considered tabulation guidelines over the next three years, issuing a new directive that prioritized civil rights legislation by counting those who identified as white and a minority group to be tabulated with that minority group. And finally, changes to the census emboldened further initiatives to eliminate the collection of race data, including the proposal of Proposition 54 in California, which sought to eliminate the collection

of race data by public institutions altogether (it ultimately failed).

The Two or More Races Population

The option to identify as belonging to two or more races was exercised by a small proportion of the U.S. populace. In the 2000 census, 7.3 million people, or 2.6 percent of the population, marked two or more races. The 2010 census marked an increase of 32 percent in the two-or-more-races population to 9 million persons (3 percent of the total population). In 2010, the most common combination was white and black at 1.8 million (20.4 percent of the two-or-more-races population). This was followed by white and some other race, at 1.7 million (19.3 percent), white and Asian at 1.6 million (18 percent), and white and American Indian or Alaska Native at 1.4 million (15.9 percent). These four groups comprised approximately 74 percent of the two-or-more-races population. However, 55.95 percent of the Native Hawai'ian and Pacific Islander and 43.8 percent of the American Indian or Alaska Native groups reported in combination with one or more other races, suggesting long-term implications for those categories.

Native Hawai‘ian Categorization

Native Hawai‘ians represent the largest Pacific Islander group in the United States. However, their racial categorization and census count has been characterized by controversy and disagreement. Hawai‘ians have historically been uncomfortable being framed or counted as “Hawaiian Americans” because of the illegal annexation of Hawai‘i as the 50th state. Instead, this group has fought for its rights and status as the Native and Indigenous people of Hawai‘i.

Native Hawai‘ians and the Census

The year 2000 stands out as a momentous year for Hawai‘ians in that the 2000 U.S. census featured for the first time a stand-alone category for Native Hawai‘ians and other Pacific Islanders. In October 1997, under a revision of the federal Office of Management and Budget (OMB) Directive No. 15, the U.S. Census Bureau adopted new standards for the classification of race and ethnicity that incorporated a separate and distinct category marked as “Native Hawai‘ian or Other Pacific Islander” (NHOPI). Historically, the inclusion of Native Hawai‘ian as a separate response category did not happen overnight.

In the 1960s, the response category of “Native Hawai‘ians” was included on the census forms only for the state of Hawai‘i. In 1970, census forms included the term *Native Hawai‘ians* except Alaska; in 1980, Guamanians and Samoans were lumped into the same category as Hawai‘ians. Since 1975 through the 1990s, Hawai‘ians as a group (with its own checkbox) were lumped generally into the all-encompassing “Asian American and Pacific Islander.” The change was made in response to concerns raised by representatives

from the state of Hawai‘i, the Office of Hawai‘ian Affairs, and public and private agencies about more accurately classifying Hawai‘ians as separate from all Asian Americans. They argued that Native Hawai‘ians have a unique political relationship with the United States (as an illegally colonized group that is placed in a “trust” with the United States acting as a guardian), which should be reflected in the census classification system and derived from Pacific Islander peoples.

Historical and Political Formation of Hawai‘i

Native Hawai‘ian categorization must be remembered in context of the historical and political formation of Hawai‘i as a sovereign, independent Hawai‘ian nation and ultimately becoming the 50th U.S. state. The Hawai‘ian Kingdom was a complex, organized, and burgeoning nation in the 1700s, well before foreigners arrived in 1778. From the 1800s through the 1900s, as more foreign interests entered the islands, it became clear that Hawai‘i was no longer just for Hawai‘ians. Foreign representatives became friendly with Hawai‘ian rulers and eventually incorporated their own voices (and governmental commissions) into the daily matters, laws, policies, and business/political directions of the Hawai‘ian Kingdom.

Residents from England, Russia, Spain, and the United States took residency on the islands and even occupied valuable parcels of land. Thus, during this time, the Hawai‘ian Kingdom and its rulers faced the colonialist dissolution of the Hawai‘ian nation and culture, as Hawai‘ians became a marginalized minority in their own home. In 1893, Hawai‘i was overthrown by the

U.S. government and placed under a provisional government by the United States. It was not until 1993, 100 years later, that Congress passed a joint resolution (known as the Apology Resolution) “to acknowledge the historic significance of the illegal overthrow of the Kingdom of Hawai‘i, to express its deep regret to the Native Hawai‘ian people.” This resolution marked the first time the U.S. government officially recognized that “the indigenous Hawai‘ian people never directly relinquished their claims to their inherent sovereignty as a people or over their national lands to the United States,” according to the resolution.

This historical and political context that surrounds Hawai‘ians has played a major role in how Hawai‘ians perceive, understand, experience, and practice their identity. For example, because of the historically tumultuous relationship with the United States and Hawai‘i’s eventual incorporation into the American union, the term *Hawai‘ian American* has never gained currency or resonated with Hawai‘ians. For Hawai‘ians, the term *Hawai‘ian American* symbolizes the forced takeover of their home and culture by a colonial oppressor. In addition, many Hawai‘ians feel that the term *Hawai‘ian American* only emerged because Hawai‘ians as a people were forced into submitting to the stronger political and economic force of the United States.

Most Hawai‘ians understand contemporary Hawai‘ian identity in terms of the historical and political backdrop of the past. Hence, there is a strong sense of distrust among Hawai‘ians for the U.S. government and a discomfort in associating “Hawai‘ianness” with “Americanness.” It also demonstrates that Hawai‘ian identity has become increasingly politicized over the years, and such a politicization may ultimately shape how Hawai‘ians make sense of, experience, claim, and report their ethnic identity.

An important chapter of the historical and political context of Hawai‘i has been the Hawai‘ian sovereignty struggle. As early as the 1800s and 1900s and in the face of the impending colonialist overthrow, Hawai‘ians came together and organized a sovereignty movement through which a resistance force was created to fight off colonialist efforts and reinstall a native government and Hawai‘ian way of life. From this historical moment to the present day, an organized Hawai‘ian sovereignty/

nationalist movement collective was formed through which many sovereignty and grassroots movement groups worked toward Hawai‘ian independence reformation as a self-governing, sovereign nation.

Hawai‘ian sovereignty has become both a sensationalized media topic and a point of contention within the Hawai‘ian community. It has left a political divide among Hawai‘ians through which some work for sovereignty while others shun anything or anyone involved with the sovereignty struggle; still others take a midway position, believing in the goals of sovereignty but not wanting to get so involved politically. Thus, such a political divide may factor into how Hawai‘ians report their ethnicity.

Blood Quantum and Reporting Ethnicity

The historical struggle over Hawai‘ian blood quantum also stands as a major influence over how Hawai‘ians understand and report their ethnic identity. Hawai‘ian blood quantum has been and continues to be the primary criterion through which Hawai‘ians are recognized as Native Hawai‘ian and are provided land and resources set aside for Native Hawai‘ians.

The notion of blood quantum was first introduced into the Hawai‘ian community in 1921, when the Hawai‘ian Homes Commission Act (HHCA) was congressionally approved. Such an act delineated the requirements needed for Hawai‘ians to claim entitlement to native homestead land leases set aside by the U.S. government, which imposed a strict definition to be considered a Native Hawai‘ian based on a minimum amount of Hawai‘ian blood. The act read: “The term ‘Native Hawai‘ian’ means any descendent of not less than one-half part of the blood of the races inhabiting the Hawai‘ian Islands previous to 1778.”

As a result, a 50 percent blood quantum amount was specified as the necessary requirement for being considered and recognized as a true Native Hawai‘ian. Such a 50 percent blood quantum became utilized by most federal and state programs set aside for Hawai‘ians and continues in force to this day.

Census 2010 to Present

As a result of the newly fashioned category slated for Hawai‘ians, the U.S. Census Bureau and

federal and state demographers have released several census reports and estimates about the size and demographic attributes of Hawai'ians in the United States. After the U.S. Census 2010, the following factors arose:

- Hawai'ians represent the largest Pacific Islander group in the United States.
- Hawai'ians have been migrating to the mainland since the late 1700s, and such a migration has complicated how mainland Hawai'ians understand, experience, claim, and report their ethnic identity in this different regional context.
- The majority of Hawai'ians belong to more than one ethnic background, and such multiethnicity may influence how they make sense of and report their Hawai'ianness (if at all).
- Knowledge about how Hawai'ians make sense of, understand, claim, and report their Hawai'ian identity can provide needed information to better serve and meet the needs of Hawai'ians in the United States.

More accurate census counts may translate into a more precise allocation of resources and monies to Native Hawai'ians (for example, in federal dollars, program support, accurate drawing of political boundaries, and enforcement of civil rights) that meet their needs for services, federal recognition, and monetary support.

Occupational Patterns

What has come to be called the Great Recession has impacted many people in the labor force, particularly the young and minorities. Indeed, the recession has determined if some Americans will go to college, when others will leave home, or when and if they will marry or have children. It has also affected decisions about homeownership and distributed wealth in ways that have been particularly negative for minorities.

Even before the recession hit, minorities were in a more precarious financial position than whites, largely because they had fewer viable employment opportunities. But, as the economy and labor market declined, so did the wealth and well-being of American families, hitting minorities especially hard. All of this took place at a time when the growth of minority communities and immigrant populations were especially high. Between 2000 and 2008, according to the U.S. Census Bureau, 83 percent of all population growth was among nonwhites.

Declining Standard of Living

The proportion of Americans living in poverty was 15 percent (46.2 million) in 2011, little changed from 2010, and the highest number in the 53 years since the Census Bureau has collected that statistic. In addition, the Census Bureau reported that median household income in 2011 dropped 1.5 percent to \$50,054—the lowest level since 1995, when adjusted for inflation—while the gap between rich and poor households rose. Meanwhile, the jobless rate remained at 8.1 percent, and homeownership dropped for a fifth straight year to 64.6 percent, the lowest in more than a

decade, hurt by more rigorous financing rules and a shift to renting.

Differences in Occupations

Different ethnic and racial groups are represented in different occupations. For example, among employed men, nearly half (48 percent) of Asians worked in management, professional, and related occupations in 2010, compared with 35 percent of whites, 24 percent of blacks, and 15 percent of Hispanics.

Employed black and Hispanic men were more likely than other men to work in production, transportation, and material moving occupations. Nearly one-half of employed Hispanic men were in two job groups: natural resources, construction, and maintenance occupations; and production, transportation, and material moving occupations. Hispanic women showed the highest figures in service occupations.

Disparities in Earnings

The wealth gap between whites and some minorities is at a 25-year high. In 2010, median usual weekly earnings of Asian and white men working full-time in management, professional, and related occupations (the highest-paying major occupation group) were \$1,408 and \$1,273, respectively. Those figures were well above the earnings of Hispanic men (\$1,002) and black men (\$957) in the same occupation group.

In 2011, median weekly earnings of Hispanics who worked full-time were at \$549—significantly lower than those of blacks or African Americans (\$615), whites (\$775), and Asians (\$866). Blacks ages 16 to 24 had median weekly earnings of

\$404, about the same as their Hispanic counterparts (\$410).

Among women in management, professional, and related occupations, median usual weekly earnings of Asian women (\$1,143) were higher than those of white women (\$932), black women (\$812), and Hispanic women (\$789).

The median wealth or net worth of Hispanic households fell by 66 percent from 2005 to 2009. By contrast, the median wealth of whites fell by just 16 percent over the same period. African Americans saw their wealth drop by 53 percent. Asians also saw a big decline, with household wealth dropping 54 percent.

Some experts believe that minorities need to be better educated about finances, noting that only 46 percent of African Americans and 40 percent of Hispanics invest in retirement plans, compared to 56 percent of whites. They argue that there needs to be an education component to help minorities learn how to save, which in turn will make them less vulnerable to economic instability during a recession.

Immigrant Workers

Census figures showed a slowing growth in the foreign-born population, which increased to 40.4 million, or 13 percent of the U.S. population. Last year's immigration increase of 400,000 people was the lowest in a decade, reflecting a minimal gain of Latinos after many Mexicans already in the United States opted to return home. The bulk of new immigrants are now higher-skilled workers from Asian countries, such as China and India, contributing to increases in the foreign-born populations in California, New York, Illinois, and New Jersey.

Hispanic Population Growth

The expansion in the Hispanic or Latino population crossed the 50 million mark for the first time in 2010, making people of Hispanic origin the second-largest group in the country. The total Hispanic population in 2010 was 50,477,594 or 16.3 percent of the total U.S. population, a 43 percent increase from a decade ago. A large portion of the minority growth is attributed to a rise in the Hispanic youth population.

Yet, while their numbers are growing, their wealth is declining. Hispanic families accounted

A Hispanic woman working in a retail store. Many Hispanics continue to work in manual or service industry jobs, and a full 65 percent of Hispanic women work in just two job groups: service occupations and sales, and office occupations.

for the largest single drop in wealth of any ethnic and racial group in the country during the recession, according to a study by the Pew Research Center in 2011. Using data collected by the Census Bureau, the study found that the median wealth of Hispanic households fell by 66 percent from 2005 to 2009. Nearly two-thirds of Hispanics' median net worth in 2005 came from home equity, according to the report, and when the housing market collapsed, so did their assets and capital.

Hispanics today are much better educated than they were 20 years ago. In 1992, 39 percent of Hispanics or Latinos age 25 and over in the labor force had not graduated from high school. By 2011, that share had dropped to 31 percent. About 12 percent of Hispanics or Latinos in the labor force had a bachelor's degree or higher in 1992. By 2011, college graduates accounted for 16 percent of the Hispanic or Latino labor force.

But while their educational attainments have improved, many Hispanics continue to work in

manual or service industry jobs. The education and health services industry employed the largest percentage of Hispanics or Latinos in 2011. Within this industry, 6 percent were employed in educational services and 10 percent in health care and social assistance. Twelve percent of employed Hispanics or Latinos worked in the retail trade industry, and 3 percent worked in wholesale trade. Eleven percent of employed Hispanics or Latinos worked in accommodation and food services (part of the leisure and hospitality industry). Construction and manufacturing industries each employed 11 percent of Hispanic or Latino workers.

Among employed women, 65 percent of Hispanics were in two job groups—service occupations and sales, and office occupations—compared with about 59 percent of blacks, 53 percent of whites, and 47 percent of Asians in the same job groups.

Unemployment rates are historically highest for Hispanics between ages 16 and 19. In 2006, the unemployment rate for Hispanic or Latino teens reached a historic low of 15.9 percent since tracking began in 1973. By 2010, that unemployment rate had doubled to 32.2 percent. Unemployment rates for other age groups have remained below those of teenagers, but Hispanics or Latinos ages 20 to 24 have higher unemployment rates than those in older age groups.

Asian Americans Making Significant Strides

Asians have also been hard hit by the recession, losing their top ranking to whites in median household wealth, dropping from \$168,103 in 2005 to \$78,066 in 2009. As with Hispanics, many Asians during this period were concentrated in states like California that took a beating from the housing downturn. In addition, more recent arrivals of new Asian immigrants, who tend to be poor, also drove down the median wealth. However, Asians have fared better, not only in the types of jobs they find but also in their overall earning potential.

In the 21st century, Asians passed Hispanics as the largest group of new immigrants to the United States. In addition to being the fastest-growing racial group in the country, today's Asian Americans earn the highest incomes and are the best educated. Just a century ago, most Asian Americans were low-skilled, low-wage laborers.

According to a nationwide survey by the Pew Research Center, Asians are more satisfied than the general public with their lives, finances, and the direction of the country, and they place more value than other Americans on marriage, parenthood, hard work, and career success. They are also much more likely than other minority groups to live in racially mixed neighborhoods.

The educational credentials of many of these recent arrivals are also impressive. More than six in 10 (61 percent) adults ages 25 to 64 who have come from Asia in recent years have at least a bachelor's degree. About four in 10 (43 percent) say Asian Americans are more successful than other racial and ethnic minorities in the United States. More recent immigrants, however, tend to be somewhat less optimistic in these assessments than those who arrived before 2000.

Of the jobs held by Asian men and women, nearly 50 percent were in management, professional, and related occupations, compared to African American men (23.5 percent), African American women (33.8 percent), Hispanic men (15.3 percent), and Hispanic women (24.1 percent).

Despite often sizable subgroup differences, Asian Americans are distinctive as a whole, especially when compared with all U.S. adults, whom they exceed not just in the portion of those with a college degree (49 percent versus 28 percent), but also in median annual household income (\$66,000 versus \$49,800) and median household wealth (\$83,500 versus \$68,529).

African Americans Abandoning the North

One hundred years ago blacks began heading to the north to escape the racism of Jim Crow and to find greater employment opportunity. In recent years, this Great Migration has begun to reverse itself. The *New York Times* reported in 2011 that the south's share of black population growth is about 75 percent of the country's total. While some of the migrants are older retirees—consistent with the broader demographic shift of Americans who leave the Rust Belt for the Sun Belt—many are “buppies”—young, college-educated, upwardly mobile black professionals. Typically this migration has been urban-to-urban, with the biggest gains in black population in cities like Atlanta, Dallas, and Houston. But more and more blacks are now moving to the suburbs. Blacks are

being drawn to the south by lower taxes, lighter regulations, faster employment growth, and better public services. The higher cost of living in northern cities, from utilities to health care, has also contributed to the move. This remigration may shift the political balance of power in traditionally conservative states like Georgia, South Carolina, Texas, and Florida.

Pacific Islander Categorization

Only since 1997 has there been a distinct Pacific Islander categorization in the U.S. census. The actual category is “Native Hawai‘ian or Other Pacific Islander” (NHPI). The creation of this separate category is another step on a long road toward accurate auditing of our multicultural society.

Census History

The first year of the U.S. census was 1790. At that time, only questions about free whites and enslaved people were posed. The 1810 and 1820 censuses asked more questions about people freed from slavery, such as age. The 1820 census also inquired about nonnaturalized foreigners for the first time. Obviously, the changes in 1810 and 1820 had to do with cultural shifts, such as early waves of immigration into the United States and the escalating tensions surrounding slavery. Between 1830 and 1930 many different racial categories were added and deleted from the census, but none of them explicitly referred to Pacific Islanders.

The 1960 census added “color” back into the race questions, switched “Indian” to “Native American,” and added the Hawai‘ian, part-Hawai‘ian, Aleut, and Eskimo category. It also removed the “write in” option for race. These changes followed the admission of Hawai‘i to the United States. Clearly, at this point, there was a recognition that Asian and Pacific Islander categories were far more diverse than was previously understood. From 1960 to 1990 Pacific Islanders were lumped in with the Hawai‘ian, part-Hawai‘ian, Aleut, and Eskimo category.

Well before the “Native Hawai‘ian or Other Pacific Islander” census category was established

in 2000, there were at least some separate data for each group—original peoples of Hawai‘i, Guam, Samoa, or other Pacific Islands have been noted in both official records and things like church and community records. For example, U.S. immigration records show that waves of Tongans immigrated to the United States in the 1950s, 1960s and 1970s, and that there was a boom in the 1980s. Immigration records also have detailed data on Fijian and French Polynesians for the same decades.

Historically, Asians and Pacific Islanders were grouped together by government agencies despite the fact that the groups self-identified in significantly different ways. This tension between convenience for government agencies and self-appellation and identity formation of ethnic groups is meaningful, and this tension is likely to shape the character of these ethnic groups in the future.

The Addition of Native Hawai‘ian and Other Pacific Islander Category

The 2000 census was the first to use the category “Native Hawai‘ian and Other Pacific Islander” (NHPI). It did so in response to a 1997 White House Office of Management and Budget (OMB) notice on revision of racial categories. The notice explicitly states that the promulgated categories “represent social-political constructs designed for collecting data on the race and ethnicity of broad population groups in this country, and are not anthropologically or scientifically based.” The change followed years of lobbying, research, and scientifically designed studies.

Most of the investigation was conducted by the Interagency Committee’s Research Working

Group (Interagency Committee), cochaired by the Bureau of the Census and the Bureau of Labor Statistics. The OMB notice based most of its directive on the report prepared by the Interagency Committee but the Pacific Islander category was an exception. The Interagency Committee recommended in its report that Native Hawaiians continue to be classified in the Asian or Pacific Islander category. However, thousands of Hawaiians opposed this move.

In the end, the OMB directed that the Asian or Pacific Islander category be divided into two categories: “Asian” and “Native Hawaiian or Other Pacific Islander.” The notice described the categories as follows. The “Native Hawaiian or Other Pacific Islander” category is defined as a “person having origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands.” The “Asian” category is defined as a “person having origins in any of the original peoples of the Far East, southeast Asia, or the Indian subcontinent, including, for example, Cambodia, China, India, Japan, Korea, Malaysia, Pakistan, the Philippine Islands, Thailand, and Vietnam.”

The OMB explained its reasoning behind this change, having found the arguments of Native Hawaiians to be compelling. Native Hawaiians asserted that data specific to their social and economic situation were required to take appropriate actions in the realm of education, labor, and housing, particularly because, being a much smaller group numerically, their data was dwarfed by that of larger Asian groups. Because of this numerical pattern, it seemed that without this adjustment Native Hawaiians and Other Pacific Islanders would never be appropriately recognized for purposes of government services. Furthermore, the OMB noted that the population groups in question were well defined so there would be no added confusion based on the change.

Public health issues were also behind the change. The Native Hawaiian and Other Pacific Islander category focuses on a group of people with specific health challenges not common to other Asians. Again, because of the numerical disparity, these health issues were repeatedly given short shrift by government and private agencies. Importantly, in comparison to other ethnic groups, NHPI Americans have higher rates of smoking, alcohol consumption, and obesity.

They also have very poor access to cancer prevention and control programs. Leading causes of death among NHPI people include cancer, heart disease, unintentional injuries (accidents), stroke, and diabetes. Other health conditions and risk factors that are prominent among these people are hepatitis B, HIV/AIDS, and tuberculosis. The tuberculosis rate for NHPI Americans in 2010 was eight times higher than that for white Americans; the NHPI case rate was 16.6 per 100,000, compared to 2.0 per 100,000 for white Americans.

On a related note, the NHPI populations in America have social health issues that demand attention. For example, the infant mortality rate for Native Hawaiians in 2002 was 9.6 per 1000, higher than the rate for all Asian American/Pacific Islander groups combined (4.8 per 1,000) and for all population (7.0 per 1,000). Recognizing the NHPI category is clearly a step toward giving appropriate attention to the health concerns of NHPI citizens, and the U.S. Department of Health and Human Services has unveiled a plan to raise the visibility of NHPI health issues.

Current Issues

The 2010 census reported that of the 308.7 million inhabitants of the United States, 540,000, or 0.2 percent, were Native Hawaiians or Other Pacific Islanders. Another 685,000 reported themselves to be NHPI along with one or more other races. This brings the total to 1.2 million people, about 0.4 percent of the U.S. population. Part of the significance of this is that NHPI as a population group is growing much faster than others. Furthermore, more than half of the NHPI category reported multiple race categorizations, which is much higher than for other groups.

Racial and Ethnic Definitions

The 2010 U.S. census was sent to every housing unit in the nation, with the objective of obtaining the most accurate count possible of the demographics of the country and each state within it. The first census was conducted in 1790, when a total national population of just under 3.9 million was reported. By contrast, the 2010 census revealed a national population of more than 308 million. Each census in the United States since 1790 has counted the American population by race and/or ethnicity, with each census up to 1840 using the categories of “Free White Males” and “Free White Females.”

The official racial and ethnic categories used by the U.S. Census Bureau have changed over the course of the nation’s history, as have the definitions of these categories. For example, the 1930 census listed “Mexican” as a racial category (the only census ever to classify Mexicans as a “racial” group). From 1940 to 1960, Mexicans were officially considered to be “white” for census purposes, unless they were “visibly Indian or Negro.” However, the 1970 census established a new category, “Spanish Origin,” to classify and count persons of Mexican, Puerto Rican, Cuban, and other Spanish-speaking Latin American ancestries. In 1980, the Census Bureau transformed the “Spanish Origin” label into the category “Hispanic.”

Because racial and ethnic categories are socially constructed phenomena and because individuals differ considerably in terms of self-identification, any attempt to classify people by race or ethnicity is inherently problematic. Individuals disagree on which labels are deemed appropriate or inappropriate, just as people do not agree on the specific manner in which the officially established racial

and ethnic categories are defined. Since matters of identity politics are highly emotional, racial/ethnic labels and their definitions (both of which have been established by the federal government) are destined to generate controversy and protest from the persons who are required to identify with such labels and definitions. Such was the case with the 2010 census.

Hispanic Identity: Ethnicity, Not Race

The 2010 census contained one question pertaining to ethnicity, along with an additional question pertaining to race. Continuing with a tradition first established in 1970, Question 8 asked respondents to identify if they were of Hispanic origin. Respondents were also asked to indicate whether they were of Hispanic, Latino, or Spanish ancestry by selecting from one of five possible categories:

- No, not of Hispanic, Latino, or Spanish origin
- Yes, Mexican, Mexican Am., Chicano
- Yes, Puerto Rican
- Yes, Cuban
- Yes, another Hispanic, Latino, or Spanish origin (respondents who selected this answer were asked to write in their national origin, such as Argentine, Colombian, Dominican, Nicaraguan, etc.)

Importantly, the U.S. Census Bureau considered Question 8 to be a question that indicated a respondent’s ethnicity, not race. Whereas popular discourses of difference in the United States often envision Hispanic Americans or Latinos as

a “racial” group, the U.S. government officially classifies this population as an ethnic group. This has been the case since May 1977, when the Office of Management and Budget (OMB) issued Directive 15, which established the official racial and ethnic standards to be used for federal statistics and administrative reporting (the OMB modified the labels and definitions slightly in 1997). OMB Directive 15 provided one *ethnic* category (Hispanic) and four *racial* categories (changed to five racial categories in 1997) to be used for recordkeeping and presentation of data on race and ethnicity by federal agencies. For census purposes, respondents are asked to identify whether they are of Hispanic/Latino ethnicity, as well as identifying their race (Question 9).

OMB Directive 15 officially defines “Hispanic” as “A person of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish culture or origin, regardless of race.” Because Hispanics/Latinos are often thought of as a racial group in popular and media-driven discourses, many people—Latinos and non-Latinos alike—often find the “regardless of race” stipulation confusing, if not contradictory. However, the U.S. government has established that Hispanics/Latinos can be of any race due to the fact that a vast range of phenotypic diversity in terms of skin color, hair texture, and geographic ancestral origins exists among the peoples of Latin America. Some Hispanics/Latinos are fair-complexioned with blonde hair and green or blue eyes, while others are much darker-complexioned and of visible African ancestry. Additionally, some Latinos are of primarily indigenous heritage deriving from the original, pre-Columbian inhabitants of the Americas. Skin color and physical appearance among Hispanics/Latinos thus represents a continuum, spanning the entire range of human phenotypic diversity.

Race

Question 9 of the 2010 census asked respondents to indicate their race. Following a precedent set in the 2000 census, respondents were allowed to select more than one racial category, if needed, to provide an accurate description.

The census listed 15 racial categories from which respondents could select, along with three open-ended options to write in a response:

- White
- Black, African Am., or Negro
- American Indian or Alaska Native (respondents who selected this category were required to write in the name of their “enrolled or principal tribe”)
- Asian Indian
- Chinese
- Filipino
- Japanese
- Korean
- Vietnamese
- Other Asian (respondents who selected this category were required to write in their race, “for example, Hmong, Lao-tian, Thai, Pakistani, Cambodian, and so on”)
- Native Hawai‘ian
- Guamanian or Chamorro
- Samoan
- Other Pacific Islander (respondents who selected this category were required to write in their race, such as Fijian or Tongan)
- Some other race (respondents who selected this category were required to write in their race)

OMB Directive 15 provided the official federal definitions for these five different racial categories. The directive defines as white “a person having origins in any of the original peoples of Europe, North Africa, or the Middle East.” The category Black or African American is defined as “a person having origins in any of the black racial groups of Africa,” while the 1997 addendum stipulated that “terms such as ‘Haitian’ or ‘Negro’ can be used in addition to ‘Black or African American.’” The directive defines American Indian or Alaska Native as “a person having origins in any of the original peoples of North and South America (including Central America), and who maintains tribal affiliation or community attachment.” The official definition of Asian reads, “a person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent, including, for example, Cambodia, China, India, Japan, Korea, Malaysia, Pakistan, the Philippine Islands, Thailand, and Vietnam.” Finally, the Native Hawai‘ian or Other Pacific Islander

label is defined as “a person having origins in any of the original peoples of Hawai‘i, Guam, Samoa, or other Pacific Islands.”

Interestingly, OMB Directive 15 and the 2010 census both classify the various Hispanic/Latino national origins as subdivisions of a larger “ethnic” category, while simultaneously classifying the various Asian and South Pacific nationalities as examples of distinct “racial” categories. These inconsistencies, combined with the “regardless of race” clause in the definition of the Hispanic/Latino label, drive much of the public’s confusion regarding the official classification and designation of Hispanic/Latino. Also worth noting is that only one of the aforementioned definitions, that of “Black or African American,” contains any mention or reference of race whatsoever. Curiously, this definition mentions the “black racial groups of Africa” without specifying who, exactly, constitutes such groups. Thus, the official definition of “Black or African American” constitutes a classic example of a circular definition.

The racial categories and definitions are inconsistent in others ways as well. Under these definitions, only the African continent is subdivided into more than one racial group, with some Africans classified as “White” and others classified as “Black or African American.” Furthermore, only the definition of “American Indian or Alaska Native” contains a qualifier requiring maintenance of tribal or community affiliation. While all of the definitions contain some reference to geographic ancestry, only the definition for “American Indian or Alaska Native” makes reference to cultural attributes as a necessary prerequisite for one’s inclusion in this racial category. Such inconsistencies and discrepancies illustrate the inherent challenges of attempting to pigeonhole the diversity of the American population into a small number of arbitrary, socially defined labels.

Selecting Multiple Races and Creating a “Hispanic Race?”

The 2000 census was the first in American history to permit respondents to indicate more than one racial category if it best reflected their respective ancestry. This protocol remained in place for the 2010 census, although the option of selecting multiple racial ancestries has not been without criticism. Specifically, civil rights organizations

such as the National Association for the Advancement of Colored People (NAACP) and the National Asian Pacific American Legal Consortium (NAPALC) have expressed opposition to this change in the way racial information is gathered out of concern that doing so would serve to distort the population estimates of specific racial groups and, thereby, undermine the political clout of minority groups. Civil rights groups have also expressed concern that distorted population counts could undermine the enforcement of civil rights legislation and affirmative action policies, as one specific racial ancestry is not necessarily an individual’s primary racial identification. Nevertheless, the move toward multiple racial identification has been embraced by many social scientists and advocates for the recognition of biracial and multiracial Americans. As the number of Americans of mixed or multiracial backgrounds is rapidly increasing, this will become an increasingly salient issue on future censuses.

The Census Bureau recently announced that it is considering eliminating the “Hispanic ethnic origin” question in favor of including the category “Hispanic or Latino” within the question on the census form that asks respondents to indicate their race. In other words, “Hispanic or Latino” would become a racial (rather than ethnic) category. Already this consideration has drawn criticism from Latino advocacy groups who prefer retaining “Hispanic or Latino” as an ethnic category, because it allows persons to indicate their respective ethno-national ancestry, such as Puerto Rican, Mexican, or Cuban.

Other Controversies

The 2010 census generated a significant degree of impassioned criticism from the media and the general public for its use of the term *Negro* in conjunction with the “Black or African American” racial category. For many Americans, this term seemed antiquated and offensive, and conjured up images of African American oppression in the Jim Crow south during the 1940s and 1950s, an era in which the label *Negro* was commonly used to refer to black Americans. Bernie Miller, chairman of the U.S. Census Bureau’s African American Advisory Committee, personally opposed the incorporation of “Negro” in the 2010 census but begrudgingly accepted it, stating, “To me, the term

Non-Hispanic whites have declined to 64 percent of the total U.S. population as of 2010. At the same time, the portion of the nation that is Asian and Hispanic/Latino is rapidly increasing, as are the biracial and multiracial segments of American society, although 97 percent of Americans still reported belonging to just one race on the 2010 census.

‘Negro’ carries negative connotations because it is so closely related to the ‘N’ word that I dare not utter. ‘Negro’ does remind me of the Jim Crow era, but my main concern is a complete count of every ‘black, Caribbean, Haitian, Negro, African, and African-American in the upcoming census.’”

Ironically, as the U.S. Census Bureau came under increasing fire for its use of the term, the agency declared that it had included “Negro” on the 2010 forms in an effort to be more inclusive toward respondents. In a news release dated January 8, 2010, the Census Bureau indicated that 56,175 respondents wrote in “Negro” as their race on the 2000 census. That such a high number of respondents had self-identified as “Negro” prompted the bureau to include the term as part of the listed racial categories under Question 9 on the 2010 census. Because the primary goal of the census is to obtain as accurate a count as possible of the population, and because the census

has historically undercounted racial and ethnic minority groups, the inclusion of “Negro” on the 2010 census was deemed an important step toward ensuring more accurate results. Tennessee State Representative Tommie Brown echoed these statements, and when asked to opine on the controversy, he said, “I’m not that sensitive about the term ‘Negro’ that it offends me. I’m more interested in removing anything that would hinder an accurate counting of our black population in the 2010 census. That is what we need to be most concerned about.”

Nevertheless, Census Bureau Director Robert Groves apologized for the inclusion of the term on the 2010 form. During a March 26, 2010, appearance on C-SPAN, Groves fielded comments from an African American caller who expressed her opposition to the Census Bureau’s use of “Negro” and her views that the term was both insulting and racist. Groves apologized and

said, “The intent of every word on the race and ethnicity questions is to be as inclusive as possible so that all of us could see a word here that rings a bell for us. It was not to be offensive, and again, I apologize on that. My speculation is that in 2020 that word will disappear and there are going to be other words that are going to change.”

Popular racial terminology has changed throughout the nation’s history, which the Census Bureau has often attempted to reflect. Over the course of the 20th century, the common label for black Americans has shifted from “colored” in the early decades, to “Negro” by the World War II era, to “black” or “Afro-American” by the 1960s, to “African American” by the 1980s. While younger generations of Americans regard “Negro” as a linguistic relic of the nation’s segregationist past, older generations of African Americans (particularly those born before the 1940s) came of age at a time when “Negro” was the conventional label used in American discourses of race. Identity politics is heavily influenced by variables such as age and generation.

President Barack Obama also generated a minor controversy with the manner in which he filled out his 2010 census form. On April 4, 2010, the White House responded to media speculation by confirming that Obama identified his race simply as “Black, African Am., or Negro.” This disclosure produced a flurry of both criticism and defense from the public, due to Obama’s mixed-race parentage. Some questioned why Obama, the son of a Kenyan immigrant father and a white American mother from Kansas, would identify solely with one of his parent’s identities. Others pointed out that under the social policy of hypodescent, also known as the “one-drop rule,” any person of known black ancestry is automatically regarded as black; therefore, Obama’s status as a black man in the public eye had been an identity already imposed on him by American society at his birth. Still others claimed that the complexities of the president’s racial classification, reflective of the rapidly growing numbers of mixed-race Americans, illustrated the pointlessness of governmental attempts to classify people by race in the 21st century.

Increasingly, scholars and advocates are questioning the accuracy or the rationale of state efforts to categorize the population by race. In

1997, for example, the American Anthropological Association (AAA) unsuccessfully lobbied the federal government to drop its classification of Americans into a few distinct, discrete racial categories because of the difficulties and logistical challenges such efforts entail. Instead, the AAA recommended that the U.S. government substitute racial categories for ethnic-national heritage on future censuses as a means of collecting demographic data on the nation’s inhabitants.

2010 Census Results: Race and Ethnic Data

The overwhelming majority of Americans—97 percent—reported belonging to just one race on the 2010 census. Whites continued to be the nation’s single largest racial group, accounting for 72 percent of the total population (223.6 million). At 13 percent (38.9 million) of the national population, blacks or African Americans comprised the second-largest racial group in the United States. Asians numbered 14.7 million (5 percent), while 19.1 million (6 percent) respondents identified as “Some other race.” Additionally, 2.9 million (0.9 percent) respondents identified as American Indian or Alaska Native. Native Hawaiians and Other Pacific Islanders numbered 0.5 million (0.2 percent), concentrated largely in Hawai‘i and California. Asians accounted for the fastest-growing racial group over the previous decade, as the Asian population increased by 43 percent since the 2000 census. The 2010 results also counted 9 million (3 percent) Americans who reported belonging to more than one race. The largest heritage combination of this group was persons of white-black heritage. The total number of Americans who reported belonging to more than one race increased 32 percent since the 2000 census.

The Hispanic/Latino population increased dramatically over the prior decade, accounting for more than half of the total population growth of the United States since 2000. The Hispanic/Latino population also increased 43 percent since 2000. This growth stems from high rates of immigration from Latin America and a relatively higher birthrate among Latinos compared to the national average. With a total population of 50.5 million, Hispanics/Latinos comprised 16 percent of the U.S. population in 2010. Hispanics/Latinos also accounted for the vast majority of respondents

who identified as “Some other race,” even though the majority of Hispanics/Latinos identify their race as white.

The census indicated significant geographic dynamics pertaining to the nation’s shifting racial and ethnic demographics. Four states (California, Hawai’i, New Mexico, and Texas), along with the District of Columbia, are now characterized as “majority-minority,” meaning that non-Hispanic whites account for less than half the population. Generally speaking, the highest portions of nonwhite populations are found in the southern and western states. Nevada has the highest increase in nonwhite/minority population since 2000, with an increase of 78 percent. Just under half (47 percent) of the population of the western states is either nonwhite or Hispanic/Latino. California, New York, and Texas each have more than 500,000 residents who are biracial or multiracial. Information from previous censuses and the 2008 American Community Survey reveal that approximately one-third of marriages in Hawai’i are between persons of different races, the highest rate of any state. Interracial marriages account for more than 15 percent of all marriages in Alaska, Oklahoma, New Mexico, and Nevada. On the other hand, Pennsylvania, Kentucky, Maine, Mississippi, and West Virginia account for the states with the lowest rates of interracial marriages. Asian Americans and U.S.-born Hispanics/Latinos are the two population groups with the highest rates of marriage outside their respective groups; the intermarriage rate for each group is approximately 40 percent.

The 2010 census reveals that the United States is rapidly becoming a racially and ethnically diverse nation, a trend that is not going to slow down anytime in the foreseeable future. The non-Hispanic white population declined to 64 percent of the total U.S. population in 2010, while the portion of the nation that is Asian and Hispanic/Latino is rapidly increasing, as are the biracial and multiracial segments of American society. The black or African American portion of the U.S. population has remained consistent at 13 percent. Even though non-Hispanic whites remain the single largest segment of American society, they are growing at the slowest rate.

Regional Patterns

The 2010 U.S. census found that the overall United States population increased 9.71 percent, from 281.42 million in 2000 to 308.75 million people. The population growth by numbers was not uniform across the country, but rather the rates of growth varied by regions within the nation. The U.S. Office of Management and Budget (OMB)—the body that oversees federal statistics—divides the nation into four recognized regions: northeast, midwest, south, and west. The rates of population growth can be examined by studying the differing variables that the census has collected about the regions and the people who reside in them.

The United States continues to be a multicultural nation comprised of people with numerous racial and ethnic backgrounds. As with the numerical population growth, the regions in which certain racial and ethnic populations reside are not uniform across the country by numbers or proportion. Additionally, the rates at which the racial and ethnic populations have grown between the 2000 and 2010 censuses have not been the same in each region. This article will explore the regional patterns of the recognized racial and ethnic groups and will serve as a starting point in examining the regional diversity of the United States.

Census Racial and Ethnic Definitions

The OMB has mandated specific definitions for the racial and ethnic categories recognized for the U.S. census and other federal statistics. The six official racial categories are White, Black or African American, American Indian or Alaska Native, Asian, Native Hawai'ian or Other Pacific

Islander, and Some Other Race. (At the time of writing, the 2010 *Census Brief* containing Some Other Race data had not been released. Therefore, the numbers and percentages reported for this group are approximations calculated from the data found in the other *Census Briefs* reporting racial and ethnic group data.)

The OMB also recognizes a seventh category, Two or More Races, which represents people who select more than one racial category to describe their racial background. With an exception of the Two or More Races data, the data for the other six racial categories is reported in three categories: Alone, In Combination, or Alone or In Combination.

The data used to explore regional patterns in this article is the racial category Alone data, as the In Combination data also is reported in the Two or More Races statistics. Ethnicity is considered to be a separate concept from race, and is qualified by whether or not a person has Hispanic, Latino, or Spanish origin. As this is a separate category from race, there is an overlap in racial and ethnic data because a person who indicates Hispanic origin also indicates one or more of the racial categories on the separate race question.

In the regional analyses below, the racial data will be outlined, followed by the ethnic data, for the purposes of clarity. However, the major focus will be on the racial data, as the Hispanic data is ultimately subsumed into the racial data because of the separate questions used in the 2010 census.

Northeast Region

The northeast is comprised of nine states: Connecticut, Maine, Massachusetts, New Hampshire,

New Jersey, New York, Pennsylvania, Rhode Island, and Vermont. It is the smallest region of the four and had 55.32 million people counted in 2010. Between 2000 and 2010, the northeast had the slowest regional growth, increasing 3.2 percent by approximately 1.72 million people.

The white (non-Hispanic) majority population in the northeast was 38.01 million people, which was 68.71 percent of the population in the region. Between 2000 and 2010, this population decreased by approximately 1.32 million people, or 3.35 percent.

The remaining minority populations—including white Hispanics—totaled 17.31 million, or 31.29 percent. Examining the racial populations further, the black population made up 11.84 percent of the regional population, or 6.55 million people. It was the largest minority racial category in the northeast. The American Indian or Alaska Native population in 2010 was 212,164, or 0.38 percent of the total number of people in the region. The northeast had the smallest proportion of the American Indian or Alaska Native population of all four regions. However, this population grew the most of all the racial groups in the northeast between 2000 and 2010, increasing by approximately 31 percent. The Asian population made up 5.53 percent of the region with 3.06 million people.

The Native Hawai'ian and Other Pacific Islander population in the northeast was the smallest of the region's racial groups, with a total populace of 20,553, or 0.04 percent. This racial group was the only one to decline in population between 2000 and 2010, decreasing by 1.59 percent. In 2010, the Some Other Race group in the northeast made up 10.93 percent of the region's population with approximately 6.05 million people. The Two or More population category comprised the remaining 2.6 percent of the total population, with 1.42 million people. Around 16 percent of all people reporting in this racial category lived in the northeast, which is slightly less than the overall proportion in 2000 (approximately 18 percent). The Hispanic population in the northeast for 2010 was 12.64 percent of the total (non-Hispanic) population, or 6.99 million people.

Midwest Region

The 12 states that make up the midwest region are Illinois, Indiana, Iowa, Kansas, Michigan,

Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. The total population for this second-smallest region in 2010 was 66.93 million people, which grew by 2.53 million people since 2000. This 3.9 percent growth rate was the second-slowest of the four regions, and was somewhat similar to the growth rate in the northeast during the same period.

The midwest region had the highest proportion of white (non-Hispanic) people of the four regions. At 52.1 million people, this group accounted for 77.84 percent of the midwest population. Similarly to the northeast, the white population also declined in number between 2000 and 2010, decreasing by 289,498 people, or 0.55 percent.

The other racial groups and Hispanic groups totaled 14.13 million, or 22.16 percent of the population. Breaking down the minority populations further, the black population made up 10.39 percent of the midwest population, with 6.95 million people. The American Indian or Alaska Native population in 2010 was 458,611, accounting for 0.69 percent of the region. This group's proportion in the region remained stable over the 10-year period between 2000 and 2010. Of the four regions, the Asian racial group had the lowest proportion of its population in the midwest; 1.73 million people were Asian, making up 2.58 percent of the regional population. The Native Hawai'ian and Other Pacific Islander population grew by 31.4 percent (around 7,000 people) from 2000 to 2010, totaling 29,546 people. Despite growing by nearly a third over a decade, this group still comprised a small proportion of the midwest population, at only 0.04 percent.

The Some Other Races racial category made up about 6.3 percent of the regional population with a count of approximately 4.21 million. The number of people reporting as Two or More Races in the midwest was similar to the number in the northeast, 1.45 million; however, the proportion was slightly smaller at 2.2 percent. Around 16 percent of all respondents in the Two or More Races category resided in the midwest in 2010, which is comparable to the 15 percent in 2000. The data for the Hispanic population shows that 4.66 million people lived in the midwest in 2010, which is 6.97 percent of the population. This is the lowest number and proportion of Hispanics of the four regions.

South Region

The south census region is comprised of 16 states: Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. The region also includes the District of Columbia. The south was the largest region by population, with a census count of 114.56 million in 2010. It had the fastest growth of the four regions, increasing just over 14 percent (approximately 14.3 million people) in the period between 2000 and 2010.

The white racial group in the south totaled 68.21 million people, which made up 59.98 percent of the population in the region. Between 2000 and 2010, the white population grew faster in the south than in the other three regions, with a change in population of 2.78 million people (a 4.21 percent growth rate).

The remaining racial and ethnic minority groups made up 40.02 percent of the regional population, with a total of 45.85 million people. The proportion of the black population in the south was the highest proportion of all regions, with a population of 22.01 million people, or 19.21 percent, in 2010. The American Indian or Alaska Native population increased from approximately 29.3 percent of the total population of this group in the United States in 2000 to 31.5 percent in 2010. The total count for this racial group in 2010 was 923,713 people, or 0.81 percent of the south regional population. The Asian population was 3.21 million, which made up 2.81 percent of the regional population. As was the case with the American Indian or Alaska Native population, the proportion of the total Asian population in the United States also increased in the south over the 10-year period between 2000 and 2010, from approximately 18.8 percent to 21.9 percent.

The Native Hawai'ian or Other Pacific Islander population made up 0.07 percent of the region, or 82,900 people. In spite of the small proportion, the Native Hawai'ian or Other Pacific Islander population had a regional growth of 61.9 percent, or 31,683 people in the 10-year period; this was the largest percentage change for this population group among the four regions. The Some Other Race category made up approximately 14.73 percent of the remaining regional population, or 16.87 million people. The Two or More Races

population made up approximately 2.4 percent of the region, which is similar to the northeast and midwest regional proportions. However, in contrast, the population of 2.75 million in the south was nearly double. The Hispanic population in the south was 18.23 million, which equaled 15.91 percent of the regional population.

West Region

The 13 states that make up the west region are Alaska, Arizona, California, Colorado, Hawai'i, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming. The west had the second-largest population after the south region, with a total of 71.95 million in 2010. Combined, the west and the south accounted for 60.41 percent of the U.S. population, and about 84.4 percent of the national population increase from 2000 to 2010. Specifically, the west grew by about 8.7 million, which enabled it to surpass the midwest population in size.

As in the south region, the white population in the west grew 2.97 percent between 2000 and 2010, or by 1.1 million people. The total population in the region in 2010 was 38.01 million, or 52.83 percent. The population sizes for the west and the northeast are about the same; however, because the west had a larger overall population, the white population in the west was the smallest majority population of the four regions.

As the white majority population had the lowest percentage of the four regions, it follows that the racial and ethnic groups of the west region would have the highest collective proportion, which they did at 47.2 percent, or 33.94 million people. The regional black population was the lowest of the four regions, with a total of 3.42 million, or 4.76 percent of the population. This was consistent with the data from 2000, which showed a population increase of 11.2 percent, amounting to a population change of 345,916 people. Overall, the greatest proportion of the entire American Indian or Alaska Native racial group resided in the west (45.6 percent). However, this percentage dropped from 2000, when it was closer to half (48 percent). Similarly, the Asian population was concentrated heavily in the west. In 2010, this population was 6.67 million, or 9.27 percent of the regional numbers. Similarly to the American Indian or Alaska Native

population, the Asian population had its greatest proportion in the country in the west, but had also dropped in proportion between 2000 from nearly half (48.8 percent) to 45.5 percent.

The Native Hawai'ian or Other Pacific Islander population in the United States also had its largest proportion in the west, at 75.37 percent. The total number for this group in 2010 was 407,014 people, or 0.57 percent of the regional population. Although still a relatively small number, it was several times greater than the proportions for the other regions. Additionally, the Some Other Race category also had its highest number of respondents located in the west. Approximately 18.71 million, or 26.01 percent, comprised the regional demographics. The largest Two or More races group in the United States also resided in the west, with a population of 3.39 million or 4.7 percent of the region. The Hispanic population was 20.60 million in the west, making up 28.63 percent of the region. Similar to many of the minority racial groups, the Hispanic population in the west was the largest of the four regions, as well as the highest proportion of population of the four regions.

Residential Patterns

Housing has been a question on the U.S. census since 1890, when fewer than half of the respondents and those who lived with them owned their homes. The housing question, which explains whether a dwelling is owned, rented, or vacant, provides an illustration of the housing market and what factors may influence it. The housing bubble, which subsequently popped during this past decade, caused much of the fluctuation seen in the percentage of homeowners in the United States and in the pricing of homes.

The discussion of race in population distribution is included as well, as respondents were asked to report whether they consider themselves white, black or African American, American Indian or Alaska Native, Asian Indian, Chinese, Filipino, Japanese, Korean, Vietnamese, Native Hawai'ian, Guamanian or Chamorro, Samoan, or other Pacific Islander. Respondents could classify themselves as one race alone or up to 57 possible race combinations. Across all races, the southern region experienced the most growth, particularly among respondents who identified with more than one race. The west also experienced heavy growth. The black population, as with previous censuses, is concentrated primarily in the south or in metropolitan areas across the other three regions.

Housing Trends and Patterns

The housing bubble refers to the economic impact of the rapid decline of the housing market. In 2006, the price index of homes began a decline that lasted until the end of 2010. The largest price drop in Case-Shiller home index history was reported on December 30, 2008. The cause for the collapse is convoluted but can be traced to

factors such as deregulation, housing tax policy, a push for homeownership for all, the subprime housing market, and low interest rates.

Any fluctuation—or in this instance, collapse of the nation's housing bubble—can influence a recession and impact home values, mortgages, home builders, real estate, home supply retail outlets, and many financial stakeholders. In 2008, the federal government spent \$900 billion to bail out institutions related to the collapse of the housing bubble. The government provided support to these institutions, specifically Fannie Mae and Freddie Mac, throughout 2012.

Across the country in all regions, homeownership declined in 2010. Although the recession and financial crisis had hit in 2008, the impact on the housing market became most apparent two years later. In 2010, 65 percent of Americans reported owning their own homes—the lowest recorded number ever.

Homeownership Among Minorities

Homeownership rates among minorities have remained somewhat stagnant over the past decade. In 2000, 46.3 percent of the black population owned homes, and in 2010, 45.4 percent did. The black population has held the lowest homeownership rate since 2005.

Forty-six percent of the Hispanic population owned homes in 2000, and 47.5 percent owned homes in 2010. A slightly higher percentage was seen among Asians and Pacific Islanders, who in 2000 had 52.8 percent of their population owning homes with an increase to 58.9 percent by 2010.

The white population remains the highest at 71 percent. Although homeownership decreased

The homeownership rate for the white population remains the highest at 71 percent, versus 45.4 percent for the black population, and 47.4 percent for Hispanics. A record low of 65 percent of Americans reported owning their own homes in 2010.

across the board in 2010, the housing crisis hit the black and Hispanic populations more so than the white population. The black community in particular saw homeownership levels drop to pre-1990s levels—the lowest in the past two decades.

The devastating plunge in homeownership rates for Hispanic and black families has had other implications as well, including a reduction in median household income and wealth and an increase in the number of households with negative net worth.

In addition to homes, black families are losing their wealth. As of 2010, the average wealth of a white family was valued at 20 times greater than that of the average black family—the largest gap since the federal government began collecting data 25 years ago. Black residents are nearly twice as likely to have lost their homes, and nearly a quarter of all blacks who bought a home just before the crisis hit were at risk of losing it.

Black homeowners are also more likely to need a subprime loan or pay higher interest rates than white homeowners with a similar income or credit history.

During the housing collapse toward the end of the first decade of the 2000s, black and Hispanic homeowners were twice as likely to be foreclosed. In California alone, black and Latino homeowners made up as much as 50 percent of foreclosures but accounted for only 30 percent of homeowners. Huge racial disparities were found during the housing crisis for high-priced lending, with banks targeting people of color. One bank that received a government bailout was accused of having steered black and minority buyers toward subprime housing loans. It is believed that these practices have impacted today's homeownership rates. Going forward, the Consumer Financial Protection Bureau is taking steps to prohibit discriminatory lending practices.

Socioeconomic Patterns

Socioeconomic status (SES) reflects a position within a cultural structure. SES is generally defined by three factors—income, occupation and education. These factors are often interrelated, as higher education provides access to occupations that have more prestige and higher salaries. In contrast, less education precludes entry into certain career options. In this situation, individuals might have access to less prestigious occupations that have smaller salaries. Within the United States, socioeconomic status is typically divided into three categories: upper class (highest income, occupational status, and education (IOE), middle class (moderate IOE), and lower class (lowest IOE). Theoretically, these class divisions might simply seem to be a matter of semantics. However, there are practical and real-world consequences to these categories. Social class (in part) dictates the communities in which families can afford to live, quality of essential services (e.g., health care, education, transportation), leisure/cultural options, and social networks as an entrée into other life opportunities.

The U.S. census is an attempt to count the country's population. More specifically, it is an effort to gather demographic data (e.g., age, race/ethnicity, income, education, family status) about individuals. From this data, the best estimate of the population is generated. Collectively, the census information provides a picture of the United States (including SES divisions) at a particular point in time. The information is used to guide the allocation of resources (e.g., money, supplies, equipment) to local communities and states. This allocation influences the degree to which infrastructure (e.g., roads, power utilities) and services

(e.g., hospitals, schools, occupational training programs) is available to individuals and/or families in each community.

The first census was taken in 1790. The U.S. Constitution dictates that census data must be collected every 10 years. The most recent census was taken in 2010. Over the centuries, the census has provided greater recognition of racial/ethnic diversity within the U.S. population and SES divisions among racial/ethnic groups. Historically, the largest racial/ethnic group represented in the upper class was white/Caucasian families. Other racial/ethnic groups (e.g., American Indian/Alaska Native, black/African American, Hispanic) were more strongly represented in the lower and middle classes. There is no evidence of an individual quality (e.g., personality, genetics) that would account for the social class divisions. Rather, it has been argued that the structure of society makes it more difficult for families of certain racial/ethnic groups to make upward SES movement (lower class to middle class) or rebound from downward movement (upper class to lower class).

A brief profile of some racial/ethnic groups is provided. The racial/ethnic categories were identified by the federal government's Office of Management and Budget and used in census data collection. Although these categories don't represent the full range of ethnic/cultural diversity within the United States, they provide some insights into the differences in economic status.

Income analyses often focus on household income. The household represents the individuals/family members who reside together. Given the considerable variation in factors, such as family membership/size or proportion of employed

family members, it might be too difficult to identify each person's income. Thus, household income is a common economic standard. Although income is not the only indicator of SES, it can be considered a divisional factor. That is, a low-income household would typically be categorized as lower class, even if household members had advanced educational degrees.

American Indian/Alaska Native

Almost five million people identify themselves as American Indian and/or Alaska Native. This represents less than 2 percent of the total U.S. population. The median household income is nearly \$35,000, which is 30 percent lower than the national median across all racial/ethnic groups. More than 25 percent of American Indians/Alaska Natives live below the poverty level (the poverty level is also an economic indicator of lower SES). However, this percentage does not indicate a low rate of employment. The majority of employed individuals work in business, science/arts, service, and sales/office occupations. Thus, employment is no guarantee of wealth or upward social movement.

Compared to the general population, this group has a lower rate of college degree attainment, which could hinder access to some occupational/economic choices. In addition, the American Indian/Alaska Native population is growing more rapidly than other groups. This growth might be an indicator of increased household size, which would suggest that the income must be used to meet the needs of more individuals. This income dispersion would make it more difficult for families to save money and/or invest in activities (e.g., college education) that would expand SES options.

Asian/Asian American

Approximately 6 percent of the population (18 million) identify as Asian/Asian American. The median household income has been estimated to be \$77,000, which is the highest rate recorded for a single racial/ethnic group. Less than 13 percent of Asian Americans live below the poverty level. The economic status is in part tied to educational and occupational attainment. Half of the Asian Americans have earned an undergraduate or graduate degree, significantly higher than the

general population rate. Nearly half are employed in management and professional fields. Such fields have typically been associated with more prestige (as an element of higher SES). Similar to American Indians/Alaska Natives, the Asian American households are growing at a faster rate than the general population, attributed partly to immigration. Although some immigrants might have limited incomes/educations in their countries of origin, this is not uniformly true. Thus, some Asian American individuals/families might have resources that make it easier for them to attain or maintain a higher socioeconomic status.

Black/African American

Approximately 40 million people identify themselves as black/African American. This represents 12 percent of the general U.S. population. This percentage has declined (from 15 percent) in the last census. This change might not indicate a significant loss of African American individuals/families, but rather that other racial/ethnic groups (e.g., Hispanic families) are growing at a faster rate and gaining a greater percentage and overall representation in census data.

The median household income of black/African Americans is nearly \$32,000. Twenty-five percent of black/African American families live below the poverty level. Similar to other racial/ethnic groups, the relatively low percentage of college-degree attainment (18 percent) might be a barrier to SES opportunities. However, a college education might not be the only barrier. It has been reported that black/African Americans with college degrees receive lower mean salaries than their white/Caucasian counterparts. Thus, educational success might not assure economic success (and SES status) if other discrepancies or forms of discrimination are present.

Hispanic/Hispanic American

Fifty-two million people (nearly 17 percent of the population) identify themselves as Hispanic, making the United States the second-largest Hispanic population in the world (after Mexico). The median household income is nearly \$38,000. In comparison to the American Indian/Alaska Native group, Hispanic Americans have similar percentages of poverty (27 percent) and college degree attainment (13 percent). This group also has a

high employment rate. Two-thirds of adolescent/adult Hispanics 15 and older were employed in 2010. Despite the high employment rate, upward SES movement has been limited for this group. It has been noted that Hispanic American households are growing and this growth is partly attributed to the number of children. In 2009, nearly 25 percent of the children in these households were younger than 6 years of age. Thus, there is a large proportion of children who need extensive care from their families and cannot contribute to household income. The Hispanic American population has more than doubled since the 1990 census and is the nation's fastest growing racial/ethnic group. Thus, it is possible that the current generation of children will represent a large proportion of the workforce in the next few decades and that this employment pattern might change their SES patterns.

Native Hawai'ian/Pacific Islander

In comparison to the other racial/ethnic groups, Native Hawai'ian/Pacific Islander is the smallest group. It represents 0.5 percent of the U.S. population (1.4 million people). The median household income is approximately \$59,000, which would typically fit a "middle class" designation. Confluent with this income, more than one-fifth have attained college degrees.

In comparison to other groups, a lower poverty level has been reported for Native Hawai'ian/Pacific Islanders (17 percent). However, it has been argued that the income/poverty issues might be somewhat more complicated. The majority of individuals within this group live in the Hawai'ian region. Given its geographical location (including distance from the U.S. mainland), it has been argued that the infrastructure and service costs are higher for local/state government. In addition, it has been noted that the general cost of living can be higher for families/individuals. Thus, the median income of \$59,000 might be less beneficial in Hawai'i than in other less-expensive locations. In addition, the small population percentage could be a consideration in the allocation of federal resources. Until Native Hawai'ian/Pacific Islanders represent a much larger portion of the U.S. population, they might not make significant gains in federal resource allocation or relief from cost of living issues.

White/Caucasian (Non-Hispanic)

The large majority (198 million people) identify themselves as white/Caucasian, but not of Hispanic origin. This designation distinguishes racial identity (Caucasian) from ethnic/cultural identity (Hispanic). Thus, this group might reflect individuals who are white, but have identities associated with other cultures/regions (e.g., Scandinavia, northern Europe). This group represents approximately 63 percent of the U.S. population. The median income for white/Caucasian households is nearly \$54,000, consistent with a middle class designation. This income rate is also consistent with educational attainment—nearly one-third have a college degree. Yet, 10 percent (nearly 20 million people) live below the poverty level. Although other racial/ethnic groups might have higher percentages of poverty, the largest number of poor people in the United States are white/Caucasian individuals.

SES Disparities and Race/Ethnicity

The U.S. census data provides useful and important information about U.S. demographics. It provides demographic details about factors such as income, education, and employment that are used to define socioeconomic status. However, this data does not (and perhaps cannot) tell the whole story about race/ethnicity and SES. Since the 1980s, there has been an increasing economic divide between upper-, middle-, and lower-class families. A relatively small number of upper-class families have a disproportionate amount of economic gain from the U.S./global economy. Simultaneously, there has been a decline in economic gain (e.g., via wages, occupational opportunities) for middle- and lower-income families. Indeed, there has been much discussion about the decreased percentage of families in the middle class and increased percentage of families in the SES lower class. Some colleagues have even speculated that the middle class will erode completely and that the United States will become a two-class (upper and lower) society.

It is certainly true that the upper class is not entirely limited to a single racial/ethnic group. Across all racial/ethnic groups, there are some families who are quite wealthy and some families who are quite poor. Thus, there has been an argument that the American Dream of upward social

mobility is equally accessible to everyone. However, the premise of equal access is inconsistent with the complex factors that impact different racial/ethnic groups.

For example, black/African American and Hispanic families have both a lower median income and lower asset accumulation than some other groups. Thus, they have fewer financial resources (e.g., assets, savings, property) that they can utilize during economic downturns. In addition, they might have fewer social network members (e.g., family and friends) who have reached the middle/upper class and have resources to share. Given the decline of job availability and salaries for low-prestige occupations during the past few decades, it is harder for families to earn a livable wage. In addition, the increasing costs of college tuition have made educational attainment beyond high school more difficult to achieve. As degree attainment is a pathway to higher prestige and higher-salaried employment, educational barriers can have lifetime consequences for SES status.

Conclusion

Such social and economic conditions highlight that SES disparities are not simply a matter of ethnic/cultural differences. Rather, it is important to acknowledge and ameliorate the structural factors that hinder the social mobility options for families of various racial/ethnic groups. There are some indications that practices, such as racial segregation in residential access, have persisted into the late 20th and early 21st centuries and have had a substantial impact on families' quality of daily life. The true test of American values (e.g., freedom,

equal opportunity) can only occur after structural barriers to SES mobility have been eliminated.

White Categorization

White categorization refers to the decision made early on by the U.S. government to determine who would count in census data as either “free” Americans or “slave.” This early classification determined by skin color has influenced race and politics throughout U.S. history. The problem with the choice of a dichotomous classification tells a story laying a foundation for racial tensions both past and present.

Beginning of Duality

As the colonies were forming their first government it was decided in Article I, section 2 of the ratified Constitution that individuals of the United States would be counted or enumerated to levy taxes. Those to be counted were determined to be free people and indentured servants (those bound by contract to servitude for a number of years) and would exclude Indians and three-fifths of all other persons. The Constitution determined that the first census would take place within three years of the initial meeting and continue every 10 years or every decennial.

While the determination appears simple enough, great debates went into what went into this article and how it would be implemented. The three-fifths clause was one term that engendered much debate in the past, as it does today. The basic point of the three-fifths rule was to determine how many enslaved people would count in the census. One belief was to interpret the clause to mean that black people were less important than white people. Slavery was a point of contention between many representatives of the northern and southern states. Those who did not want slavery to continue did not want to count black

slaves, and congressmen who wanted to continue slavery wanted enslaved people to count equally so as to determine state representation in the new government.

The northern states were more heavily populated and would end up with more representation if the black population were not in the count and could work to abolish slavery. The southern states had a much smaller white population and would lose their voice to continue slavery if the black population did not count. Hence, the compromise known as the three-fifths rule. Regardless which belief one chooses, this rule continues to drive debates over racial inequality today because in the end the categories to determine how someone “counted” or did not “count” would initially be based on skin color.

Deceptive Choices

The first U.S. census took place in 1790, one year after George Washington was named president, and consisted of six questions. The questions included the name of each head of household and the number of people in each household. Further descriptions were required to list the number of free white males over and under the age of 16 for the purpose of military conscription. Additionally, free white females were counted and all other free persons were listed by sex and color, as well as enslaved people living on the premises. These initial questions related to name, address, age, sex, and color/race are the only questions that exist on all 23 administrations of census data from 1790 to 2010. Hence, these questions led to the initial category of race with two choices: white or black.

A further important concept regarding how individuals were categorized within the census data is that the decision of race selection was determined by the census marshal, not the individual named in the data collection. Additionally, there were no apparent instructions given to census data collectors until 1820. These issues appear to begin the murky and complicated relationship around the concepts regarding race and color.

While the census listed people in the category of either white or black, the reality of which box to select remains murky. African American studies educator Jill Rowe highlights this disparity in her discussion regarding individuals of color who settled in Ohio. During this time, individuals of color intermarried with settlers of diverse ethnicities. However, census takers labeled children of these diverse unions as black. Therefore, people with European and Native American, or European and African, or any combination thereof were labeled as mulattos, and census takers reported them as black. This designation served to disenfranchise them from those labeled white and subjected them to second-class citizenship or worse.

While it may not have been the intent of the Founding Fathers to make skin color a racial issue, the reality is highlighted in the stories of the black settlements of northeastern Ohio. Ohio became a natural place for many mixed-race and freed slaves to immigrate. One reason was that Ohio was a free territory/state and did not condone slavery. While Ohio did not allow slavery in 1804, the new state did implement “the Black Laws”; these laws were designed to prevent free black and mixed-race citizens from moving to the state and eventually led to an attempt by white residents to force people of color to leave, resulting in a marked reduction of African Americans from the area by 1865.

The story of Joel Goings is one story of an individual who persevered despite threats. Goings, reported variously as being either Native American or free black, married Elizabeth Cole, a white woman, in 1837 and parented nine to 11 children, one of whom was D. C. Goings. D. C. Goings went to medical school and became a prominent village shaman in Remley, Ohio. Upon his death, D. C. Goings was buried in a black cemetery. This single action illustrates the practice of

categorizing free individuals of mixed parenthood as African American, thereby distinguishing them from free whites. The “one drop rule,” initiated in Tennessee in 1910 and codified in the Immigration Act of 1924, would make any individual black if they had any African ancestry. While the checking of a box is no longer a task left to others or based on a simple dichotomy of black and white, the problems of which box to choose and the ramifications of this choice continue.

Race and the Early Census

While some categories in every census since 1790 remain consistent, much has also changed. As the American society changed, with an ever growing diverse population and territory the need to restructure the census became apparent.

From 1790 through 1840, the census data was collected by the U.S. marshals’ judicial districts. The first set of data was sent directly to President George Washington. However, in 1800, the secretary of state began to oversee the census data and U.S. marshals reported census data directly to that department. In 1849, the Interior Department was created and oversaw administration of the census from 1850 to 1900. Along with the need to change how the census was administered, the need for more inclusive data collection also became necessary. Therefore, it was determined in 1810 to add inquiries about agriculture. The 1820 census expanded the population data collected and also inquired about individuals in the occupations of agriculture, commerce, and manufacturing. This data was handwritten by the census marshal and handbound for presentation to the U.S. secretary of state. In 1830 this method of presentation was discontinued, and a preprinted census was implemented to ensure everyone was collecting similar data.

In 1850, the census expanded significantly. The U.S. marshal was now responsible to ensure their assistants properly completed each census for their citizens. Additional inquiries regarding wages, taxes, schools, crime, and mortality were added. As requirements for data grew, many individuals were concerned about the invasion of their privacy. The census of 1860 added for the first time two new categories in the area of race: American Indian and Asian. In 1880, laws began to be implemented to limit access to information,

and these laws were finally codified in 1954. The census of 1870 most notably dropped the selection of free or slave under the category of black. The 1890 census stood out not in data collection but in the knowledge that American expansion into new territories was over. Subsequent census collections reflected the filling in of population, rather than the colonization of new land. After the acquisition of Hawai'i, the census revised the category of Asian to Asian and Pacific Islander.

Immigration and Race Categorization

Major changes in the census also coincided with the first surge of a large number of immigrants to the United States from central, eastern, and southern Europe from 1869 to 1924. Research suggests that the surge of ethnic workers impacted the white/black color boundary due to the competition over the existing resources. These European minorities had little education and were competing for the same jobs as black workers. Competition for the same jobs, along with immigration laws designed to reinforce the Anglo heritage, inflamed the existing institutionalized antiblack sentiment. This sentiment was attributed to a rise in attacks on blacks by these same immigrant populations.

As the ideology of a white America grew stronger, societal tolerance of difference became more apparent. Notions of expressing one's ethnicity as German American and Irish American after World War I were akin to treason. Therefore these immigrants began to acculturate or assimilate into the white American culture. The final immigration act of 1924 drastically reduced the numbers of incoming immigrants as a way to preserve the homogeneity of the United States. Hence, this act reinforced the already existing ideology of race differences between whites and blacks. Descendants of these immigrants quickly aligned with white ideology to create the illusion of a stronger homogenous white America.

Census data was reflective of some of the changes regarding the country's interest in creating a white America. The census of 1940 added an additional white category: white, Spanish-speaking and white, non-Spanish speaking. This was the first inclusion of people of Hispanic origin.

The 1950 census included significant changes in the race selection categories. For the first

A census taker records a woman's responses during a door-to-door survey in 1920. Mass immigration between the late 19th century and 1924 exacerbated anxieties about race and ethnicity in the American population.

time in census history a person could do a partial self-selection regarding data for the census. This iteration of the census added the category of other, and returned the selection of Asian to a single status. Therefore, the status of Pacific Islander was removed from the census; however, in 1960 Pacific Islander once again was paired with Asian.

Additionally, American Indian now was also paired with Aleut and Eskimo. The census of 1970 fully included those who are of Spanish origin and those who speak Spanish from any race. The census of 1990 changed the term *Spanish* to *Hispanic*, which brings us to recent changes to the census that continue to highlight the role that race plays within the political system.

Politics of Immigration

While the Constitution is seen as what institutionalized racial lines, the categorization of white versus other race or ethnic designations has been part of the political agenda since colonial times. Basically, America has been asking its citizens to “tell me your color, and I will tell you your place.”

While the first mass immigration in the late 1800s and early 1900s appeared to inflame the existing black/white tensions, the next wave of immigrants appeared to open a door for potential political change. In 1965, immigration law was once again changed and abolished the quota system enacted in 1924. This act instead focused on immigrants’ skills and family relationships with current U.S. citizens. This law had been suggested by President John F. Kennedy and was signed into law after his death by President Lyndon B. Johnson. Upon signing the legislation, President Johnson said “the old system violates the basic principles of American democracy, the principle that values and rewards each man on the basis of his merit as a man. It has been un-American in the highest sense, because it has been untrue to the faith that brought thousands to these shores before we were a country.” While it would be many years before racial tensions would begin to shift, the Immigration Act of 1965 appears to be one political move in this direction.

During this time numerous theories regarding race and immigration began to be published. Three essayists—George Sanchez, Jon Gjerde, and Erika Lee—would pose competing theories regarding immigration. The common purpose of these essays was to understand the relevance of immigration throughout history as it compared with the immigration wave of 1965. George Sanchez posed the challenge of recognizing and understanding historical approaches of white immigrants’ experiences with those of nonwhite immigrant. Jon Gjerde asks if the theories of the Chicago school and Turnerian school remained applicable. Gjerde favored a combination of perspectives in order to create a matrix of possible understandings regarding immigrant experiences. Erika Lee’s focus was to discuss the evolution of immigration and naturalization law. Like Gjerde, Lee postulates there does not appear to be a one-size-fits-all answer for the political complexities regarding the understanding

of immigration or the complexities of race and racial categorization.

As the 20th century came to a close, the need to have a multicultural understanding of America, as well as the world, began to develop. As people of color began to give voice to their differences, they also began to call for a common understanding based on cultural difference. No longer would one group be able to speak for all groups. Nowhere is this more true than with the Hispanic or Latino populations. One political theory behind the influx of recent emigration from Latin America to the United States is the move of large corporations from the United States to Latin America. The companies change the economics of the small cities they inhabit and those too poor to adapt are forced to move. Problems exist for these individuals as they move to the United States because their self-image of race is dramatically different.

The United States defines race almost exclusively as a biological category, which is rigid and inflexible. Latin America, on the other hand, has a fluid definition of race based on relationships and situational contexts. This implies that the simple selection of a single box may be problematic for the Latin population, as with other cultures. While this sounds easy, Ellis Cose, a writer for *Newsweek*, tells the story of a friend from Argentina who is confused about whether he is white or Latino, a fact he never questioned until he came to the United States. The story highlights that while some Latin Americans have a fluid view of their race, others may also share the American view related to biology. This leads to the question of what is white and what does that category mean today.

White Categorization Today

While the United States has moved past the initial days when people were labeled black or white, or later when naturalization was an option only to free white persons, the legacy of the color categorization remains. Two recent examples stand out. In 1983, Susan Guillory Phipps, a woman who lived her entire life as a white was told through the appeals court that she must accept the legal designation of black. She was considered black by the state of Louisiana as she had 3/32 parts of black ancestry and state law decreed that anyone

who had 1/32 parts black ancestry was black. In another example, in the 1990s, Susan Graham, a white woman married to a black man, testified at a Senate hearing after census officials stated that her biracial children would have to have the official designation of the mother's race. These two examples highlight the remaining inconsistencies in the designation and categorization of who is and what it means to be white.

The 2000 and 2010 census data also reflect the inherent problems regarding white categorization. In the 2000 census, Americans for the first time were able to select more than one category for race, and it was subsequently decided that all individuals who selected white and minority categories would continue to count as minority. The decision to allow multiple selections of race was pushed by those who consider themselves multiracial.

In the 2010 census, an overwhelming majority of individuals selected only one race and this majority also designated themselves as white. Americans were allowed to select more than one category for race, and those who selected multiple categories were counted as such. The most common multiple categories were white and black. A new designation in the 2010 census concluded that the term *Hispanic* was not a race but instead an ethnic designation. Therefore this population tended to either identify their race category as white or some other race.

The term *white* has had multiple meanings over the last 220 years. Its meaning will continue to shift as the national paradigm regarding the meaning of race also shifts.

Part II: A-to-Z Articles

A. Philip Randolph Institute

Founded in 1965 by A. Philip Randolph and Bayard Rustin, the A. Philip Randolph Institute facilitated the bridging between the civil rights movement and the labor movement. These cofounders concurrently considered fighting for civil rights and workers' rights. By 1965, Randolph had established himself as a prominent leader among African American laborers. Rustin, a longtime partner of Randolph, had also organized and led civil and labor rights activism, including the March on Washington in 1963.

The collaboration between the civil rights movement and the labor movement was based on the idea that African Americans and workers of any color shared similar struggles and goals: attainment of freedom and justice. This alliance had proven to be effective in the late 1950s and the early 1960s, culminating in the passing of the Voting Rights Act of 1965. This historic case served as validation to advance Randolph's and Rustin's vision for the black-labor alliance.

Currently led by President Clayora Brown, the institute has grown across the United States, totaling over 90 local chapters in almost 30 states. Brown became the president in August 2004. She also serves on the boards for Workers United,

Amalgamated Bank, the Centers for Disease Control and Prevention's Business Response to AIDS/Labor Response to AIDS, and other organizations. She was also appointed to the National Commission on Employment Policy by former President Bill Clinton and to the New York State Workforce Investment Board by former Governor George Pataki.

Under Brown's leadership, the institute has nine focus areas: civil rights, strong antidiscrimination measures, and affirmative action; policies to promote a decent wage, high growth, and full-employment economy; labor law reform and worker health and safety protections; decent minimum living standards for all, including antipov-erty programs, a fair minimum wage, and a comprehensive safety net; universal, affordable health care; family leave and child care; progressive and fair tax policies; international workers' rights, and fair trade education and training programs; and education and training programs. All these programs are implemented at different levels, ranging from local communities to the White House. The institute and its members have helped grassroots efforts particularly through its local chapters, which include youth and college chapters, and at the federal level through lobbying activities.

Many of the activities the institute leads are pertinent to workers, immigrants, and those who continue to struggle to achieve political and social

Asa Philip Randolph was born in 1889 to a minister, Rev. James William Randolph, and a skilled seamstress, Elizabeth Robinson Randolph. He went on to become a leader in the civil rights movement, as well as the American labor movement.

equality. In 2009 and 2010, the institute urged its members to support the legislation that would extend emergency loans to the American auto industry. The institute also continues to be vocal about its support for the health care reform that would enable universal health care. Similarly, it was committed to representing the interest of workers in Wisconsin when the state faced the elimination of public employee rights for collective bargaining. In Miami, Florida, the institute joined local organizations to protest outside the Department of Homeland Security to demand changes in immigration policy for Haitians. African American LGBT Work Place Training is another resource that the institute launched in 2010 in hope of establishing a fair working environment for LGBT (lesbian, gay, bisexual, transgender) laborers.

The A. Philip Randolph Institute also recruits and trains youth activists. Through the Youth Leadership Program, it annually invites approximately 100 young people for a weeklong labor

training session. The program aims to train the next generation of labor and civil rights leaders to seek equality in the country.

Abie's Irish Rose

Few works in American popular theater history have been as successful and as vilified as first-time playwright Anne Nichols's 1922 sentimental comedy, *Abie's Irish Rose*. Despite critical carping over its low-brow slapstick, fluffy plot complete with stale jokes and hokey dialects; and manipulation of ethnic stereotypes, the play ran for more than five years (2,327 performances), making it at the time the longest-running play in Broadway history. Beyond that New York run, the play found long-term national success in touring companies and in both film and radio adaptations.

The 1920s were an extraordinary time for American theater. Following World War I, after Broadway had long stagnated, recycling formula burlesque shows and vaudeville sketches, lightweight musical theater, and heavy-handed melodramas, young playwrights tested experimental ideas imported from Europe with bold plays that explored provocative social issues and reimagined the stage space itself; these plays have become that decade's defining achievements.

In contrast, *Abie's Irish Rose* excites little contemporary interest save as a period artifact. A young man (Abraham "Abie" Levy) returns home to his strict Jewish father, Solomon, a successful businessman and widower, to introduce his new bride, Rosemary Murphy, a singer he had met overseas during the war. The two have already been married by a chaplain but, uncertain of the reaction his father will have to his marriage to a Catholic, Abie decides to tell his father that Rosemary is a nice Jewish girl he wants to court, certain the old man will fall under Rosemary's charms. The father does—and he too quickly facilitates a traditional Jewish wedding to be held within the week. Rosemary's father, Patrick, a staunch Catholic with a deep aversion to the Jewish people, arrives from California for the wedding, accompanied by the family priest. Rosemary has told her father that she is marrying a nice Irish boy. But Patrick arrives too late—the ceremony is over. Both fathers discover their children's elaborate hoax and bemoan such chicanery and the betrayal of their religions, all the while exchanging derogatory ethnic barbs. The priest and the rabbi, both chaplains during the war, react far more tolerantly. To mollify Patrick, the couple is married for a third time by the priest.

The play's last act offers a most sentimental resolution—largely disowned by both fathers, Rosemary and Abie have set up a modest apartment and have apparently been blessed with a child. They are preparing to celebrate Christmas, an obvious expression of how the two have found common ground. Perhaps coaxed by the holiday season, both fathers in turn show up to meet their grandchild—Solomon promises, if it is a boy, to leave him his fortune while Patrick makes a similar promise if it is a girl. The fathers—and audiences—are charmed when the couple introduces their twins, a boy and a girl. As the curtain falls, the fathers soften their rhetoric, giving hope that the families can be brought together.

At a time when the Jews and the Irish were the dominant urban ethnic groups and clashed over politics, religion, culture, and jobs, Nichols's play explores the dilemmas facing both immigrant groups who must adjust to the cultural diversity of their adopted homeland by using farce, a genre that lacks the psychological nuance of the era's more respected social realists such as Eugene

O'Neill and Elmer Rice. Certainly, both fathers exaggerate familiar stereotypes: Solomon Levy is educated, wealthy, and considers business acumen a measure of moral worth; he manipulates guilt expertly; he meddles in his grown child's love life; he mistakes strict observance of religious customs for faith; and he has a conservative suspicion of change. Patrick has a fondness for drink; he is street smart and good with his hands; he is a fierce proponent of Irish nationalism; he is prone to maudlin emotions; he mistakes religion for blind obedience to the institutional church; and he is given too quickly to fisticuffs.

Legacy

Nichols's premise in which entrenched ethnic prejudices of an older generation are challenged by a romance involving the family's younger generation (critics quickly pointed out its debt to *Romeo and Juliet*) became something of a formula in both film and television, ranging from groundbreaking sitcoms in the 1970s, most notably CBS's *Bridget Loves Bernie*, to James Cameron's blockbuster *Titanic*. But, like many of Norman Lear's provocative sitcoms in the 1970s, *Abie's Irish Rose* uses the vehicle of stock characters to expose the problems with bigotry itself. It preached an idealistic (if naïve) gospel of tolerance through the vehicle of the priest and the rabbi, a message that gives the lightweight romantic farce its serious intent. Thus, *Abie's Irish Rose*, now largely forgotten, marks an important achievement in American ethnic literature—not only for its courageous promotion of tolerance but, unlike more sophisticated social realist dramas of the era, for bringing that message to a wide audience.

Abolition

Abolition (or abolitionism) refers to the movement to end the transatlantic slave trade and racial slavery in the United States through the late 17th century to the ratification of the Thirteenth Amendment following the American Civil War in December 1865. The first call for an end to slavery in the United States came in 1688 with the “Germantown Quaker Petition Against Slavery,” a two-page document that said all humans, regardless of their skin color, have rights that should not be violated. Although individual acts of resistance to slavery occurred throughout the United States in the 17th century, the abolitionist movement did not garner much wide-scale attention and support until the 18th and 19th centuries.

Enlightenment and Revolution

The Enlightenment began in the 17th century as a European philosophical movement that declared reason as the guide to wisdom, rejected superstition and ignorance, and held that there was a basic goodness in all humankind. As Enlightenment thought spread throughout the United States, a reconsideration of the role slavery played in the nation’s development soon followed.

The Enlightenment idea of the natural equality of all human beings came into direct conflict with the enslavement of Africans and African Americans. Likewise, the idea of natural human rights was further supported by religious beliefs of many Christian sects, including the Quakers, evangelical Methodists, and Baptists who believed that slavery was morally wrong as God created all living beings to be free.

Demand for an end to British colonial rule came about in the 1760s after a series of measures by the British Parliament such as the Sugar and Stamp Acts were found oppressive by the Americans. The effect of such measures led to calls for American independence using Enlightenment principles of “life, liberty, and the pursuit of happiness,” as noted in the 1776 Declaration of Independence. This call for freedom influenced many enslaved African Americans to volunteer on the side of the patriots in the hope that their military service would lead to the abolishment of slavery. While full emancipation would come gradually to the north by the 1820s, for slaves in the south, emancipation would not come for another four decades.

The North and South Divide

After the American Revolutionary War, northern states began moving toward ending slavery. This shift was brought on by several factors, including changes to the northern economy from agriculture to industrialization, a growing moral and religious revivalism by way of the Second Great Awakening, and remnants of natural rights thought brought on by the Enlightenment. In 1780, Massachusetts became the first state to end slavery. Other northern states like Pennsylvania, Connecticut, Rhode Island, and New York passed “gradual emancipation” statutes before the turn of the 18th century. Under the provisions of these statutes, no new slaves could be brought into the state, and the children of existing slaves were to be freed after serving an indenture. By 1820, all northern states had passed laws that fully ended slavery.

In sharp contrast to their northern counterparts, many southern politicians publicly reaffirmed their commitment to slavery. In 1783, Thomas Jefferson wrote his *Notes on the State of Virginia* in which he defended the institution on racial grounds. Many southern delegates at the Constitutional Convention further defended slavery as justified by history, economics, and necessity. Some historians claim that while the southern delegations shared Jefferson’s view that slavery was justified on racial grounds, during closed-door sessions of the Constitutional Convention, delegates offered a more practical justification for the institution’s continuance—economics and

A slave auction block at Green Hill Plantation in Campbell County, Virginia. Slaves commonly experienced whippings, rapes, and executions. In 1780 Massachusetts became the first state to end slavery, and by 1820, all northern states had followed suit.

politics. To that end, the southern delegation was not asking their northern counterparts to accept slavery as morally legitimate but to accept that slavery was in the self-interest of the north to keep the union intact.

The south's commitment to slavery was so deeply entrenched that it forced the new U.S. Congress to engage in a series of political debates about the expansion of slavery into the western territories. These political clashes between northern and southern politicians resulted in a series of compromises that allowed limited expansion of slavery, including passage of the Northwest Ordinance of 1787, entry of Louisiana and Missouri as slave states, the Three-Fifths Clause, and Missouri Compromise. In 1808, the United States banned further importation of slaves from Africa; however, the ban was inconsistently enforced through the 1860s. With this ban on slave importation came a new series of fugitive slave laws that were passed beginning in 1793, with new, harsher fugitive slave laws passed intermittently through the 1850s. These laws were designed to return slave "property" to their owners even if the slave was able to successfully escape to the free northern states. As slavery became even more deeply entrenched in the south because of these political developments, a burgeoning abolitionist movement made up initially of white religious groups began to develop.

Early Organizing

In 1775, Quaker abolitionist Anthony Benezet organized the first antislavery society in the world. The organization would become known as the Pennsylvania Society for Promoting the Abolition of Slavery, and in 1787, Benjamin Franklin became its first president. Throughout the north and upper south, similar societies were established through the 1830s. Most of these antislavery societies utilized a common organizing framework known as American Convention for Promoting the Abolition of Slavery and Improving the Condition of the African Race. Generally, only white people participated in these Quaker-dominated organizations, although some did cooperate with leaders from the free black communities. The members of these early abolitionist organizations focused their attention on securing gradual, compensated emancipation in Delaware, Maryland, and Virginia. Additionally, they worked to keep free blacks from being reenslaved and frequently called for free blacks to be sent out of the country.

Early white abolitionist groups were reluctant to challenge the property rights of white masters, so instead they advocated for both compensation for white slave masters' "property" and a gradual approach to emancipation. Their early advocacy of sending free blacks out of the country began to gain such traction that by 1816 a group of white Americans founded the American Colonization Society (ACS), which aimed to end slavery by sending African Americans back to Africa.

Free Blacks and Abolition

Slavery was gradually abolished in the north following the American Revolution, but for the vast majority of African Americans in the United States, emancipation remained elusive. Political changes to manumission and self-purchase laws following the revolution made it possible for the number of free blacks to grow in numbers and influence in the abolitionist movement. Between 1790 and 1820, the free black population in the upper south rose from approximately 8,000 to 40,000. This growth of the free black population contributed not only to the establishment of black churches and black schools but also led to greater participation of free blacks as leaders in the abolitionist movement.

Among the first free blacks to call for the abolition of slavery was Peter Williams, Jr., a black Revolutionary War veteran who founded the *Freedom's Journal* in 1827, the first African American-run newspaper in the United States. Edited by John B. Russwurm and Samuel E. Cornish, the newspaper called for the complete abolition of slavery, debated colonization proposals to send enslaved blacks to Liberia, and circulated David Walker's *An Appeal to Coloured Citizens Around the World*, which called for black unity and armed rebellion to end the institution of slavery. One of the most famous black abolitionists was Frederick Douglass, who founded the *North Star*, a journal that argued that the antislavery movement must be led by black people.

By the 1830s, free blacks were convening regular state meetings to discuss ways to abolish slavery. Free blacks often differed on the approach that abolitionists should take; for example, David Walker and Henry Highland Garnet called for slaves to overthrow their masters, while Russwurm and Paul Cuffe proposed establishment of a modern black country within Africa. The latter group, with the support of the mainly white ACS, established the nation of Liberia in West Africa in 1822.

Radical Abolitionism

From roughly 1783 through the 1830s, many white and some black abolitionists supported colonization as the best way to abolish slavery. However, critics of the ACS forcefully condemned the group's colonization approach as a scheme to appease white southern slave masters' interests. When white abolitionist William Lloyd Garrison, a former ACS member, publicly apologized and denounced colonization and called for the complete and immediate abolition of slavery, without compensation to slave masters, his denouncement signaled the move from gradual to radical abolitionism.

Garrison eventually founded his own antislavery newspaper called the *Liberator* in 1831; he cofounded the American Anti-Slavery Society with Arthur Tappan in 1833. Garrison used forceful language and once raised controversy when he publicly burned a copy of the U.S. Constitution, stating that the document was a "covenant with hell" when compromises were made to write slavery into the document.

Nonetheless, Garrison advocated nonviolent, passive resistance to slavery. However, by the 1850s, many abolitionists grew weary of waiting for the U.S. government to overturn laws legalizing slavery and decided to take measures into their own hands.

With the passage of the Fugitive Slave Law in 1850, many abolitionists began to support the Underground Railroad as a means of opposing slavery. Using this network of safe houses and secret routes, many black slaves were able to escape enslavement by traveling north to Canada. Black and white abolitionists aided these fugitive slaves with food and shelter. The Underground Railroad was viewed by many white southern politicians as one of the most radical forms of abolition because it sought to completely undermine economic and political viability of the entire slave system. The Underground Railroad was most active in the 1850s; estimates put the number of slaves who escaped via that network at approximately 30,000.

Probably the most controversial abolitionist of all time was John Brown, a white abolitionist who led an unsuccessful revolt against the federal armory at Harpers Ferry in Virginia in 1859. Brown's planned attack shocked and terrified the nation, especially as he was the first white man to use violence to try to put an end to slavery.

Two years after the raid on Harpers Ferry, 11 southern slave states formed the Confederate States of America (CSA) and seceded from the union. This secession resulted in a bloody four-year civil war between the CSA in the south and Union in the north in large part over the question of slavery. On September 22, 1862, President Abraham Lincoln issued the Emancipation Proclamation, an executive order freeing all enslaved people in any territory still in rebellion on January 1, 1863; the Thirteenth Amendment, which made it illegal to hold any person in bondage or involuntary servitude, was ratified in December 1865.

Abolitionist Movement

There had always been sentiment against slavery in colonial America, with the earliest formal statement condemning the practice originating in 1688 among German and Dutch Quakers descended from the original Mennonite settlers. But throughout the colonial era and the beginning years of American independence, those opposing slavery were divided on how this might be achieved and what might happen following emancipation. Some favored state or federal legislation to eliminate slavery, some believed that slave owners ought to be compensated by the government for the loss of their property, while others called on people to donate to funds for the purpose of purchasing the freedom of slaves. Similarly, some people advocated sending the freed slaves to Africa or the Caribbean to establish their own nations, some believed slaves should be freed but could not bring themselves to advocate social and political equality, while others stressed the equality of all peoples regardless of race. All wanted to see slavery ended but could not agree

on tactics or the end result beyond freedom. Over time, the abolitionists emerged as the more radical of the antislavery groups.

While any real decision on the topic of slavery had been avoided at the Constitutional Convention by bargains that created the so-called Three-Fifths Compromise, the issue arose on the national stage once again during the controversy that led to the Missouri Compromise in 1820. At roughly the same time, a religious revival began that culminated in the Second Great Awakening. Among the most effective advocates of this new religious view was the Presbyterian minister Charles Grandison Finney in upstate New York. Finney rejected the Calvinist belief in predestination, instead preaching individual responsibility for redemption and salvation. Where the stricter older view maintained that a person could do nothing to gain salvation since only God could ordain deliverance, Finney preached that mankind had free will and with it, the ability to influence his own destiny. No longer was the individual powerless to affect whether he achieved salvation. One could, in effect, earn a place in heaven. Laced with liberal democratic ideals and antiaristocratic overtones that fit well with the popular ideas of the day, Finney's ardent preaching struck a responsive chord in an era of religious and social revival. This reorientation of Protestantism to "doing good" led directly to a melding of religious activism with social causes, and hence to increasing memberships in a variety of social movements of the day, including temperance, women's rights, and the antislavery crusade.

Renewed popular interest in the antislavery movement also led to an increase in the number of "immediatists" who advocated immediate emancipation as opposed to a gradual approach. But the abolitionists were more than just immediatists. The melding of religious zeal with their pursuit of an immediate, uncompensated emancipation for all slaves resulted in a militantly uncompromising approach. Since slavery was a sin, it ought to be abolished immediately. Since it was a sin for everyone so afflicted, all ought to be freed. And since one should not profit from a sin, owners, as sinners, should receive no compensation in any form from anyone for their loss.

Among the first whose writing could be classified as radical abolitionist was David Walker, a free

African living in Boston, who published *Walker's Appeal* in 1829. In it he criticized the American Colonization Society and other gradualist anti-slavery movements, maintaining that slaves would only be freed through their own efforts to rise up and throw off their shackles. Perhaps most closely associated with the early rise of radical abolitionism was William Lloyd Garrison, a cofounder of the American Anti-Slavery Society, who began publishing the *Liberator*. In his first issue dated January 1, 1831, he explained his purpose:

I am aware that many object to the severity of my language; but is there not cause for severity? I will be as harsh as truth, and as uncompromising as justice. On this subject, I do not wish to think, or to speak, or write, with moderation. No! no! Tell a man whose house is on fire to give a moderate alarm; tell him to moderately rescue his wife from the hands of the ravisher; tell the mother to gradually extricate her babe from the fire into which it has fallen;—but urge me not to use moderation in a cause like the present.

As Garrison's statement suggests, the abolitionists were insistent, direct, and spared no words in their condemnation of slavery, eliciting from southerners a quick and equally unequivocal defensive response. With Walker, Garrison, and other abolitionists calling for everything from immediate emancipation to slave uprisings, the south was on edge. Its worst fears came true in 1831 when Nat Turner led a slave insurrection in Southampton County, Virginia, that killed 57 white men, women, and children before being subdued. In its wake, dozens of Africans were killed, many of them completely innocent. No one knows how many suffered this fate, but with the entire area aroused, it did not take much to bring forth retaliation. Southerners immediately blamed northern agitators for the revolt and enacted additional laws to prevent further outbreaks. Possession of antislavery newspapers and other such materials was prohibited, and antislavery dissent was no longer tolerated. Antislavery people in the south either learned to keep their opinions to themselves or fled north.

The rise of abolitionism was promoted by influential advocates such as Frederick Douglass,

Wendell Phillips, Theodore Weld, Lucy Stone, and Sojourner Truth. Among its more strident advocates were recent immigrants to America, including the Germans Karl Heinzen, Bernhard Domschke, and Carl Schurz, along with the Poles Marie E. Zakrzewska, Jan Tyssowski, and Adam Gurowski. In response, beginning in the 1830s, southerners began a more spirited defense of slavery as not only an economic necessity but also a good system that benefited everyone, including the slaves. As attitudes began to harden, and the fear of violence and even national partition began to appear, some northerners rose to oppose what they viewed as a group of troublemakers intent on provocation. In October 1834 a mob attacked African residents in Philadelphia, Pennsylvania. In the following year William Lloyd Garrison was attacked by a mob in Boston, Massachusetts, dragged through the streets, and nearly lynched before authorities jailed him for his own protection. Other mobs attacked antislavery meetings and African settlements in Cincinnati, Ohio; Hartford, Connecticut; and Utica, New York. In 1837 the abolitionist newspaper publisher Elijah P. Lovejoy was killed by a proslavery mob in Alton, Illinois; the mob also destroyed his printing presses and burned his warehouse. Tensions rose so much that between 1836 and 1844 the postmaster general refused to allow antislavery material to be delivered in the south by the U.S. mail carriers, and the House of Representatives voted to routinely table any proposals or petitions dealing with the slavery issue. Proponents hoped this would prevent any further rise in tensions.

Despite opposition that was sometimes violent, by 1837 there were over 600 abolitionist societies in New York, Massachusetts, and Ohio alone, and by the following year, the nation counted some 1,300 societies with an enrollment of 109,000. The escaped slave Harriet Tubman led an increasing group of daring individuals who helped slaves escape to freedom through the Underground Railroad, another direct action the south viewed with alarm. In 1839, wealthy New York businessmen Arthur and Lewis Tappan, assisted by James Birney, a New Yorker who was a former Alabama slaveholder, formed the Liberty Party as a political home for abolitionists and other antislavery activists anxious to translate their cause into political action. It nominated Birney for president in 1840

A statue of William Lloyd Garrison on Commonwealth Avenue in Boston, Massachusetts. Garrison was the editor of the *Liberator*, an abolitionist newspaper. At its start, the *Liberator* had fewer than 400 subscribers, but it became very influential.

and 1844 but gained few votes outside New York State. In 1848, most of the Liberty Party followers merged with groups of antislavery Whigs and Democrats to form the Free Soil Party, but most of its members left for the new Republican Party when it was formed in 1852.

The furor created in the north by the passage of the Fugitive Slave Act, the publication of Harriet Beecher Stowe's *Uncle Tom's Cabin*, and the enactment of the Kansas-Nebraska Act provided opportunities for abolitionists to keep their cause before an increasingly receptive northern public, while concurrently raising fear and outrage in the south. By the time of John Brown's raid in 1859, southerners automatically equated abolitionism with a threat to their way of life and associated it with the antislavery Republican Party.

The abolitionists succeeded in radicalizing the American antislavery movement, which in turn

called forth increasingly strident defenses of the "peculiar institution" from southerners. Most historians agree that this contributed significantly to the rising tensions that led to the Civil War and prevented any compromise that would have averted the nation's bloodiest conflict.

Abrahamic Religions

The United States, by law, was designed to be religiously inclusive, including humanist and secularist ideas. When the nation was founded in 1776, the nation was 98 percent Protestant. For much of American history, Christianity has had a formidable influence on American culture. Though a culturally Christian nation, it struggled to be inclusive of all denominations and religions. Today, America still struggles with religious inclusivity as the country continues to become more religiously diverse. An overview of the Abrahamic religions in a multicultural America begins with a brief history of religion in America, a look at America's religious landscape, an overview of each of the Abrahamic religions, how Americans are navigating religious diversity, and future trajectories for the Abrahamic religions in America.

While previously an almost purely Anglo-Protestant nation, Americans responded by reimagining a once de facto Christian nation as one that could embrace Judaism and Catholicism as well as Protestantism. Each of these religions affirmed one God who spoke through prophets and holy books. All three religious groups were deemed compatible with such American virtues as liberty, equality, and democracy.

After 9/11, the reality of our global society was clear and an expanded view of faith became increasingly the norm. For many years, elected officials had lauded the valuable faith-based work being done by America's churches, synagogues, and mosques. The existence of a Judeo-Christian-Islamic, or Abrahamic, America had been recognized, but Islam existed as a tiny, marginalized outsider.

While Islam was increasingly recognized in American politics and culture, Americans did not necessarily embrace Muslims. Many responded with fear and hatred. This is unlike a similar response in the previous century to changes in the religious makeup of American society. Just as Christians struggled to accept Jews until World War II, now Christians and Jews are struggling to accept Muslims.

America's Religious Landscape

In a 2011 Gallup poll that asked the question "Do you believe in God?" 92 percent of respondents said they do, while 7 percent said they do not and 1 percent had no opinion. The U.S. government does not collect religious data in its census, but according to the American Religious Identification Survey (ARIS) 2008 findings, Americans predominantly self-identify as Christian; however, they are slowly becoming less Christian, with 76 percent of U.S. adults identifying as Christians in 2008, down from 86 percent in 1990. Simultaneously, a Gallup poll released in 2007 found that 53 percent of Americans would refuse to vote for an atheist as president, which is up from 48 percent in 1987 and 1999. For instance, there is only one American congressional representative who is openly non-theistic. The survey also indicated that 38 percent of Americans would refuse to elect a Muslim for president. Six percent said they would refuse to vote for a Jew.

Although no one religion is formally allowed to rule over American society, its influence on American traditions and politics is evident. Traditionally, elected representatives place their hand on the Bible when sworn into office. Furthermore, political rhetoric often evokes the hand and heart of God to strengthen, guide, and comfort Americans across faith, ethnic, class, and political lines. Although most Americans recognize the nation's religious pluralism, it was not until 1960 that John F. Kennedy became the first Catholic president. Joe Biden became the first Catholic vice president in 2008. America has not yet seen its first Jewish presidential candidate. Joe Lieberman is the only Jewish vice presidential candidate to run on a major party ticket. In 2006, the first Muslim was elected to Congress and used a Qur'an once owned by Jefferson when reenacting his swearing-in for photos.

Religious affiliation differs across racial and ethnic lines. According to the Pew Forum 2007 U.S. Religious Landscape Survey, black Americans were most likely to be part of a formal religion while Asian Americans were least likely. Table 1 portrays Abrahamic religious affiliations across ethnicities in America.

Judaism

Of the three Abrahamic faiths, Judaism is the oldest and the original of the three monotheistic religions. The one true God of the three religions chose Abraham and his descendants to be his people, known as Hebrews. God promised to bless the Hebrews and all people on earth through the Hebrews. The terms *Jew* and *Judaism* come from the word *Judah*, a name representing one of 12 tribes of the Hebrew people. Today, the term *Jew* is used as a description of a group of people who trace their ancestry back to Abraham or as a description of one who practices Judaism. Thus, American Jews are U.S. citizens of Jewish ethnicity or of the Jewish faith. Jews make up slightly less than 2 percent of the U.S. population.

Jews were present in the United States during the formation of the original 13 colonies, but the population was very small. Most came to the United States from Spain and Portugal. The largest population of Jews settled first in South Carolina and achieved the ability to vote and to be active in political life in 1790. Due to persecution

Table 1 Overview of Abrahamic religious affiliations in America

	White	Black	Asian	Latino
Christian	78 percent (53 percent Protestant, 22 percent Catholic, 2 percent Mormon, 0.5 percent Jehovah's Witness, and 1 percent Orthodox)	85 percent (53 percent Protestant, 5 percent Catholic, 0.5 percent Mormon, 1 percent Jehovah's Witness, and 0.5 percent Orthodox)	45 percent (27 percent Protestant, 17 percent Catholic, 1 percent Mormon, <0.5 percent Jehovah's Witness, and <0.5 percent Orthodox)	84 percent (23 percent Protestant, 58 percent Catholic, 1 percent Mormon, 1 percent Jehovah's Witness, and <0.5 percent Orthodox)
Jewish	2 percent	<0.5 percent	<0.5 percent	<0.5 percent
Muslim	0.5 percent	1 percent	4 percent	<0.5 percent
Other religion	4 percent	2 percent	27 percent	1 percent
Agnostic or Atheist	16 percent	12 percent	23 percent	14 percent

and economic difficulties in parts of eastern Europe, Jewish immigration to the United States increased dramatically in the early 1880s. In the early 1900s, over 2 million Jews immigrated to the United States and settled predominantly in the New York metropolitan area, establishing one of the world's largest Jewish populations.

There are four major branches of Judaism in the United States. The largest denomination is Reform, followed by Conservative, Orthodox, and Reconstructionist. Jews are an ethnoreligious group and include those born Jewish and those who have converted to Judaism. A major difference between the groups is their approach to Jewish law. Orthodox Jews believe that the law is divine and unalterable, and thus it should be strictly followed. Reform Jews, for example, believe that the laws are general guidelines rather than a strict set of obligations required of all Jews. Judaism is rich with tradition. Shabbat is a weekly day of rest lasting from sundown on Friday through dusk on Saturday. High Holy Days include Yom Kippur and Rosh Hashanah. Other important festivals in Judaism include Passover,

Shavuot, Sukkot, Purim, and Hanukkah. Each commemorates an important event in Jewish history or enduring values of the faith. Less than half of the Jewish population say they belong to a synagogue or routinely practice their faith. In comparison to all American ethnic groups, American Jews are most likely to describe themselves as atheist or agnostic. Religious traditions are still observed, but adherence to the religion is on a sharp decline. Even fewer Jews today practice kosher dietary laws or observe the Shabbat on Saturday.

Historically, the Jews worked hard to integrate into the American Christian culture. Jews experienced discrimination throughout U.S. history but nothing like the Jews in Europe. As a minority group, they were the largest non-African American group to participate in the civil rights movement in the 1960s. However, despite being a minority group, Jews have greatly influenced American society in education, science, the arts, literature, business, and politics. Today, as a group, American Jews tend to be better educated and earn more than Americans as a whole.

Christianity

Of the U.S. adherents of the three Abrahamic monotheistic religions—Christianity, Judaism, and Islam—98 percent identify themselves as Christians. Christians in the United States come from a variety of different cultures and adhere to a variety of different dogmas and creeds. The most inclusive definition of Christianity that unites Catholics, Orthodox, Evangelicals, and Protestants is the belief that Jesus Christ is God incarnate and that Jesus Christ died and rose from the dead to take away the sins of those who believe in Him granting his followers access into heaven for eternity.

Spanish Roman Catholics arrived in what is now the United States in 1513. In 1607, 104 settlers of the Church of England established Jamestown in Virginia. Christianity spread at a rapid rate in America as more settlers from Europe from a vast array of denominations settled in the New World as well as through conversions of the native population. The different Christian denominations settled in common areas known as colonies. The 13 original colonies divided along denominational lines. By the time of the signing of the Declaration of Independence in 1776, these Christian denominations had great influence in the formation of the new government. However, the government was not a Christian government nor was the newly formed United States of America officially a Christian nation. In 1797, the Treaty of Tripoli, signed by President John Adams stated, “As the government of the United States is not in any sense founded on the Christian religion . . .”

Despite the diversity of Christians in the United States, they do share common traditions, practices, and language that unite them into a collective yet diverse culture. Since the United States was predominantly Christian during its formation, a Christian culture emerged. This culture included celebrations and feasts marking the birth and resurrection of Jesus. Sunday was set aside as a day of rest and Christians would gather for church. Church consisted of the singing of hymns, prayers, communion, and the proclamation of the scriptures. In early U.S. culture, praying in school or displaying the Bible in public governmental buildings was common and accepted. Christianity played a vital role in shaping the U.S.

landscape. Christians built schools, hospitals, and orphanages, and they established charities. Christians have always held prominent positions in law, medicine, business, and government. In fact, every U.S. president has claimed Christianity as their religion.

Yet for most of U.S. history, Christianity was a private affair, emphasizing personal piety and morality. Christianity has entered into the public arena during times of crisis. Ironically, Christianity has been used to both support and denounce issues such as slavery, women’s suffrage, war, and civil rights. However, a major shift took place in the 1980s when a group of Christians made a conscious decision to take their faith from the private to the political. This group formed the Moral Majority in order to lobby lawmakers to ban abortion, allow prayer in public schools, support Israel, denounce homosexual behavior, and protect themselves against secularism. These politically vocal Christians still play a significant role in shaping the political agendas today through the same goals, with the addition of curbing the influence of Islam in the United States. Currently, the majority of Christians in the United States are part of the Moral Majority, but they are the most resourced and vocal in shaping American public policy.

Islam

Muslims make up less than 1 percent of the U.S. population. The majority of Muslims come from southeast Asia, Arabia, and Africa. Today, of the 2.7 million Muslims living in the United States, 35 percent are natural-born citizens. Due to immigration, the fertility rate, and conversions, the number of Muslims living in the United States is expected to double over the next 20 years.

There are roughly 30 sects in the Islamic religion. The largest Islamic denomination is Sunni and the second largest is Shi’a. A common conviction shared by Muslims is the belief in one God (Allah) and that Muhammad is God’s messenger whom God chose to reveal the Qur’an. Muslims believe that Jesus was a prophet but not God. They believe that Muhammad is the last prophet sent by God and that the Qur’an is the Holy Book with authority over the Old and New Testaments of the Bible. Most Muslims practice mandatory prayer five times a day, almsgiving,

fasting during the month of Ramadan, and a pilgrimage to Mecca once in their lifetime. The major differences between the Sunni and the Shi'a have to do with the legitimate successor to Muhammad and are political in nature. However, in the United States there is less division between the two groups.

The Founding Fathers refer to Islam (Muhammadanism), which influenced the concept of freedom of religion in the new republic. Benjamin Franklin is quoted saying, "Even if the Mufti of Constantinople were to send a missionary to preach Muhammadanism to us, he would find a pulpit at his service." Muslims first entered the United States in significant numbers as slaves from Africa in the late 1700s. By the middle of the 1800s, records show that Muslims fought with Union soldiers during the Civil War. Immigration of Muslims from the Ottoman Empire to the United States expanded during World War I. Albanian Muslims built the first mosque in the state of Maine in 1915. Today there are over 2,000 mosques scattered across the country.

Muslims played an infinitesimal role in shaping U.S. culture and politics due to their small numbers. Throughout U.S. history, relations were good with Islamic countries and Muslims living in the United States integrated well into society due to their hospitable nature. The first notable historic act by Muslims in the United States was the formation of the Nation of Islam in 1930. The teachings of the Nation of Islam differed from traditional Islam, advocating black supremacy. The Nation of Islam gained national attention during the civil rights movement in the 1960s. Another significant shift occurred when the United States backed the establishment of the State of Israel in 1948. This started a rift between the United States and Islamic countries, which started to create negative perceptions of American Muslims. Despite declining international relations, overall U.S. Muslims were seen as positive and productive citizens. All of that goodwill changed, of course, on September 11, 2001, when self-proclaimed Muslims attacked the United States. After the events of 9/11, non-Muslims in the United States took great interest in Islam. Muslim Americans were put on the defensive by their non-Muslim neighbors due to guilt by association. In response, Muslims Americans

have gone on the offensive to promote their religion as a religion of peace that can and should coexist with fellow Americans, including Christians and Jews.

Navigating Religious Diversity in America: One Nation Under God

Navigating religious diversity in the United States has never been easy. Tolerance among the Christian denominations has proven difficult throughout U.S. history. Tolerance among the three Abrahamic faiths has proven to be even more difficult. According to the 2006 Faith Matters Survey, 72 percent of Americans believe that the United States is divided along religious lines. Although this number is certainly significant, contextualizing this figure with other similar reports on diversity in America portrays a somewhat broader story. According to this study, 93 percent report that America is divided across racial divides; 96 percent report divisions along economic lines. Furthermore, 97 percent believe America is divided across political constituencies.

While divides between doctrines exist, common values such as love, peace, compassion, forgiveness, and mercy stretch across the Abrahamic religions, binding them together and uniting them at their very core. Robert Putnam, in his book *America's Grace*, points out that most Americans, save an intensely religious few, have a more expansive view of God's truth than individual doctrines might dictate or portray. While commonalities exist, real differences among the Abrahamic religions of Judaism, Christianity, and Islam remain. The three largest monotheistic religions in the world espouse an exclusive doctrine claiming inerrant truth. The more Christians, Jews, and Muslims interact in meaningful dialogue and form friendships, the better the chance that the current conflict narrative fueled by ignorance and mistrust will be transformed into a new conciliatory narrative based on knowledge and trust. Toward this end, interfaith partnerships among the three Abrahamic faiths are happening all across the United States. One example of this is the work of Interfaith Ministries in Houston, Texas, the third most diverse city in the United States, with relatively large Jewish and Muslim populations. Interfaith Ministries (IM) for Greater Houston brings people of diverse faith traditions

together for dialogue, collaboration, and service to build upon and live out their shared beliefs.

The Interfaith Youth Core led by Eboo Patel is another such example of an organization equipping individuals, especially youth, with the leadership skills, relational capital, and interfaith knowledge that build bridges in this nation under God. The formation of personal relationships among individuals of different faiths is the key to a flourishing pluralistic religious nation. The research indicates and faith leaders have demonstrated that collaborations emerge, trust is built, and civility is strengthened when individuals from different faiths learn about one another's faiths, serve their common community, and build personal relationships across doctrinal lines.

Future Trajectories

Based on current population trends, some researchers have begun to predict the future of America's religious landscape. Vegard Skirbekk and Anne Goujon of the World Population Program along with Eric Kaufmann of the University of London used the General Social Survey findings, census immigration statistics, and Pew data to make such predictions. Based on research on projected age patterns, conversion, fertility, and immigration rates, researchers expect that Hispanic Catholics are likely to nearly double to become 18 percent of the population by 2043 and will likely outnumber Protestants during the second half of the century. The percentage of Americans from non-Christian faiths, except for Judaism, is expected to double. As a result of projected immigration statistics and higher fertility rates, Muslims are expected to surpass Jews by 2023.

Liberal Protestants, a group that currently has an older demographic with low fertility rates and that will yield little expected growth from immigration, will likely decrease in number. Additionally, conservative Protestants are expected to see a decline in numbers as the overall population of white Americans continues to fall. The number of secular (agnostic and atheist) Americans is projected to rise in the immediate future but will likely plateau as a result of modest immigration and fertility rates of this population.

While demographic projections are some of the most certain within the social sciences, these projections are not universally accepted among

experts. Some argue that population growth and decline are contingent on multiple factors and cannot be easily predicted. Fertility rates may change, immigration laws may tighten, or patterns may shift. Social and political issues are also elusive. Few predicted the religious schisms that resulted from the gay marriage debate or the scandals that arose within the Catholic Church. Similarly, the recent growth of the nondenominational churches was unexpected. Finally, religious conversion rates and continuity of religious identity within families is not guaranteed.

Academy Awards

The Academy of Motion Picture Arts and Sciences established the Academy Awards in 1929 with 12 “Best” U.S. film categories, which increased to 25 in 2012. From 1929 through 2011, a total of 2,809 Oscars were awarded, including a limited number to individuals of nonwhite backgrounds. The vast majority of awards, across categories, were won by white, U.S.-born nominees.

Filmgoers are a diverse group, yet Oscar voters are relatively homogenous, predominantly Caucasians (94 percent), and male (77 percent) with only 14 percent younger than age 50. In 2011, Academy invitees comprised 30 percent females and 10 percent nonwhites. One of 43 Board of Governors’ members is nonwhite. Blacks represent 2 percent of the 6,000 plus Academy members, and Latinos fewer than 2 percent. In 2012, the Academy identified 14 percent of new invitees as people of color, including African Americans, Latinos, Asians, and Asian Americans across categories.

Diversity at the Academy

Minority nominees’ career directions have followed a different trajectory than whites’, resulting in 72 percent likely to work in television versus 36 percent who succeed in film. Nonwhite winners and nominees make fewer movies annually than whites. They are also less likely than whites to be nominated again.

In such categories as acting, directing, producing, and screenwriting, white artists of diverse ethnic backgrounds have earned Oscars. Some white actors have been nominated or won Oscars for playing people of color. Jeff Chandler (white) was nominated for his performance as Apache Chief Cochise. Luise Rainer (white, German, Jewish) won an award for playing a Chinese farmer, and Linda Hunt (white, American, female) won an award for her performance as an Asian male.

A limited number of Latinos, African Americans, and Asians have won Academy Awards. While the majority of acting Oscars have been awarded to white Americans, many white English-speaking Europeans, Canadians, British, South Africans, and Australians have won, often portraying Americans.

Latinos/Latinas and Hispanic Representation

Latinos/Latinas and Hispanics have been minimally recognized and were often cast in ethnic and non-Latino roles. Anthony Quinn (Mexican American) won two Best Supporting Actor awards, playing Mexican and French nationalities, and was nominated for Best Actor as a Greek. Jose Ferrer (Puerto Rican) won his Best Actor and Best Supporting Actor awards and received another acting nomination for playing Frenchmen. Supporting Actor awards were won by Benicio del Toro (Puerto Rican) as a Mexican, while Javier Bardem (Spanish) played a character of deliberately unknown ethnicity, which has often been identified as Slavic or Russian.

No Latinas have won the Best Actress award, but three women have won for Best Supporting Actress. Rita Moreno (Puerto Rican) won for actually playing a Puerto Rican; Mercedes Ruehl (Cuban/European American), who has made a career of playing ethnically diverse characters, won her Oscar for playing an Italian American; and Penelope Cruz, the first Spanish actress to win an Academy Award, won for her role as a Spanish mentally ill ex-wife.

Latino and Hispanic individuals have been nominated for Best Director Award, but none has won. There have been winners in art direction, cinematography, music, and foreign film categories.

African Americans at the Academy Awards

African Americans comprise the majority of nonwhite Oscar acting winners and nominees. Hattie McDaniel’s Best Supporting Actress win in 1939 for *Gone With the Wind* was the first by a nonwhite performer. Sidney Poitier, Jamie Foxx, Denzel Washington, and Forest Whitaker have won for Best Actor, while only Halle Berry has won for Best Actress. Louis Gossett, Jr., Denzel Washington, Cuba Gooding, Jr., and Morgan Freeman have won for Best Supporting Actor. Hattie McDaniel, Whoopi Goldberg, Jennifer Hudson, Mo’Nique, and Octavia Spencer have won for Best Supporting Actress. Denzel Washington is the only African American actor to have won twice.

John Singleton is the only African American to have received a nomination for directing. T. J. Martin is the first African American director to win an Oscar for best documentary. Several

*Hattie McDaniel starred in *Gone With the Wind* in 1939 as Mammy, a role for which she won the Academy Award for Best Supporting Actress. She was the first African American to ever win an Oscar. In the film, the character Mammy was a house slave. McDaniel, front center, also became the chairman of the "Negro Division" of the Hollywood Victory Committee during World War II and is shown here leading a group of entertainers to a performance and dance for the troops.*

African Americans have won in music categories: Original Score (Prince and Herbie Hancock), Best Original Song (Isaac Hayes, Irene Cara, Stevie Wonder, Lionel Richie, and Rappers Juicy J, Frayser Boy, and DJ Paul), and Best Sound Mixing (Russell Williams, a three-time winner; and Willie D. Burton). Williams was the first African American to win multiple awards in any category.

Special Awards have gone to several African Americans. In 1948, James Baskett received a special award for his portrayal of Uncle Remus in Disney's *Song of the South* and was the first African American male to be honored by the Academy. In 2001, Sidney Poitier was the first African

American to win a Lifetime Achievement Award followed by James Earl Jones in 2011. Quincy Jones and Oprah Winfrey have received the Academy's Jean Hersholt Humanitarian Award.

Asians as Award Winners

Only two Asian actors, Yul Brynner (Vladivostok, Far Eastern Republic) and Ben Kingsley (British, half Asian Indian) have won Best Actor Awards. Yul Brynner won for playing the King of Siam; Ben Kingsley played Gandhi. Haing S. Ngor (Cambodian) was the only Asian actor to win an Oscar for a supporting performance. He actually lived through events similar to those depicted in the film. No Asian women have won the Best

Actress award. Miyoshi Umeki (Japanese) is the only Asian to win for Best Supporting Actress.

Ang Lee is the only Asian to win the Best Director Award in a nonforeign film category for *Brokeback Mountain* in 2005 and *Life of Pi* in 2012; three other Asians have been nominated. Asians have been better represented as winners in categories reflecting technology, cinematography, animation, music, makeup, and costumes. There were also multiple Asian winners among foreign, short, documentary, and animation films.

Best Picture

The Best Picture category comprises diverse time periods and populations, across a range of subjects. Some winning historical films include *Lawrence of Arabia* (Arabia during World War I), *The Sound of Music* and *Schindler's List* (the Holocaust), *Gandhi* (India), and *The Last Emperor* (China). Other films about social issues include *Gone With the Wind* (U.S. Civil War), *West Side Story* (New York City ethnic gangs), and *Slumdog Millionaire* (India). *The Color Purple* was the first nominated film coproduced by an African American while *Precious* was the first nominated film directed by an African American. *The Blind Side* was coproduced by an African American.

Conclusion

While Academy Award winners have been ethnically diverse, a limited number of Oscars have gone to people of nonwhite backgrounds. Academy voters have been mostly white, older, male Americans, while most highly promoted films have had white themes and have starred white actors. Among many people of color, this has led to a sense of being disenfranchised in regard to the Academy Awards.

Acculturation/ Assimilation

Whenever individuals or groups holding different cultural values come into sustained contact with each other there will inevitably be a degree of adaptation, conscious or unconscious, voluntary or enforced, to the cultural patterns of the other. Such adaptation is known as acculturation, of which assimilation is a subset, and is of increasingly vital importance to multicultural societies.

Acculturation in its broadest sense refers to the changes in beliefs, values, and behaviors that occur during the interaction of two or more disparate ethnocultural groups as a result of the reciprocal learning and incorporation of cultural features from each other. It can therefore be distinguished from enculturation, which is the gradual acquisition of the behaviors, values, and beliefs of an individual's own cultural tradition, and from transculturation, which is the ongoing creation of new cultural patterns initiated by intercultural contact. Nowadays, the most common focus for the study of acculturation phenomena is immigration, chosen or obligatory, on the part of both individuals and larger cultural groups. The degree to which immigrants adapt to the cultural values of the host society, and the expectations on the part of the dominant group regarding the beliefs and behaviors of immigrants, define to a large extent the context for acculturation studies.

The term *acculturation* was first proposed in 1880 by the explorer and ethnologist J. W. Powell, who defined it as psychological changes resulting from cross-cultural imitation. Imitation is the key term here, as Powell was specifically interested in the phenomenon of Native Americans who were adopting European clothing and learning English, aspects of a process he regarded as both desirable and inevitable as cultural groups progressed from savagery through barbarism to civilization—the anthropological paradigm prevailing at the time. The assumption that one cultural group in an encounter is superior and should therefore be emulated gives rise to an assimilative model of intercultural change, in which the dominant culture's patterns are gradually adopted by the other, replacing and eliminating the original. This unidirectional nature of cultural influence was axiomatic throughout the European-dominated world of the 19th century; colonial administrators in British India were so horrified by the thought of “going native,” even in the adoption of indigenous dress, however practical, that formal dress codes were rigidly enforced in the face of all climatic logic.

A more enlightened and enduringly influential formulation was offered in 1936 by anthropologists Robert Redfield, Ralph Linton, and Melville Herskovits, who redefined acculturation as the set of phenomena that results when groups of individuals with different cultures come into continuous firsthand contact, with subsequent changes in the original cultural patterns of either or both groups. The explicit acknowledgment in this definition that acculturation is, or can be, a two-way process enables it to be considered a more inclusive concept than that of assimilation, mentioned above, which implies the absorption of one culture into another.

Redfield and his colleagues considered assimilation to be a potential phase of acculturation, which was itself just one aspect of the ubiquitous phenomenon of culture change generally. Various modifications to this definition have been proposed, most notably that of the Social Science Research Council in 1954. Their attempted clarification broadened the scope of the concept to include cultural effects brought about by only indirectly cultural or noncultural factors, such as demographics and environmental change.

They also introduced the notion of delay, referring to internal adjustments following upon the acceptance of culturally alien traits or patterns, and suggested that some acculturative change can be a reactive adaptation of traditional modes of life, a return to certain cultural patterns currently in abeyance. This notion of reactive adaptation seems particularly persuasive when applied to societies or groups faced with the uncertainty of rapid social or economic change. Developments as otherwise disparate as the 1980s U.K. debate over Victorian values, the growth of Radical Islam in the late 20th century, and the U.S. Tea Party movement of 2011 to 2012 all share a desire to return to the perceived simplicities of a cultural Golden Age.

Conceptual Models

Probably the first psychological model of acculturation was formulated by W. I. Thomas and Florian Znaniecki in their 1918 paper, “The Polish Peasant in Europe and America.” From their research into the acculturation of Polish immigrants in Chicago, Thomas and Znaniecki identified three modes of acculturation linked to individual personality types. The first of these they termed the Bohemian, in which an immigrant's original culture is abandoned in favor of a full adoption of the host culture, a phenomenon now termed assimilation, as mentioned above and further expanded later. The second strategy, the Philistine, refers to the opposite approach, in which the culture of origin is maintained and that of the host society rejected. In contemporary usage, this strategy is generally known as separation, described below. Preservation of the immigrant's traditional culture while adapting to that of the host society was termed by Thomas and Znaniecki as Creative-Type, but corresponds in current terminology to the notion of integration, also elaborated below.

A weakness of the theoretical model proposed by Thomas and Znaniecki is that it focuses exclusively on the individual's degree of adaptation to the host culture, ignoring the reciprocal nature of the interaction made clear in the definition of Redfield, Linton, and Herskovits. Accordingly, acculturation effects are now generally thought to manifest themselves in two interconnected areas: the sociocultural and the

A 19th-century portrait of a Native American from southeastern Idaho wearing European clothing. The term acculturation was first proposed in 1880 in response to the phenomenon of Native Americans adopting European dress and learning English.

individual. Sociocultural effects refer to changes in the wider social group and its institutions, such as education and national policies, and have traditionally been of interest to sociologists and anthropologists. Individual effects focus on the psychological reactions to acculturation on the part of individual members of the groups affected, and have been studied extensively by cross-cultural psychologists, as well as intercultural communications scholars. Although there are differences in terminology and definition, most contemporary scholars of acculturation share a general conceptual framework more or less resembling the multidimensional four-part model proposed by John W. Berry.

Berry's theoretical approach identifies four types, or strategies, of acculturation characterized

on one dimension by the relative degree of attachment to an individual's original culture, and on the other by the relative desire to adopt the patterns of the dominant majority or host culture. A strong preference for maintaining one's own cultural heritage combined with a positive attitude toward participation in the host society results in the "integration" strategy. Successfully realized, integration leads to the formation of a bicultural identity, and is manifested at the social or national level as an explicit ideology of multiculturalism or pluralism. Full integration, however, has proven an elusive goal for many societies; the Dutch scholar Jan Pieter van Oudenhoven has claimed that among modern nations probably only Canada has a clear pluralist policy in this respect. (He goes on to say that, although Australia officially has a multicultural policy as well, this is not fully endorsed by the population.)

Attempts to foster inclusive societies of mutual cultural respect have often been problematic for liberal Western democracies as their populations are not always ready to accept certain aspects of cultural difference that are perceived to run counter to their own cultural or legal traditions. The 2004 ban on wearing the Muslim headscarf in French educational institutions is an example of the incompatibility of a fully integrationist attitude with Berry's second strategy, assimilation.

Individuals who either reject (or are obliged to abandon) their own culture or who have a relatively much greater attachment to the culture of the dominant group are exhibiting the "assimilation" attitude, of which the larger social equivalent is the ideology of the melting pot, if voluntary, or the pressure cooker, if enforced. Although assimilation can be voluntary on the part of immigrating individuals willing to eschew their cultural and linguistic distinctiveness in favor of a wholehearted adoption of the core values of a new society, it is more likely to be a requirement on the part of the dominant culture. Research has indicated that there is a clear preference among the majority of host populations for immigrants to assimilate.

Even within positively assimilationist societies, however, such as the United States or Germany, perceived cultural differences such as skin color or accent can be insurmountable barriers to full assimilation, and attitudes of the host population

can be strongly influenced by external political developments, such as economic factors, wars, or acts of terrorism, leading to generalization, stereotyping, and prejudice.

In the case of individuals whose strong attachment to their own culture leads them largely to reject the traditions and patterns of the dominant culture, the strategy is one of "separation." The existence of ethnic enclaves or ghettos renders this a viable voluntary strategy, given a liberal attitude on the part of the larger group and because immigrants can relocate geographically without having to make a huge cultural readjustment. In the contemporary United States, religious communities, such as the Amish or Hasidic Jews, are examples of voluntary separation. If enforced at the social or national level, however, separation is mandated by a policy of segregation or apartheid, as in formerly segregationist South Africa and the United States before the civil rights legislation of the 1960s.

Furthermore, in practice, even voluntary cultural or ethnic ghettos may be at best tolerated by the host population (the "live and let live" attitude), although such enclaves may be seen to have positive touristic interest. Any perceived negative impact on the larger society, though, such as rising crime rates or falling property values, can serve to reinforce stereotypes, breed resentment, and intensify mutual cultural incomprehension.

Finally, the term *marginalization* is used for individuals who have relatively little interest in, or opportunity for, maintaining their own cultural heritage, yet who either reject the dominant culture or are denied access to it. Berry points out that although the strategy of marginalization can be freely chosen by individuals, it is more likely to be the result of failed assimilation, in which original cultural identity is lost yet discriminatory attitudes of the dominant society preclude full participation. At the sociocultural level, laws and policies that embody such discriminatory attitudes resulting in imposed marginalization are said to have an ideology of exclusion or, in extreme cases, cultural genocide (ethnocide). The former large-scale abduction of many generations of aboriginal children in Australia (the "stolen generations") has been termed attempted cultural genocide, and the People's Republic of China has been accused of carrying out ethnocidal policies in Tibet.

Individual Choice

Berry makes the point that an individual's choice of acculturation strategy is constrained by two important factors: the attitude of the individual's ethnocultural group toward acculturation, and the expectations of the dominant or host society. Both integration and separation, that is, are only possible when the individual's ethnic group shares in his or her wish to maintain a traditional cultural heritage, while assimilation can be an individual strategy pursued independently of the feelings of the cultural collective. Also, as Berry has noted, integration can only be freely chosen and successfully achieved by nondominant groups when the dominant or host society has an open and inclusive orientation toward cultural diversity. A mutual accommodation is therefore required, in which the acculturating group adopts the basic values of the dominant society, while that society adapts its social institutions, such as education and health care, to respond to the particular cultural needs of the nondominant group.

As noted above, however, although most contemporary societies are increasingly culturally plural, integration has been achieved only rarely, incompletely, and sporadically, even in states with an explicit multicultural policy. To explain this, Berry has suggested that, apart from a national commitment to multiculturalism, four psychological preconditions need to exist in the wider society and in the subdominant group. First, there needs to be a widespread acknowledgment of the value of cultural diversity within the society. Second, there must be relatively low levels of prejudice in the forms of ethnocentrism, racism, and discrimination. Further, the nondominant ethnocultural groups must exhibit mutually respectful attitudes among themselves, which may mean abandoning specific intergroup hatreds obtained in their country of origin. And finally, there needs to be a positive sense of attachment to, or identification with, the larger society by all individuals and groups.

Criticism and Alternative Models

A criticism of this fourfold model of acculturation is that it is insufficiently complex to account for the observed range of cultural adaptation among immigrant or subdominant individuals and communities. Few individuals can be identified

unambiguously as falling into any one of the four categories proposed by the model, and its very multidimensionality means that there are in fact 16 interaction permutations possible. That is, an immigrant with an integrationist attitude to acculturation in a host culture requiring assimilation is in a different situation to a similar individual in an integrationist society. One attempt to formulate a more comprehensive framework with better predictive utility is the Interactive Acculturation Model (IAM) proposed by Richard Bourhis and his colleagues.

Regarding such factors as a significantly influential context, the IAM pays detailed attention to the ideologies and policies with regard to immigration on the part of the host society or nation that affect the outcome of acculturation interactions. By correlating these attitudes to those of the acculturating individuals or groups, the model claims to predict relational outcomes that are termed consensual, problematic, or conflictual. In describing both state policies and immigrant attitudes, the IAM retains most of Berry's terminology, although it rejects marginalization (which seems to have little empirical support) as a category in favor of individualism and (as a possible immigrant phenomenon) anomie.

Although not an explicit element of the model, when considering state integrationist policies Bourhis differentiates what are termed pluralist ideologies from civic ideologies. In both cases a multicultural nation will expect immigrants to conform to basic values, such as democracy, freedom, and the legal code, while exercising no regulatory jurisdiction over individual cultural or traditional customs provided that they do not conflict with the broad values of the host society. In the United Kingdom, for example, the maintenance of language and religious beliefs are acceptable manifestations of cultural diversity, while polygamy and "honor killings" are not. A state with a pluralist ideology, however, will attempt to foster cultural diversity in this sense by means of positive legislation and financial support for immigrant cultural institutions. Conversely, a state with a civic ideology, while not suppressing diverse cultural expression or expecting immigrant populations to assimilate, does not promote diversity through financial or political means. Bourhis also proposes the term

ethnist as a subset of the assimilation ideology, in which the state assumes a total mandate over both public and private values, requiring full cultural assimilation as a prerequisite to citizenship or, in extreme cases, restricting full citizenship to members of the host ethnicity.

In the IAM, host society acculturation orientations are thus defined as integration, assimilation, segregation, exclusion, and individualism. Acculturation orientations on the part of the immigrant community are categorized as integration, assimilation, separation, anomie, and individualism. Relative values for these attitudes are obtained by survey methods, and when the two sets of orientations are subsequently plotted onto a 5-by-5 matrix, the model predicts that consensual relations will obtain in only three of the 25 possible permutations: when immigrants with integrationist, assimilationist, and individualist attitudes acculturate in societies that share their orientations. All other relational outcomes are predicted to be either problematic (10 cases) or openly conflictual (12 cases).

After analyzing this set of results, Bourhis has concluded that social policies reflecting an integrationist approach—expressing either pluralism or civic ideologies—are more likely to yield positive and harmonious relational outcomes than policies reflecting the assimilation ideology. Similarly, segregation and exclusion orientations reflected in immigration policy are more likely to result in problematic relations or conflict. As Bourhis concedes, however, even pluralist and civic ideologies cannot guarantee successful integration, since some members of the host population will be bound to hold exclusionist or segregationist attitudes, while some members of the immigrant culture will inevitably experience anomie or hold separatist beliefs. The IAM is clearly a more comprehensive and potentially useful tool for studying acculturation than earlier four-part models, although Bourhis concedes that further empirical research is needed to confirm its validity and reliability.

Measuring Cultural Differences

Although not initially designed as a theoretical acculturation model, the Developmental Model of Intercultural Sensitivity (DMIS) devised by intercultural communication scholar Milton J. Bennett nevertheless offers a useful perspective

on individual attitudes to cultural difference. The DMIS comprises six descriptive terms for orientations to cultural diversity, the first three of which are categorized as ethnocentric and the final three as ethnorelative. Bennett considers that development through these six stages constitutes a dynamic measure of intercultural competence in dealing with perceived difference, although he points out that progression through the stages is not necessarily unidirectional or irreversible, and that a demonstrated competence in one aspect of diversity may not apply in all encounters with difference. In other words, a negative intercultural experience may result in regression to an earlier stage of sensitivity, in which an individual may exhibit a robust ethnocentrism with regard to religious difference, say, but simultaneously display entrenched ethnocentric attitudes in matters of race or sexual orientation.

The first stage of the DMIS is denial, representing the lowest level of openness to cultural difference, or extreme ethnocentrism. Individuals or groups exhibiting this orientation are either literally unaware that alternative cultural systems exist, or are so unfamiliar with other cultures that their ways are seen as bizarre, pathological, or subhuman. Few groups in today's world are so isolated as to have had no contact at all with other cultures, so denial is more often manifested as an inability to perceive meaningful cultural difference, such as the variations among a generalized "Asian" culture. Individuals at the next stage, defense, are aware of other cultural realities, but perceive them as inferior or threatening to their own culture, which is seen as the sole repository of truth and goodness. Racism and anti-immigration attitudes are symptomatic of a defense mind-set, as are nationalism and strongly assimilationist policies.

Bennett has also identified a reverse form of defense, in which individuals transfer their cultural allegiance to another group, usually a minority culture, but the stereotypical polarization of the "us and them" worldview is retained. Minimization is the most benign of the ethnocentric stages. It refers to the universalist belief that human beings are all basically the same and that cultural differences are merely superficial. Inevitably, however, one's own culture forms the basis for this assumed universal reality, and a lack of

cultural self-awareness prevents this attitude from developing into an ethnorelative worldview.

Acceptance is the first of the three ethnorelative stages of the DMIS, and involves an understanding that one's own culture is just one among a number of equally valid and equally complex worldviews and value systems. Other cultures may still be judged negatively, but an awareness of the cultural context distinguishes such a judgment from the pejorative perceptions of the defense stage, in which one's own culture represents the only true way of being. The next stage, adaptation, transcends the cognitive and involves an empathic connection to another culture in which that culture's perceptions, feelings, and behaviors can be experienced naturally as part of one's own expanded range of worldviews. Adaptation, unlike assimilation, does not imply the abandonment of one's own culture but rather an augmentation, the ability to experience the world through more than one cultural perspective.

The term *integration* is the final stage of the DMIS. It is not used in the sense employed by both the Berry model and the IAM as described above but instead refers to the ability to shift perception between cultural frames of reference without losing a sense of selfhood, since the self is construed as being this multicultural entity. Bennett uses the term *liminality* to describe individuals at this stage of integration who choose to eschew any one core cultural identity, occupying instead a kind of transitional state between cultures and adopting a perspective appropriate to the situation. Individuals at the integration stage may therefore be particularly skilled at mediating intercultural conflict, as they are able to experience the differing realities of the situation as perceived by the disputants.

Research

Early research on acculturation and its effects was conducted mainly by anthropologists interested in how individuals adapt to dominant cultural patterns. More recently, however, acculturation phenomena tend to have been more extensively studied by cross-cultural psychology scholars. As a consequence of this disciplinary perspective, studies have been based on affective, behavioral, and cognitive theory. The focus of research has been on the acculturating individual or group, while attitudes and institutional policies on

the part of the host society have been relatively neglected. Research topics have therefore concentrated on such areas as the mental health of acculturating individuals and levels of acculturative stress as reflected in alcohol addiction, drug use, and domestic violence. Furthermore, research has tended to examine one acculturating ethnocultural group in one specific society or setting. While these studies have yielded a wealth of invaluable data and insights, there is now a growing consensus that research needs to widen its scope in at least three vital respects.

First, there needs to be a more collaborative, integrated, multidisciplinary approach incorporating perspectives not only from anthropology and sociology but from economics, demography, education, and political science. As the contexts for acculturation have grown increasingly complex, due to a result of factors such as urbanization, globalization, intermarriage, and demographic change, so have research tools needed to become more comprehensive and sophisticated.

In the multicultural United States of the early 21st century, it makes little sense to talk of majority and minority cultures, given the mixed ethnic nature of the supposed Anglo “majority,” and the older proxy variables used by researchers, such as language, generation, and period of residence, may no longer be useful in defining acculturation. Second, although most acculturation takes place in the majority world, most research is still confined to the Western developed nations. International multigroup, multisociety studies are necessary to derive a common terminology and set of reference tools that will be applicable across the widening range of contexts in which acculturation is occurring. Finally, given that acculturation is above all concerned with cultural change, more longitudinal research must be undertaken in order to study acculturation effects over time and isolate core factors from contingent ones.

These research directions represent formidable challenges for scholars in the field of acculturation studies, but given the importance of the subject it is hoped that such challenges will be met with creativity and determination from researchers in a wide range of disciplines.

Adams-Onís Treaty (1819)

The Treaty of Paris may have brought independence to the United States in 1783, but the borders of the new nation remained somewhat ambiguous. During the colonial era, border disputes between the English-speaking colonies and their French, Spanish, Dutch, and indigenous

neighbors provoked many conflicts and not a few wars. One long-standing dispute was the location of the border between the United States and the Spanish colonies of east and west Florida. Following independence, overlapping claims continued to cause suspicion and varying degrees of hostility between the two nations. This was exacerbated by slaves escaping into Spanish lands and the general belief among Americans residing along the border areas that the Spanish were protecting escaped slaves and inciting the Indians to raid the U.S. frontier settlements.

In 1803 the Louisiana Purchase brought further ambiguity to the western border between the United States and Spain through lack of a clear definition and faulty maps. Further, on the southern border some Americans, including President Thomas Jefferson, argued that the deal had also included Florida. Over the years the United States made several offers to purchase Florida, and in 1810 and 1812, with Spain preoccupied by the Napoleonic Wars, it annexed portions of west Florida.

In the following years, American military forces occasionally moved temporarily into Spanish territory on the justification that they were in pursuit of Indian raiders. The most notable incursion into Florida occurred during Andrew Jackson's campaign against the Seminole Indians in 1817–18 (First Seminole War), which included attacks on Spanish outposts he accused of aiding the Indians. These actions, and the often belligerent rhetoric from north of the border, convinced many Spanish officials that the United States would eventually annex Florida by force.

While Jackson's troops were in action in Florida, President James Monroe directed his secretary of state, John Quincy Adams, to renew American offers to purchase Florida. By this time, Spain, beset by financial problems and fearing that it could not defend Florida against an increasingly likely American invasion, was becoming more amenable to negotiation. Spain first sought British aid, but when that was not forthcoming, it decided that it was better to sell Florida than to run the risk of losing it with no gain. The result was the Adams-Onís Treaty signed on February 22, 1819, by Adams and the Spanish foreign minister, Don Luis de Onís Gonzalez Lopez y Vara. Within the United States, the treaty was considered a great

triumph, although some politicians from the western states, led by Henry Clay, believed that government officials should have held out for the inclusion of Texas as part of the accord.

Terms

Under the terms of the agreement, Spain ceded all of Florida to the United States, but of equal or greater importance was an arrangement of the border between American and Spanish territory in the west. The two nations agreed that the western boundary of Louisiana would be along the lower Sabine River north to the Red River, then west to 100 degrees west longitude, north to the Arkansas River, west along that river, then north to 42 degrees north latitude, and from there west to the Pacific.

With Spain giving up its claims to the Oregon region, the United States gained unobstructed access to the Pacific coast. In return the United States agreed to pay off some \$5 million in claims by U.S. citizens against the Spanish government, give up its claim to territory in Texas west of the Sabine River, give up claims to some other areas along the western border, and extend favorable tariff provisions for Spanish traders using ports in Florida.

Although the treaty's provisions were honored by both sides, some inaccurate surveys initially resulted in conflicting reports on exactly where portions of the northern border of Texas lay.

The United States set up a commission to handle claims against Spain, and over a three-year period, it examined 1,859 claims valued at \$5,454,545.13. To remain within the treaty amount of \$5 million, claims were eventually paid at a discount of 8.33 percent. Tension with Spain decreased, allowing the Spanish government to concentrate its resources on frequently ineffective efforts to oppose the increasing number of independence movements within the Spanish Empire in Central and South America. With the successful Mexican Revolution in 1821, the borders agreed on in the Adams-Onís Treaty became the demarcation lines between the United States and Mexico.

Effects

Gaining direct access and ports on the Pacific Coast led to increased U.S. trade with Asia, but the most

immediate cultural influences on the nation were the incorporation of thousands of new Hispanic citizens with their cultures and traditions into the national fabric, as well as setting the stage for continuing confrontations with indigenous peoples as Americans began to move westward in larger numbers in pursuit of the country's Manifest Destiny.

Adoption, Transnational/ Transracial

Identity and cultural heritage are often crucial to the self-esteem and personality development of many American children. This is particularly important for children from minority racial and ethnic classifications. Children who are of the same racial classification as their adoptive parents but of a different ethnic group can also be affected, such as European American parents transnationally adopting a child from Russia who is racially classified as white or Caucasian, but ethnically Russian.

The practice of placing children with prospective adoptive parents who are not of the same race is called a transracial adoption (TRA) or transracial placement. TRA in the United States is older than the nation itself. In 1492, Christopher Columbus kidnapped and adopted a Native

American boy, who later became his translator and guide.

TRA in America predominantly involves the adoption of black children by white parents. There are extremely few, if any, documented cases of black parents adopting white children. However, the phenomenon of blacks serving as foster parents for white children is slightly more frequent. The one-way nature of TRA is demonstrated not only by the lack of adoptions of white children by black parents but also by other nonwhite parents and even by interracial or biracial couples.

The first documented modern TRA occurred in Minneapolis, Minnesota, in 1948. TRA gained momentum in the mid-1950s and then declined in the early 1960s. However, with the civil rights movement in the mid-1960s, there was another rise in the number of TRAs. This trend continued until the early 1970s, when vocal opposition began to cause a decline in the practice.

The question of whether white parents should adopt black children has been the subject of momentous debate in social work and child development literature. The discussion was initiated by a position paper drafted by the National Association of Black Social Workers (NABSW), which vehemently opposed placing black children with white families and referred to this placement as a form of "cultural genocide."

A 1972 groundbreaking and controversial NABSW position paper decrying TRA set the tone for more than two decades. In an attempt to adhere to NABSW preferences, adoption agencies nationwide enacted and enforced same-race placement policies. As a result, the number of TRAs dropped drastically nationwide. By 1987, despite a higher percentage of black children in foster care, the number of TRAs had increased only slightly since the 1970s. In fact, even when including international adoptions, TRAs currently account for only about 8 percent of all adoptions in the United States.

Multiethnic Placement Act of 1994 and Interethnic Adoption Act of 1996

From the 1970s through the early 1990s, race-matching was regularly a determinative factor in placing black children in adoptive homes. During this time period, TRA was considered a last-resort placement alternative. Eventually,

Congress identified race-matching as a cause of foster care drift and the escalating number of children in foster care. Some estimates indicated a 72 percent increase in the number of children in the foster care system between 1986 and the early 1990s. It is arguable whether the precipitous rise in the number of children in foster care was due to race-matching or to the federal and state welfare policies of the 1960s, 1970s, 1980s, and 1990s.

In 1993, Texas became the first state to pass a statute prohibiting the use of race to delay, deny, or otherwise discriminate in child placement decisions. The following year, modeling its legislation after the Texas statute, Congress entered the TRA debate by passing the Multi-Ethnic Placement Act of 1994 (MEPA). Although MEPA did not allow race to be the sole factor in rejecting preadoptive parents, it did allow race to be considered in adoption placements. Thus, rather than achieving the congressionally intended purpose of resolving the TRA debate by limiting the basis for considering race, MEPA fueled the debate further. In addition, there was evidence that, following passage of MEPA, race-matching in adoptions continued.

To close the so-called loophole of race matching, Congress repealed portions of MEPA and passed Section 1808 of the Small Business Job Protection Act of 1996, titled "Removal of Barriers to Interethnic Adoption" (IEAA).

IEAA's purposes were to ensure that the practice of race matching ended and that race was not considered during the adoption process—even for purposes of racial sensitivity screening or when the birth parent requested that the child be placed intraracially. Further, IEAA contained an enforcement provision whereby federally funded state programs and private programs receiving federal funds that violated IEAA would have their funding reduced.

In 1997, in response to the passage of MEPA/IEAA, the NABSW issued a revised policy statement regarding TRA, which—while softening its stance on TRA—continued to stress the importance of sensitivity to identity, heritage, ethnicity, and culture in regard to the placement of children for both foster care and adoption. In mentioning the importance of continued contact with extended family, the NABSW implicitly supported kinship care and adoption.

Arguments For Transracial Adoption

There are several arguments in favor of TRA. Supporters of TRA note that while 27 percent of children in foster care are black, approximately 67 percent of American families waiting to adopt are European American or white.

In passing MEPA/IEAA, Congress determined that racial matching and same-race placements were responsible, at least in part, for the length of time children spent in foster care. Furthermore, children are less likely to find permanent placements as they age.

Adoptions are not all successful; however, the failure rate is unrelated to adoptions across racial lines. There is no evidence that TRAs harm children; in fact, research data indicates that TR adoptees fare well. Over 75 percent of TRAs are considered successful, a number comparable to same-race adoptions. Sixty-eight percent of TRA children do not feel any discomfort with their appearance compared to their adoptive parents or the community in which they were raised.

Further, while identity is admittedly a complex topic, social and cultural attitudes are learned, not inherited. Individuals are not born with a sense of self, but develop self-awareness through social interaction. Studies show that most TR adoptees experience a positive sense of ethnic identity as well as a high comfort level when dealing with white people. Most white parents meet the identity needs of their adopted black children. Finally, race-matching violates state and federal civil rights laws as well as constitutional guarantees against racial discrimination.

Arguments Against Transracial Adoption

Those against TRA argue that the practice occurs unilaterally; far more white adults adopt black children than black adults adopt white children. It is in the best interests of a child to preserve a child's racial, ethnic, and cultural heritage in adoption placement decisions. Racial matching provides an atmosphere that helps instill a sense of personal, social, and racial identity.

TRA has been criticized as actually harming black children. Eleven percent of black children who were transracially adopted prefer to be racially classified as white. Further, the notion that a parent's love is enough to overcome external racism is naïve. The United States is not yet a color-blind

society. Blacks are still disproportionately victims of racism—subject to verbal attacks, physical altercations, employment discrimination, higher arrest rates, and discriminatory sentencing guidelines.

Black adoptive homes can be found for black children, but potential black adoptive parents are often disqualified because of agencies' widespread use of criteria that require middle to upper-middle class incomes and lifestyles.

Finally, MEPA/IEAA disallows the best interests of children to be considered. By eliminating racial considerations in adoption proceedings, these statutes discount the racial attitudes of white prospective adoptive parents. Empirical studies of transracially adopted black children and adults have not conclusively proven that such adoptions are not psychologically harmful to these children.

Transnational/International Adoption

Since 1971, U.S. citizens have adopted almost 500,000 children internationally or transnationally. Historically, the majority of these children were from Asia (about two-thirds) and South America. In fiscal 2012, American parents adopted 8,668 children internationally: China (2,697); Ethiopia (1,568); Russia (748); and Korea (627). During that period, the number of international adoptions dropped by 7 percent from fiscal 2011, following a recent trend. In fiscal 1989, there were 8,102 transnational adoptions (TNAs). By fiscal 2004, the number had nearly tripled to 22,884, the largest single-year total. Worldwide, the United States is the recipient of the majority of children who are placed internationally each year.

Although modern U.S. TNA began after World War II, following the Korean War in the late 1950s, there was a surge in TNA. Eighty-five percent of all TRAs are international adoptions. Between 1953 and 2007, 107,145 Korean children were transnationally adopted into U.S. families. As a result, one-tenth of Korean American U.S. citizens were adopted.

In a 2009 study, 81 percent of Koreans and 70 percent of whites rated their identity as an adopted person as either important or very important. In addition, 78 percent of TNA Koreans considered themselves ethnically white as children. With maturity, access to more diverse communities, and affiliations with other Asians, over 50 percent self-identified as Korean American by adulthood;

U.S. children in foster care were 41 percent white, 27 percent black, 21 percent Hispanic, 5 percent biracial, 2 percent American Indian/Alaska Native, and 1 percent Asian from 2007 to 2011. Only about 8 percent of U.S. adoptions are transracial.

81 percent found their racial/ethnic identity to be important. However, when traveling to their countries of origin, TN adoptees often experience alienation due to their American upbringing and lifestyles. A 2000 study found that black TRA females were more likely to be proud of their ethnicity than Asian TNA females.

Seventy to 80 percent of TN adoptees have few serious behavioral or emotional problems, similar to same-race adoptees. Preadoption deprivation does contribute to postadoption mental health or behavioral issues. However, developmental delays due to deprivation prior to adoption are generally overcome within one year postadoption.

Advancement via Individual Determination

Advancement via Individual Determination, commonly known as AVID, is a nationally recognized college readiness system designed to increase learning and performance for marginalized populations. Participating students develop behaviors and skills needed to experience academic success with demanding curriculum, usually taught in an elective class setting with a trained educator.

With instructional strategies and support systems, AVID students have the potential to succeed in a rigorous course of study and meet four-year college entrance requirements. Although secondary schools are the focus, AVID's support structure, curriculum, and training can span from elementary to higher education. The AVID program can effect change and systemic reform at the school and district levels through influencing the

culture, beliefs, and instructional methodologies of K–16 schools.

Mary Catherine Swanson, a veteran teacher in San Diego, California, founded AVID in 1980, when she headed the English Department at Clairemont High School. After a federal desegregation order mandated busing inner-city students to her school, Swanson wanted to develop a program that aligned with her philosophy: When students are held accountable to the highest standards, and provided appropriate academic and social support, they will rise to the challenge. Swanson created an academic elective and called it "Advancement Via Individual Determination." Along with her colleagues, the Clairemont faculty merged academic rigor with support services and "untracked" their college preparation classes.

AVID targets students in the academic middle (Bs and Cs), especially those from groups underrepresented in college attendance, who experience generational poverty and potential "first-generation" students (the first person in the nuclear family to attend a four-year university). AVID coordinators and site teams help choose students who are capable of succeeding at the university level but whose circumstances could impede their attendance. Students are commonly selected through an interview process to identify those with the willingness to work hard and the heartfelt desire to attend college.

Four Strategies

Students are enrolled in the AVID elective, where they work on four strategies that directly target writing, inquiry, collaboration, and reading (WIC-R). In addition, AVID students learn organizational and study skills, work on critical thinking, and practice asking probing questions. The techniques learned in the AVID elective can be applied to all classes, and students are challenged to enroll in their school's most rigorous classes, such as honors and Advanced Placement. In these ways, AVID provides students with both the tools and support necessary to succeed in institutions of higher education.

To complement these skills and strategies, AVID offers a comprehensive network of support services that demystify the college admissions process. Secondary students receive academic help from college tutors, visit multiple college

campuses, and participate in enrichment and motivational activities to make college attainable. Test preparation services for admissions exams (SAT, ACT, and PSAT) are offered, along with family workshops on the college application process, as well as guidance for completing financial aid and FAFSA (Free Application for Federal Student Aid) forms.

Philosophy and Growth

AVID's clear program philosophy—raise expectations of students and, with a support system, they will rise to the challenge—expanded to elementary schools as an embedded resource for sequential academic skills, called the AVID College Readiness System or ACRS. Another branch of the company, AVID for Higher Education (AHE), works with 28 postsecondary institutions to increase students' academic success, including increased rates of retention and completion of higher education. Staff development and professional training is available and considered a crucial element for successful AVID programs at all levels.

Although AVID began with one class of 32 high schoolers, it now impacts over 700,000 students in 4,900 schools. AVID programs based in the United States are divided into four divisions: Eastern (1,041 sites in 157 districts); Central (1,284 sites in 241 districts); Western (671 sites in 154 districts); and California (1,578 sites in 412 districts). In addition to active programs in 45 of the 50 United States, there is also an international presence in Canada and Australia.

While the expansion of the AVID program is impressive, what distinguishes AVID from other educational reform programs is its continuous success rate. Latino/a and African American/black AVID students take Advanced Placement Program (AP) tests at rates that consistently exceed their peers in non-AVID programs. High school graduation rates are far superior when compared to students who do not have access to support services, and impressive statistics connect leadership skills and postsecondary attendance to AVID participation. Moreover, benefits appear to ripple out from AVID classes, services, and professional development to the broader school environment.

AVID is considered by many school administrators and policy makers as an essential strategy for

turning the college dream into a broader reality for an increased number of diverse students. At present, AVID programs only service a percentage of schools nationwide, so a great number of students do not have access to this support system. Some experts caution that the impressive AVID success rates result in part from a comparison with public schools students who are not enrolled in a comparable college-readiness program. As such, policy makers should not only focus on the success rates that AVID has achieved in supplementing the public educational system but also on expanding and systematizing these type of essential support services.

Advertising

National advertising began in the 1850s, when railroads began carrying newspapers and national consumer goods across the country. Advertising further expanded in the 1880s, when industries embraced new production techniques that allowed for the creation of large quantities of standardized products. In response to such profound manufacturing changes, national advertising of branded goods emerged. In the prosperous 1920s, consumer spending was fueled by the increased availability of consumer credit on such goods as automobiles and household appliances. Americans were engaging in more leisure-time activities such as moviegoing, and advertising served to promote such products and services. This was coupled with the rise of mass media, including circulation magazines and radio broadcasting. Media's ability to reach mass audiences

led to a one-size-fits-all approach to national advertising media messages, catering to white consumers. Since then, advertising messages have transformed with the ability of new media technologies to reach targeted audiences, shifting demographics within the United States, and protests by various minority groups, particularly during the civil rights era.

Since the 1920s, American advertising has grown as new media technologies spur the delivery of commercial messages in ever-changing ways. One of the most striking developments in advertising methods has been the shift in how advertisers reach audiences. Now, rather than attempting to market items to undifferentiated mass consumers, advertisers attempt to segment and target particular groups for specific products and brands. At present, segmentation has become the norm in advertising.

Market segmentation is the strategy of dividing potential consumers into identifiable segments and then directing media messages through targeted media to reach those audiences. This is a consumer-driven approach in which corporations subdivide the total heterogeneous potential market for a product into smaller segments, each with its own homogeneous characteristics. Segments are broken down in numerous ways by place of residence, socioeconomic status, sex, age, education, ethnicity, and race. Segmentation is important for advertisers because they can design ads geared to market segments and place them in media reaching those segments.

The focus on segmentation has been the result of two trends: new media technologies that allow for highly targeted marketing messages, and the shift in U.S. demographics and the recognition that some groups of consumers have significant buying power.

Media Technologies

With traditional media, the most efficient way to deliver a message was to blanket the largest mass-market audience possible. The 1990s saw significant changes in media technology, leaving behind the era of “mass media.” Targeted media outlets provided by such technologies as cable television, the Internet, and satellite radio have allowed advertisers to reach specific audiences. Instead of the major networks, for example, advertisers

have hundreds of channels for television to broadcast targeted messages. This, along with the steady growth of racial and cultural diversity and the upward mobility of people of color, also forced changes in the communications industry. For example, in 2001, white-owned media conglomerate Viacom bought Black Entertainment Television (BET), and NBC purchased Spanish-language television network Telemundo. Viacom executives admitted publicly their need for a presence in the African American marketplace.

In addition to the introduction of specialized cable channels, magazines such as *Ladies' Home Journal* and the *Saturday Evening Post* have been joined or replaced by magazines aimed at specific audiences interested in specific topics, such as running, body building, shopping, and hunting. Satellite radio stations also target specific demographics, and the Internet enables advertisers to consider usage tracking and customer profiles. The popularity of blogs and social networking sites allows advertisers to reach audiences that are highly defined. In 2010, Internet advertising revenue surpassed newspaper advertising revenue. That same year, mobile advertising had gained the attention of the advertising industry, with some of the largest media companies making large investments to bring advertisements to mobile phones and tablet screens. Personalized media technologies such as these have allowed for even more tightly targeted ads.

Demographic Shifts

Specialized media outlets available through new media technologies allow advertisers to direct specific content to more targeted audiences. At the same time, there has been an increased awareness about the diversity of American consumers. Advertisers now understand that paying attention to cultural, racial, and ethnic diversity makes business sense.

Before the 1960s and 1970s, there was an implicit assumption within the United States that immigrants would become fully integrated into the host culture. By the 1990s, however, the “melting pot” model of assimilation was questioned as a way of conceptualizing contemporary trends. Whereas it was once assumed that the United States had a single culture into which all citizens should assimilate, it was found that there

were groups who could not or would not assimilate. With this shift in understanding, there has been more interest in targeting the ethnic market as a result of its increasing size, purchasing power, and potential for future profit. Companies have attempted to reach these consumers more effectively by using differentiated marketing strategies including new product lines, focused advertising, and customized promotion programs. Kraft, Pepsi-Co, AT&T, Coca-Cola, Nabisco, and Sears are some of the organizations that have set up multicultural marketing departments to specifically target the “ethnic market.”

Advertisers pay special consideration to demographic segmentation, which categorizes consumers by personal and household characteristics as tabulated by the U.S. Census Bureau. In the United States, with the increase of immigrants from certain sectors of the world, the racial and ethnic landscape has been dramatically changing over the last few decades. According to the U.S. Census Bureau, the population of Asians and Latinos is growing at faster rates than any other racial/ethnic group. Advertisers have been required to respond to such fluctuations in the racial/ethnic makeup of the United States.

Of all the demographic variables, age, ethnicity, and sexual orientation are of particular interest to advertisers. Advertisers do not pay special attention to all “niche” markets, however. Instead, they concentrate particularly on those that are large and have buying power. In 2012, the two largest niche markets were Latino and African American consumers. Other markets include Asian Americans, gays and lesbians, and seniors. Advertising messages are now tailored to the interests and consumer behavior of these groups. Such demographic characteristics remind advertisers that consumer markets are diverse; to be effective, advertising messages must speak to the needs of emerging markets.

Stereotyping

Historical and contemporary studies continually demonstrate that advertising’s depiction of American society has been highly skewed in its portrayal of race, class, gender, and sexual orientation. When minorities are in marketing messages, stereotyping may occur because these messages are designed to tell a complete story on a single

page or in 20 seconds. The effort to create easily identifiable characteristics in such a short period of time can lead to stereotyping.

A central concept in advertising strategies is the issue of representation. Marketers spend much of their time envisioning and constructing consumers. Consumer researchers place emphasis on evaluating representations of targeted audiences, and the impact these representations have on consumer behavior. Because some characteristics of a group are highlighted over others, one outcome of advertising representations of the “other” is stereotypical versions of reality.

For years, advertisers reflected the place of non-whites in the social fabric of the United States by either ignoring them or, when including them in advertisements for mass audiences, reinforcing the preconceived image that many white Americans apparently had of blacks, Latinos, Asians, and Native Americans.

African Americans

In the mid-1960s, black civil rights groups targeted the advertising industry, protesting the lack of integrated advertisements and the stereotyped images that advertisers continued to use. This, coupled with pressure from federal officials, resulted in the quick inclusion of African Americans as models in television advertising during the 1967 and 1968 television season. At this time, black advertising executive D. Parke Gibson’s 1968 book *The \$30 Billion Negro*, coupled with a number of articles on black and Latino consumers in media trade publications, spurred advertisers to see these groups as potential consumers.

In the mid-1960s, black civil rights groups targeted the advertising industry for its use of stereotyped images, and the lack of integrated advertisements. By the end of the 1970s, national advertisers had pulled a good deal of the advertising that negatively stereotyped blacks. At times, however, they simply replaced the negatively stereotyped ads with images of affluent, successful people of color. Such images were also far from the reality of most African Americans.

In the new millennium, the advertising industry has further recognized a growing African American middle class. To capitalize on its buying power, large companies such as Procter & Gamble joined with agencies that specialize in

targeting African Americans. However, attempts to grab a share of this buying power have also been problematic. Fear of controversy, coupled with a lack of sensitivity, has led some advertisers and agencies to stick to established imagery and subtly reinforce the mainstream culture's perceptions of the black community. For example, interest groups have criticized liquor companies for overemphasizing African Americans in malt liquor ads. African American men are still portrayed as good dancers, basketball players, and are overly associated with hip-hop. Black women are often constructed as oversexed and animal-like, or as sassy and overweight.

Marilyn Kern-Foxworth, who has studied African American images in advertising, contends that the legacy of racist imagery remains with us today. For example, she describes how

Aunt Jemima reflects the black mammy stereotype present in popular film and literature. The large, bandanna-wearing, desexualized mammy romanticized the relationships between black slaves and their white owners. Over the years, the legacy continues, though Aunt Jemima has now lost weight and her bandanna, and she now wears pearl earrings. Similarly, boxes of Uncle Ben's rice products still feature a well-groomed and happy black servant. Early advertisements for Cream of Wheat featured Rastus, the black servant whose picture is still on the box.

As African Americans have been increasingly acknowledged as customers, African American consumers have become more savvy viewers of commercial messages. For instance, strategically timed advertising (during Black History Month, for example) and advertising that borrows heavily from black or hip-hop culture is often seen as contrived by African American consumers. African American audiences are also wary about being singled out by advertisers. Instead, African American audiences respond better to advertising that is "universal." That is, they respond well to ads that feature a variety of ethnicities or have appeal across cultures. In a similar vein, advertisers, to be effective, need to understand that not all black audiences are the same. For example, there is a generational divide between the civil rights generation and the hip-hop generation.

Latinos

Like African Americans, Latinos historically have either been ignored by advertisers, or have been represented stereotypically. In the same way that negative images of African Americans were altered by protest, such representations of Latinos were also altered after protests by Latino activists. For example, Frito Bandito, the sneaky Mexican bandito who stole "crunchy" corn chips from unsuspecting homemakers, was withdrawn in the early 1970s after it became the target of Latino protests.

Frito Bandito was not the only negative representation of Latinos. In 1969, an influential article by Tomás Martínez described commercials for Granny Goose potato chips featuring fat gun-toting Mexicans, an advertisement for Arrid deodorant showing a Mexican bandito spraying his underarms as the announcer intoned, "If it

"It's in Town Honey!"

An ad for Aunt Jemima pancake flour from the November 7, 1909, edition of the New York Tribune. A former slave, Nancy Green became the spokesperson for the Aunt Jemima pancake mix in 1890 and played the character until her death in 1923.

works for him it will work for you,” and a magazine photograph of a Mexican sleeping under his sombrero against a Philco television set. Martínez was particularly disturbed by a Liggett & Myers commercial for L&M cigarettes, which featured Paco, a lazy Latino who never “feenishes” anything, not even the revolution he is supposed to be fighting.

In 1970, a position paper prepared by activists Domingo Nick Reyes and Armando Rendón charged that the media had transferred the negative stereotypes it once reserved for blacks to Latinos who had become “the media’s new nigger.” The protests of Latinos soon made advertisers more conscious of how they portray Latinos.

As advertisers began to realize that African Americans held the promise of untapped profits in the 1960s, they realized that Latinos were also a target that was too good to pass up. Industry trade publications contended that Latinos had the same characteristics that made blacks an attractive market, but their use of Spanish allegedly cut them off from English-language advertising. Advertisers in the 1960s and 1970s were advised to use language and culture most familiar to their target audience to give their messages the greatest impact.

By the 21st century, the amount spent by Latinos in the United States increased remarkably. The population also became more complex, including more people from a variety of nations, as well as generational, gender, and regional differences. Latinos, once a single market segment, were split into more subgroups by advertisers. Still advertisements will target the largest number of Latinos, supporting the idea that there is no difference between ethnicities or nationalities. Critics contend that this erasure of individual cultures sends a message that specific heritages are not valued.

Asian Americans

Advertisers have also used images of Asians that cater to the stereotypes held by white America. As with blacks and Latinos, it took organized action by Asian Americans for corporations and advertising agencies to change. Following protests in the mid-1970s, for example, a Southern California supermarket chain agreed to remove a television campaign in which a young Asian karate-chopped his way down the store’s aisle, cutting prices.

In the 1980s, several firms were hit financially by Japanese imports, and this increased the negative depictions of Asians, specifically Japanese people, in ads. Such advertisements played upon the fears of perceived Japanese economic dominance. Others played on well-known stereotypes. For example, one commercial featured a Chinese family laundry that used an “ancient Chinese laundry secret” to get clothes clean. Companies pitching products from air travel to pantyhose portrayed Asian women as seductive China dolls to promote their products.

The lack of a large Asian American community in the United States may be one reason why such groups were still stereotyped in the 1980s. However, their population and income growth rate in the 1980s and 1990s made it clear that they were a market to pay attention to. By the mid-1980s, there were signs that advertising was beginning to integrate Asian Americans into crossover advertisements designed to have broad appeal.

The increasing numbers of Asian Americans have led to the community having more economic clout. Their average annual income is reported as the highest household income of any U.S. group. Noting the different national origins in this group, advertisers have been advised to be careful to avoid cultural conflicts.

Like many Latinos, many Asian Americans are newcomers to the United States who prefer media in their native language, which is what advertisers use to reach them. And, like African Americans, they also share physical characteristics that distinguish them from whites in advertising appeals.

Gays and Lesbians

After the gay liberation movement in 1969, advertisers began to consider selling to the lesbian and gay market. In the early 1970s, *Advertising Age* began running articles about the possibilities of marketing to gays. Lesbians figured little in these early discussions.

Advertising companies were initially reluctant to take on the gay market because there was not much reliable statistical data about gay men. However, in 1977, the *Advocate* hired a marketing firm to survey its readers. The results indicated that *Advocate* readers were gay professionals, between 20 and 40, with above-average incomes. Because they did not have to support a family,

they could spend their incomes on themselves, particularly on high-priced items such as clothes, travel, and liquors. By painting the gay market as one comprised of upscale men with expensive habits, the survey seemed to confirm what was thought about the gay market, and by extension, the gay community. By 1980, national advertisers such as Seagrams, Simon and Schuster, and major film companies began placing ads in national publications like the *Advocate* and in local gay newspapers. Advertisers also became aware that, especially in urban areas, the fashion predilections of gay men were being emulated by straight men. Advertisers began to see gay men as both hyperconsumers and as influential trendsetters.

By the mid-1990s, most advertisers had overcome reluctance about advertising in gay publications; it would seem that advertisers would always want to tap any potential markets to increase profits. However, there have been times, especially in media channels that target mass audiences, when advertisers have backed away from controversy over running an advertisement to satisfy one audience over another. For example, in 2005, the American Family Association (AFA) threatened to boycott the Ford Motor Company if it continued to run ads for Jaguar and Land Rover in the gay and lesbian media.

At times, a network has anticipated controversy and has refused to run an advertisement. For example, in 2010, Mancrunch.com, an online dating site for gay men, attempted to buy time during the Super Bowl. The commercial featured two young men on a sofa watching a sporting event, and while watching the game, they simultaneously reach into a bowl of chips and touch hands. The inadvertent contact sparks a flame between two men, and they begin to kiss, while a third man watches them with a puzzled expression. CBS opted not to run the advertisement.

It is important to note that, while there is great ethnic and racial diversity within the gay and lesbian community, such diversity is not reflected in advertising. Identity-based advertising overwhelmingly focuses on prosperous white men as the representative homosexual. Not only have advertisers focused on white models of “gayness,” but most of the marketing research has been aimed at gay men rather than lesbians, bisexuals, or transsexual people. So, while major

national magazines like *Out* and the *Advocate* define themselves as serving lesbian and gay readers, in practice the gay white male market is their target audience, and thus women and nonwhite gays and lesbians are marginalized.

Gay scholars have discussed how pervasive images of white, upper-middle-class, “straight looking” people often appear at the expense of those more distanced from and threatening to the mainstream, such as the poor, the elderly; ethnic, racial, and sexual minorities; drag queens; and butch lesbians. In advertisements and in gay publications in general, scholars have noted a paucity of nonwhite gay and lesbian images. Advertisements tend to focus on the prosperous white man as “the” representative homosexual; the cultural privilege of whiteness and maleness leaves the gay part of homosexual identity to be the most salient. The exception is advertisements for fantasy vacations to “exotic” lands where gays and lesbians of color exist to serve the desires of the gay white consumer. Thus, while advertisements that target gays can subvert stereotypes by portraying gays as “normal” people, such images also offer a version of gay visibility that perpetuates the stereotype of an idealized consumer.

One reason for the dearth of ethnic gay marketing may be related to the idea that gay minority populations are less open about sexual orientation than whites, and this makes it more difficult to market to them directly. At the same time, however, the narrow constructions of gay identity that advertising presents can, in turn, further hinder gay people of color from affirming their own gay identity, because the images of “gayness” presented in the media do not look like them.

The Price of Segmentation

With new advancement of personalized media technologies and an increased awareness of diverse audiences, advertisers have benefited from the growing emphasis on segmentation. Critics, however, are concerned as to the impact such marketing segmentation will have on the political organizing of marginalized communities. As marketers come to better understand the immense economic disparities within various groups, the profit imperative may motivate advertisers to play on those disparities rather than the similarities between groups. The segmentation target

marketing entails may ultimately undermine political cohesion between diverse communities.

and whites, and some women. A policy designed to redress centuries of discrimination and injustice, affirmative action has been targeted for engaging in alleged reverse discrimination. Moreover, affirmative action has been, in part, responsible for the elevation of millions of African Americans, white women, and other minorities into higher education, business, politics, and industry. The idea of equal opportunity—a key ideal of Americans—has rarely extended to minorities. Liberal politicians, trying to address the lack of opportunity found in African American life, instituted the policy under pressure from civil rights activists, the civil rights movement, and the growing demands for equality of postwar America. Along with the Cold War, American politicians needed to eliminate the oppression of African Americans and prove that the United States was the land of the free.

Definition

Merriam-Webster describes affirmative action as "an active effort to improve the employment of members of minority groups and women," and as an "effort to promote the rights or progress of other disadvantaged persons." There are different types of affirmative action: minority and female businesses competing for government contracts; minority and female students applying for admission to colleges and universities; minorities and females applying for admissions into graduate, law, and medical schools; and minorities and females applying for jobs in the private and public sectors. These goals for inclusion of minorities and women can be achieved in a number of ways that are often referred to as race-conscious or gender-conscious measures. For instance, a university can take into account a candidate's race when determining admissions decisions. Universities can justify such race-conscious measures because they serve a compelling educational, societal, and governmental need.

However, affirmative action cannot be used in such a way that discriminates against whites or others. Quotas, for example, are strictly prohibited except in the most narrowly tailored instances in which a court orders such steps to redress the most intransigent employer or educational institution. Last, courts have ruled that affirmative action can be limited, or even eliminated, if it deprives others of their constitutional rights.

Affirmative Action/ Equal Opportunity

Affirmative action has been one of the most controversial and divisive issues of the past 50 years. The policy divides Democrats and Republicans, liberals and conservatives, many African Americans

Early History

The idea of affirmative action is rather recent in the American imagination. Furthermore, it is completely associated with African Americans in the popular mind-set. Yet affirmative action has been present in the United States since colonial times. The ways in which it has been practiced have been abundant and varied. At Ivy League educational institutions, such as Harvard, Yale, Princeton, Chicago, and Pennsylvania, so-called legacy admissions have long been used. The principle is that children—historically they were usually male—of alumni are given preference in admission decisions. For instance, despite John F. Kennedy's less than stellar academic record in prep school, he was still admitted to Harvard, in part, as the result of his father's status as a 1912 alumni of the university. But the concept also applies to other areas, such as unions and public sector employment. In places such as Boston, New York, and Philadelphia, jobs in law enforcement, emergency services, public utilities, and municipal agencies were long determined by ethnicity, family ties, and partisan concerns.

Affirmative action has long been used in more personal ways that benefit a select group. Students graduating from college have also played off their fraternity/sorority connections, relationships with parents of their friends, and connections made during their collegiate years to obtain internships and jobs that circumvent the normal hiring processes. The point here is that affirmative action can, and often does, take different forms. Only in the past 50 years has affirmative action become racialized and determined, at least by some, to be unacceptable.

African Americans and Race-Conscious Measures

Arguably, some of the earliest efforts to redress racial discrimination date back to the New Deal and the Roosevelt administration. In 1933, Franklin D. Roosevelt was inaugurated as president of the United States. In the midst of the Great Depression, with unemployment at 25 percent, millions of Americans demanded a new political course. As the new president situated himself in the White House, hundreds, and eventually, thousands of men and women took positions with the new administration. Many of these people were

progressives and liberals, committed to charting a new path for the nation. Roosevelt welded together an unlikely coalition of Southern Democrats, labor unions, African Americans, intellectuals, and women, into an electoral and governing coalition. Some of those people were sympathetic to the calls for freedom and equality.

One prominent member of the Roosevelt administration who was long associated with civil rights was Harold Ickes. Ickes desegregated the Department of the Interior. He issued orders that banned discrimination, especially in the Public Works Administration. Contractors doing business with the projects under Ickes's control were prohibited from discriminating against blacks, subject to losing pay for allowing discrimination to take place. Some were even required to set aside positions for African American workers. Blacks also benefited from other government agencies and programs, such as the Civilian Conservation Corps, the U.S. Housing Authority, the Federal Works Authority, and the Works Progress Administration. Moreover, as World War II dawned, FDR was cornered by A. Philip Randolph's proposed March on Washington to protest discrimination.

Randolph demanded defense industry jobs for African Americans in June 1941. After refusing President Roosevelt's demands to stop the march, Randolph finally received a satisfactory solution: an executive order. The president issued Executive Order 8802, which said that "no discrimination in the employment of workers in defense industries or government because of race, creed, color, or national origins" was allowed. The southern delegation in Congress howled at the president's decision, which also created the Fair Employment Practices Committee (FEPC). Through race-sensitive members of the Roosevelt administration and pressure tactics of people such as A. Philip Randolph, the FDR years saw the beginning of what would become affirmative action.

The Modern Era

The modern era of affirmative action began during the Kennedy administration. In March 1961, President John F. Kennedy (JFK) signed executive order 10925, which created the Committee on Equal Employment Opportunity. This committee ordered that all federally financed projects take "affirmative action" in regard to hiring

practices. Moreover, it mandated that employment not be discriminatory. Kennedy had campaigned for the White House, in part, on the promise of doing more for African Americans. By the end of the 1950s, the United States was in the throes of the civil rights movement. Civil rights leaders, led by Dr. Martin Luther King, Jr., Whitney Young, John Lewis, Diane Nash, Rosa Parks, James Farmer, and others, led protests throughout the south demanding first-class citizenship, voting rights, and economic justice. Most African Americans could not get into good schools and universities. Most African Americans could not, even when possessing a postsecondary education, secure white-collar employment. The sickness of racism prevented white employers from hiring and/or promoting black employees. When Dr. King was arrested in Georgia on flimsy charges, then senator Kennedy and his brother, Robert F. Kennedy, called the judge and helped secure his release. In doing so, the Kennedy brothers secured black votes for the presidency. The result was supposed to be vigorous action on the critical issues of the day: civil rights. The issuance of executive order 10925 was a part of that understanding: to compel federal contractors to level the playing field. But it was minor in comparison to what would be coming in the next few years.

On the sun-drenched streets of Dallas, Texas, on November 22, 1963, President Kennedy was assassinated in front of his wife and horrified bystanders. And with his untimely death, Vice President Lyndon Johnson (LBJ) assumed the presidency. Many African Americans were disturbed at the thought of the 6-foot-4-inch Texan in the White House. After all, Lyndon Johnson, as Senate majority leader, had wielded tremendous power, power that had been used to largely stifle civil rights legislation throughout the 1950s. Yet LBJ managed to surprise political observers by becoming one of the most important and revered civil rights presidents in American history.

As President Johnson took control of the government, he deliberately tied his political destiny to the legacy of the martyred President Kennedy. Among his first priorities was the passage of the landmark Civil Rights Act of 1964. The law banned discrimination based on race, color, religion, national origin, and sex. Along with a

declaration of War on Poverty, Johnson moved aggressively to initiate affirmative action, define what it was supposed to be, and explain why it was needed to address economic problems in the African American community. In June 1964, at the historically black Howard University, Johnson made a famous and lasting speech that formally introduced affirmative action to the nation.

Speaking to the Howard graduates, Johnson discussed ways in which African Americans were unable to progress. Johnson said the following:

In far too many ways American Negroes have been another nation: deprived of freedom, crippled by hatred, the doors of opportunity closed of hope. . . . But freedom is not enough. You do not wipe away the scars of centuries by saying: Now you are free to go where you want, and do as you desire, and choose the leaders you please. You do not take a person who, for years, has been hobbled by chains and liberate him, bring him up to the starting line of a race and then say, "You are free to compete with all the others," and still justly believe that you have been completely fair.

As a demographic group in the United States, African Americans were certainly behind the majority white population in education attainment, wealth, health, occupational achievement, and standard of living. Moreover, few African Americans in June 1964 had much in the way of financial or social mobility. The structural and institutional barriers were too high for the vast majority of African Americans to climb on their own. Tremendous human capital was being wasted by the cultural and racial bias of the majority. Steps would have to be taken to compel recalcitrant educational institutions, businesses, and others to make use of all human capital.

In September 1965, Johnson took steps to put affirmative action into place. With Executive Order 11246, he required all contractors of the federal government to "take affirmative action" to secure minority employees. By 1967, the original executive order had been amended to cover women as well. In compelling contractors to hire African Americans, Johnson ensured that large corporations, and other businesses, would hire African Americans if for no other reason than to

secure government contracts. Moreover, it was presumed that after securing employment with such firms, those firms would change their culture and recognize the value added to their firms by their new employees. The next president of the United States, Richard M. Nixon, would dramatically advance the cause of equal opportunity.

In 1968, former congressman, senator, vice president, and 1960 Republican presidential nominee Richard M. Nixon won election to the White House. He had run a divisive and antagonistic campaign that preyed on the fears and racial hatreds/resentments of southern and blue-collar voters. Endlessly pounding home the message of “law and order,” Nixon implicitly promised to do something about the protesters, civil rights marchers, and others, who many believed were destroying the country. Little did they know that in crucial ways Nixon would advance the cause of equal opportunity.

In 1969, President Nixon took dramatic action; he initiated what became known as “the Philadelphia Order.” Often referred to as one of the most powerful affirmative action orders in history, the Philadelphia Order guaranteed fair and nondiscriminatory hiring practices in construction jobs in Philadelphia. Whites controlled public works agencies and private sector contracting in Philadelphia. They used their numbers and power to prevent African Americans from obtaining jobs in construction, law enforcement, firefighting, public works, and city government.

Arthur Fletcher, an African American and assistant secretary of labor, designed the plan as a test case. The central idea was not to impose quotas but to provide powerful incentives for construction firms to hire African Americans. The backlash to affirmative action and equal opportunity was coming, in court cases that challenged the constitutionality of the policy.

Legal Challenges and the Conservative Revolution

In 1978, in the landmark Supreme Court decision *Regents of the University of California v. Bakke*, the high court ruled that the University of California, Davis had violated the rights of Allan Bakke. Bakke, a 33-year-old white man, had applied to the university’s medical school and was denied admission. Since the medical school reserved 16

seats for minority and disadvantaged student applicants, Bakke argued that it had engaged in “reverse discrimination.” Educational institutions could not have a system that set firm quotas into place. Moreover, “reverse discrimination” became a commonly used phrase in conservative circles. It remained so for the next 30-plus years.

By 1980, however, the Supreme Court reversed course and permitted small quotas. In *Fullilove v. Klutznick*, a federal law requiring that public works projects have 15 percent set-asides for minority contractors was challenged. The law in question was the Public Works Employment Act of 1977 and its “minority business enterprise” provision. The court claimed that the inflexible arrangement in place would violate white contractors. But the “limited” approach and focus of the law did not violate the Constitution. This was an important case because of the difficulties minority-owned businesses had securing government contracts. Often larger, white-owned businesses had the inside track on securing contracts, thus leaving smaller and less influential businesses at a significant disadvantage.

In fact, the Supreme Court has taken contradictory positions on affirmative action and equal opportunity. While the court ruled in favor of Bakke and against petitioners in *Fullilove v. Klutznick*, this demonstrated the complexity of this important issue. Over the course of the next 30 years the Supreme Court continued to frustrate supporters and opponents of affirmative action. In 1986, the court ruled against a local school board’s plan to lay off white teachers before minority teachers in an effort to maintain diversity in *Wygant v. Jackson Board of Education*. In 1987, in *United States v. Paradise*, the high court decided that strict quotas were acceptable in very limited circumstances after the Alabama Department of Public Safety refused to promote or, in many cases, hire African American state troopers. In 1989, in *City of Richmond v. Croson*, it was determined that affirmative action and other race-conscious measures must be able to survive “strict scrutiny.” A Richmond affirmative action/equal opportunity program that set aside 30 percent of construction monies for minority-owned businesses because of past discrimination did not meet that threshold. As the 1990s dawned, however, public sentiment and a new administration

would challenge the use of these measures in ways that had not been seen before.

Affirmative Action/Equal Opportunity Under Attack

A case that compelled the Clinton administration to reevaluate the more than 130 affirmative action or race-conscious programs throughout the federal government was *Adarand Constructors, Inc. v. Peña*. During the 1990s, affirmative action increasingly came under attack from opponents. *Adarand* prompted President Clinton to take a closer look at the federal government's role in such programs and policies.

While the Supreme Court's decision in the *Croson* case applied to local and state governments, *Adarand* targeted the federal government. The question once again would be "Can federal programs survive 'strict scrutiny'?" In an exhaustive review, the Clinton administration decided to limit programs that were of questionable value and protect other, more acceptable programs that advanced affirmative action and equal opportunity. Clinton delivered a landmark address at the National Archives in July 1995, in which he strongly defended the controversial program because of the necessity of providing opportunity to disadvantage groups and because of the stubborn persistence of racism and discrimination.

At the same time Clinton was implementing new guidelines for the federal government, Republicans around the country were demanding change, often using the rhetoric of Martin Luther King, Jr., and his call that men be judged not by the color of their skin but by the content of their character. In California, voters passed Proposition 209, which banned all affirmative action throughout the state. Michigan, Texas, and Florida all considered the same. And there was growing pressure from interest groups to pass voter-approved referendums, like California had done. In 2000 and 2001 opponents of these measures petitioned the Supreme Court for relief. In what became known as the Michigan cases—*Gratz v. Bollinger* and *Grutter v. Bollinger*—the high court grappled with the meaning of opportunity, fairness, equal protection of the laws, and societal interest. In *Gratz*, the court ruled that race could be used but it had to be more narrowly tailored. In *Grutter*, the court approved the "compelling

interest" served by the University of Michigan Law School by having a diverse student body.

In 2006, opponents of affirmative action again pounced by attacking efforts to integrate schools. In a 5–4 decision, the Supreme Court determined that integration plans in Louisville, Kentucky, and Seattle, Washington, were unconstitutional. *Parents v. Seattle* and *Meredith v. Jefferson* represented a major reversal for the federal government and its commitment to equal opportunity and integration.

Conclusion: Ricci v. DeStefano and Fisher v. University of Texas

By 2006, the Supreme Court had changed. Chief Justice William Rehnquist died in 2005. Associate Justice Sandra Day O'Connor retired in 2006. President George W. Bush appointed two hard-line conservatives to fill their seats, Chief Justice John Roberts and Associate Justice Samuel Alito. In 2009, the court heard the case of *Ricci v. DeStefano*. White firefighters in New Haven, Connecticut, filed suit after they were denied promotion because the city had thrown out a test because too few minorities had passed it. The court ruled that it was unconstitutional and a denial of the plaintiffs' rights to refuse to promote the firefighters who passed the test because too few minorities had failed to succeed. Arguably, however, the most important affirmative action case in 30 years went before the Supreme Court in 2013. *Fisher v. University of Texas* challenged the court's decision in *Grutter*.

Abigail Fisher, who is white, had applied to the University of Texas and was denied admission. She filed suit, claiming that her rights were infringed because Texas had a 10 percent plan to admit all top graduates, and the university then placed her in a regular pool that considered race as a factor for admission.

Finally, affirmative action and equal opportunity have been controversial. Most Americans declare themselves prejudice free, yet oppose efforts to open opportunity to others. While the United States is changing demographically and politically, these measures continue to come under attack from a variety of places. It remains a struggle for which activists remain vigilant. The push for equal opportunity is complicated by the changing demographics of the United States.

Once considered as a program for African Americans, affirmative action has increasingly been used to assist underrepresented groups of all stripes. Latinos and Asians, in addition to African Americans and women, have been able to use affirmative action to gain access to better schools, the workplace, and business contracts. Employers and schools often seek qualified minorities and underrepresented groups—anyone who is not white—to diversify their schools and workplaces. In the process, more minorities have made academic and economic gains.

Afghan Americans

There are an estimated 70,000 to 90,000 people of Afghan ancestry in the United States, according to the U.S. Census Bureau in 2010, although community groups and researchers estimate the actual population to be higher—possibly up to 150,000. The vast majority of Afghan Americans live in

major urban areas, particularly the San Francisco Bay Area; in and around Washington, D.C.; New York City; and Los Angeles.

Small numbers of Afghans have lived in the United States throughout the 20th century, arriving on student scholarships or as businessmen. However, the vast majority of Afghans living in the United States came to the country as refugees beginning in 1979. During the Soviet occupation of Afghanistan (1979–89), Afghan refugees were welcomed to the United States as victims of a Communist regime. After the Soviet Union's withdrawal from Afghanistan, civil war followed by the Taliban regime meant that Afghan refugees did not return to Afghanistan; instead, where possible, they arranged for their extended family members to join them in the United States. After the terrorist attacks of September 11, 2001, and the subsequent U.S.-led coalition attacks on Afghanistan, Afghans continued to arrive in the United States, mainly through family reunification or through special refugee resettlement programs aimed at vulnerable Afghans such as widows and other female-headed households.

Most Afghan Americans come from relatively wealthy, urban backgrounds in Afghanistan. Many had previously worked for the Afghan government or in other professional roles such as university professors, doctors, lawyers, or engineers. Some have been able to continue their professional careers in the United States, but for many, language issues and the difficulties of transferring professional qualifications have meant that they have sought out other employment as business owners or in local government, for example. Younger Afghans, both male and female, are generally encouraged by their parents to go to university and pursue professional careers.

Afghanistan is a culturally diverse country, comprising many different ethnic groups, including Pashtuns, Tajiks, Hazara, Uzbeks, and others. There are two official languages—Dari (an Afghan variant of Persian) and Pashto. All these ethnic and linguistic groups are represented in the Afghan diaspora, but most Afghan Americans prefer to publicly stress the unity of the label *Afghan*, especially when interacting with non-Afghans. The religious heritage of most Afghan Americans is Sunni Muslim, followed by Shi'a Muslim, and a tiny number of non-Muslim Afghans. In areas

where there are sizable populations of Afghan Americans, communities have built mosques. Other indicators of sizable Afghan American populations include Afghan grocery stores and restaurants serving halal food, and banqueting halls, used to host Afghan weddings, engagement parties, funeral wakes, and other events such as concerts or fund-raisers for humanitarian projects in Afghanistan. For example, in Fremont, California, the concentration of Afghan businesses in one particular area has led to its being referred to as Little Kabul.

Afghan Americans draw on a rich and extended cultural heritage that combines Islamic culture and traditions specific to the geographical area now called Afghanistan. Afghan Americans' two biggest annual celebrations reflect this combined heritage, with one being religious (*Eid-ul Fitr*, the end of Ramadan, the Islamic month of fasting) and the other pre-Islamic (*Now Ruz*, the Persian new year).

Socializing with family, extended family, and friends is an important part of Afghan American

culture, often revolving around shared meals. Afghan cuisine shares some similarities with food from Afghanistan's neighboring countries but is also uniquely Afghan. Aromatic spices such as cardamom and cumin are used more than spicy ingredients such as chili. An Afghan meal, particularly when guests are present, is likely to include a variety of different dishes such as pilau (rice cooked in meat broth), *qorma* (stews of meat and/or vegetables), *ashak* or *mantu* (Afghan dumplings), kebabs, chutneys, and flat bread. Green or black tea is usually drunk, with dried fruit and nuts as snacks.

Intellectual culture and heritage is highly prized by most Afghan Americans, particularly the fields of poetry and literature. Perhaps the most famous Afghan Americans are those associated with literature and academia, such as the author of *The Kite Runner*, Khaled Hosseini, and other writers such as Mir Tamin Ansary, Fariba Nawa, and Zohra Saed. Afghan American academics include Ali Ahmad Jalili, Nazif Shahrani, Shaista Wahab,

Dr. Ashraf Ghani and U.S. Ambassador Karl W. Eikenberry meeting in Panjshir Province, Afghanistan. Ghani was born in Afghanistan, but he moved to the United States in 1977 to attend Columbia University; he did not return to Afghanistan until 2002. He is a leading scholar of political science and anthropology and worked at the World Bank for a number of years.

and Mohammad Qayoumi, the first Afghan American president of an American university. In politics Zalmay Khalilzad has been U.S. ambassador to the United Nations, Iraq, and Afghanistan, and other Afghans who have previously worked or studied in the United States have gone on to significant roles in Afghanistan politics, such as presidential candidate Ashraf Ghani and members of President Hamid Karzai's family.

Afghanistan faces an uncertain future. Although some Afghan Americans have visited Afghanistan since 2002, insecurity there makes it impossible for most to consider returning for long periods. Over thirty years, Afghan refugees have established themselves in the United States financially and socially, and brought up a generation of Afghan American children.

African American Vernacular English

African American Vernacular English (AAVE) has been known by a variety of names: ebonics; black English; African American Language (AAL), also called African American English; black

vernacular; black English vernacular (BEV); black vernacular English (BVE); or nonstandard Negro dialect, to name a few. Whatever it is called, studies have estimated that in the late 1960s to early 1970s over 80 percent of Americans of African descent spoke some variety of black English.

Creole

Its origins are one of several controversies surrounding AAVE. Dillard University along with creolists like William Stewart and John Rickford, theorize that the differences from other English dialects are traceable to normal historical factors, specifically to language-contact phenomena associated with the West African slave trade and with European maritime expansion in general, and to survivals from West African languages. This theory equates the development of AAVE with that of other English-based Creoles of Jamaica, Trinidad, Guyana, Hawai'i, or Sierra Leone. In contrast, there are those who deny any parallels between AAVE and other African-based Creoles. The fact is that the controversy rests on the degree of influence from British and other white dialects rather than complete denial of the impact of African survivals in these languages in contact. According to Rickford:

From the point of view of the creolist/dialectologist debate, the fundamental question is whether a significant number of the Africans who came to the United States between the 17th and 19th centuries went through processes of pidginization, creolization and [maybe] decreolization in acquiring English [the creolists' position], or whether they learned the English of British and other immigrants fairly rapidly and directly, without an intervening pidgin or Creole stage [the dialectologists' position].

Ebonics

The term *Ebonics*, which emerged in the mid-1970s, has been described as having "linguistic and paralinguistic features, which on a concentric continuum represent the communicative competence of the West African, Caribbean, and United States slave descendants of African origin." It includes the various idioms, patois, argots, ideolects, and social dialects of black people, especially those who have been forced to adapt to colonial circumstances.

Ebonics derives its form from ebony (black) and phonics (sound) and refers to the study of the language of black people in all its cultural uniqueness. This politicized definition gave rise to one of the loudest debates in the mid-1990s following a move by the Oakland, California, School Board to recognize Ebonics as a language.

Language Versus Dialect

At the heart of the controversy is the distinction between what is characterized as language and what is dialect (if it is a language, it validates the creolists' argument). The designation of language carries a clout not allocated to a dialect. Languages can be used to refer to either a single linguistic norm or to a group of related norms. Dialect refers to one of the norms. Some regional varieties may be associated with literary traditions. Other regional varieties may be considered pejorative and not associated with any literary tradition. Dialect may be used for local varieties and various types of informal, lower-class or rural speech. As a social norm, dialect is a language that is excluded from polite society. A language has more power than any of its dialects. In sum, distinguishing languages from dialects, we draw upon notions of power, solidarity, low and high prestige, mutual intelligibility, and dialect continuum. Clearly, there is complexity in the ongoing controversy in attempting to distinguish AAVE/Ebonics/black English vernacular as a language rather than a dialect.

The discussion about language and dialect is further complicated by adding the variety standard English as the norm. Standard English is that variety of English that is usually used in print and that is normally taught in schools and to nonnative speakers learning the language. It is also the variety of English normally spoken by educated people and used in news broadcasts and other similar situations.

Historical Perspective

Descriptions and controversies around AAVE/black English date back to the earliest writings about language in America. From the early description of Negro dialect by W. F. Allen as phonetic decay and debasement of language on the isolated St. Helena Island in the Georgia Sea Islands in 1865 to the patronizing 1916 *Literary*

Digest editorial that describes plantation songs as full of warm-blooded sentimentality, we see the negative depiction of African Americans through their language. For example, when Zora Neale Hurston published her seminal work on Negro folklore in 1935, which represented the language, culture, and discourse style as accomplishments of pride, she was deeply criticized for exposing Negroes in a distasteful light.

More recent descriptive studies of AAVE focused on metropolitan areas, a by-product of the African American Great Migration from rural south to urban north in the early to mid-20th century. Sociolinguist Walt Wolfram explained the following:

The large influx of African Americans in these metropolitan areas led to intensified racial isolation and, along with other social and cultural ramifications of such de facto segregation, a social environment conducive to the maintenance of ethnolinguistic differences.

Like all languages, AAVE possesses distinct words, sounds, and grammar. For example, educator and linguist Geneva Smitherman states the following:

. . . the pronunciation system of black English employs the same number of sounds as white English (ranging from 45 to 48 sounds counting stress and intonation patterns), but these sounds exist in a few different patterns of distribution.

In AAVE, speakers frequently reduce or simplify word endings so that, for example, "test" becomes "tes," or "ask" becomes "as." Likewise, the medial or final "th" becomes "f," such as in "birthday" becoming "birfday." Other recognizable differences in pronunciations are represented by a shifting of primary stress to the first syllable as in PO-lice or DEE-troit. Verb tense use is probably the most observable so that "he is going" becomes "he going"; "he is gone" becomes "he gone"; and "he has been gone for a while" becomes "he been done gone." Another prominent marker of AAVE is the use of double negatives, which serve to stress meaning, such as, "I don't want nobody to give me nothing."

Discourse Style

AAVE spans more than just the syntactic, phonological or morphological characteristics. It is also important to explore the notion of African American discourse style. The ability to speak “well” is a very important component in the African American experience. Speaking well establishes one’s reputation in the African American community. It is used to earn the community’s respect, and has its roots in African verbal art, *Nommo*, the belief in the magical power of the word. This power spans social, political, musical, spiritual, emotional, and even psychological boundaries. In the late 20th century, African Americans could be heard saying “Word” or “Word up” as signifying agreement. This reference comes from the sociohistorical belief in the power of the word.

A prominent feature of AAVE discourse style is that of call and response, an interactive and interdependent speech act demonstrating communality rather than individuality. Emphasis is on group cohesiveness, cooperation, and the collective common good. Whether in sacred or secular settings, the African-derived tradition of call and response is a spontaneous verbal and nonverbal interaction between speaker and listener in which all of the speaker’s statements (calls) are punctuated by expressions (responses) from the listener.

Another common attribute of African American discourse style is signifying, a survival tactic of verbal insult in which a speaker humorously puts down or talks about the listener to make a point, or sometimes to make fun. It is generally not taken seriously. The indirect method may be used to play the dozens, as in, “Yo mamma’s so fat, that when the whales saw her they started singing ‘We are family.’” It is socially acceptable and the humor makes it easier for the recipient to accept it.

Another feature is narrative sequencing, which reflects the storytelling tradition that makes abstract observations about life, love, and people in the form of a concrete narrative sequence that meanders from the point, associating episodes along the way. The story is dramatically acted out. These are not the only discourse features of AAVE, but they are ones that are easily recognized as giving AAVE its unique character.

Bona Fide Language

Despite documented evidence, there is still today denial that AAVE either exists or that it should be classified as a bona fide language, even though features of black English are used in some form by a substantial number of African Americans and are often co-opted by television, advertising, and the media. For example, in 1996 when the Oakland school board passed a resolution recognizing Ebonics as a language, its purpose was to provide a means for speakers of Ebonics to qualify for federally funded programs traditionally restricted to bilingual populations. However, the effect was to raise the controversy over African American Vernacular English to a new high.

Though the resolution had many detractors and supporters, it was later concluded that Oakland was looking for tools to teach children Standard English so that they might be more competitive in the marketplace and have access to the rights of Standard English speakers. It was then that the Linguistic Society of America announced a resolution affirming that, whatever the name used, the language variety was rule-governed, systematic, and distinct.

Hip-Hop and Rap

In recent years hip-hop culture has become a major purveyor of AAVE and its discourse style. Many scholars of rap music and hip-hop more broadly locate its origins in African American verbal traditions such as playing the dozens, signifying, the hidden messages in enslaved people’s folktales and songs, the call and response of the black church, the joy and pain of the blues, the jive and slang of the jockeys, hipsters, and jazz musicians, the boasting of street talk, and the eloquence of black activists. One might even brag that AAVE is no longer owned by African Americans. It has become a national treasure, yet still problematized for many African Americans who have become handicapped by its sole use.

The push for standardization of any language artifact brings with it political and cultural manifestations that have particularly affected African American Vernacular English. In an environment where racialized imagery and issues of intellect and identity are continuously explored, it is appropriate to conclude that whether AAVE is a language or a dialect, it is clearly used by a great

many African Americans in a variety of settings. As a result, from classroom teachers to politicians, American society is undergoing a repositioning of cultural and linguistic diversity that engages social contexts and allows multiliteracies to enrich society.

African Americans

African American history, a relatively recent field, has since the 1960s become integral to our understanding of U.S. history. From the colonial era through the 21st century, even as slavery and racism relegated it to the margins of official history, African American history has been inextricably linked to the U.S. (American) past. African Americans made defining and profound contributions to U.S. society and culture from the earliest colonial settlements through the 21st century. As both a labor and sociocultural force, black slaves helped build the British colonies in North America into the society that in 1776 would proclaim its national identity as the United States of America.

African American slaves formed the labor force upon which early American society depended, contributing the labor that made possible the great agricultural empire of the antebellum south. As recent research has shown, slave labor was also essential to the establishment and early development of regional centers such as New York and Washington, D.C., including the construction of monuments in our capital that are today synonymous with American history and identity, such as the Capitol and the White House.

Though the African American legacy was, until the post-1960s era, largely dismissed by mainstream historians, today African Americans have been recognized not only for their material contributions to the founding of the country but also for their defining role in the emergence of what are regarded today as quintessentially American cultural practices. Jazz, blues, rock and roll, spirituals, and rap music, whose origins lie deep in the African American past, are some of the better-known and popular American cultural practices with African American origins.

Less known within mainstream U.S. society, but equally influential on U.S. history and culture, are the great literary works written by African Americans from the slave era to the present, and particularly the distinctive perspective on American history and culture expressed in these works. The prophetic voice in African American writing, which, according to many scholars, has for centuries articulated the moral conscience of American society, shaped both black and white American literature and culture in innumerable ways. This influence helped determine the progression of U.S. history from the slave era through the 20th century.

From the poetry of the slave author Phillis Wheatley and the autobiography of the former slave Olaudah Equiano in the late 18th century to the great slave narratives of Frederick Douglass and Harriet Jacobs in the 19th century, language and writing, as the scholar Henry Louis Gates has famously asserted, became for many blacks synonymous with the quest for freedom, equality, and justice. These democratic ideals, proclaimed in the founding U.S. national documents, were both critically scrutinized and renewed by black writers who called for the nation to live up to its foundational ideology.

One can trace later classic African American literary works—such as W. E. B. Du Bois's *The Souls of Black Folk* (1903), Richard Wright's *Native Son* (1940), Ralph Ellison's *Invisible Man* (1952), or Toni Morrison's *Song of Solomon* (1978)—directly to these early slave writers. Scholars agree that the modern African American literary tradition rests upon the foundation of slave narratives of the 19th century and earlier. But slave narratives, which number in the thousands, were not only among the first literary works written by African Americans; they were also the first historical narratives produced by blacks and therefore also form the foundation of the field of African American history. Equally important, one can also trace the famous prophetic sermons and speeches by civil rights-era leaders as different as Martin Luther King, Jr., and Malcolm X back to a slave society within which the black church formed the most influential social institution.

Fundamental to African American history and culture, as described above, the oral (folk) tradition formed the underlying source not only of black writing but of a wealth of cultural knowledge that was for centuries, from the slave era to the present, maintained within African American communities. One cannot narrate black history without emphasizing the centrality of an oral cultural tradition that kept alive the history and culture of black communities under brutally oppressive social circumstances. Even under centuries of slavery, when literacy for slaves was outlawed and slave families could be broken up at the whim of the slave owner, African Americans both remembered their past and creatively adapted themselves to their new circumstances in North America. This does not mean that much was not lost as Africans were severed from their homelands and forced to adapt to their lives as slaves; but the simplistic assumption that slaves in North America, or in other regions of the Americas, lost all of their ties to an African past no longer forms a viable part of scholarly research on African American history and culture.

The history of African Americans can be divided into four periods spanning the slave era to the 21st century: the African diaspora and slavery, the colonial and antebellum period, the post-bellum period to World War I, and the modern era. Within this chronological framework,

The engraving shows slaves marching in chains by the site of the U.S. Capitol in Washington, D.C., around 1815. Recent research has shown the use of slave labor in the construction of national landmarks such as the Capitol and the White House.

discussion of one era may nevertheless overlap with and illuminate other eras. The first period, the African diaspora and slavery, discusses the history of African Americans in the context of New World slavery and provides an account of African American history in the early colonial era to 1700. The second, the colonial and antebellum period, traces African American history in the late (i.e., post-1700) colonial era leading up to the American Revolutionary War and examines black history in relation to the sociohistorical events preceding the Civil War. The post-bellum period to World War I (1865–1918) covers a defining time in modern African American history, when the progressive policies established during the Reconstruction era (1865–76) gave way to the Jim Crow period; it also describes the first Great Migration of African Americans from the south to the north, which began in 1910. Finally, the modern period covers African American history from 1919 to the present, which saw the emergence and recognition of African Americans as full citizens only as they and their supporters brought an end to Jim Crow segregation. This struggle culminated in the 2008 election of the first African American, Barack

Obama, to the presidency of the United States. The modern era also saw the remarkable rise, through music, literature, and other arts, of African American culture to a position of prominence within U.S. mainstream and popular culture.

The African Diaspora and Slavery

The history of African Americans begins before the first slaves landed in the British colonies of North America in the 1620s. As noted above, this history includes the collective memory of a distant African past, kept alive by African Americans over centuries of enslavement through a wealth of cultural (folk) practices. It also includes a slave past shared with the descendants of Africans who live today throughout the Americas. Though sometimes overlooked in accounts of U.S. history, current scholarship examines early African American history within this broader hemispheric (American) setting, in which the definition of “America” is expanded to include the Caribbean, Spanish America, and Brazil. The early history of African Americans comes into sharp focus as one branch of a larger socioeconomic process spanning centuries when set within this broader geographic framework. By 1513 the Spanish, who were the first colonists to import African slaves to the New World, had brought slaves to their colonies in Cuba and Hispaniola. This places the African presence in the Americas close to a century before the arrival in North America of the first English colonists, whom we call the Pilgrims.

The African diaspora refers to the peoples throughout the Americas who are descended from African slaves. The Atlantic slave trade, which brought approximately 12 million African slaves to the Americas, flourished from the mid-16th century to the mid-19th century, reaching its peak in the late 18th century. During this time enslaved Africans were uprooted from their homes and dispersed to regions throughout the New World. Their destinations depended entirely on the contingencies of the market economy of slavery. In his classic slave narrative, *The Interesting Narrative of the Life of Olaudah Equiano* (1789), Equiano describes his travels as a slave and seaman in the Caribbean, the British colonies in North America, as well as other parts of the Americas. His book, like most slave narratives both an autobiography and a historical account, provides an early

picture of how the Atlantic slave trade operated in a hemispheric setting. This trade in people sent African slaves throughout the Americas as European colonists sought a labor force to establish their colonies and build productive, though brutally exploitative, agrarian economies.

Those brought to North America were a small minority of the total number transported to the Americas during the Atlantic slave trade. The large majority of slaves, by some estimates 95 percent of the total population transported over approximately 250 years, were taken to the Caribbean, Brazil, and Spanish America. But despite the relatively small percentage of slaves transported to North America, by the early 18th century approximately half a million enslaved African Americans lived in the British colonies that would become the United States. By the mid-19th century, when the United States was on the brink of civil war, approximately 4 million slaves lived in the southern states out of a total southern population of 9 million. The population of the United States as a whole at this time was 22 million.

The first African slaves brought to the British colonies in North America in the 1620s were exploited for their labor to establish farms and towns in the wilderness of the New World. The great economic benefits of slave labor to white American society led to the rapid increase in the slave population particularly in the southern colonies, where a plantation-based agrarian (cotton) economy became dependent entirely on slave labor for its survival. While in the north the proportion of slaves to the entire population was never more than 5 percent, in the south by 1790 it had grown to a third of the population and by 1860, as noted above, to almost half of the southern population.

As both slave writings and historical research on slavery describe, in the United States this institution took on a character distinct from its forms in other regions of the Americas. Although slaves throughout the New World shared many experiences, such as the daily brutal reality of their physical enslavement, and were also bound together by a history rooted in an African past, in North America slavery developed unique characteristics, which will be discussed below.

Orlando Patterson uses the concept of “social death” to define the experience of slavery as it

existed from antiquity to the modern era. “Social death” captures the daily immediacy of physical and psychological oppression visited upon slaves as a matter of course, whether or not they were regarded by their masters as “privileged” (e.g., house slaves). To summarize Patterson, the slave’s life was characterized by three inter-related experiences that collectively defined his or her status as a slave: absolute powerlessness, alienation from all rights or claims of birth, and a generalized sense of dishonor. The slave’s powerlessness was marked by the fact that it “always originated . . . as a substitute for death,” meaning that because the master could at any time take the life of his slave, the latter always lived under the “conditional commutation” of death. The slave’s “execution was suspended only as long as the slave acquiesced in his powerlessness.” Second, the slave existed as a socially dead person. “Because the slave had no socially recognized existence outside of his master, he [she] became a social nonperson,” so that “he ceased to belong in his [her] own right to any legitimate social order.” Finally, according to Patterson, the slave “could have no honor because he had no power and no independent social existence, [and] hence no public worth.”

The Colonial and Antebellum Era

From the colonial period through the Civil War (1620–1865), African Americans formed a foundational segment of the American population. Even as they, with some exceptions such as freed slaves and their descendants, lived under the yoke of slavery, blacks created a distinctive rich culture that sustained them through centuries of adversity, a legacy that made a lasting imprint upon both American and world culture.

African American history in the antebellum era can be characterized as a series of struggles and “negotiations” with the dominant (white) European American society, social processes that varied greatly depending upon the region and period examined. These struggles and negotiations involved a series of complex efforts by blacks, over a span of generations, to adapt to the harsh realities of slavery and thus assure, to the extent that this was possible given the harsh circumstances as described by Patterson, their physical and cultural survival.

Adaptation to their condition did mean that African Americans did not resist slavery. Rather, blacks adopted some white (European) American practices and beliefs and then adapted them to their own life experiences as slaves. In this and other ways, African slaves and their descendants became African Americans. Religion (Christianity) offers perhaps the most striking example of the process by which a (white) European American social institution was adopted, then transformed, by blacks to address their needs and condition as slaves.

Because slaves transported to North America could not openly practice African religions, they and their descendants adopted Christianity but adapted it to their own social circumstances and individual needs. In some regions of the Americas, such as the Caribbean, African slave culture created syncretic religions comprised of both Christian and African-origin religious beliefs. In North America black Christianity, though not syncretic, became a pillar of slave society and a primary means of resistance to slavery. The black church under slavery not only offered daily spiritual sustenance for its oppressed followers, but by focusing on key passages in the Bible it embraced the hope of inevitable escape from bondage. While pro-slavery white Christians used selected tales from the Bible to justify slavery, black Christians embraced the story of the plight of the Israelites under Egyptian bondage, and their eventual salvation, as the foundation of black (slave) Christianity.

In the slave narrative *Incidents in the Life of a Slave Girl*, Harriet Jacobs describes these radically different interpretations of the Bible in a moving passage in Chapter XIII in which she compares a pro-slavery sermon to one given by a preacher sympathetic to the plight of slaves. Jacobs concludes her narration by citing the folk refrain of a slave preacher: “Ole Satan’s church is here below; Up to God’s free church I hope to go.” The focus on biblical stories addressing the condition of slavery, along with the fact that the black church offered a primary space of slave unity and community, meant that the black church also became a place where resistance to slavery could be safely discussed or planned. Most of the dozens of slave rebellions in North America that took place from the colonial through antebellum eras,

of which the most famous was led by the slave preacher Nat Turner in 1830, were organized through the black church. Yet, as Jacobs's book also illustrates, resistance to slavery more often took forms other than open rebellion. Slaves could run away, feign illness, disrupt or sabotage work, among many other subversive, but nonviolent, acts. Jacobs emphasizes in her book that the generational struggle to maintain the black family unit under slavery, when its very existence posed a direct threat to the institution of slavery, formed a fundamental, though often unacknowledged, means of resistance.

Despite laws that made teaching slaves to read and write illegal, slaves, former slaves, and free blacks in North America wrote thousands of historical and literary works, primarily autobiographical slave narratives but also fiction, poetry, journalism, political tracts, sermons, ballads, diaries, journals, and letters. The history of African Americans from the colonial era through the Civil War was narrated by blacks themselves through these writings, even as their collective history would be denigrated and dismissed by mainstream and "official" historians until well into the 20th century. As Gates shows, under slavery—as well as under the racialized culture that existed in the free northern states—literacy and language took on a special meaning for African Americans. Just as, as Gates states, the first slaves to escape were those who had learned to read and write, for free blacks as well language and writing became identified with selfhood and inevitably with freedom.

Free blacks such as Martin Delany (*Blake, or The Huts of America*, 1859–62), Harriet E. Wilson (*Our Nig: Sketches From The Life of a Free Black*, 1859), and William Wells Brown (*Clotel; or, The President's Daughter*, 1853) wrote foundational novels. As early as the late 18th century, slaves such as Phillis Wheatley and Jupiter Hammon wrote and published poetry, a literary genre that, according to slave owner Thomas Jefferson (see *Notes on the State of Virginia*, 1785) and other white Americans, could never be mastered by blacks given their assumed intellectual inferiority. Frederick Douglass, Harriet Jacobs, Harriet Tubman, Henry Bibb, Olaudah Equiano, and thousands of other former slaves wrote autobiographies, though only the most famous of these remarkable narratives are read today. Most slave

narratives went unpublished, existing today only as manuscripts, but the works by Jacobs, Douglass, and Equiano have since the 1960s become classic literary (and historical) texts, as important to understanding colonial and antebellum U.S. history as the famous writings by Thomas Jefferson, Benjamin Franklin, or Cotton Mather.

David Walker's *An Appeal to the Coloured Citizens of the World* (1829) is the best-known and influential political essay by an African American published in the antebellum era. Moving beyond simple appeals to end slavery, Walker stridently called for African Americans to free themselves from slavery, first by recognizing their own humanity and then by taking direct action rather than depending upon the promises of hypocritical U.S. institutions such as the government or the church. Walker highlights not only the presence of an early black nationalist movement, but his brilliant criticism of U.S. political and religious institutions delineates the fundamental sociohistorical contradiction, centered on race and slavery, faced by the United States from its founding through the outbreak of the Civil War. Walker points to the bitter reality that by the early 19th century, even as the northern states increasingly opposed the southern states' "peculiar institution," at least tacitly acknowledging the hypocrisy of the republic's founding democratic ideology, for decades the north continued to accommodate the south. This political accommodation, which signaled the country's failure to live up to its founding principles of equality and justice, lasted until the south seceded in 1861. It explains why slavery lasted in the United States much longer than it did in most other nations in the Americas.

The Civil War and Reconstruction

During the Civil War thousands of free blacks and newly freed slaves fought heroically against the Confederacy in the Union army's newly formed United States Colored Troops (USCT). Martin Delany, a physician and the author of the novel *Blake, or The Huts of America*, among other works, became the first black field officer in the U.S. Army, achieving the rank of major, the highest rank of any African American soldier in the Civil War. By the end of the war, black regiments formed approximately one-tenth of the entire Union army's ranks. Twenty-five African

American soldiers earned the Medal of Honor during the Civil War, including 15 who were members of the United States Colored Troops, such as Christian Fleetwood and Charles Veale, who received the medal for their actions in the Battle of Chaffin's Farm on September 29, 1864.

Just as slavery formed the primary cause of the Civil War, after the national cataclysm between the United States and the Confederate States the newly freed slave population of approximately 4 million became a central subject of concern in the postwar policy known as Reconstruction (1865–77). Reconstruction policy aimed broadly to rebuild the south, which lay in ruins after the war, but it also enforced the newly adopted Thirteenth, Fourteenth, and Fifteenth Amendments to the U.S. Constitution, which extended full rights of citizenship and suffrage to all African Americans. Moreover, it created programs of racial uplift, such as the Freedman's Bureau, which assisted freed slaves in a variety of ways as they sought to integrate into postwar southern society. Scholars generally agree that Reconstruction policy proved a noble though short-lived and ultimately unsuccessful attempt to address the urgent needs of freed slaves.

The Thirteenth Amendment, which outlawed slavery, was adopted in 1865; the Fourteenth Amendment, which granted all rights of citizenship to blacks, was adopted in 1868; and the Fifteenth Amendment, which protected voting privileges for African Americans and other races, was ratified in 1870. Along with adopting these laws, the victorious North recognized that in the aftermath of war the millions of newly freed blacks in the south required further assistance and protection. But the progressive policies toward blacks implemented under Reconstruction, which led to the election of hundreds of blacks to national, state, and local political offices, would be overshadowed by the backlash that followed. With the end of Reconstruction in 1877 and the establishment of the black codes and then Jim Crow segregation—de jure and de facto regulations that discriminated against and disenfranchised blacks—African Americans would struggle for decades under racial oppression. The thousands of lynching of blacks—estimated to be between 3,000 and 4,000—during these decades were the most obvious and terrifying evidence of black

disempowerment before the law. The civil rights movement of the 1950s and 1960s emerged as blacks sought to empower themselves and reclaim their full rights as U.S. citizens.

W. E. B. Du Bois is regarded as the most influential black intellectual of the late 19th and early 20th centuries and a foundational figure in modern black history. His classic 1903 book, *The Souls of Black Folk*, examines the dire social condition of African Americans at the end of the century, when 90 percent of blacks still lived in poverty in the southern states. Du Bois's work, a richly hybrid text comprised of essays, autobiography, fiction, history, and sociology, traces this condition to the slave era as well as to the Reconstruction and post-Reconstruction period. A combination of intimate autobiographical pieces about the author's personal experience of racism and scholarly essays that provide sociohistorical context, Du Bois's work, much like David Walker's *Appeal* decades earlier, called upon the conscience of Americans to recognize the humanity of blacks and thereby extend equality and justice under the law to them as U.S. citizens.

Du Bois's incisive argument against Booker T. Washington—who was the most prominent African American leader of the era and author of the slave narrative *Up From Slavery* (1901)—cast Washington as an accommodationist toward Jim Crow segregation. The debate with Washington, in which Du Bois called for an immediate end to segregation and full civil rights for blacks, would set forth the terms for discussions of black progress well into the 20th century.

The Modern Era to World War I

Beginning in 1910, the oppressive racial and socioeconomic conditions under which southern blacks lived, described a few years earlier by Du Bois in *The Souls of Black Folk*, led to the first Great Migration of African Americans to the north. The outbreak of World War I led to labor shortages in the north as European immigration, amid the conflict, came to a halt and tens of thousands of young American men entered the military. Although the migration of blacks to the north would last into the post-World War II era and as late as the 1970s, during the initial migration to 1930 approximately 1.5 million blacks migrated to the northeast and midwest. This migration of

approximately one-tenth of the U.S. black population from the rural south to the urban north had a profound impact on African American society. It presented blacks with economic opportunities in the industrial north that had never existed for them in the south, fundamentally transforming the African American population.

The Great Migration also led to racial hostility against African Americans as their numbers grew dramatically in cities such as Detroit, Pittsburgh, New York, and Chicago. Jim Crow segregation had existed in the north long before the Great Migration. Into this tense racial setting thousands of African American veterans returned from World War I; having fought for the United States in the Great War, these veterans and their

families realized that even in the north, as blacks they remained second-class citizens. The series of race riots that took place from 1917 to the early 1920s, though not confined to the north, killed scores of blacks and resulted from racial hostility directed at blacks as they sought in the modern Jim Crow era to assert their rights as U.S. citizens.

The Modern Era: World War I to the Present

The 20th century saw remarkable achievements by African Americans as they were collectively freed, after 80 years of struggle culminating in the civil rights movement led by Reverend Martin Luther King, Jr., from the strictures of Jim Crow segregation. The continuing Great Migration

An African American family stands outside a brick cottage that had served as slave quarters at the Hermitage Plantation in Savannah, Georgia, around 1907. In the early 18th century there were approximately half a million enslaved African Americans in the future United States, and by the mid-19th century, out of a total population of 9 million people in the southern states, about 4 million were slaves.

The struggle for civil rights for African Americans culminated in the 2008 election and 2012 re-election of Barack Obama as the first African American president. President Obama, surrounded by his family and First Lady Michelle Obama, whose ancestry includes slaves, pauses to survey the crowd after his second presidential inauguration swearing-in ceremony on January 21, 2013.

after World War I led, by the 1970s, to approximately 5 million more blacks leaving the south for the northeast, midwest, and west. The 20th century also saw the emergence of a black middle class and upper class, as blacks sought jobs and opportunity in the great urban industrial regions of the northeast, midwest, and west. Though a black middle and upper class had always existed in the northeast and midwest, in the modern era and particularly after World War II these groups dramatically increased in numbers. The dream of both W. E. B. Du Bois and Booker T. Washington, that education would transform and uplift the African American population, was realized as blacks finally gained full access to colleges and universities. This, along with the end of Jim Crow segregation in schools and all other walks of life, opened doors for blacks in business, government,

the arts, and entertainment. The black dream of freedom and uplift through education culminated in the election of Barack H. Obama to the presidency, the first African American to hold this office. Of the previous U.S. presidents, that is, those who held the office before the Civil War, 12 had owned slaves and eight owned slaves while in office.

But as African Americans in the post-1960s era made great advancements, the legacy of Jim Crow racism and its attendant socioeconomic inequities continued to weigh on large segments of the black population. The black urban underclass never saw sustained economic benefits from the social transformation brought about in the 1960s and after by the civil rights movement and the Great Society. Though overt racism in the form of Jim Crow segregation ended, other types of racial

inequality emerged, as in the legal and justice system, causing untold harm to large segments of the black population. Today non-Hispanic blacks account for approximately 40 percent of the total prison and jail population, roughly 1 million of the 2.3 million people incarcerated, though they comprise only 12.6 percent of the U.S. population. African Americans are incarcerated at nearly six times the rate of white Americans, and mostly for nonviolent drug-related offenses. Many black urban communities have been devastated by the so-called prison industrial complex, where their family members may be imprisoned for decades, often for crimes whose origins are rooted in poverty. The transformation in the United States in the last 30 years from an industrial to a service and information-based economy, which has resulted in the closing of industrial plants throughout the northeast, midwest, and west, has proven calamitous to what was an emerging urban and suburban black middle class.

For contemporary black leaders like Benjamin Todd Jealous, Al Sharpton, and Jesse Jackson, or educators and intellectuals such as Cornel West, Henry Louis Gates, and Bell Hooks, among many others, the clarion call for freedom, equality, and justice for African Americans therefore remains as urgent today as it was during the Jim Crow era. This sense of urgency—itsself a response to the backlash to the progressive (liberal) policies of the 1960s that culminated in the presidency of Ronald Reagan (1981–88)—continues to define African American politics in the 21st century even as Democrats in 2008 retook the White House.

Twentieth-Century Entertainment and the Arts

In the realm of entertainment, popular culture, and the arts, African Americans from the 20th century to the present have shaped U.S. culture in profound and myriad ways. Many cultural genres regarded throughout the world today as quintessentially “American” have African American origins, the most obvious being jazz, blues, and rock and roll (and rhythm and blues) music, all of which dominated U.S. popular music for much of the 20th century. Jazz greats such as Louis Armstrong and Duke Ellington, blues artists such as Robert Johnson and Charlie Patton, and rock and roll stars like Chuck Berry and Little Richard,

among many others, contributed defining works to the American musical legacy. Rap music, whose origins are rooted in the 1970s and 1980s, continues this legacy in the 21st century; much like jazz, blues, and rhythm and blues in the 20th century, rap music has transcended racial and cultural boundaries in this manner and come to dominate the U.S. popular music scene and extend its influence throughout the world.

In the 20th century African Americans produced a wealth of fiction, autobiography, non-fiction, poetry, and plays, including some of the classic works of modern U.S. literature such as Ralph Ellison’s novel *Invisible Man* (1952), Zora Neale Hurston’s novel *Their Eyes Were Watching God* (1937), and Langston Hughes’s poetry of the 1920s through 1940s. The African American literary tradition, whose achievements culminated in the novelist Toni Morrison’s acceptance of the Nobel Prize for Literature in 1993, begins with the slave narratives and traces a path in the late 19th century through writers such as Du Bois, Paul Larence Dunbar, Frances E. W. Harper, and Charles Chestnut.

The Harlem Renaissance, a cultural and arts movement based in Harlem, New York, which spanned the 1920s, marked the first great outpouring of artistic production by blacks in the 20th century and stands as a pinnacle of modern African American artistic achievement. This movement constituted in part a cultural and political response to the endemic racism of the period and particularly the continued oppression under Jim Crow society. Among the best-known writers associated with the Harlem Renaissance are Hurston, Hughes, Claude McKay, James Weldon Johnson, and Alain Locke.

The Harlem Renaissance’s influence on U.S. and African American writing and culture has been immeasurable. Morrison and other modern and contemporary writers such as Ellison, James Baldwin, Alice Walker, August Wilson, and Ishmael Reed pay homage to this early black literary movement in their works. Collectively 20th-century black writers and scholars not only created a literary tradition that has today gained international recognition but also played a pivotal role in establishing African American literature and other arts as academic disciplines in colleges and universities. The success of African Americans today

throughout the arts, including film, television, and music, rests upon the foundation built by these early writers and artists, as well upon the legacy of black voices from the colonial era through the 19th century who challenged their status as slaves through writing and other forms of resistance. This great social and cultural legacy extends today to all African Americans, of all occupations and classes, as well as to the nation as a whole.

African Methodist Episcopal Church

The African Methodist Episcopal Church is the largest black religious denomination in the United States. It was established in 1816 in Philadelphia, Pennsylvania, by people of African ancestry. The denomination's name clearly indicates the significant contributions of African Americans to emerging Christianity in North America. The formation of the AME Church marks one of the earliest expressions of black religious independence in antebellum America.

The denomination had its beginning in the mutual aid society and antislavery association called Free African Society (FAS), which Richard Allen, Absalom Jones, and others founded in Philadelphia in 1787. These African societies

functioned at the time as quasi-religious institutions that helped fulfill the socioeconomic, cultural, spiritual, and material needs of the African American population in urban Philadelphia and its surroundings.

Generally, historians and scholars of black religion have noted several principal historical forces that stimulated the assertion of black religious independence. These include the long narrative of racial segregation and discrimination in white churches during and after slavery, the moral failure of Christianity in the United States, and the desire for black Christians to gather in free, autonomous worship using the African American tradition and cultural practices within the context of the black church.

The genesis of the AME Church can be traced to a day in November 1787, when Richard Allen and other black Methodists at the predominantly white St. George's Methodist Episcopal Church (MEC) in Philadelphia took a decisive step to no longer tolerate racial segregation and discrimination in the church. Allen, Jones, and other black Christians had attended a public worship service at St. George's MEC, and as they knelt in prayer in a gallery that was reserved for whites only, some trustees forced them to abruptly leave the church. As Allen recounts:

All went out of the church in a body . . . and they were no more plagued with [us] in that church . . . Here was the beginning and rise of the first church of the denomination later known as the African Methodist Episcopal.

The ousted blacks were determined to reshape FAS as an exclusively African congregation. Most wanted to align themselves with the Episcopal Church, but a small group that included Allen pushed to remain Methodist. In 1794, Bethel AME, with Allen as pastor, came into being. Bethel later was a well-known station of the Underground Railroad. Allen successfully sued in Pennsylvania courts in 1807 and 1815 so that Bethel AME could operate independently of white Methodists.

The AME Church came into existence as a reaction to white hostility against blacks in church. It is good to note here that many slaves joined the Wesleyan movement because of its antislavery

sensibility, and the Methodist Church was probably the first to license black preachers.

AME and Black Freedom

The AME denomination stands as an institutional symbol of black freedom. It contributed enormously to the fostering process of racial consciousness and solidarity in the African American community. It strongly and consistently opposed slavery and institutional racism, and it supported the famous Vesey conspiracy, which was a plan to liberate African slaves in Charleston, South Carolina, and then flee to Haiti. Denmark Vesey, inspired by the spirit of the Haitian Revolution (1791–1804), organized what would have been the most extensive slave revolt ever known in American history. The uprising was planned for July 14, 1822. Slaves opposed to the plan tipped off Charleston officials to the plot, and Vesey and his conspirators were quickly arrested, interrogated, and ultimately hanged. As one of the elderly bishops declared at the denomination's 1856 general conference in Cincinnati, "Every colored man is an abolitionist, and slaveholders know it." Vesey also had helped institute an AME congregation in 1817.

The Metropolitan African Methodist Episcopal Church in Washington, D.C., was founded in 1838 and is listed in the National Register of Historic Places. The AME Church grew out of the Free African Society, which was established in 1787.

Social Vision

The AME Church has enjoyed a great reputation for combining secular relevance with the spiritual development of its members. It is fully committed to an ethic of social and political activism, and the common good of all people. As a social institution, it propagated the uplift ideology, which can be observed in its mission statement: The Mission of the AME Church is to minister to the social, spiritual, and physical development of all people. And the religious emphasis is reflected in the church's motto: God Our Father, Christ Our Redeemer, Holy Spirit Our Comforter, and Humankind Our Family.

Furthermore, the AME Church has been a catalyst in the education of African Americans as well as the advancement of the black community since the time of slavery. It was Daniel Alexander Payne, an influential AME bishop and educator, who linked black liberation to education and helped found Wilberforce University, the first historically black, private, liberal arts institution, in 1856. The denomination also established other universities and theological schools, including the well-known Western University (Quindaro, Kansas), Allen University (Columbia, South Carolina), Morris Brown College (Atlanta, Georgia), Jackson Theological Seminary (Little Rock, Arkansas), and the African Methodist Episcopal University (Liberia, Africa).

The AME Church continues the project of social service relief and the Christian vision of social development. Today, the denomination maintains housing projects in many cities and states across the United States. The church's missionary zeal has been apparent since the 1820s, when it had actively participated in missionary endeavors in Haiti, South Africa, Canada, Bermuda, and West Africa. Some of the AME's leading scholar-activists and religious thinkers include James H. Cone, the father of black liberation theology, Cecile W. Cone, and Jacqueline Grant, feminist theologian.

Afrocentrism

Afrocentrism will be defined here primarily as an ideology and a cultural, intellectual, and educational movement that stresses the African perspective in the quest for values, knowledge, truth, and understanding. Afrocentrism is an intellectual orientation that seeks to de-center the Eurocentric paradigm by shifting the geography of reason and the discourse of civilization to the significance of ancient Egypt in the birth of the modern world. Afrocentrists argue for the putative influence of ancient Egypt—which they contend was undeniably black—on the ancient Greek civilization.

The Afrocentric paradigm articulates the cultural uniformity thesis of continental Africa and across the black diaspora; advocates of this school of thought valorize the African heritage and the continuity of African cultural traditions and values in the African diaspora, as well as the survivals of Egyptian civilization. Afrocentrism is chiefly concerned with the vexed question of the black African origin of civilization and the blackness of pharaonic Egypt. Yet, African American Afrocentrists pursue the de-Europeanization of American education and culture by promoting a

wider openness to cultural relativism, alternative histories, and worldviews.

Origins

The origin of the term *Afrocentrism* is unknown. African American historian William Jeremiah Moses credited W. E. B. Du Bois as probably the first writer to have used the concept of “Afrocentrism” as early as 1961 in a paper proposal, “Proposed plans for an Encyclopaedia Africana,” whose objective was to be “unashamedly Afro-Centric, but not indifferent to the impact of the outside world.” Nonetheless, the cultural critic and most influential Afrocentrist scholar today, Molefi Asante of Temple University, would popularize Afrocentrism as a distinctive worldview in numerous path-breaking studies including *Afrocentricity, the Theory of Social Change* (1980), *The Afrocentric Idea* (1987), *Kemet, Afrocentricity and Knowledge* (1990). Asante defines Afrocentricity as a philosophy and program for social change. In *Kemet*, he writes:

The Afrocentric method seeks to transform human reality by ushering in a human openness to cultural pluralism which cannot exist without the unlocking of the minds for acceptance of an expansion of consciousness.”

Asante’s objective is to inspire proponents of this school of thought “to put African ideals and values at the center of inquiry.” Afrocentrists employ rigorously the African cultural image as a tool to increase the self-esteem and consciousness of the people of African ancestry in the United States and in the African diaspora.

Egyptocentrism

The Afrocentric ideology can be traced in the writings of black and nonblack writers in the 19th and 20th centuries. To various degrees, the works of these writers exhibit both Afrocentric and Egyptocentric themes and ideologies. While the discourse of Afrocentrism seeks to link the cultural traditions and civilization of ancient black Egypt to those of continental black Africa and the black diaspora, the discourse of Egyptocentrism puts forth the idea that ancient Egypt was geographically and culturally African and that the flourishing civilization of Egypt was unquestionably Negroid.

The debate over the black genesis of civilization and over the character of ancient Egypt and the idea that ancient Greece had borrowed both cultural and intellectual resources from the black people of Egypt has also appeared in several controversial texts, such as George G. M. James’s *Stolen Legacy: The Egyptian Origins of Western Philosophy* (1954), Yosef Ben-Jochanan’s *African Origins of the Major “Western Religions”* (1970), and Ivan Van Sertima’s *Nile Valley Civilization* (1980). It is noteworthy to underscore here it was the three-volume magisterial work of the white British and Cornell University historian Martin Bernal, under the provocative title *Black Athena*, that has gained the academic attention of the Afrocentric movement in the United States. The multivolume work (1991, 1991, and 2006), as the author states, was “essentially concerned with the Egyptian and Semitic roles in the formation of Greece in the Middle and Late Bronze Age.” In this historical revisionism project, Bernal also sought to boost the African American self-esteem in the United States and affirm black agency in world history.

Bernal fortifies the works of previous Afrocentrists by establishing literary, archaeological, and linguistic data of the substantial influence of ancient Egypt and Phoenicia on Greek civilization. His well-developed thesis about the Egyptian question claims for the African backgrounds of Attic civilization, resulting in his rejection of the notion that Greek civilization was original and autonomous. Bernal declares that Greece had imported both Egyptian culture and language through the exchange with the Semitic people, known as the Hyksos, in the 17th and 16th centuries B.C.E. The Cornell professor had agreed with other Afrocentrists on many points, that (1) Egyptians introduced civilization to Greeks, (2) Hyksos brought to Greece Egyptian language and culture, (3) classical Greek philosophers borrowed from Egyptian philosophy, (4) Egyptian origins of many of the Greek heroes, such as Socrates and Inachus, (5) Roman poet and playwright Terrence was a black African, and (6) Cleopatra had African ancestors.

In response to Afrocentrist claims and reconstruction of modern history, the Wellesley College professor of classics and ancient history Mary Lefkowitz published a contentious book titled

Not Out of Africa: How Afrocentrism Became An Excuse to Teach Myth as History (1996). Throughout the book, Lefkowitz has sustained the long-standing thesis/tradition of the priority of Greece in the development of human civilization and the world of ideas. For her, Afrocentrism should be regarded as a mass of invented histories and traditions of black achievements in world history: As she asserts, “The Afrocentric myth of ancient history is a myth, and not history . . . The ancient Egypt described by Afrocentrists is a fiction.” She added that Afrocentric theories of history and culture are “based on false assumptions and faulty reasoning, and cannot be supported by time-tested methods of intellectual inquiry.”

Furthermore, Lefkowitz states that Afrocentrists are damaging the curriculum in the United States by actively indoctrinating students along their party line across the public school systems and in the sphere of higher learning. Claiming that she is defending “academic standards,” Lefkowitz’s objective is clear:

I would like our children and college students to learn about the real ancient Egypt and the real ancient Africa, and not about the historical fiction invented by Europeans.

As Lefkowitz observes, “Teaching the myth of the Stolen Legacy as if it were history robs the ancient Greeks and their modern descendants of a heritage that rightly belongs to them.”

Multicultural Education

According to Stephen Howe, “Public controversy has centred particularly around the inroads Afrocentrism has made into school-level education in the United States.” By 1991, it was reported that roughly 350 private schools or “Afrocentric academies” devoted to the approach had been established, educating more than 50,000 children. The number has continued to grow. Numerous public school authorities have also introduced Afrocentric curricula, including wholly Afrocentric schools in predominantly black districts as Detroit, Baltimore, and Milwaukee had done. Elsewhere, curriculum reform designed to introduce Afrocentric perspectives produced national-level public storms and political battles, as in New York and Washington, D.C. A first generation of

explicitly Afrocentric school textbooks has begun to appear in various locations, such as Atlanta, Georgia, and Portland, Oregon, with the impact of the *African American Baseline Essays*. Afrocentrism continues to penetrate rapidly into U.S. higher education; the African American Studies department of Temple University in Philadelphia is nationally known as the largest and most influential Afrocentrist program in the United States.

Conclusion

In conclusion, Afrocentrism has contributed a multicultural representation to and multicultural inclusion in America’s dominant culture, as well as offered a multicultural perspective in America’s public education and higher learning. The ultimate goal is to create a more inclusive human discourse and educational environment in which other people’s voices and histories will not be left out in the meganarratives of American and human history.

Age and Ethnic Diversity

The immigration and population shifts that have changed the faces of the United States have also shifted patterns of aging in ways that have profound implications for most of the country’s social institutions. Because increasingly diverse

populations have spread unevenly across the country, states and regions are facing the need to craft different approaches to these challenges. By 2030, it is expected that one in five Americans will be 65 or older, and by 2050, the United States will be a minority-majority country.

At every age and stage of life, the increase in racial and ethnic diversity will impact the country's cultural and social institutions, including education, politics, religion, housing, and employment. Understanding the demographic patterns is essential for preparing those institutions for the country's increasingly diverse future. While changes related to age and ethnic diversity may seem obvious, the implications of those changes are more subtle and important.

Demographics: Age and Ethnic Patterns

Projections for the racial and ethnic composition of the United States show somewhat dramatic changes through 2050. The total U.S. population is expected to grow from 312.8 million in 2012 to 458.1 million by 2050. Over the same period, the non-Hispanic population is expected to increase from 261.6 million to 314.6 million, and Hispanics from 51 million to 143.5 million.

The distribution and location of the population throughout the United States has significant implications. For example, 50 percent of the Asian population lives in the western part of the United States and comprises 11 percent of that region's population; 45 percent of the Asian population lives in the northeast states. The Hispanic population is concentrated in California, Texas, and Florida. The American Indian and Alaska Native population is concentrated in the south and west. The largest percentage of the black population are in the south (54.3 percent), followed by the northeast (17.8 percent), and midwest (17.7 percent).

Concentrations of racial and ethnic groups in urban areas have grown, according to the 2010 U.S. census. In 2010, approximately 12 percent of the population moved to another location, some within their own county but most to another county. The age group with the most mobility was 20 to 29, with 25 percent reporting a move; the next most mobile age group was 30 to 44, with 14 percent reporting a move.

Traditional locations for Asian and Hispanic immigrants have been gateway areas—California

and New York for Asians, with Florida, Texas, and New Mexico for Hispanics. However, an increasing number of immigrants and especially persons of Hispanic origin are settling in the south and midwest, in rural areas and small towns. They are attracted by a lower cost of living as well as jobs in agribusiness, meat-packing industries, roofing industries, and minimal skilled labor positions, such as in health care. The children of these minorities make an impact on the educational institutions, retail and grocery stores accommodate new tastes, and cultural institutions adapt to integrate them. Bilingual or multilingual education and culturally responsive ethnic social services are created to serve these populations. Shifts in the age distributions of various racial and ethnic groups by birth cohort or generation provide insight into the implications of ethnic diversity across the age span.

The fastest-growing population group is Hispanic. This demographic represents a younger population with higher fertility rates than the white, black, and Asian populations. The median age in 2010 for the total U.S. population was 36.9, projected to be 37.1 in 2015. The median age of individuals reporting Hispanic origin was 19.9, while that of blacks was 31.7; Asians, 36; and whites, 38.4. Burgeoning numbers of Hispanic children in communities will stress schools and health care facilities that support the very young.

Childbirth rates are one indicator of the changes in ethnic diversity. As census figures indicate, the Hispanic population is growing at a faster rate than other racial and ethnic groups. In 2010, average U.S. births per woman were 1.9 overall. By category, these rates were Hispanic, 2.4; black, 2; white, 1.8; Asian or Pacific Islander, 1.7; and American Indian/Alaska Native, 1.4. The replacement level for a country is 2.1.

While childbirth rates of the various racial and ethnic groups have implications for social institutions in the United States, so do the changing proportions of aging racial and ethnic groups. The 2010 census figures show that the white population is aging and not increasing. By 2050, ethnic Hispanics and Asians will constitute a significant proportion of older Americans. The elderly Hispanic population will account for 19.5 percent of all older Americans, while elderly Asian Americans will account for 11.8 percent. The white

population will account for 57 percent of older Americans by 2050.

The 2010 census figures also show that the number of people aged 65 and older is increasing at a higher rate in the Hispanic and Asian American populations and populations claiming two or more races than in the white and African American communities. These figures will influence how the elderly are cared for within the various communities as a matter of both cultural norms and public policy.

The medical model of providing care, drugs, surgery, and delaying death through treatment is costly. Currently, 35 percent of the 39.5 million persons over 65 live in nonfamily households or nursing homes. Of these, 14 million have at least one disability. When adult children live away from their elderly parents, often at great distances, caring for these elderly becomes a public policy problem.

Although the number of young Hispanics is growing rapidly, the number of Hispanic elderly is also increasing, as populations from earlier waves of U.S. immigration begin to age. For example, Cubans who came to the United States during the early Castro regime were often well educated and older; they are in a higher income bracket than those who came in the Mariel boatlift of the 1980s, who were not as educated and did not have the same economic success. Because their employment is often irregular, they are not covered by Social Security or pension benefits, and providing care at the end of life falls to the family, to public agencies, or through the cracks.

Asian elderly, including Chinese, Japanese, and Koreans, enjoy a degree of prosperity. The Confucian value on education translates into educational attainment levels, which lead to more economic prosperity. Older Asians have the lowest rate of poverty of the minority groups in the United States.

The minority elderly have been considered at risk of a form of double jeopardy with regard to their quality of life and health. For example, African American elderly today are affected by the previous years of segregation, access to education, and a history of manual jobs. The health care needs and chronic illnesses of African Americans, particularly related to diabetes, lung cancers, and heart disease, bears this out.

Implications of Age and Ethnic Diversity

Factors such as birthrates, aging, mobility, and family changes due to intermarriage have implications for intergenerational relationships, family relationships, and caregiving expectations for both young and old. Until the past century, populations have been characterized as a pyramid, with many children under 5 and fewer people living past 65. Now, with birthrates declining in various ethnic groups and life expectancies increasing among all ethnic groups, a Pandora's box of implications has been opened. The changes in the distribution of age and ethnic diversity in the United States will have a profound impact on the nature of the country in every facet of life, including such institutions as education, family relationships, religion, and social services.

Public education continues to integrate students with diverse language and cultural backgrounds in classrooms. This is an even bigger challenge when stressors on school systems related to federal and state accountability programs and development and adoption of common curricular standards are considered. High school graduation continues to be a challenge for much of the U.S. population. Hispanics have the lowest educational attainment level, with 61 percent completing a high school diploma and 13 percent achieving a bachelor's degree. Blacks report an 82 percent high school completion rate, and 18 percent attain a bachelor's degree or higher. Whites report a 90 percent high school completion rate and 39 percent bachelor's degree completion rate. Asians 25 years or older report that 85 percent have a high school diploma, 50 percent have at least a bachelor's degree, and 20 percent have a postgraduate degree.

The new diversity is reshaping families as well as regions. As the census shows, an increasing number of Americans identify themselves as mixed race, reflecting interracial and interethnic marriages. Almost one-third of Asians and 26 percent of Hispanics who married in 2008 married a spouse with a different race or ethnicity. By 2050, it is estimated that 25 percent of Asians and 50 percent of Hispanics will report mixed ancestry. The least common groups to intermarry are whites and blacks. The fabric of American culture will thus be considerably varied.

The intergenerational relationships among family members are affected by mobility as well

as interracial/interethnic marriage. Asians and Hispanics have traditionally valued community and collectivist values in family and childrearing. When family members move to another community, they may lose those ties. Child care and elder care are two areas directly affected by mobility and changing family relationships. If there is no grandparent to help raise a child or no adult child to care for an aging parent or grandparent, diverse approaches to child care and elder care emerge.

The numbers of older immigrants and refugees are increasing, particularly from India, China, and Mexico, in addition to other Asian and Latin American countries. Often they are the parents of children who are U.S. citizens but arrive with more socioeconomic deficits, limited or no knowledge of English, and difficulties in securing jobs or government benefits. This puts a variety of economic and psychosocial pressures on their children and extended family to support them.

The religious perspectives of a family are affected when individuals join the family from a differing religious perspective. Religions offer answers to questions such as the existence of God, the value and meaning of life, ways to approach life cycle events such as birth and death, and what happens at death. Community structures such as health care and religious institutions are challenged to accommodate the cultural and ethnic diversity of the population. The changing norms associated with various religious traditions can make a difference in areas such as retail and media.

The perception of the dominant U.S. culture as white, Anglo-Saxon, and Protestant no longer holds. While Christianity continues to be the most widely reported faith, families from Asian backgrounds may bring Confucian or Buddhist perspectives of authority, family, and death. Families from Hispanic backgrounds have generally reported a Roman Catholic perspective. The increasing number of Muslims in the United States also adds to the religious diversity. Increasingly, individuals report no affiliation with any religion.

The increasing number of ethnicities in the United States has led to more diversity in celebrating life events, moving beyond baptisms, confirmations, and bar mitzvahs to quinceañeras, first and 60th birthdays in Chinese communities, and recitations of the Qur'an.

Each cultural and religious tradition may lead to different goals and outcomes for having children and approaching death. Census figures related to the poverty of children and the elderly illustrate the country's challenge in allocating resources to vulnerable populations.

Conclusion

The 2010 census paints a picture of a country experiencing changes among all ethnic age groups. These changes will continue to mold and shape social institutions that serve the life span, such as education, employment, religion, and health care and will affect the intergenerational and social response to needs at each age and stage of life.

Agriculture and Ethnic Diversity

The United States as a whole is increasingly ethnically diverse. While this been a part of the American catechism for generations, the data continue to underscore just how true it is: White non-Hispanic Americans are on their way to

becoming a plurality rather than a majority, non-white babies born in 2012 outnumbered white babies, and the number of predominantly white communities is declining. The growth of diversity is happening essentially across the board. In 1980, two-thirds of communities were at least 90 percent white; in 2010, less than one-third of communities were.

The number of communities without an ethnic majority at all, once a rarity, is steadily rising. Such communities are not small statistical anomalies, either. Cities such as Oakland, California, and Jersey City, New Jersey, are roughly equally divided between whites, blacks, Hispanics, and Asians. What the 2010 U.S. census revealed about ethnic diversity is that it is not simply a national trend—which could happen as the result of a growth in ethnic-majority communities of non-whites—but one happening on the local, micro level. This is true in many work sectors as well. While many work sectors diversify slowly, especially (as in the case of medicine or law) because of the high cost of entry and resulting association between class and occupation, other sectors are becoming increasingly diverse.

An Ethnically Diverse Pursuit

But agriculture has always been an ethnically diverse pursuit in the United States. In the colonial and early national eras, when family-owned farms were the norm, distinct styles of farming were practiced by the various western European immigrant groups that constituted the population. Northern Irish families tended to grow corn, which they would use both to feed hogs and to feed the family; cornmeal and grits quickly became staple foods in the south, especially outside the rice country of the Carolinas. After butchering, hogs would be smoked or cured to preserve the meat through the winter. The practice of using small fish to fertilize corn was introduced to New Englanders by local Native Americans and sometimes employed farther south. German American families, on the other hand, often grew wheat, barley, or other grains, and traditionally relied on oxen as their work animals.

As the country expanded westward after independence, waves of immigration provided the manual labor and sheer numbers necessary to turn wilderness into settled lands. Some of those

hired to build the railroads, famously including numerous Chinese immigrants, who later settled down as farmers after the rails were complete. The Northern Irish tradition of raising corn and hogs together was transmitted through the midwest, in which southerners constituted a large part of the settlers, while the “wheat frontier” passed westward at the northern latitudes. The cattle capital of the country shifted from New England to Texas and Kansas as the country expanded, with those new territories building strong industries based on beef, usually by English, Irish, and German Americans (with numerous Hispanic American workers). However, dairy farming remained a prominent industry in New England until the federal farm buyouts of the 1980s.

African Americans were one of the most important players in American agriculture in the 19th century, with slaves providing the manual labor necessary for the south’s cotton empire, among other agricultural concerns. Free blacks during and after the Civil War included many skilled farmers who acquired farms of their own, which was often easier than finding whites willing to hire them at fair terms, although in the south and some frontier states, the practice of sharecropping continued to exploit black, white, and Hispanic labor. Black families on the coasts of Florida and South Carolina were deeded “forty acres and a mule” in 1865, although President Andrew Johnson reversed this, and most never received their land. The 1865 Freedman’s Bureau, though, provided education and relocation services to freed slaves and provided millions of acres of lands for settlement and homesteading. By 1910, there were nearly one million black farm owners possessing a total of 15 million acres, representing about an eighth of American farms. As large-scale commercial farming became the norm in the 20th century, this number dwindled.

After the end of slavery, immigrants were increasingly a source of labor for farms. While some homesteaded in the west and owned farms of their own, others found work as field hands or other agricultural workers on large farms that were usually white-owned. By the first decades of the 20th century, Mexican Americans and Mexican migrant workers comprised the largest portion of California’s agricultural labor force, for instance. In the same era, many Filipinos traveled

to the mainland following the 1898 annexation of the Philippines by the United States, finding work on farms and often housed in migrant camps. Migrant workers and recent immigrants were often forced to seek work through labor agents, especially if their English fluency was poor, and these agents often charged a fee for procuring work.

Agricultural workers were originally excluded from the right to organize labor unions and the benefits of unemployment and disability insurance until the United Farm Workers Union (UFW) was founded in 1962, after decades of failed attempts by Mexican, Japanese, and Filipino farm workers to unionize. The UFW was formed by the merger of the Agricultural Workers Organizing Committee, principally Filipinos, and the primarily Mexican National Farm Workers Association. The UFW's 1965 strike against the growers of table grapes led to a collective bargaining agreement in 1970, representing more than 10,000 farmworkers.

The 2002 Agricultural Census

The most recent Agricultural Census by the U.S. Department of Agriculture (USDA) is the 2012 census, the deadline for which was actually extended into mid-2013 in order to maximize the number of responses. The most recent completed Agricultural Census to be released by the USDA is the 2007 census.

The 2002 Agricultural Census was the first to collect information on multiple-operator farms, which accounted for half of all farms in six states, and about a third of all farms overall. Second and third operators tended to be much younger, and while women were only 11.2 percent of principal operators, they were 27.2 percent of all operators, because of the large number of farms run with female second operators. Interestingly, despite the increase in the average age of farmers, the average age of female operators is declining. The farms most likely to be operated by multiple generations, and by implication to stay in the family, were dairy, cotton, tobacco, and grain farms.

The 2002 Agricultural Census also collected ethnic data. Data on minority-owned farms have historically been more scant than data on white-owned farms, because the farms are usually smaller. Smaller farms are less likely to complete

their census forms, and small minority-owned farms in many cases may be disconnected from the larger farming community. The historical data on farms owned by American Indians and Alaska Natives are especially thought to be incomplete.

Beginning in 2002, the National Agricultural Statistics Service (NASS) made special efforts to collect information on minority farm operators, including pre-census promotional activity targeting specific ethnic minorities and female farmers, and obtaining mailing lists from public and private sectors likely to have information on minority farm operators. In order to improve coverage of agriculture on reservations, reservation-level census report forms were used, addressing agricultural activity on entire reservations, which were then checked against individual forms in order to prevent duplication of data. Reservation and Alaska Native village officials were also consulted in generating mailing lists of farmers to contact.

In the 2002 Agricultural Census, whites were found to be the majority of farm owners, at about 1.386 million. Of these, 19,194 blacks were full owners of farms, 10,443 American Indians or Alaska Natives, 639 Native Hawai'ian or Pacific Islanders, 5,935 Asians, and 5,419 operators of mixed race. Very few farms owned by nonwhites were corporations. Rhode Island, a small and largely white state, was the only state with no black farm operators; 72,349 farm owners were Hispanic.

The 2007 Agricultural Census

In the 2007 Agricultural Census, 2.2 million American farms were counted. Of those, 1.83 million had a white male principal operator. While the number of principal operators had increased 4 percent since 2002, the number of nonwhite operators had increased faster than that, and the number of Hispanic operators of any race had increased 10 percent. Female principal operators increased almost 30 percent, claiming a much larger share of principal operators than in the past. Despite this growth, no nonwhite non-Hispanic group could claim more than 3 percent of principal operators. The average age of farm operators increased from 55.3 in 2002 to 57.1 in 2007, while the number of operators over 75 grew by 20 percent and the number of operators under 25 decreased by 30 percent.

Sixty percent of all American farms report less than \$10,000 in annual sales, making them part-time operations for farmers who must rely on nonfarm work in order to earn a living. Nonfarm income covers a portion of farm expenses for 1.2 million American farms—more than half.

Diversity varies within the various subfields of the agricultural sector. Asians and Native Hawaiians have a higher percentage of fruit and tree nut farms than other races, most of which are located in Hawai'i and California. American Indian, black, and Hispanic farmers are most likely to own cattle ranches. Female farmers are equally divided among cattle ranches and feedlots, aquaculture, and other crops.

The 2007 Agricultural Census reported 79,703 American Indian or Alaska Native operators on 61,472 farms and ranches. More than a quarter of these operators reported a second or third race. The number of American Indian or Alaska Native operators grew 88 percent over 2002, and the number of single-race American Indian or Alaska Native principal operators grew 124 percent in that same period. American Indians were 1.6 percent of principal farm owners and 2.4 percent of farm operators in 2007. The average size of an Indian farm was 1,431 acres, considerably larger than the national average of 418 acres, though the average value of sales, \$40,331, was lower than the \$134,807 national average. Seventy-eight percent of American Indian farms earned less than \$10,000. Only 42 percent had Internet access, less than the national average of 57 percent. Only 71 percent of Indian operators were male, less than the national average of 86 percent, and 51 percent reported farming as their primary occupation, compared to 45 percent nationally. Arizona, New Mexico, Nevada, Oklahoma, and Montana had the highest percentage of American Indian farm owners.

Thirty-eight percent of Indian-owned farms were cattle ranches; 13 percent were sheep and goat farms. Only 3 percent were grain and oilseed farms, compared to 15 percent nationally.

The 2007 Agricultural Census counted 20,417 Asian operators at 15,360 farms, growing 40 percent over 2002, and 18,289 of them reported Asian as their only race. The average Asian-owned farm was 124 acres, considerably smaller than average, but average sales were \$327,621, more

than twice the average. Forty-eight percent had Internet access, and 42 percent had sales under \$10,000. Female Asian farm operators grew 45 percent from 2002. Asians were 0.6 percent of farm operators and 0.5 percent of principal operators in 2007.

Asian farm operators are more likely to own their farmland outright rather than renting or leasing it, and more likely—57 percent—to have farming as their primary occupation. Sixty-three percent of Asian-operated farms grow specialty crops, including fruit and nut trees, vegetables and melons, and greenhouse and nursery operations. Only 9 percent of farms nationwide fall into this classification. The largest category of Asian-operated farms is fruit and nut tree operations, accounting for 37 percent. Only 26 percent of Asian farms raise livestock. More than half of Asian principal farm operators live in Hawai'i or California.

The 2007 Agricultural Census counted 41,024 black operators on 32,938 farms, a 9 percent increase over 2002—more than the overall 7 percent increase, though small compared to the other minorities; 39,697 reported black as their only race. Blacks were 1.3 percent of farm operators and 1.4 percent of principal farm operators in 2007.

Black-operated farms were smaller than average, comprising an average of 104 acres earning \$21,340 a year. Seventy-nine percent earned less than \$10,000 a year, and only 34 percent had Internet access. Female black farm operators increased by 53 percent over 2002 and accounted for 14 percent of black principal farm operators. Black farmers were older than average, at 60.3 years, and a full 37 percent of black farmers were 65 or older. While 44 percent named farming as their primary occupation—about the same as average—93 percent derived less than half of their income from farming, higher than the 80 percent average. Mississippi, South Carolina, Louisiana, Alabama, and Georgia were home to the highest numbers of black farmers.

Forty-six percent of black-operated farms were cattle ranches, compared to 30 percent nationally. Grain and oilseed farms, fruit and nut farms, and dairy farms all accounted for much smaller percentages than nationally. Tobacco and cotton accounted for slightly higher percentages than the average, as did hog farms.

The 2007 Agricultural Census counted 82,462 Hispanic farm operators on 66,671 farms, an increase of 14 percent over 2002; 55,570 were principal operators. Hispanic operators accounted for 2.5 percent of operators and principal operators. The average Hispanic farm was slightly smaller than the national average—307 acres in size and \$119,634 in sales. About two-thirds, 67 percent, were under \$10,000 in sales, and 44 percent had Internet access. The number of female Hispanic operators grew 20 percent over 2002, accounting for 12 percent of Hispanic farm operators.

About a third of Hispanic-operated farms were cattle ranches. Sixteen percent were fruit and nut tree farms, compared to 4 percent nationally. Only 3 percent were grain and oilseed farms, compared to 15 percent nationally. Most Hispanic-operated farms were located in New Mexico, California, Texas, Florida, and Hawai'i, which also experienced the greatest growth in Hispanic operators over 2002.

In 2007, women comprised 14 percent of principal operators, a 24 percent increase over 2002; 1,008,943 farm operators were women, a number increasing considerably faster than the national growth average. The most female principal farm operators were found in Arizona, New Hampshire, Massachusetts, Maine, and Alaska. Female-operated farms were smaller on average, 210 acres in size and \$36,440 in sales. They were about as diverse as male-operated farms, producing considerably less grain and oilseed crops, tobacco, cotton, dairy, and cattle, but more sheep and goats, poultry and eggs, and other animals.

Alamo, Battle of the

The Battle of the Alamo in San Antonio, Texas (February 23 to March 6, 1836), was one of many in the Texas independence movement. An estimated 1,800 Mexican troops, during a 13-day siege under President General Antonio López de Santa Anna, launched an assault on the old Alamo mission. About 200 rebellious Texians defended the mission, led by Colonels William Travis and James Bowie. While the Mexican army was victorious at the Alamo, the battle inspired many Texians to join the Texian army, which ultimately prevailed at the Battle of San Jacinto (April 21, 1836) and ended the revolution.

Manifest Destiny

After Mexican independence from Spain in 1821, the government offered land grants to Anglo Americans in the area of Texas as part of a policy of settlement and pacification of its northern territories, what is now the southwestern part of the United States. It was a predecessor to the Homestead Act, but more generous in allocation. Unable to populate Texas with enough of its own citizens, Mexico encouraged those of another nation to immigrate in exchange for large grants of land, approximately 5,000 acres in size. Settlers were required to convert to Catholicism and loyally support the Mexican government. Anglo Americans coming westward under the worldview of Manifest Destiny had little desire to abide by these conditions and quickly tired of the Mexican government's attempts at enforcement.

Manifest Destiny was not only policy but also ideology. It embodied the notion that Christianity was superior to the polytheism of American Indians and multiple saint worship, or "idolatry" of Mexican Catholics. Anglo Americans also believed in the superiority of the political

The Alamo complex has gradually become known as a battle site rather than a former mission. Its defenders consisted of 13 native-born Texans, 41 Europeans, two Jews, and two blacks; the remainder were Americans from 23 other states.

and economic forms of democracy and capitalism, even though the Mexican Constitution had been modeled directly on that of the United States. Manifest Destiny expressed the belief that nonwhite peoples were incapable of self-government through democracy, a notion intertwined with that of slavery and free labor, implying that nonwhite peoples were incapable of success in a capitalist system driven by notions of private property and individualism. Additionally, Mexico outlawed the practice of slavery in 1829, which caused a financial loss to U.S. settlers, who once again saw a government in Mexico City as intrusive and foreign to their way of life in Texas.

Call to Arms

The U.S. government made several attempts to purchase the area of Texas, but Mexico refused,

given its centrality in the middle of the greater Mexican nation at the time. Finally, in 1835, Stephen Austin, son of Texas' first settler Moses Austin, gave a call to arms. Approximately 7,000 Mexican soldiers arrived at the Alamo mission in spring 1836, under the leadership of Santa Anna. Santa Anna offered the roughly 189 people holed up inside the Alamo the opportunity to surrender, which they refused, hoping to buy time until Sam Houston and other leaders received support from the U.S. government. Thus, Mexico predictably won the Battle of the Alamo, and the rallying cry, "Remember the Alamo," served as a reminder to Anglo settlers and the U.S. government of those who died there.

Texas did not achieve independence at the Alamo, and it was not until the Battle of San Jacinto in April 1836 that Anglo settlers defeated Santa Anna and exchanged the area of Texas for safe passage of him and his men back to Mexico. Sam Houston became the first president of the Republic of Texas in October 1836. Subsequent annexation of Texas by the United States in 1845 was one of the primary causes of the war between Mexico and the United States from 1846 to 1848, as Mexico believed this was the original design of Anglo American settlers who came in the 1820s.

Battle Retold

The Battle of the Alamo is one of the most written about, poorly remembered, and mythologized in U.S. history, with each generation ascribing its own meaning to the events that occurred at the small mission. Its significance was redefined in the 1950s and 1960s Cold War imagination as the epitome of frontier freedom and rugged individualism, in songs such as *The Ballad of Davy Crockett* and movies such as *The Alamo*, directed by John Wayne. The post-9/11 era reinvented it as a battle of American freedom fighters versus Mexican terrorists in the 2004 John Lee Hancock updated depiction of *The Alamo*.

Several important issues are lost in the subsequent retellings of the Battle of the Alamo. The first is the two conditions upon which Anglo Americans received land and were allowed to settle in Texas. Second is Americans' vigorous defense of slavery and the resistance to its abolition by the Mexican government. Third, no one had to die at

the Battle of the Alamo, but chose to do so, negating the notion of a savage Mexican government slaughtering innocent Americans defending their land and liberties. Fourth, inside the Alamo were women, blacks, and Tejano supporters who fancied their commercial and economic prospects in an independent Texas. Their presence and participation complicates a simplistic binary binational narrative of “good” Americans defeating “bad” Mexicans in a fight for freedom and liberty that shapes Mexican and Anglo American relations from that time to this.

Alaska Native Claims Settlement Act (1971)

The Alaska Native Claims Settlement Act, codified as 43 U.S.C. 1601 et seq., was signed into law by President Richard Nixon on December 18, 1971. The act, the largest land claims settlement in American history, was intended to resolve all the various issues surrounding Native land claims in Alaska and stimulate the economy of the state.

Details of the Act

Alaska Natives had often been treated as a distinct category of peoples from Native Americans, but their treatment from the territorial period (1912–37) was inconsistent. Alaska Native peoples’ claims to various Alaskan lands had been handled equally inconsistently, and across the century, federal government actions were based on a number of conflicting premises at various times. There had long been a push, accelerated once Alaska became a state, for some kind of federal act to clarify policy once and for all. The need for this resolution was strengthened when the Atlantic-Richfield Company discovered oil on the Arctic coast of Alaska at Prudhoe Bay. Transporting oil from a remote, harsh location to the lower 48 states would most efficiently be accomplished by constructing a pipeline to the port of Valdez, where it could be loaded onto tanker ships. Pipeline construction could not begin as long as the lands through which it would pass remained in dispute.

The solution was to distribute nearly \$1 billion (\$963 million) to Alaska Natives in return for the permanent abandonment of their claims to aboriginal lands. The U.S. Treasury supplied \$462.5 million of the settlement, while the rest came from revenue sharing in the oil industry. About one-ninth of the state (44 million acres of land) was distributed along with the money. Anyone with at least one-fourth Native ancestry was eligible for settlement benefits.

Village and Regional Corporations

The distribution of the settlement was accomplished by creating 200 local village corporations and 12 Native-owned regional corporations (and later, a 13th Native-owned regional corporation) representing Alaska Natives who no longer lived in Alaska. The regional corporations represented the Alaska Native population of 12 geographic regions of the state, and individual Alaska Natives enrolled in their local corporation and became shareholders. Alaska Natives alive at the time of the settlement received 100 shares of stock in their local corporation; a 2006 amendment made it easier for corporations to also issue stock to those born later.

Corporations were given land in proportion to the population of their enrollment. Village

corporations own the surface rights to their lands, while regional corporations own subsurface rights to all Native lands in their region.

The 13 regional corporations formed to distribute the settlement include the following:

- The Arctic Slope Regional Corporation, which includes Barrow and Point Hope
- The Bering Straits Native Corporation, including Seward Peninsula and Unalakleet
- The Northwest Alaska Native Association Regional Corporation, including Kotzebue
- The Calista Corporation, including the southwest coast, the villages in the Bethel area, the villages on the Lower Yukon River, and the Lower Kuskokwim River
- Doyon, Limited, including the Koyukuk, Middle, and Upper Yukon Rivers; the Upper Kuskokwim River; and Tanana River
- Cook Inlet Region, Inc., including Kenai, Tyonek, Ekulutna, and Iliamna
- The Bristol Bay Native Corporation, including the Upper Alaska Peninsula and Dillingham
- The Aleut Corporation, including the Aleutian Islands, the portions of the Alaska Peninsula in the Aleut League, and the Pribilof Islands
- The Chugach Alaska Corporation, including Cordova, Tatitlek, Port Graham, English Bay, Valdez, and Seward
- The Sealaska Corporation, including southeastern Alaska and Metlakatla
- Koniag, Incorporated, consisting of the islands on and around Kodiak Island
- Ahtna, Incorporated, consisting of Copper Center, Glennallen, Chitina, and Mentasta
- A corporation for nonresident Alaska Natives

Alaska Purchase

The westward movement was a prominent feature of American history from earliest colonial times. The Louisiana Purchase stimulated the trans-Appalachian movement, which gained impetus with the popular belief in Manifest Destiny in the two decades leading to the Civil War. The election of 1844, in particular, revolved around the issue of U.S. expansion into the Oregon Territory and Texas. Yet, few thought of Alaska as part of this westward destiny; thus it came as a surprise to the general public when the United States purchased this vast, seemingly empty, and inhospitable wilderness area in 1867.

First explored by Russia, which established small fur trading posts as early as the late 1740s, the area had several permanent colonies sprinkled about by the 1790s in what is today Alaska. In 1799, Tsar Paul I bestowed upon the Russian-American Company a monopoly on the increasingly lucrative fur trade. Under this arrangement, Russian traders often forced the native peoples to do the hunting for them through various forms of coercion, including holding family members hostage and in some cases in virtual slavery. It has been estimated that some 80 percent of the indigenous population died during the first half-century of Russian occupation from abuse or the introduction of new diseases.

During the first half of the 19th century, British traders began arriving in the areas along the

eastern borders of Russian Alaska. Americans also began to arrive, both as traders and as hunters and trappers, often in regions the Russians considered to be theirs. By midcentury, competition from these two nations, coupled with a diminishing supply of furs due to overhunting and the increasing difficulty of supplying, much less defending, their distant possessions caused the Russians to be apprehensive about retaining their territory. Following the Crimean War (1853–56), Russia became increasingly fearful of losing Alaska to the British. As a result, the tsar began to consider selling the region before it was lost with no compensation.

Initial overtures to the United States met with little success because the outbreak of the Civil War monopolized American attention. Eduard Stoeckl, the Russian *chargé d'affaires* in Washington, had arrived in 1850 and used the intervening time well to make the acquaintance of a number of prominent American politicians, including William H. Seward, who later became secretary of state. Stoeckl was a strong proponent of selling Alaska. His previous relationship with Seward served both nations well once the war was over and serious negotiations began.

The final treaty signed on March 30, 1867, ceded Alaska to the United States in return for \$7.2 million, about two cents per acre for the 586,412 square miles. In the United States, most reaction to the purchase was positive, although critics of the administration labeled it “Seward’s Folly.” The 1896 discovery of gold in the region, together with the later unearthing of rich deposits of copper and oil, have since made the purchase of Alaska one of the most lucrative acquisitions in world history.

Russian Control

At the time of the purchase, the areas controlled by the Russian government contained some 700 Russians, about 1,800 people of mixed Russian and indigenous background, and an estimated 8,000 indigenous people in areas under Russian control. The two largest Russian settlements were at Sitka (then called New Archangel) and St. Paul. The former contained 116 cabins with 968 people, while the latter had 100 cabins with a population of 283.

Aside from these, the Russians estimated there were an additional 50,000 Aleuts, Inuits, and

The Alaska Pipeline enters the ground near the town of Coldfoot above the Arctic Circle. The project prompted the settlement of long-standing Alaska Native land claims through the Alaska Native Claims Settlement Act of 1971.

other indigenous peoples in Alaskan areas outside direct Russian control. Under the treaty, the Russians and people of mixed races were accorded the option of becoming U.S. citizens, but few did. The purchase brought under U.S. control a diverse population speaking Aleut, Yupik, Inuit, and other related dialects.

Indigenous Population and Preservation

In 2012, Alaska contained some 90 Russian Orthodox parishes with more than 20,000 members, most of whom were of indigenous background. The indigenous residents comprised about 15.6 percent of the state population, Asians 4 percent, people of mixed race 5.5 percent, and so-called whites 69 percent.

Generally referred to as Eskimos, a name given to them by the Algonquins to the east, Alaska's indigenous population contains 11 discrete cultures, each with its own language, as well as 22 separate dialects. The Alaska Native Heritage Center has classified these into five major groups, including the Athabascan in central eastern Alaska from the Brooks Mountain Range to the Kenai Peninsula; the Unangax and Alutiiq (Sugpiaq) peoples of the coastal south and southwest; the Yup'ik and Cup'ik to the southwest; the Inupiaq and St. Lawrence Island Yupik People to the north and northwest; and the Eyak, Tlingit, Haida, and Tsimshian on the coastal areas of the northwest.

Indigenous customs, crafts, and traditions are preserved among many communities, as well as in museums and other public repositories. These include traditional forms of weaving, wood carving, music, the crafting of clothing from skins, and the igloo (a house made from ice). Among the most popular and well-known native traditions is dogsledding (or "mushing"), which is still used for transportation in some places and has also moved into the mainstream as recreational and sporting events, including the famous Iditarod race from Anchorage to Nome each March.

In 1971, Congress enacted the Alaska Native Claims Settlement Act, which addressed indigenous financial and property claims and established 13 Alaska Native Regional Corporations to administer the resulting settlement. Under the terms of the legislation, 148.5 million acres of land, approximately one-ninth of Alaska's area, was transferred to the corporations, along with some 200 native villages and \$962.5 million. Eligibility to participate was limited to those who could prove at least 25 percent Native ancestry, which eventually numbered about 80,000 people.

Albanian Americans

Officially, the first Albanian to come to the United States was Kolë Kristofori from the southern region of Albania in the 1880s. Since his arrival thousands of his fellow Albanians have followed from the Balkans, Arbreshë of Italy, and elsewhere. According to the 2010 U.S. census, the total population of Albanians in the United States is 193,813. The largest population of Albanian Americans live in New York, New Jersey, Massachusetts, Michigan, Illinois, California, Arizona, and Texas. They are found in every area of professional life. For example: Regis Philbin (entertainer), William G. Gregory (astronaut), Eliza Dushku (actress), John and Jim Belushi (comedians), Bleona Qereti (singer and actress), Joseph DioGuardi (politician); Ferid Murad (physician/pharmacologist/Nobel laureate), Fan S. Noli (scholar and diplomat), and Faik Konica (statesman and author).

Albanians are descendants of the ancient Illyrians, an original Indo-European language group inhabiting the Balkan Peninsula between the Bronze and Iron Ages in mid-2nd century B.C.E. And, later description of the Illyrians is documented in the mid-4th century B.C.E. Greek text, *Persiplus* (also known as *the Costal Passage*). From this period to the 20th century C.E., the Illyrians and their descendants were dominated by various empires (e.g., Romans, Slavic Serbs, the Ottoman Turks). Albania's name is linked to an Illyrian tribe variously known as Arber, or Arbreshë, and later, Albanoi.

Emergence of a Modern Nation

Although Albania became an independent country in 1912, and was recognized by Europe's leading nations at the 1913 Conference of London, those ethnic Albanians living in what is modern-day

Kosovo, Macedonia, Montenegro, Greece, Serbia, and Italy have remained outside the Albania's reconfigured borders. Further, at the Paris Peace Conference of 1920, France, Britain, and Greece agreed to divide and parcel Albania among Italy, Greece, and Yugoslavia but did so without input from the Albanians and the Americans in those negotiations.

This oversight led U.S. President Woodrow Wilson, in March 1920, to block the Paris Agreement and support Albania's independence by his recognition of an official Albanian representative to Washington, D.C.

The Albanian Diaspora in the United States

The Albanian diaspora is comprised of (1) Albanian immigrants who become citizens (such as performer Bleona Qereti), (2) U.S.-born children of Albanian immigrant parents (e.g., comedians Jim and John Belushi), and (3) U.S.-born children of one Albanian immigrant parent married to a U.S. citizen (such as Nobel laureate Ferid Murad). Most arrived in waves.

The first wave of Albanians who migrated to the United States was small compared with other European ethnic groups, for example, the Irish or Italians. The second wave arrived in the aftermath of World War II, and continued through the 1980s. At the end of World War II, Albania fell to Enver Hoxha, a communist dictator who denied Albanians the most basic of human rights. Also, many migrated from the former Yugoslavia to the United States because of the repressive regime. Furthermore, during this second wave, ethnic Albanians (also identified as Chams) were removed by force from their homes in Greece during World War II. They were stripped of their citizenship and their properties, leading some to immigrate to the United States. The third and final wave of Albanians resulted from the loss of political freedom in Kosovo and elsewhere during the late 1980s and early 1990s, and during Serbia's War on Kosovo between 1998 and 1999.

Contemporary Scene

Albanian Americans, like other immigrant groups, hold closely to their cultural and family traditions and their language, and value hospitality as they acculturate to their new national home. Most are bilingual: Parents encourage

their children to learn and speak both Albanian and English. Because families speak Albanian at home, their children maintain their cultural heritage while embracing the worldview, beliefs, and practices of their new country.

"Besa," a promise rooted in Albanian history and culture, is a unique code of honor that extends beyond hospitality. Simply, "Besa" is a protection or responsibility for others (e.g., guests or strangers). It is believed to have played a critical role in Albanians' providing refuge for Nazi-fleeing Jews in Albania during the European Holocaust. In the United States today, Albanian Americans continue to value, demonstrate, and live by this code.

Ferid Murad

Ferid Murad, the son of an Albanian immigrant father and an American mother, was born in Whiting, Indiana, in 1936. A world renowned pioneer in biochemistry, he was a 1998 co-winner of the Nobel Prize for his work in medicine. Specifically, he and his colleagues were recognized for demonstrating how nitroglycerin and related drugs impact the cardiovascular system and blood vessel dilation. Professor Murad, currently on the faculty of George Washington University, has taught and researched at Northwestern University, the University of Virginia, Stanford University, and Abbott Laboratories. He is a member of the National Academy of Sciences and the Institute of Medicine of the National Academy of Sciences; a fellow of the American Academy of Arts and Sciences, a member of the Texas Academy of Medicine, Engineering and Science Technology, and an honorary member of the Academy of Sciences and Arts of Kosovo.

Alcatraz Island, Occupation of

The occupation of Alcatraz Island occurred in 1969 when a handful of Native American protesters, mostly students, claimed the island by "right of discovery" as a means of drawing attention to the federal government's treatment of Indian rights. The occupation had a tremendous impact not only on the fight for Native American rights, but also on federal Indian policy. The 1969 occupation drew its inspiration from an occupation attempt five years earlier. According to the Treaty of Ft. Laramie (1868) between the United States and the Sioux, any federal land declared to be surplus or no longer in use would be returned to the Native American population. Alcatraz had gained notoriety as a maximum-security federal prison, but by 1963 the federal government had closed the prison and vacated the island. In 1964, it was officially declared to be surplus property.

Seeing an opportunity to draw attention to Indian treaty rights, a small group of Sioux protesters occupied the island for four hours on March 8, 1964, citing the provision of the Treaty of Ft. Laramie. To further draw attention to the historical treatment of Native Americans in the United States, the protesters even publicly offered to pay the federal government the same minimal purchase price that the government had originally paid to the nearby Indian population. The 1964 protest was never meant to be a long-term occupation, but it would inspire just that five years later.

The Occupation

On November 20, 1969, 79 individuals, mostly students but also including families and children,

set out from San Francisco to occupy Alcatraz Island on a long-term basis. They included fourteen students who had already stayed overnight on the island earlier in the month. The protesters, and others who would later join them, did their best to set up a functioning community on the island. Eventually, the community began publishing a newsletter; one member, John Trudell, even began making daily radio broadcasts to the outside world.

The occupiers made long-term plans to redevelop the island for Indian needs, including plans at one point to establish a center for Native American studies, a Native American spiritual center, and even a Native American museum. The number of occupiers grew over time, and some celebrities traveled to the island to make an appearance in support of the occupiers or donated funds and other resources.

However, the community of occupiers was not immune to conflict. There were power struggles within the leadership group of original protesters. Eventually, the occupiers had to deal with new occupiers who had brought drugs with them, or who had come for less than noble purposes. Things came to a head on January 3, 1970, when 13-year old Yvonne Oakes, stepdaughter of Richard Oakes, one of the original student leaders, fell to her death. Though a federal inquiry would later rule it an accident, circumstances surrounding the girl's death remain mysterious. Broken-hearted by the loss, Richard Oakes and his wife, Annie, left the island. By the end of May, the government had cut off electrical power and all telephone services to the island. The next month a mysterious fire destroyed much of the island's infrastructure. Those circumstances, combined with the fact that many of the original protesters had left to return to school or for other reasons, showed that the occupation was losing both momentum and focus. In addition, the occupation was starting to lose its cause célèbre status and was fading from the public eye. Finally, on June 11, 1971, federal forces removed the remaining 15 occupiers.

Legacy

It would be hard to overestimate the historical significance of the Alcatraz occupation. In one sense, it ended in defeat, as the last remaining occupiers were forcibly removed from the island. But

in a much larger sense, it was a resounding success. The occupation was an important catalyst for other significant protests and demonstrations, especially because the Alcatraz occupiers were so successful in garnering national attention through their actions. Other important demonstrations, such as the trail of broken treaties, the occupation of the Bureau of Indian Affairs building, the American Indian Movement (AIM) seizure of the *Mayflower II*, and the longest walk found inspiration in the occupation of Alcatraz Island.

Just as importantly, the occupation influenced a significant change in federal policy toward the Native American population. Following World War II, the federal government began a major shift in its relations with Native Americans—the so-called termination policy. Believing that Native Americans needed to be fully assimilated into American society as individual citizens, as opposed to members of tribal communities, the federal government began trying to end its special relationship with Indian nations, as established by the many treaties into which the country had entered over the course of its existence.

Lawmakers also hoped to terminate the significant financial obligations incurred by the government in honoring the provisions of these treaties. The national attention drawn to treaty rights by the occupation of Alcatraz Island, as well as the criticism of federal policy it inspired, helped change federal policy away from termination and toward recognition of existing treaty rights, as well as the rights of Indian nations regarding self-determination.

Aleuts

The Aleuts are an Alaska Native people indigenous to the Aleutian Islands, most of which are part of Alaska except for the extreme western islands, which remain part of Russia. The Aleutian Islands consist of 14 large volcanic islands and 55 small islands that form the majority of the Aleutian Arc in the northern Pacific Ocean toward the Bering Sea. They are located in the westernmost part of the United States. The Aleutians became American territory with the rest of Alaska in 1867, and the Aleut residents in the United States were granted citizenship in 1924.

Some of the Aleutian Islands were captured by Japanese forces in 1942, and islanders were transported to Hokkaido as prisoners of war. The campaign to retake the Aleutian Islands of Attu and Kiska was a prominent part of the Pacific theater in World War II. Before that attack, nearly 1,000 Aleuts had been forcibly evacuated and rounded up into camps by the United States; in 1988, reparations were offered in the amount of \$12,000 for each eligible Aleut.

The name *Aleut* means “community” in the Aleut language; Aleuts self-identify either as Aleut or as Unanga, which means “original people.” Aleuts living in majority-Aleut communities number only about 2,000, although another 15,000 people, mainly living in Alaska, have partial Aleut heritage.

Demographics and Culture

There were an estimated 25,000 Aleuts on the islands before Russian settlement. Aleuts encountered Russians in the 1700s, and many were converted by missionaries to the Russian Orthodox Church. Russian fur traders were the first to use the word *Aleut* as a demonym in reference to the people of the Aleutians. There are considered to be few to no full-blooded Aleuts left in the wake of the Russian period. Only 2,000 of those who enrolled in the Aleut Corporation, the Alaska

Native regional corporation established in 1971 to distribute the settlement from the federal government for Alaskan lands, could establish even one-fourth Aleut ancestry.

Before Russian settlement, Aleuts lived in partially underground houses called *barabaras* or *ulaxes*, which were dug into the ground to offer protection from the high winds of the island chain. The roof was made from layers of sod on top of wooden or bone frames, with a doorway in the roof. A hole in the ceiling was used to let smoke escape, and the entranceway used an “Arctic entry” to prevent the cold wind from filling the rest of the house. Today, no *barabaras* are in use. Traditional Aleuts used tools and weapons made of chopped stone, in the core and flake tradition, and stored their food in special chambers in their *barabaras*. The Aleutian Islands provide

An Aleut boy wearing overalls and fur boots in August 1938 in the Aleutian Islands, Alaska. The Unangan and Unangas are seafaring peoples who have lived in the Aleutian Islands for at least 9,000 years and are known for their fur and animal skin crafts.

few natural resources, and grass was used as a burning fuel and for weaving baskets. Stone and bone were used for almost everything else. *Baidaras*, large boats used for transporting people and goods, were made of bone and walrus skins, while the smaller *baidarka* was covered in seal skins and used for the fast maneuvers required during hunting.

The Aleuts subsisted on hunting, gathering, and fishing, relying on salmon, cod, and other fish, as well as seals, walrus, deer, moose, caribou, and sometimes whale. Like many Alaska Natives, Aleuts collected berries, mixing them with fat and fish to make *alutiqqutigaq*. Hunting was accomplished with barbed darts and several types of harpoons, usually slung from throwing boards to improve the aim. The Aleuts were known for their use of the compound harpoon, which separated into four parts: a long shaft that fit into a foreshaft joined with a ring of bone, fixed with a toggle-head spear tip consisting of a razor-stone head attached with twine to a lower subshaft. The tip would break off once it penetrated an animal but remain connected to the harpoon shaft via the twine, making it harder for a wounded animal to escape. Over time, a diet relying mainly on sea mammals such as seal and walrus shifted to a reliance on salmon.

Most Aleuts today speak English or Russian. The Aleut language is a dying language, spoken by probably less than 200 people. A member of the Eskimo-Aleut language family, it includes the Attuan dialect, now extinct; the Atkan language, spoken on Atka and the Bering Islands; and Eastern Aleut, the dominant dialect. Few Aleuts who are not Native elders speak the language with fluency, and they are more likely to know only a few words or phrases.

Algonquian Languages

North American indigenous languages are known for their large range of diversity, especially when compared to languages from other regions of the world. In Europe, for example, there are only four major language families (Indo-European, Basque, Afroasiatic, and Uralic), whereas North America boasts nearly 60 major linguistic families and isolates. The Algic language family is only one of these major families, and within its remit are another three separate subgroups, to which the Algonquian language group belongs. The other two subgroups of the Algic family consist of two languages in California that are distant relatives to the Algonquian languages; these are known as Wiyot and Yurok. However, despite being a part of such a linguistically diverse continent, the Algonquian language group is one of the most widespread and populous indigenous language bands in North America. Despite this fact, many Algonquian languages, like many other indigenous languages, are extremely endangered today.

Background and Geography

Algonquian languages (not to be confused with the Algonquin language itself) have historically been spoken primarily in the Great Lakes region (extending to some parts of the Rocky Mountains), along the coast of the northern Atlantic down to the modern-day Carolinas. They are also spoken in New England and in parts of Canada. Each language within the Algonquian language subgroup has many of its own dialects, and therefore it is difficult to state precisely how many languages make up the Algonquian subgroup; general estimates approximate, however, that there are around 40 languages in total with a small handful under dispute. Some of the most popularly spoken languages within the Algonquian family

include Cree, Ojibwe (or Anishinaabemowin), Fox-Sauk-Kickapoo, and Blackfoot (Siksika).

One clue to the language subfamily's widespread reach is found in tribal histories, many of which have been corroborated by anthropological and linguistic evidence. The Blackfoot tribe, the most westward tribe of those that comprise the Algonquian language group, is said to have migrated from the Northeastern Woodlands around 1200. Such a migration makes sense linguistically and culturally, as the Blackfeet have adapted to Plains/Athabaskan traditions and Blackfoot is the most divergent of the Algonquian languages. According to Ojibwe oral tradition, the tribe originated from the Lenni Lenape (also known as the Delaware) and migrated around 1660 from the mouth of the St. Lawrence River near New Brunswick across the Great Lakes, following the sacred *mii-gis*—a floating seashell—until they reached the divide between Lake Huron and Lake Michigan, at which point the group split into three divisions, which became the Potawatomi, the Ottawa, and the Ojibwe.

These histories of migration are also reflected in contemporary cultural divisions. Officially, the Algonquian language subfamily is its own genetic subgroup, though some scholars have further divided the group into three geographic sections: Plains Algonquian, Central Algonquian, and Eastern Algonquian. These divisions are largely based on geography rather than language. Within such a real categorization, Plains Algonquian is comprised of Blackfoot, Cheyenne, and Arapahoan, whereas Central Algonquian contains a number of derivations of Ojibwe, Cree, Fox-Sauk-Kickapoo, Menominee, Miami-Illinois, Potawatomi, and Shawnee. The final division, Eastern Algonquian, is arguably more linguistically accurate as a genetic subgroup of the Algonquian language subfamily. Eastern Algonquian languages have all but disappeared; of the listed 16 subdivisions, only five still have living speakers.

Linguistics

In a similar vein to many North American indigenous tongues, Algonquian languages have complex polysynthetic morphologies, meaning that one word can encapsulate what it would take another language many words to explain. For example, in Ojibwe the word *asiniikaa* means

Table 1 Statistics for the Algonquian languages

Language	ACS 2010	MLA 2000	Census 2000	UNESCO	Ethnologue
Eastern

Cheyenne	2,156	2,089	2,320	Definite to Severe ⁶	Living
Arapahoan	1,226	1,052	1,215	Severe to Extinct ⁷	Living
Atsina	57	55	80	Critically Endangered	N/A

¹ This status is a little better in Canada, where the language is merely Vulnerable.

² UNESCO divided these into Central Ojibwe (located in Canada—Definitely Endangered), Eastern Ojibwe (located in Canada—Severely Endangered), Northwestern Ojibwe (located in Canada—Vulnerable), and Ojibwe (located in Minnesota, Wisconsin, and Michigan—Severely Endangered).

³ In Canada, the language is Severely Endangered, whereas in Michigan it is Critically Endangered.

⁴ Both communities noted by UNESCO were located in Canada.

⁵ Sauk-Fox is evaluated together by UNESCO as Critically Endangered, whereas Kickapoo is critical in Mexico but Severely Endangered in Oklahoma, Texas, and Kansas.

⁶ Definitely Endangered in Montana and Severely Endangered in Oklahoma.

⁷ Severely Endangered in Wyoming and Extinct in Oklahoma.

“there are many rocks/stones” (or “there is a lot of rock/stone”). Additionally, the languages in the Algonquian group also have animate and inanimate nouns; objects are viewed as living or nonliving based on the word itself. This linguistic gendering is sometimes compared to Romance languages such as Spanish or French, in which

words are given sexual gender. However, as with French and Spanish, distinctions between genders are not always obvious. For example, in Ojibwe the words for cloud (*aanakwad*) and grape (*zboomín*) are inanimate, whereas the words for kettle (*akik*) and potato (*opin*) are animate. Additionally, not all dialects view nouns in

the same way. For instance, in Ojibwe the word for bread is *bakwezhigan*, which is considered animate in Minnesota and inanimate in southern Ontario.

There has been much discussion surrounding the grammatical categories of animate and inanimate nouns; some linguists claim that these distinctions are anthropologically important, while others believe them to be merely syntactic. One argument against this anthropological approach is the fact that, at times, inanimate nouns can be treated as animate beings through the use of transitive and intransitive interaction within a sentence. This is commonly done in folklore, for instance, where inanimate things like stones can speak and act in an animated manner.

Language Statistics

Although official 2010 census numbers have not yet been released, a report issued by the U.S. census and the American Community Survey (ACS) in 2010 provides statistics for indigenous-language speakers. According to the ACS, there are an estimated 21,299 Algonquian-language speakers as of 2010. These figures, however, are not necessarily entirely accurate. In addition to the fact that the numbers are estimates, statistics regarding the number of speakers as of the 2000 census are also somewhat contradictory. According to the Modern Language Association (whose reports are based on the U.S. 2000 Census Summary File 3), there were an estimated 19,390 speakers of Algonquian languages in the year 2000; following this, the estimates therefore project an increase in the number of speakers. However, according to the 2000 census special tabulation 224, there were 22,195 speakers in 2000, leading to a decrease in the number of speakers, according to the estimates.

Because of these discrepancies, all three statistics, denoted as ACS 2010, MLA 2000, and Census 2000, respectively, are included in the table. Despite these numbers, a variety of revitalization programs are in effect that aim to combat the decline of indigenous languages. These programs include a number of Algonquian languages, especially Ojibwe, which is the focus of a number of groundbreaking educational initiatives including immersion schools, online dictionaries, and community collaborations.

In addition to statistical numbers, it is also important to recognize the age and fluency of the speakers. Because of this, many languages have been given distinctions of endangerment to better qualify their status. The United Nations Educational, Scientific and Cultural Organization (UNESCO), for example, has an interactive *Atlas of World Languages in Danger* in which languages are given a status of vitality from the following: vulnerable (most children speak the language but it can be restricted at school or at home); definitely endangered (in which children no longer learn the language as a mother tongue in the home); severely endangered (in which grandparents speak the language, parents understand it but do not speak it among themselves or teach it to their children); critically endangered (in which the youngest speakers are grandparents or older—and this is partial and infrequent); and extinct (no speakers left).

In addition to UNESCO's categorizations, the Ethnologue organization (part of SIL International) has its own database in which languages are designated as living or extinct—"extinct" being defined as the state in which there are no longer people still living that learned the tongue as a first language.

Algonquian-Speaking Tribes

The Algonquian language tribes have commonly been divided into three separate categories: Eastern, Central, and Plains. There are several reasons for this distinction. Initially, it is believed that all Algonquian-speaking people resided in the Northeastern Woodlands areas of the United States and the Southeastern Woodlands of Canada. However, different groups migrated westward along the Great Lakes in separate waves, with the farthest groups settling in the plains of Montana.

The first group to leave the original Algonquian region was the Blackfoot tribal group, which was presumed to have left the region around 1200 C.E. Following the Blackfoot were most likely the Atsina and Arapaho tribes, the former having broken away from the Arapaho in the 1700s when both tribes were still residing in the easternmost Plains regions of the Dakotas and Minnesota. They were followed by the Cheyenne, who were presumed to have separated from their Great Lakes Algonquian brethren around 1500 and moved westward until the early 19th century, when they settled in a region straddling the Black Hills of South Dakota and the Powder River country of Montana. The last group to migrate westward began their exodus around 1660, traveling from the mouth of the St. Lawrence River near New Brunswick across the Great Lakes until reaching the divide between Lake Huron and Lake Michigan.

It was at this junction that the group is said to have split into three divisions that became the

Potawatomi, the Ottawa, and the Ojibwe; these three tribal groups ultimately formed an alliance known as the Council of Three Fires. The Cree were largely nomadic, with various bands occupying territory in northern Canada that spanned the entire breadth of the combined distribution of the other Algonquian tribes. Modern-day Cree territories essentially mirror the migrations of their southern Algonquian associates.

The migration patterns of the Kickapoo and the Miami are less clear, although in the 17th century they were known to occupy land in Illinois and Wisconsin. Similarly, the Fox and Sauk people are presumed to have continued to live along the St. Lawrence River until the colonial period, during which they were pushed farther west as a result of various conflicts. Interestingly, two cultural groups, the Shawnee and the Menominee, are presumed to have already been present in the Central Algonquian region and were not party to any migrations from the Northeastern Woodlands.

It has been argued that the Shawnee, residing primarily in Ohio, are descendants of the mound-builder culture (also known as Fort Ancient culture) that evolved from the Hopewell culture dating to 100 B.C.E. This link is considered tenuous by some scholars, however, and remains under debate. Regardless of any additional evidence, the Shawnee consider the Lenni Lenape people (or the Delaware) to be their origin tribe, a trait shared with the 1660 migration group consisting of the Ojibwe and other tribes; this is just one piece of evidence suggesting that the Shawnee migrated with this larger group. Additionally, an archaeological gap in the Ohio region between the 1500s and before the first evidence of Shawnee occupation suggests that the Shawnee residence at the site was discontinuous and perhaps entirely separate from that of the descendants of the Fort Ancient culture.

Under no doubt, however, is the historical presence of the Menominee in upper Michigan and Wisconsin. The tribe is believed to have resided in that area for over 1,000 years, descended from the Old Copper Culture, which inhabited that region for the previous 10,000 years.

These historic migrations have separated the Algonquian-speaking peoples into essentially geographic regions, with the most distant cultural and linguistic tribes occupying the westernmost reaches of the group. Because of this, the cultural

development of each region is markedly different from the rest, and therefore it is appropriate to discuss them separately. It must be noted, however, that individual tribes—even those within the same region—are very different from one another, and as such it is difficult to put forward an overview of a general Algonquian culture. There are certainly more differences than there are similarities when it comes to important discussions such as politics, clans, religion, and individual histories.

Plains

Because the Plains tribes of the Blackfoot, Arapaho (Atsina), and Cheyenne were the first to migrate away from their northeastern origins, it is fitting that the cultural developments of the tribes would be markedly different from other Algonquian-speaking tribes. As a result, the Plains Algonquian have far more in common culturally with Athabaskan tribes than they do with their linguistic brethren. This is primarily because the region they inhabit is very different from that of the Central and Eastern Algonquians. The Plains are very flat lands, covered in prairie and grassland—a very dissimilar topography to the trees, rivers, and lakes of the Central and Eastern Woodlands. The lifestyle historically associated with the Plains is nomadic in nature, with tribes hunting buffalo and following the herds in tepees. This was a hunter-gatherer lifestyle, with little evidence to suggest an agricultural component (although the Cheyenne and Arapaho did partake in agricultural traditions when they still resided in Minnesota).

When horses were introduced into the Americas, these tribes were one of the first groups to adopt the animals, having previously used dog travois; eventually, they became well known for their large herds of horses. The arts and crafts of these tribes were not based in pottery or basket weaving, but rather on animal-skin paintings and carving stone and bone. The Arapaho, because of their residence on the eastern Plains, had a more mixed regional culture, participating in the fur trade and fishing. One particularly famous cultural tradition among the Plains tribes was, and continues to be, the Sun Dance ceremony, in which participants dance while staring into the sun and are impaled with small stakes connected to the Sun Dance pole in the quest of a vision from the

Great Spirit. These tribes have been consistently pushed into reservation lands and now reside in Montana, Wyoming, and Oklahoma.

Woodlands

The Central Algonquian tribes are very culturally similar to their eastern counterparts, due to their later date of migration and also the similarity between the topography of the Eastern and Central regions. Both regions are comprised of forestlands that border the Great Lakes, along with many smaller bodies of water and rivers. Because of this environment, the lifestyles of the Central and Eastern Algonquian tribes consisted of hunting, gathering, and agriculture—this was usually within mostly static residences, though some seasonal travel did take place. Food was traditionally a combination of game, plants, berries, fish, maize, and wild rice.

The environment was also an influence on the tribes' arts, crafts, and accommodation. Whereas the Plains tribes tended to live in tepees made of buffalo hide, the Central and Eastern tribes tended to make houses out of birchbark; smaller versions were used in the summer (wigwams) and larger versions in the winter (longhouses). Birch bark also had a number of other uses including basket making and birch-bark bitings (similar to snowflake cut-outs), as well as making canoes. Because of the vast number of waterways in this region, most Woodlands Algonquian tribes used birch-bark canoes as their main method of transportation. The Eastern tribes also have traditions of making wampum belts out of shells, and decorating boxes and clothing with dyed porcupine quills—the latter a tradition the Central and Eastern tribal groups share. Both the Central and the Eastern Algonquian tribes were major participants in the fur trade starting in the 1600s.

Of interest to Native American history more generally are two important political figures who have come from Woodlands Algonquian tribes. Tecumseh (Shawnee) and Dennis Banks (Ojibwe) have both had a significant impact on maintaining indigenous rights in opposition to colonial government efforts to assimilate Native Americans. Tecumseh, whose brother was the religious leader known as the Shawnee Prophet, was responsible for promoting a return to ancestral lifestyle among indigenous people, and also politically and

militarily opposing the U.S. government during the War of 1812. Dennis Banks is a cofounder of the American Indian Movement, which was created to protect indigenous civil rights, especially in urban areas. This goal was eventually extended to protecting and promoting traditional ways of life, including maintaining rights to hunting, fishing, trapping, and ricing.

Contemporary Period

As a result of numerous U.S. and Canadian government policies over the years, a certain polarization has become apparent throughout Algonquian tribal cultures. Through policies of assimilation, the creation of reservations, and the decimation of large swaths of indigenous populations, there has been a certain aspect of homogenization of indigenous culture on the one hand, and an extenuation of differentiation on the other. As the Algonquian tribes enter the 21st century, it is easy to say that many native tribes have become similar, with certain aspects of pan-Indian culture taking over from the individuality of tribal customs and ways of life; however, an element of individual tribal revival is visible in the increasing efforts being made by Algonquian communities to combat assimilationist policies and cultural homogenization. Individual Algonquian tribes are emphasizing very different aspects of their own traditional cultures, whether it be ricing, religion, crafting, language, or storytelling. Because of this, it is difficult to discuss contemporary Algonquian tribes in a general sense, as each tribe, government, reservation, and community is focusing on markedly different aspects of political and cultural life.

Alianza Hispano Americana

The Alianza Hispano Americana (AHA) was one of the oldest and largest *sociedades mutualistas* (mutual aid societies for Latinas/os) in the United States. Founded in Tucson, Arizona, in 1894 by Pedro C. Pellon, Mariano G. Samaniego, and Carlos I. Velasco, the Alianza spread to 300 chapters, referred to as lodges, in 20 states with over 17,000 members, and survived into the late 20th century. Mutual aid societies provided benefits unavailable to members from employers or New Deal social safety net programs, such as credit unions, disability benefits, and unemployment insurance or burial insurance. In addition to socioeconomic unity, Alianza founders also provided political and cultural solidarity to combat discrimination from Anglo banks and institutions, which viewed Mexican Americans as "outsiders" and poor investments. The Alianza's multipurpose motto was "Protection, Morality, Instruction."

In 1896, the Alianza became a fraternal insurance society and remained one until 1965. Unlike other mutualistas, the AHA allowed women to join in 1913 in response to the suffrage movement. AHA membership in 1939 rose to 17,366, a monumental growth from its 1,171 members in 1907. The Alianza required all members to be

of Mexican ancestry; however, in 1954 it joined forces with the National Association for the Advancement of Colored People to fight discrimination, and Louis Armstrong was given an honorary membership in 1957 for his civil rights work.

Benefits and Protections

After Arizona became part of the United States under the Treaty of Guadalupe Hidalgo of 1848, and had its inclusion expanded under the subsequent Gadsden Purchase Treaty of 1854, Mexicans in the region faced challenges from Anglo Americans to their land, economic well-being, and political power. They also faced challenges to the maintenance of their culture, language, and religion. Anglos who settled in the late 19th century formed a chapter of the American Protective Association in 1894 in Tucson, an organization that was anti-Catholic and, in the case of Arizona, anti-Mexican. Responses to Anglo American encroachment in the Southwest—not only physically but also economically, politically, and culturally—were met with a variety of responses, ranging from social banditry and armed resistance to benign accommodation through intermarriage.

Tucsoneses, native Mexicans from Tucson, viewed Anglo American settlement in the area a threat to their way of life, and more wealthy citizens saw the Alianza as an important response. Lodges sprang up quickly in mining areas, where interactions with Anglo American capitalists were particularly intense. Membership in the Alianza increased after the first wave of Mexican migration into the United States during the Mexican Revolution of the early 20th century, although a few Alianza chapters existed in Mexico. This transnational insurance and benefit can be seen in the more contemporary organizing and benefits provided to members of the agricultural labor union Farm Labor Organizing Committee (FLOC) in Ohio. The FLOC published a regular newsletter, *Alianza*, which featured the work of local chapters, or lodges.

The fraternal insurance movement began in the late 1800s in the United States to combat the limiting of life insurance to the wealthy. Immigrants, black Americans, and Mexicans, included by conquest or migration, viewed the benefits of mutual aid societies and fraternal insurance organizations as providing a modicum

of security in hostile and insecure times and locations. Not all mutual aid societies were as financially solvent as Alianza, and they collapsed because of unsound financial structuring during the Great Depression and post–World War II periods. In Texas, University of Texas scholar George I. Sanchez assisted the Alianza with a project to desegregate prisoners.

Keeping Culture Alive

Alianza also held a number of events and charitable works at its lodges, or chapters, which also added to its success. It had an annual Gold Trophy for the best lodge (*logia ideal*) to encourage civic engagement, which was included in the organization's definition of morality. In Tucson, one lodge had a delivery service for the needy, delivering food, clothes, and toys to families at Christmas. Like many organizations, Alianza encouraged its members to become involved in its structure and culture as part of their commitment to the value of instruction. One lodge in Arizona offered after-school instruction in the Spanish language to Mexican American children who were only taught in English at school.

In Arizona the influence of La Alianza could be seen in other organizations, such as the Tucson Mothers and Wives (*Madres y Esposas*), who played a vital role in the Allied war effort on the home front during World War II. Women staffed an office that provided translation and letter-writing services, a newsletter, and social interaction for families of service personnel. Alianza was clearly an extension of the strong history and culture of mutualism in the state.

Alien and Sedition Acts (1798)

As the first president of the United States following adoption of the Constitution, George Washington was faced with a major financial crisis. Huge national and state debts threatened the newly independent government with economic collapse; the treasury was empty, and government revenues were insufficient to meet annual expenses or even pay the interest on the mounting debt. For a solution, Washington turned to the first secretary of the treasury, Alexander Hamilton, a proponent of a strong central government.

Hamilton's financial plan called for full payment of the national debt to reestablish a firm credit, new taxes, and the creation of a national bank. Immediately, opposition arose, led by James Madison and Thomas Jefferson; they viewed the new federal government as one of limited power, with all other powers not specifically enumerated in the Constitution reserved for the states. Two factions developed over this division of power. The Federalists believed that the Constitution created a strong national government with wide, flexible powers. The Jeffersonian Democratic-Republicans believed that the central government was a confederacy of independent states that voluntarily gave certain specific powers, and only those powers, to the central government while retaining all others for themselves.

The differences between the two factions were magnified by conflicts over foreign policy. The Federalists favored close relations with Great Britain, America's leading trading partner. With the outbreak of the French Revolution, the Jeffersonians tended to favor closer relations with France, an emerging democracy. When the French Revolution turned radical and began widespread executions, Federalists were appalled at the possibility

of the Jeffersonians allying the United States with the French radicals. Jeffersonians were equally dismayed that the Federalists supported aristocratic England and appeared to be trying to create a strong central government along British lines. Jeffersonians gained support from many new immigrants, largely those from Ireland and France who had a long-standing antipathy for England.

When President Washington chose not to run for a third term in office, the Federalist John Adams won the contest to succeed him, with Jefferson elected as vice president. This created a unique situation where the leaders of the two divergent factions were the key figures in the national administration. During Adams's term in office, relations with France deteriorated to the point that an undeclared naval war existed. At the same time, Federalists were greatly concerned with the unexpectedly strong showing of the Jeffersonians during the nonpresidential election of 1796 and noted that large numbers of immigrants had voted for Jefferson's Democratic-Republicans.

Adams strongly believed that such an organized opposition group was detrimental to national stability. Consequently, following the election of 1796, the Federalists acted to protect the nation from what they feared would be the introduction of European radicalism to American politics. To accomplish this, in 1798 they enacted four laws that are known collectively as the Alien and Sedition Acts. The first three of these laws centered on the feared immigrants. The Naturalization Act extended the residency required for becoming a citizen from five years to 14. The Alien Friends Act gave the president authority to do the following:

. . . order all such aliens as he shall judge dangerous to the peace and safety of the United States, or shall have reasonable grounds to suspect are concerned in any treasonable or secret machinations against the government thereof, to depart out of the territory of the United States, within such time as shall be expressed in such order.

The Alien Enemies Act allowed the president to apprehend and deport resident aliens if their home countries were at war with the United States.

Jeffersonians objected that the two Alien measures gave the president the authority to detain

and deport aliens merely on suspicion without any required evidence or legal hearing. Before its enactment, some aliens left the country, fearful of what might happen if they remained.

The fourth measure, the Sedition Act, troubled critics the most. A portion of it read as follows:

That if any person shall write, print, utter, or publish, or shall cause or procure to be written, printed, uttered or published, or shall knowingly and willingly assist or aid in writing, printing, uttering or publishing any false, scandalous and malicious writing or writings against the government of the United States, or either house of the Congress of the United States, or the President of the United States, with intent to defame the said government, or either house of the said Congress, or the said President, or to bring them, or either of them, into contempt or disrepute; or to excite against them, or either or any of them, the hatred of the good people of the United States, or to excite any unlawful combinations therein, for opposing or resisting any law of the United States, or any act of the President of the United States, done in pursuance of any such law, or of the powers in him vested by the constitution of the United States, or to resist, oppose, or defeat any such law or act, or to aid, encourage or abet any hostile designs of any foreign nation against the United States, their people or government, then such person, being thereof convicted before any court of the United States having jurisdiction thereof, shall be punished by a fine not exceeding two thousand dollars, and by imprisonment not exceeding two years.

To Jeffersonians, this was a very clear violation of the Constitutional protections in the Bill of Rights. Its intent became quite clear when some 25 people, most of them Republican newspaper editors, were arrested, and their publications were forced to close. The accused even included the Vermont Democratic-Republican Congressman Matthew Lyon, who was fined \$1,000 and sent to prison for four months because of an article he published in the *Vermont Journal* criticizing the Adams administration.

Clearly, the acts aimed to restrict the influence of immigrants in elections and the political process,

but the Sedition Act also threatened fines and imprisonment to U.S. citizens for exercising Constitutional rights of freedom of speech and freedom of the press. To Jefferson, this was an inexcusable effort on the part of the Federalists to suppress minority opinions and undermine the basic tenets of American democracy and the Bill of Rights.

In response, Jefferson and Madison authored the Kentucky and Virginia Resolutions in which they argued what became the states' rights theory and established an argument for state nullification of federal laws enacted without the government having the explicit authority granted to it by the Constitution.

Conflict over the Alien and Sedition Acts became a national issue in the election of 1800, which led to the election of Jefferson. He promptly pardoned anyone still in jail once he was sworn into office. Jefferson's theory of nullification, spawned as a reaction to the Alien and Sedition Acts, became the basis for the states' rights argument adopted by the south in its growing split with the north in the decades leading to the Civil War.

Alien Land Laws

The Alien Land Laws refer to state legislation passed in the late 19th and early 20th centuries barring persons ineligible for U.S. citizenship from owning or leasing land. Initially, in some western states, Alien Land Laws were enacted to ensure

that resident aliens (who were white) could hold land in the same manner as citizens as a means of encouraging westward settlement. Larry A. McFarlane, in a study of similar legislation in Kansas enacted in 1891 and repealed in 1901, makes the case that “populist agrarians” wanted to restrict land speculation by British mortgage companies and absentee landlordism.

Anti-Asian Alien Land Laws, on the other hand, arose from the intensification of competition for natural resources between Americans, who believed that they had so-called natural rights to the land, but not “inassimilable Orientals.” Similarly, workers’ fear that “Americans” were losing jobs to Asian labor significantly added to anti-Asian sentiment. On a more profound level, the battle over landownership was intimately tied to the enduring question of American identity. Alien Land Laws implicitly tied national identity to racial identity and both of those to the notion of an essential and natural connection to the land.

To understand the scope of this struggle over land, the evolution of the Alien Land Laws must be connected to a larger history of Supreme Court decisions between 1891 and 1924 and to federal legislation going back to 1790. The Alien Land

Laws, in other words, used several lines of attack. The 1790 Naturalization Act, for instance, stipulated that only “whites” could apply for citizenship. The Naturalization Act of 1870 expanded citizenship to include former enslaved people and those of African descent, but expressly stated that Asians were “aliens ineligible for citizenship.”

Anti-Asian Alien Land Laws also used other federal legislation, such as the Page Act of 1875, the Chinese Exclusion Acts passed between 1882 and 1904, the Gentlemen’s Agreement between Japan and the United States of 1907 to 1908, and the establishment of an Asiatic Barred Zone in 1917. The 1875 Page Law prohibited the entry of “undesirable” Asians, that is, contract laborers, any Asian woman who would engage in prostitution, and persons who were deemed convicts in their country of origin.

Asian Exclusion Laws

In 1859, Oregon passed a law that specifically barred Chinese immigrants from owning land. Then in 1879, California gave the right of land ownership to white Americans or African Americans only. This law eventually became the 1913 Webb-Heney Alien Land Act, which used the

Kiichiro Kosai and his son, Frank Kosai, were the original owners of this dairy farm in Auburn, Washington. As Japanese immigrants, they fought a legal battle for ownership of the farm after their 1919 purchase of the land was challenged under Washington State’s Anti-Alien Land Law of 1921. The photo shows the farm’s creamery (left), milk barn, and main barn in the late 20th century.

wording that persons ineligible for citizenship could not own or lease land. The 1913 Webb-Heney Act was signed into law by then-governor Hiram Johnson, and expanded in 1920 and, again, in 1923. Eventually, California's example spurred other states to pass similar legislation, namely, Arizona, Arkansas, Florida, Idaho, Louisiana, Minnesota, Montana, Nebraska, New Mexico, Oregon, Texas, Utah, Washington, and Wyoming.

Chinese immigration dried up largely due to the Chinese Exclusion Acts, while the remaining Chinese in the continental United States found relatively more safety living in urban enclaves than on the land. The Alien Land Acts began to have a significant impact on Japanese immigrants, as well, many of whom were small farmers. By 1909, Japanese farmers in California owned 16,449 acres of farmland and leased another 137,233 acres. Although the influence of the Asiatic Exclusion League was declining by 1911, ongoing Yellow Peril agitation by other nativist groups, now fueled by the rise of Japan as a world power, led to the Gentlemen's Agreement of 1907 to 1908. Efforts to close loopholes in existing Alien Land Laws led to the 1920 Alien Land Law prohibiting the rental or leasing of land by corporations with stock held by aliens ineligible for citizenship. Land could also not be held in the name of minor children of aliens ineligible for citizenship. In 1923, states tightened the existing Alien Land Laws. To circumvent these laws, beginning in 1916, Punjabi men in California began to marry Mexican women, who as a group were eligible for U.S. citizenship. After 1923, these men began to transfer land titles to their Mexican wives and their children.

In 1947, Utah repealed its Alien Land Law. The U.S. Supreme Court, in 1948, in *Oyama v. State of California*, declared that Fred Oyama's rights as a U.S. citizen to equal protection of the law had been violated by a provision in California's 1923 Alien Land Law. The Oregon Supreme Court invalidated the Alien Land Law of that state in 1949, followed in 1952 by decisions in California's Supreme Court.

All in the Family

All in the Family, a television comedy program famous for its controversial topics, premiered February 1971 with a 34th-place rating and, surprisingly, became the country's top-rated series by fall. The show broke new ground as a sitcom, the television format that exemplified popular culture during the second half of the 20th century, as it became a catalyst for discussion about religion, politics, social class, race, and sexuality. It was innovative because of its plot-driven, hot-button topics. Each episode offered viewers opportunities to compare their lives and values with those of the fictional Bunker family. *All in the Family* ushered in a new era of television as it explored controversial themes in a caustic and humorous, reality-based format.

So relevant was *All in the Family* in the 1970s, that people reportedly planned their Saturday

evenings around watching it, with more than 50 percent of the American TV viewing public, or nearly one-third of all Americans, tuning in regularly during its prime seasons. It occupied the top of the Nielsen ratings for five years, won four consecutive Emmy awards as Outstanding Comedy Series, and garnered numerous other Emmy and Golden Globe awards for its insightful portrayal of contentious social issues. President Richard Nixon discussed it on the Watergate tapes, and further testament to its cultural significance is an exhibit of set pieces from the program on display at the Smithsonian Institution in Washington, D.C. The series was further honored on a 33-cent stamp by the U.S. Postal Service.

Politics, Controversy, and Stereotypes

The 1970s were a time of cultural change, and *All in the Family* was both entertainment and a mirror of conservative versus liberal ideology in daily life. Newspapers and nightly news programs broadcast Vietnam War opposition, women's liberation struggles, new standards of morality, and changing attitudes about race and ethnicity across the nation.

Norman Lear, *All in the Family*'s creator, believed that great humor came out of great pain and wanted to capitalize on these issues through what he imagined as a "tragicomedy" series. Typical television programs, unlike plays or films, however, depended less on plot and more on characters because of 30-minute time restrictions. Lear envisioned a new program videotaped before a live studio audience that would serve as a window into an authentic family's generational disagreements.

Norman Lear was further inspired by a British television comedy, *Till Death Do Us Part*, (1965–75) and with coproducer Bud Yorkin changed the lead character from a mean, bigoted dockworker to a likable blue-collar laborer in Queens with intolerant viewpoints. Archie worked through his wrenching social issues, misperceptions, and prejudices with counterpoint provided by the rest of his extended family. In summary, the characters at 704 Houser Street were Archie, a man with narrow-minded values and dismissive of anyone not in agreement with him, and his stay-at-home, somewhat naïve wife Edith, who catered to her husband's every need. By contrast, daughter Gloria Stivic and husband Mike, a full-time graduate

student and counterculture radical, were both liberal-minded idealists who enthusiastically endeavored to fight racism, sexism, and Archie's old-fashioned thinking. Politically and socially misguided Archie used myriad inflammatory racial epithets, bullied his "dingbat" wife Edith, and fought with his "Polack pinko meathead" son-in-law Mike.

Emmy-winning actors Carroll O'Connor, Jean Stapleton, Sally Struthers, and Rob Reiner portrayed these characters. Running for nine seasons (1971–79), it continued in a related version until 1983. Its spin-off shows included *The Jeffersons*, further breaking new ground in television with an upwardly mobile African American family in the lead roles.

All in the Family was both heralded and attacked. Each episode was less a situation comedy and more of a brief teleplay about societal issues, from homosexuality to ethnic prejudice, utilizing comedic overtones. The show was initially vilified in editorial columns across America, accused because of its crude language and topical discussions that legitimized intolerance and promoting racial slurs. Although 74.8 percent of Americans self-classified as white in 2010, many white U.S. citizens in the 1970s personally identified more strongly as ethnic Polish, Irish, Italian, Greek, and other European ancestries because of national pride associated with their parents' struggles as immigrants. Archie's ethnic slurs, therefore, evoked as much controversy as his character's racial epithets.

Ebony magazine accused *All in the Family* of endorsing racial labels, and the Teamsters International lodged a protest against Archie's character for portraying the working man as an uninformed bigot. Alternatively, in 1973 the American Civil Liberties Union bestowed upon Norman Lear the Freedom of Press Award for presenting life as it really was and for attacking controversial topics from both the right as well as the left. Other awards followed as the program's writers' intentions were better understood. Mike, Gloria, or Edith consistently served as liberal voices of reason to Archie's convoluted logic. *Variety* summarized the nation's sentiments similarly: according to viewers' perspectives, it could make prejudice look silly or justify it, evidence of what researchers call selective perception hypothesis.

All in the Family continues to warrant attention because it instigated heated national debates about prejudice and social issues. Schools ask for study guides, readers' polls remain inconclusive regarding its liabilities or value, and academics continue to deconstruct the program 40 years later. Although empirical evidence proving its influence is inconclusive, it unquestionably raised cultural issues that persist today.

All Indian Pueblo Council

Tribal oral history and the records of Spanish chroniclers support the existence of what came to be called the All Indian Pueblo Council (AIPC), a tribal confederation of designated leaders from respective tribes who entered into a compact to govern collective concerns, long before the first European contact in the 16th century. The first written account of the council is a meeting with Governor Juan de Oñate in 1598. The unified action during the Pueblo Revolt of 1680 indicates that some political unity among the Pueblo nations continued to exist. Organized opposition to foreign intrusion continued into the mid-19th century. Organized opposition to the Bursum

Act, a law that threatened Pueblo land and water rights in 1922, helped defeat the bill. The All Indian Pueblo Council continued to oppose threats to Pueblo sovereignty during the decades that followed. In 1965, the AIPC adopted a constitution and bylaws. A few years later, the federal government returned 48,000 acres to the Pueblo, signaling a significant policy shift that increased the AIPC's responsibilities. In the 21st century, the AIPC continues in its unique position, advocating for the Pueblo and other tribal nations.

Although the first written account of the AIPC is from the late 16th century, historians agree that the Native American cultures that became the Pueblo nations had developed a regionally based tribal confederation before the Spanish arrived. The first written account notes that on July 7, 1598, Spanish colonial governor Juan de Oñate met with seven Pueblo leaders who were said to represent 34 villages. These representatives agreed that the Pueblos would acknowledge the authority of the king of Spain. The Spanish concluded that the seven represented a confederation of distinct cultural communities because they belonged to different language groups. The pattern of regional cooperation continued into the next century when various tribes united in attempts to drive the Spanish from the region. In 1650, six Pueblos joined with their traditional enemies, the Apaches, to plan an attack. Nine leaders were hanged and others enslaved when the plot was discovered.

Revolt of 1680

The most famous and most effective organized revolt against the Spanish occurred in 1680 when more than 70 communities, from Santa Fe and Taos in the Rio Grande valley to the Hopi pueblos nearly 300 miles west, worked together to plan an attack that took place on August 10, 1680. The Pueblo Revolt of 1680 was the single most successful rebellion of Native Americans against European invaders. Even after the Spanish reestablished their presence in the region, the Pueblos continued to resist foreign intrusions, including attacks against the Mexicans in 1837 and the Americans in 1847.

The revolt of 1680 served as a rallying cry more than two centuries later when the Pueblos organized under the direction of the AIPC to fight intruders once again. In July 1922, Senator Holm

O. Bursum of New Mexico introduced a bill that held the potential to deprive the Pueblos of as much as 60,000 acres of their land and place water rights and contested lands under the jurisdiction of state courts that were hostile toward Pueblo concerns. The AIPC met on November 5, 1922, to draft an official protest. The council also raised \$3,500 to send a delegation to Washington, D.C. Working with other Indian rights organizations, the General Federation of Women's Clubs, and various intellectuals and artists from New Mexico, under the direction of social reformer and Indian rights advocate John Collier, the group's lobbying efforts were successful. The protests of the AIPC and the group's supporters captured nationwide attention and prepared the way for further reform.

Other threats against Pueblo sovereignty prompted decisive action from the AIPC. In the early 1950s, the council took a leading role in the repeal of Indian termination legislation. In the 1960s, the AIPC's leaders were active in the civil rights movement. On October 19, 1965, the All Indian Pueblo Council adopted a formal constitution and bylaws. The formal constitution was in place about the same time that an ongoing battle in which the Pueblos had been engaged for generations acquired renewed vigor.

Blue Lake Watershed

The Taos Pueblos had attempted for decades to regain control of the Blue Lake watershed, a 48,000-acre area high on Wheeler Peak in the Sangre de Cristo Mountains. It is believed to be their place of origin, and where their ancestors rose up from the earth. By executive order, President Theodore Roosevelt in 1906 made the area part of the Carson National Forest. The Pueblos' right to the land was recognized in 1848 by the Treaty of Guadalupe Hidalgo, which promised to respect the grants of lands originating under the previous Spanish rule. Their rights were affirmed in 1965 by the Indian Claims Commission. Between 1966 and 1970, the Blue Lake claim was the subject of four congressional hearings. Two bills were introduced in 1970: one, a compromise bill that would give the Pueblos use but not a trust title; the other—which had the support of six key U.S. senators, including Senator George McGovern (D-SD) and then chairman of the Subcommittee on Indian Affairs, and of President Richard

Nixon—recognized the full rights of the Pueblos. The combined actions of the Pueblos of Taos and the AIPC and a host of supporters, from a political cartoonist to the National Council of Churches, succeeded. On December 15, 1970, President Nixon signed into law the bill that returned the disputed 48,000 acres to the Pueblo.

In 2009, the AIPC added a new member, the Tiguas of Ysleta del Sur Pueblo, the only Pueblo in Texas, bringing the number of representatives on the council to 20. The Tiguas were originally part of the New Mexico Pueblo and were driven into Texas by the Spaniards during the Pueblo Rebellion of 1680.

The AIPC of the 21st century continues to focus on the education of its youth, particularly with its scholarship program, which has led to a dramatic increase in college enrollment. The AIPC also continues to serve as the united political voice of the Pueblo people, endorsing local, state, and national candidates. Additionally, it works to revitalize Pueblo culture and to preserve the Pueblo languages.

Amana Colonies

The Amana Colonies, located today near Iowa City, Iowa, originated as a communal venture in the 19th century. In 1854, the Community of True

Inspiration, a group of German Pietists, established these settlements on a tract of 20,000 acres. A commune was quickly established and prospered until the beginnings of the Depression, in which this previously nearly self-sustaining local economy came to an end. Today, the Amana Colonies, like other antebellum communitarian locals, has become a tourist attraction for the American-history buff. The faith is still strong in the region, although since the end of communalism, there have been a number of other developments.

The Community of True Inspiration was founded in 18th-century Germany, distinguishing themselves from their largely Lutheran surroundings based on the sect's rejection of elaborate ritual and their insistence on the efficacy of continued revelation. These Inspirationists turned to the messages of "instruments," modern prophet-like figures who informed the faithful of the will of God. In Europe, conflicts with neighbors and local governments forced the Inspirationists to relocate several times. It was not until the 1840s that the sect made the decision to set out for the New World.

Under the leadership of the instrument Christian Metz, more than Inspirationists made the journey from Germany to the first Inspirationist colony on American soil: Ebenezer, New York. In 1854, concerned with the arrival of neighboring settlements and the growth of nearby Buffalo, the decision was made to once again relocate. This time they went to Iowa, where they could settle at a greater distance from outsiders; seven villages were organized on 20,000 acres of land: Amana, West Amana, East Amana, South Amana, High Amana, Middle Amana, and Homestead.

Based on their reading of scripture and the instruction of their instrument, the Inspirationists developed a communal system in which all property was held in common, with the exception of a few household goods. Adherents lived in village apartments and dined in a communal kitchen. Each individual was assigned to work in a variety of occupations, determined partly on the society's view of gender roles. Men worked on the farms or as factory workers while women labored in the community school or kitchens.

Metz established a series of rigorous rules for life in the Amana Colonies. For example, settlers were forbidden from wearing certain "worldly"

fashions, playing sports or card games, or running side businesses to accrue additional pocket money. During the 19th century, those who did not comply with the rules were encouraged to leave the settlements.

The Great Change

In 1932, the Inspirationists went through a period of transition that they refer to as the Great Change. At this time, the villages voted to end their communal effort and eventually discarded many of the more stringent rules. They placed the community's property and businesses in a joint-stock corporation, the Amana Society, while operating the religious arm independently as the Amana Church Society.

This Great Change has been credited to three preceding issues. First, the colony entered a post-charismatic period after the death of Christian Metz and Barbara Heineman Landmann, another of the group's instruments. These prophet figures had strengthened the community's identity and zeal in living up to their ideals. When a board of elders became the final voice of authority for Amana, dissent became increasingly common. Second, despite their efforts, the colony was no longer secluded from the outside world. Technology and America's road systems had rendered true isolation impossible. In addition to travelers who made their way through the Amana Villages, young men also faced the draft during World War I (although as pacifists, serving in noncombatant roles). The result was a mixing of loyalties and a questioning of communal regulations. Finally, with the Depression, the villages faced bankruptcy.

In religious matters, the Inspirationists are still characterized by their early Pietist ideals. Services are simplistic. Hymns are sung without musical accompaniment. Men and women sit in pews on either side of the church building. Women wear a black cap, shawl, and apron during the services in answer to the Inspirationists' interpretation of biblical requirements. In addition to studying the Bible, the sect also uses the inspired writings of their 19th-century instruments. On the other hand, a number of changes have been instituted in religious life in Amana. Since the early 20th century, the society has made a gradual shift from German to English (eventually holding services in

both languages.) There is now only one service per week in lieu of the original eleven weekly services. In the 1980s, the society allowed women to serve as elders.

As with other communitarian ventures from the period, industries that were previously run as part of the colonies have continued with a great deal of economic success in the 20th century. Amana Refrigeration, Inc., founded in 1934, was recently bought by Whirlpool. The local businesses have shifted toward heritage tourism, as a number of groups have worked together to preserve the historical buildings and to draw potential guests to the area.

Amerasian

The term *Amerasian* has been used to describe children born to Asian women and American citizens, particularly to U.S. military personnel while they are stationed in different parts of Asia, including Japan, South Korea, Vietnam, Laos, Cambodia, the Philippines, and Thailand. The term was coined by author Pearl S. Buck, a founder of the Pearl S. Buck Foundation, who dedicated her life to the improvement of the lives of mixed-race children in Asia. Although the original meaning of the term *Amerasian* is a person born in Asia to a U.S. military father and an Asian

mother, the term has also been used, more currently, to describe a person in the United States of mixed Asian and Caucasian ancestry.

The large U.S. military presence in a number of Asian countries since the end of World War II has been a key factor in creating opportunities for G.I.s and local women to meet and potentially develop intimate relationships. The initial cross-cultural encounters occurred in all kinds of places and settings, but especially on and around the military bases. Entertainment establishments catering to American G.I.s such as bars, clubs, and brothels often spring up near bases, and they can become gateways for G.I.s to pursue sexual relationships with local women. There are also many G.I.s who meet local women employed by the military in positions such as interpreters, sales clerks, or waitresses, and fall in love, leading to long-term romantic relationships. Whether their relationships were in good faith or not, unprecedented numbers of interracial liaisons between G.I.s and local women in different parts of Asia consequently gave a rise to the phenomenon of mixed race or Amerasian children.

Many of the Amerasian children are fatherless, and in many cases, they have little or no knowledge of their biological American fathers. These deserted children were often raised by their mothers alone but sometimes had family support from their kin. Under some extreme circumstances, Amerasian children were abandoned by their mothers and by their G.I. fathers, and were placed in orphanages.

Even though Amerasian children's experiences are diverse, they share a similar plight. Historically, they have been marginalized by mainstream society in their home countries because they are stereotypically viewed as the products of illegitimate and exploitative sexual unions between G.I.s and prostitutes. The fatherless Amerasians, particularly those born to African American fathers, face more severe prejudice and discrimination than their Amerasian counterparts whose fathers are Caucasian.

Some believe that Amerasians would be better off if they were raised in multicultural society such as in the United States. Pearl S. Buck, for example, was a pioneer who advocated international adoption and established Welcome House after World War II to find homes for underprivileged

children suffering from injustices and discrimination. Through various nonprofit organizations and religious groups, thousands of Amerasians with little future prospects in their home countries have been adopted by American families since the end of the war. However, there are still numerous Amerasians who are subjected to harsh lives in various parts of Asia.

Amerasians in Postwar Japan

With Japan's unconditional surrender in World War II, Allied occupation of Japan began and nearly half a million U.S. troops arrived later in 1945. As U.S. occupation progressed, so did the fraternization between American G.I.s and Japanese women. G.I.s strolling with Japanese women in public places became common sights, whether their relationships were commercialized, short-term

The annual Asian American Festival held in Houston, Texas, is only one of the many events held in the United States every year that celebrate the culture, traditions, and history of Amerasians living in the United States.

companionship or enduring ones. Hundreds of thousands of American G.I.s–Japanese couples crossed racial and sexual boundaries in one way or another, and some were determined to marry. As more and more couples crossed the boundaries, the issue of Amerasians inevitably became visible as a social problem.

Foreign media started using the terms *occupation babies* or *G.I. babies* to refer to mixed-race children fathered by American G.I.s. The Japanese general public used the Japanese terms such as *ainoko* (child in between) and *konketsuji* (mixed-blood child). Since these terms carry derogatory connotations in Japanese, they have almost no use in present-day Japan. A more neutral term, *haaf* (half Japanese and half American) was created and many Japanese Amerasians themselves adopted the term. There are also other Japanese Amerasians who claim that the term does not recognize them as fully part of the Japanese group but emphasizes half Japanese and half American. Both Amerasian and non-Amerasian scholars tend to use the term *Amerasians* regardless of racial background of their American fathers, while some use more specifically Eurasian and Afroasian to distinguish between Japanese-white Amerasian and Japanese-black Amerasian.

Neither the Japanese government nor the U.S. military authorities acknowledged the growing population of Amerasians as a political issue and failed to provide government assistance for the children. Many Amerasians ended up living in orphanages. For example, the Elizabeth Saunders Home, which was established by a wealthy Japanese individual, separated Amerasian children from the society that was full of prejudice and hostility against the mixed-race children. The orphanage aimed to provide both English and Japanese language education and help the children develop mixed-race identity in the hope of finding them future homes in the United States.

The earliest survey conducted by the Japanese Ministry of Welfare in 1952 revealed a relatively high proportion of deserted children were born to black G.I.s and Japanese women. According to the survey, approximately 4,000 Amerasian children born out of wedlock had been abandoned by G.I. fathers or by both parents. Nearly 500 children were in orphanages; of these children,

77.6 percent of them were Eurasians born to white G.I.–Japanese couples and 23.4 percent were Afroasians born to black G.I.–Japanese couples. In 1958, one orphanage reported that 30 percent of children were Afroasian, while 52 percent were Eurasian and 18 percent were “others.” Fifteen years after the end of occupation, one source estimated there were more than 20,000 deserted Amerasian children in Japan, and that one-sixth of them were believed to be Afroasian children.

Amerasian children were stigmatized regardless of their fathers’ racial backgrounds. They encountered neglect, prejudice, and discrimination, but Afroasian children and their Japanese mothers particularly faced greater social rejection from Japanese mainstream society than their Eurasian counterparts did. The issue of deserted Amerasian children is not just a personal problem or a legacy of U.S. occupation. It is an international political issue associated with U.S. global militarization, which has demanded continuous relocation of U.S. military personnel to overseas duty stations since the U.S. involvement in World War II.

Amerasians in South Korea

The history of Amerasians in South Korea can be traced back to the aftermath of World War II, when Japan’s defeat initially brought over 70,000 U.S. troops to the Korean Peninsula. This officially ended the Japanese colonization of the previous 35 years. Following World War II, the Korean Peninsula was partitioned into the two halves—the north and the south under control of the Soviet Union and the United States, respectively. This tragic partition of the Korean Peninsula opened up a new stage of global conflict between the communist and anticommunist camps, which tremendously affected particular Asian countries and their regions. U.S. military involvement in the Korean War contributed to expansion of American military forces in South Korea.

Following the Korean War, the tension between the United States and communist countries over the Korean Peninsula never ended; this allowed the United States to retain troops to defend their South Korean ally and its neighboring regions. Consequently, American military bases in South Korea, as well as their camp towns, have become the country’s familiar scenes ever since. There

are approximately 29,000 military personnel stationed in the present South Korea, and the camp towns have been playing a significant role in facilitating opportunities for American G.I.s to meet local women.

Just like Amerasians in other Asian countries, Korean Amerasians are viewed as the product of illegitimate sexual unions between prostitutes and American soldiers. They are associated with unequal power relations: the U.S. military presence represents its superiority and masculine dominance over the country, as well as Korean women’s sexuality. Moreover, in countries such as South Korea, where the ideology of racial purity is deeply embedded in society, it is no surprise that Korean Amerasian children are easily singled out and marginalized by mainstream society as pariahs. In local schools, many Amerasian children experience bullying, name-calling, physical abuse, contempt, and insults from their Korean peers. Not all teachers are sensitive to the mixed-race children and some teachers are even hostile to their Amerasian students. These harsh school environments affect their academic performance and overall educational achievement levels. Also, the dropout rates among Amerasian schoolchildren are significantly high.

Not only do the Amerasians face prejudice and hostility from other Korean people, but they are also subject to institutional discrimination. Since racial profiling in hiring processes is a common practice, mixed-race Koreans are more likely to be concentrated in low-end jobs that have fewer benefits. It is no surprise that the unemployment and underemployment rates among the Amerasians are also high. Until recently, the Amerasians were barred from military conscription, a mandatory duty for all citizens of South Korea, which prevented them from fulfilling their masculine responsibility as South Korean citizens. Because of their exclusion from serving the country, the Amerasians were ineligible for government employment and benefits. Although the law was amended in 2006 and military enlistment was extended to the Amerasians, unlike their Korean counterparts, their enlistment is not mandatory but is still voluntary.

Many Korean women working in camp towns originally met future fathers of their mixed-race children through their sexual service jobs. As

single mothers, these women are likely to continue working in camp towns but find it extremely challenging to provide a decent education and a stable family life for their children. Some mothers decided to place their children up for adoption in Western countries, particularly the United States. Indeed, South Korea became one of the major source countries sending adoptees to the United States. Korean transnational adoptees include Korean children from impoverished families, but from 1955 to 1965, the majority of them were mixed-race children fathered by American G.I.s.

In the United States, mostly as a response to pressure from other countries, Public Law 97-359 (also known as the Amerasian Act), legally defined mixed-race individuals of Asian ancestry who were fathered by U.S. citizens between 1950 and 1982 as Amerasian. This law allows the designated Amerasians to obtain permanent residence in the United States. The countries covered by the law are South Korea, Vietnam, Laos, Cambodia, and Thailand. It acknowledges the issue of the Amerasian associated with the impact of U.S. military involvement in wars such as the Korean War and Vietnam War on the people and societies in these affected countries. Nonetheless, the law neglects the fact that mixed-race children continued to be born to G.I.-Asian couples after the designated time and other Asian countries and many of them remain underprivileged primarily due to their Amerasian identity without their American fathers. Moreover, to apply for this special immigration program, each adoptee must provide evidence of financial support by a U.S. citizen or lawful permanent resident sponsor for the first five years or until the beneficiary is 21 years old.

Amerasians in Contemporary Okinawa

As in the case of Amerasians in South Korea, the large population of American military personnel in contemporary Okinawa is primarily responsible for the persistent issue of single motherhood and mixed-race children fathered by American G.I.s. Okinawa, which makes up less than 1 percent of Japan's total land area, hosts 38 military bases that account for 75 percent of the total land area used exclusively by the U.S. military in Japan today. According to the Report of Women's Issues Arising from the U.S. Military Bases, it is estimated that there are about 3,700 Amerasians

under the age of 18 who have been raised by Japanese single mothers in Okinawa.

Many single mothers with Amerasian children share similar legal issues to solve. Some are mothers of out-of-wedlock children who seek paternity establishment from their ex-boyfriend, so that their children can obtain U.S. citizenship. Other women, who divorced their G.I. husbands, take legal action to obtain child support from their former husbands. These women expressed fear that legal action might upset their ex-husbands or boyfriends and might adversely affect relationships between the children and their fathers. For Amerasian children living outside the United States, connections to their American fathers and obtaining U.S. citizenship are essential to making sense of their dual identities: Japanese identities, and the racial and cultural identities associated with their American fathers. Nonetheless, the Japanese government offers virtually no support for these mothers who are struggling with the legal issues. Consequently, they are likely to seek assistance elsewhere on their own.

Amerasian children in single motherhood have their own issues to deal with. In many cases, they face hardship in school and society primarily because of their different physical appearance. The majority of Amerasian children born in Okinawa and raised by single Japanese mothers do not speak English fluently. The absence of American fathers in their homes makes it difficult for Japanese mothers to give their children opportunities for speaking English in their everyday lives. Since these children look like Americans, their English proficiency is often assumed. When Amerasian children attending Japanese schools are not able to meet their peers' expectations, they are likely to be ridiculed and bullied. Stigmas attached to Amerasian children, such as being called "illegitimate" or "deserted," are other sources of emotional burdens.

In 1988, a group of Okinawan mothers of Amerasian children established the AmerAsian School in Okinawa to provide bilingual education for children born to Japanese women and American G.I.s in a bullying-free school environment. The school accepts all Amerasian students ranging from kindergarten up to junior high school age who demonstrated a need for such a learning environment. The Japanese government

does not accredit the AmerAsian School, which has the classification “free school.” Neither the Japanese government nor U.S. government supports the school with funding. The school runs primarily on donations and generous amount of tuition received by the parents. For the majority of mothers of Amerasian children, who are single working mothers with relatively low incomes, the choice of whether to send their children to the AmerAsian School or to Japanese public schools is not widely available.

Vietnamese Amerasians

Vietnamese multiracial children fathered by American servicemen tend to be mixed with other Vietnamese refugees who escaped their home country during and after the Vietnam War and emigrated to the United States. However, while large numbers of former Vietnamese allies emigrated to the United States as political refugees, Vietnamese mixed-race children were granted official immigration primarily under the classification of Amerasians. The fact that hundreds of thousands of mixed-race children were born to Vietnamese women and American servicemen between the early 1960s and 1975, and that the majority of their G.I. fathers deserted them, became known to the world much later. When Vietnam’s new communist regime came to power, the mixed-race children were marginalized as “children of the dust” and faced extreme hardships and fears of persecution.

In 1987, the Amerasian Homecoming Act was enacted by Congress, allowing mixed-race children fathered by American citizens who were born between January 1962 and 1976 to become eligible for immigration to the United States. Under this law, some 25,000 Amerasians and about 60,000 to 70,000 of their relatives were admitted to the U.S. between 1988 and 2009. After the peak period of emigration rush between 1988 and 1993, the annual numbers of eligible Vietnamese Amerasian applicants for U.S. immigration declined over the years. Aside from the diminished numbers of eligible Amerasian applicants, the false applications by the Vietnamese who claim to be relatives of Amerasians increased and became problematic. This problem led to tight control of the immigration application process, which came to affect eligible Amerasian applicants. Out of desperation

and frustration, these rejected Amerasians were often susceptible to illegal brokers who used the Amerasians to traffic the Vietnamese into the United States.

Amerasian children who were mostly raised in the United States or adopted into American families have different experiences from their Amerasian counterparts who emigrated to the United States as adolescents. The new American family tends to raise their adopted children as Americans, with English names and expectations that they will assimilate into mainstream society. Also, many of the young Amerasians, especially those who came to the United States when they were still babies, do not know much about the country where they were born. Many Amerasians also constantly deal with their Amerasian identity and belongingness: America or Vietnam, but not both. Some organizations provide support systems for Amerasians to promote their Amerasian identity and develop their own voices. Other Amerasians who came to America as young adults also face various problems ranging from discrimination, social isolation, and language barriers to lack of job opportunities, abuse, and poor mental health.

Many Amerasians research their family roots and wish to meet their biological fathers when they arrive in the United States. Some actively search for their American fathers through various networks. Only a small percentage of Amerasians have been able to reach their American fathers. Although there are many moving stories of reunification, these reunions do not always bring happy endings.

American Anti-Slavery Society

The American Anti-Slavery Society (AASS) was the first national antislavery society in the United States of America. Immediatists, those who supported the immediate emancipation of enslaved people without compensation to slaveholders, established the society in Philadelphia in December 1833. For the remainder of the 1830s, it was the central organization of the abolitionist movement. It brought national attention to the movement to immediately abolish slavery.

Besides its significance as the organizational force of the early antebellum abolitionist movement, the AASS was also a pioneer in several other social movements. It was an interracial organization that sought to abolish slavery, and

it declared that all people are equal, demanding full equality for African Americans, a revolutionary proposal at the time. The AASS also called for gender equality. Thus, the organization was at the forefront of three major social issues in American history, the related movements to abolish slavery and end racism, and the women's movement for equality.

Before the rise of immediatism, the American Colonization Society (ACS) attracted many anti-slavery advocates who considered its plan to colonize freed enslaved people in West Africa a worthy program of gradual emancipation that could eventually help end slavery in the United States. However, most free African Americans opposed the ACS, suspicious of slaveholder involvement in that organization and believing their future and rightful citizenship to be in their country of birth, the United States. African Americans' opposition to the ACS influenced white antislavery proponents such as William Lloyd Garrison and others who would align with the AASS to also oppose the ACS and embrace immediatism.

Garrison subsequently launched an abolitionist newspaper, the *Liberator*, in Boston in 1831. With the *Liberator* as his platform and support from African Americans, Garrison called for the immediate emancipation of enslaved people and for racial equality. Garrison pushed for a meeting of abolitionists in Philadelphia, and at that meeting in December 1833 attendees formed the American Anti-Slavery Society.

Interracial and Female Membership

Whereas antislavery organizations of an earlier era had been white-only organizations, the AASS was an interracial organization that included blacks. It also accepted women. Of the 62 attendees at the organizational meeting, three were African Americans and four were white Quaker women. Subsequently, African Americans formed their own auxiliary societies affiliated with the AASS. Women, as well, formed auxiliary women's antislavery societies that included African American women and functioned in cooperation with the AASS, especially in fund-raising.

During the 1830s, the AASS was a whirlwind of activity. Members formed local, state, and regional abolitionist societies across the north.

They relied on moral suasion, convincing others of the moral and Christian grounding of their cause, to gain support for their goal of immediate abolition. Furthermore, they lobbied Congress with thousands of antislavery petitions, leading southern lawmakers to call for passage of a gag rule to prevent discussion of slavery in Congress. The AASS also launched a massive postal campaign to flood the nation, particularly the south, with abolitionist literature. Southern leaders and postmasters then tried to squelch circulation of abolitionist pamphlets in the south. Theodore D. Weld, one of the most influential abolitionists, recruited “the 70,” a group of abolitionist lecturers to traverse the country delivering abolitionist lectures.

Schism Within the AASS

Despite the zeal of the American Anti-Slavery Society’s members and the organization’s success in increasing its membership and drawing attention to abolition as an issue, tensions mounted within the organization from 1837 to 1839. Those tensions led to a schism in 1840. Among the issues that split the organization were the role of women in the AASS, the efficacy of the political involvement, and disputes between Garrisonians and others who believed Garrison’s views impractical and too extreme.

Concerning the women’s issue, female abolitionists such as Sara and Angelina Grimke had scandalized the nation by speaking before mixed audiences of men and women. Garrison and his closest associates supported the Grimkes, encouraged women’s full participation in the AASS, and called for women’s equality. Other abolitionist leaders, including Arthur and Lewis Tappan, preferred a more traditional role for women in the organization.

The “women’s question” and other issues came to a climax at the 1840 AASS convention. Garrisonians controlled the convention and elected Abigail Kelley to the business committee. At that point, the more conservative members, including the Tappans, left the organization to found a new immediatist organization, the American and Foreign Anti-Slavery Society (AFASS). Abolitionists who believed that moral suasion alone could not win emancipation and so favored participation in the political process departed from the AASS and

founded the Liberty Party, the United States’ first antislavery political party.

African Americans in the AASS had urged the organization’s white members to remain consistent with their stated ideals and to treat African Americans as equals. They resented the condescending paternalism of many white abolitionists and asked that they employ African Americans in businesses that they owned. The insistence that white abolitionists’ actions match their rhetoric remained a constant in the abolitionist movement. African Americans in the AASS also believed that the Garrisonians’ emphasis on ideological purity hindered the effort to win emancipation, causing many of them to depart for the AFASS in 1840.

After the schism, the abolitionist movement was never again unified in a single organization; however, the movement against slavery continued and gained adherents. Antislavery political parties grew larger, from the Free Soil Party to the Republican Party. Women from the AASS met at a convention in Seneca Falls, New York, in 1848 and launched the women’s movement to secure gender equality. Although the AASS was a much smaller organization after 1840 and suffered financial difficulties, it remained active in the movement against slavery and continued to call for equal rights for all Americans. The American Anti-Slavery Society survived until 1870 when it disbanded because its members felt its reason for existence had passed after the abolition of slavery.

American Colonization Society

The American antislavery movement was not monolithic nor did all its members believe in the equality of races. Some who thought slavery wrong also believed that the races were sufficiently different that they could not live together without discord. The movement is sometimes divided into “gradualists” who favored a gradual emancipation and “immediatists” who would accept only an immediate emancipation. In truth it was much more complex, with numerous approaches proposed by diverse antislavery factions. One of these was colonization.

The origins of the colonization movement are often traced to Paul Cuffee, a Quaker ship owner descended from the African Ashanti and the Native American Wampanoag tribes. Cuffee proposed sending emancipated American slaves to Africa, where they could live in freedom without the discrimination they would face in the United States. He took the first group of 38 freed slaves to Sierra Leone in 1816 and brought back valuable cargo to make the trip financially viable.

Cuffee died the following year, but his idea outlived him with the founding of the Society for the Colonization of Free People of Color of America, or simply the American Colonization Society, in 1816. The genesis of society began with Virginian Charles Fenton Mercer’s concern about the possibility that freed slaves might foment a rebellion. Through a political acquaintance, Mercer interested Presbyterian minister Robert Finley in the idea, resulting in a meeting at the Davis Hotel in Washington, D.C., on December 21, 1816, which is generally considered the origin of the society.

The meeting was chaired by Henry Clay and attended by such notables as Andrew Jackson, Francis Scott Key, James Monroe, Bushrod Washington, and Daniel Webster. One week later the group adopted a formal constitution. Its first officers were president Bushrod Washington (eldest nephew of George Washington), vice presidents Robert Finley, Henry Clay, and Richard Rush (the son of Benjamin Rush), and secretary John Caldwell. The organization attracted clergy, philanthropists, and other antislavery people who

Paul Cuffee was a successful mixed-race ship owner who planned to bring freed slaves to Africa and then return with lucrative cargo. In 1816, he took 38 American blacks to Sierra Leone but died before he could complete other such journeys.

earnestly believed that “repatriation” to Africa would provide those of African descent with a better opportunity for equal treatment and successful lives. Though not a member of the group, another prominent supporter of the colonization idea was Abraham Lincoln.

Given its guiding premise that people of African ancestry could not enjoy equal freedom and opportunity with other Americans, the society has often been criticized as racist and was generally opposed by African American leaders at the time. For the same reason, the society was often at odds with abolitionists, the Republican Party, and other groups favoring the elimination of the peculiar institution of slavery and the extension of citizenship rights to freed slaves.

Initially, the society also brought together two otherwise opposing groups—Quakers and

plantation owners, the latter mostly from the upper south. Many of the early antislavery Quakers also believed that those of African descent stood a better chance of success through repatriation since they faced near-universal discrimination in the United States. At the same time, the growing number of free people of African ancestry proved increasingly worrisome to southerners who feared the organization of slave rebellions. They also believed that freed slaves could never be successfully integrated into society and saw in the colonization movement a means of ridding their states of this potential menace.

The American Colonization Society was largely responsible for the founding of Liberia as a place of resettlement for freed slaves in 1821. In the succeeding years, thousands of free Africans relocated to Liberia until, in 1847, it declared itself to be an independent nation. It has been estimated that by 1867 the society directly assisted some 13,000 people to settle in Liberia. In 1825, it began publishing the *African Repository and Colonial Journal*, under the editorship of the Rev. Ralph Randolph Gurley, to promote its activities. Among these were ongoing efforts to raise money to fund the resettlement. In 1819, the society received a grant of \$100,000 from the U.S. Congress, and over the years it occasionally received funds from Maryland, Missouri, New Jersey, Pennsylvania, and Virginia. However, most of its funding came from individual donations.

Following the Civil War and the adoption of the Thirteenth and Fourteenth Amendments, the society enjoyed little support for its colonization efforts; very few people actually moved to Liberia—perhaps fewer than 3,000 between the end of the war and 1890. Under the leadership of William Coppinger, the society refocused its efforts on education and missionary work, but membership and funds steadily dwindled. By the end of the century, it was little more than a shell organization. Although the society continued to exist officially until 1964, it ceased publication of its journal in 1919 and conducted little activity thereafter. Upon its dissolution, its papers were donated to the Library of Congress.

American Council for Polish Culture

Created as an umbrella organization for local and regional groups interested in preserving Polish culture, the American Council for Polish Culture, Inc. (ACPC) was first organized as the American Council of Polish Cultural Clubs in Detroit in July 1948. Its purpose is to provide support for groups promoting awareness of Polish language, history, art, and culture. The council engages in a variety of activities from sponsoring events and celebrations to providing scholarships, disseminating educational materials, and fostering exchanges with Poland. In 2012, the organization included 21 affiliates in 15 states and the District of Columbia. Its governing board, which meets twice yearly, is elected and includes five officers, 12 national directors, representatives from each of the affiliates, and past presidents. It is recognized by the Internal Revenue Service as a 501(c)(3) charitable and educational organization.

The ACPC holds an annual convention hosted by local affiliates at locations that vary from year to year. The convention includes business meetings, presentations, seminars, exhibits, concerts, visits to local points of interest, and an awards

banquet and ball. The organization also publishes the quarterly magazine *Polish Heritage* containing articles and news about the organization, its activities, and Polish culture in general. Among ACPC's contributions toward maintaining awareness of Polish culture in the United States were the founding of the American Center for Polish Culture (now the Polish National Center) in Washington, D.C.; the donation of a sculpted plaque to Harpers Ferry National Historical Park commemorating the poet, dramatist, and sculptor Cyprian Norwid; providing funds for the restoration of the monument to Revolutionary War General Casimir Pulaski in Savannah, Georgia; and supporting an annual Marcella Kochanska Sembrich Concert and award to a young Polish American singer in honor of Marcella Sembrich, a star with the New York Metropolitan Opera and the Royal Opera House in London. The recipient of the Sembrich award is invited to perform at the next ACPC annual convention.

Education and Scholarship

To promote education, the ACPC presents "Polish Perspectives," a popular display at the National Conference on Social Studies that attracts more than a thousand educators from across the nation. In addition to displays, ACPC provides educational materials designed for secondary school teachers. A week-long Youth Leadership Conference scheduled each summer in Washington, D.C., provides college students with opportunities to learn more about the history and culture of Poles and Polish Americans, meet with civic and political leaders, and discuss how they might promote Polish culture in their home communities.

Further, the ACPC provides a number of scholarships to children of its members. To promote the Polish language and culture, the organization offers an annual scholarship of \$2,000 for summer study at a university in Poland. It also oversees the Brigadier General Casimir Pulaski Scholarships Family Trust, which provides grants of \$5,000 to Polish American students pursuing advanced studies at American universities, and the Skalny Scholarships, which grant \$1,000 awards to Polish Americans attending U.S. colleges. The Skalny Scholarships are funded in memory of Louis and Nellie Skalny by the Louis Skalny Foundation Trust.

To foster research and dissemination of Polish culture, the ACPC also sponsors a number of competitions and awards. Among the former are the Literary Competition, which makes funds available to local affiliates in order to promote literary contests for high school and college students; the Adam Styka Art Competition at the shrine to Our Lady of Czestochowa in Doylestown, Pennsylvania; and a Polish Poster Exhibit at the annual national conference. To recognize contributions to the promotion of Polish culture, the ACPC presents an annual Cultural Achievement Award to a Polish American for outstanding achievement in artistic or cultural activities. It also offers an annual Distinguished Service Award to "a prominent American or Polish American who has made an outstanding contribution toward the better understanding and greater appreciation of Polish artistic, cultural, humanitarian, professional, scientific, social or public service achievement."

In addition to its national agenda, the individual ACPC affiliates sponsor lectures, exhibits, concerts, and other cultural activities in their own locales. Many maintain ties to local universities, such as the Polish Cultural Club of Greater Hartford, which is a major supporter of the Stanislaus Blejwas Endowed Chair in Polish and Polish American Studies at Central Connecticut State University; the Polish Heritage Society of Rochester (New York), which cooperates in sponsoring programs at the Eastern European Studies Center established at the University of Rochester by the Louis Skalny Foundation Trust; and the Friends of Polish Art of Detroit, which collaborates with the Youth and Kubienski Art Competitions at the Galeria Art Museum on the campus of the Orchard Lake Schools in Michigan.

American Dilemma, An

An American Dilemma: The Negro Problem and American Democracy was Swedish economist Gunnar Myrdal's influential study of race relations in the United States. The Carnegie Corporation commissioned the project in 1937. After years of ethnographic fieldwork, economic analysis, and historical research, this 1,500-page book was published in 1944 to considerable international acclaim. Myrdal later received a Nobel Prize, in part for this, his best-known work. Its impact on U.S. race relations has been mixed.

Contributors

Newton D. Baker and Frederick P. Keppel provided the original impetus for the study, believing, by the mid-1930s, that a comprehensive study of the role of the "Negro" in American life was pressing. Baker, the son of a Confederate officer and a Carnegie trustee, and Keppel, the acting president of the Carnegie Corporation, proposed to name an impartial scholar, and they tapped Myrdal as much for his impeccable international reputation as a scholar and Swedish politician as for his status as a foreigner whose opinion might be taken as neutral.

Myrdal, sensing that his study had enormous political implications, originally applied to Keppel to work with a team of three: a white northerner, a white southerner, and a black man, the combination of whose perspectives he imagined he could render as impartial. But the Carnegie Corporation encouraged Myrdal, at the outset of the project, to work only with black political scientist (and later civil rights leader) Ralph Bunche, then chair of the Political Science Department at Howard University.

Sharp disagreements between the two over the necessary means of solving the "American dilemma" led to Bunche's departure after a year of collaboration. Bunche believed that transracial working-class solidarity would provide the means of agitating for antidiscrimination laws. Myrdal

believed the issue should be pursued by elites, and mainly cites Bunche in *An American Dilemma* as a kind of native informant on issues of black leadership and what Myrdal describes as black anti-elitism. Not crediting him specifically as a collaborator, Myrdal only makes occasional reference to "the Negro intellectual Ralph Bunche" who "testifies" or offers "descriptive commentary" in the body of the text. He cites Bunche's scholarly work repeatedly in the footnotes.

Argument

Myrdal posited a set of cultural norms and habits he called the "American Creed." The Creed is a composite of democratic values: egalitarianism, faith in the rule of law, and a fundamental commitment to fairness. He argued that the American Creed was in fundamental tension with the legal system of U.S. racial segregation and its underlying ideological prejudices. Locating the "Negro problem" as primarily being a problem located in white consciousness rather than black experience, Myrdal systematically unpacked white assumptions about race-based inferiority.

With 47 chapters and 10 appendices, Myrdal intended his study to be as comprehensive and authoritative as possible. Myrdal investigated not only a range of historical topics, such as chattel slavery and Reconstruction, but how those histories were taught (or incorrectly taught) in U.S. public schools. He considered the role of social practices, like occupational discrimination and lynching, as sites through which white Americans ingested an idea of racial inferiority without being explicitly taught. Using the interwoven concepts of caste, class, and color, Myrdal posited the existence of a fixed caste system in the United States, which was distinguished from the class system by reliance on a race-based hierarchy, as well as by the caste system's greater durability. Myrdal argued against the use of the term *race*, which he believed had biological implications that contributed to the diffusion of bigotry.

Myrdal ultimately devoted 10 chapters to cultural trends in African American political organizing, economic opportunity, religious institutions, and social thought. Generally, he believed that new social formations and changes being brought to bear by World War II would have the effect of creating major changes in U.S. race relations. The

book's tremendous impact is explained, in part, by this prescience.

The study is not altogether progressive with regard to its assumptions about the social construction of race in the United States; for example, Myrdal ascribed a "social pathology" to the black community. Stemming from a sociopsychological sense of inferiority derived from caste pressure, the pathology explained why black family formation, crime and insanity rates, and the supposed dearth of cultural accomplishments in black culture were out of step with other ethnic groups. The data and assumptions supporting these contentions were widely criticized by later scholars.

Impact and Legacy

An American Dilemma has sold well over 100,000 copies. Perception of its impact today derives largely from its citation, in the desegregating U.S. Supreme Court decision in *Brown v. Board of Education*, as a general influence on the court's ruling. In the 1950s and 1960s, Myrdal's work created what David Southern has suggested was a white liberal orthodoxy on race; he argues that it had enormous appeal to those who believed reformation of race relations should be gradual and orderly, and hence the book had a tempering effect on civil rights organizing. Per David Southern, Myrdal's study may also have played a role in diverting midcentury scholars toward the study and criticism of white, rather than nonwhite, political attitudes about race.

American G.I. Forum

In the spring of 1948, after experiencing years of segregation and inequality as repayment for extensive honorable service in World War II, Mexican American veterans met in Corpus Christi, Texas, to found the American G.I. Forum (AGIF). Led by Dr. Hector P. Garcia, the AGIF challenged not only discrimination in military benefits but also in housing, education, health care, and politics. The AGIF has persisted over the past six decades by evolving to meet contemporary issues in the Mexican American community, working with other Chicano civil rights organizations, and serving as a model and training ground for Mexican American leaders. Women's, youth, and senior auxiliaries of the AGIF have made it a family organization bridging generations.

The 1944 Serviceman's Readjustment Act, popularly known as the G.I. Bill of Rights, was the product of the Bonus Army March during the Great Depression and fears of another possible economic crisis upon the return of so many men back into the domestic economy as the war neared its end. The G.I. Bill provided unemployment pay to help transitioning veterans; loan guarantees for homes, businesses or farms; and education and training. The inability of Mexican Americans to access these benefits, or use local American Legion clubs that were "whites only," was unacceptable to returning veterans and their families. Leadership and negotiating the military bureaucracy were two things Mexican Americans learned from their service, and they applied that knowledge to the creation of the AGIF, which moved from the awarding of basic benefits to discrimination on draft boards and lagging health care. It fought for migrant workers, students, and voters.

The case of Private Felix Longoria of Three Rivers, Texas, provided a successful platform for the launching of AGIF issues to a larger audience. Private Longoria was killed in action in the Philippines, yet his family was denied use of Rice Funeral Home for services because the funeral director contended whites would not like it, and the cemetery was segregated. Longoria's widow and sister-in-law contacted Dr. Hector P. Garcia to see what might be done about the matter. Garcia brought national attention to the case of Felix Longoria, prompting then Texas Senator

Lyndon Baines Johnson to have Longoria buried with honors in Arlington National Cemetery in Virginia, in 1949.

In 1954, the AGIF took up the case of Pete Hernández (*Hernández v. Texas*) in conjunction with the League of United Latin American Citizens (LULAC); the case went to the U.S. Supreme Court and expanded the understanding and application of the equal protection clause of the Fourteenth Amendment to the Constitution. *Hernández v. Texas* recognized class bias in jury selection as equal to race, and that was more than just a black–white binary. It eventually led to Mexican Americans being recognized as an ethnic minority group in the state. The G.I. Forum also ensured enforcement of the *Brown v. Board of Education of Topeka* decision in the Texas Supreme Court by challenging violations by local school districts.

The G.I. Forum expanded across the country in the late 1950s and engaged in electoral work on behalf of John Kennedy and Lyndon Johnson. Following the victory of Kennedy, forum members rose to a few positions of national leadership. In the late 1960s, forum charter member Vicente T. Ximenes was appointed the head of the Equal Employment Opportunity Commission (EEOC),

Dr. Hector P. Garcia founded the American G.I. Forum after World War II to fight discrimination against Mexican American veterans. He was awarded the Presidential Medal of Freedom in 1984.

and Dr. Garcia was appointed by President Johnson as alternate ambassador to the United Nations. Dr. Garcia addressed the UN in Spanish, the first time the nation was represented in a language other than English. Garcia and other forum members marched with farm workers in Texas in 1968 and continued to expand their work beyond veterans' affairs to address veterans' communities and broad socioeconomic and political conditions.

While focused on official channels of government, the G.I. Forum also engaged in more direct actions; in 1972 Dr. Garcia and 17 students were arrested for a sit-in targeting the Corpus Christi School District for de facto segregation after the *Brown* decision. He also spoke against making English the official language of the United States in 1987, three years after receiving the Presidential Medal of Freedom, the highest civilian honor, from Ronald Reagan, who supported the English language agenda.

In 1998, President Bill Clinton made the AGIF a congressionally chartered veteran's organization following the death of Dr. Hector P. Garcia earlier that year. Garcia was also recognized as a national hero when his image was placed on the \$75 I bond series issued by the U.S. Treasury, joining other famous ethnic Americans such as Martin Luther King, Jr., Marian Anderson, Chief Joseph, and Spark M. Matsunaga.

Today the AGIF has chapters in 40 states and Puerto Rico, and operates under the motto Education Is Our Freedom, and Freedom Should Be Everybody's Business.

American Indian Movement

In 1968, an activist group of Native Americans from the Oglala Lakota Sioux tribes, including Dennis Banks, Clyde Bellecourt, Russell Means, and George Mitchell, founded the American Indian Movement (AIM) in Minneapolis, Minnesota, to address issues of housing, treaties, and police harassment. A year later, AIM joined with the Indians of All Nations to occupy Alcatraz Island in the San Francisco Bay. The event gained national attention and focused awareness on issues impacting American Indians.

Background

There had been several American Indian social movements prior to AIM, including the “ghost dance” and “peyote meetings,” which are the most widely recognized. These earlier social movements united American Indians from several different cultures, highlighting the commonalities among the nations in their struggle against conquest. This “pan-Indianism” was further developed as a result of other federal policies, such as the movement of Indian children to boarding schools where they interacted on a daily basis with white society, and the relocation policy that moved American Indians to the cities, where they interacted with people from tribal backgrounds different from their own.

One of the first major political organizations that formed was the Society for American Indians. After the American Indian New Deal policies came into play, the American Indian Federation rose to address the issues brought to the forefront. For example, the Indian Reorganization Act (part of the New Deal) required the abandonment of tribal political structures for the adoption of dominant

group political structures with federal oversight. A second major political organization was the National Congress of American Indians (NCAI).

The National Congress of American Indians, which consisted of tribal members from several different tribal nations, developed to lobby Congress on issues that impacted American Indians who lived on the reservation. Issues included voting, self-determination, Indian civil rights, and Indian education. The most significant legislation addressed by the NCAI was the Termination Act, passed by the Eisenhower administration in 1953. This legislation called for an end to the tribal/federal relationship and the ultimate breakup of reservation land with relocation of American Indian individuals to urban centers. Many of those who migrated to the cities were young American Indians, who then interacted with people from different tribal backgrounds. These young individuals had a different focus than young people associated with other social movements of the 1960s and 1970s. Unlike their counterparts, the young American Indians, instead of focusing on issues related to youth, were focused on the rediscovery of traditional ways and the interaction with their elders. In addition, their focus was on issues of sovereignty rather than issues of equality.

The Occupation of Alcatraz

The occupation of Alcatraz Island lasted for 18 months and energized the American Indian people. Although only 100 American Indians occupied Alcatraz at any given time, over 5,600 American Indians served in support roles. The Alcatraz occupation brought American Indian issues to the forefront, which had an impact on American Indians throughout the nation. Members of the American Indian Movement were able to pressure the federal government to address American Indian grievances and, more importantly, the Alcatraz occupation spearheaded the beginning of an intertribal social and political movement that swept the country.

Storming Washington

In 1972, a caravan of American Indians went to Washington, D.C., in what came to be known as the Trail of Broken Treaties, in which AIM members occupied the Bureau of Indian Affairs (BIA) and demanded restoration, review, and commitment

to treaties the U.S. government had made with the tribes, including return of 110 million acres of land—and the abolishment of the BIA itself.

The goal of the American Indian Movement was different from that of other civil rights movements. The black civil rights movement, the women's movement, and the lesbian, gay, bisexual, and transsexual movements all focused on issues of equality, desegregation, and individual rights. The American Indian Movement's focus was on issues surrounding tribal sovereignty. AIM began working on such issues as housing, schools, employment services, and other tribal needs. Culture has always been at the forefront of the American Indian Movement. Its members have fought against mandatory boarding schools, suppression of Indian language and religions, and other U.S. policies.

In 1970, AIM held its first national conference to develop a long-term plan to achieve their goals of culture preservation, better education, and the right to sovereignty. AIM was instrumental in the return of 25,000 acres to the Lac Courte Oreilles Ojibwe in Wisconsin. Northern States Power Company had built a dam that flooded reservation land. AIM took over the dam and reached a settlement. AIM took action to support issues of education and in 1972 offered culturally based education at two schools, the Red School House and the Heart of the Earth Survival School. When federal funds were cut, AIM sued the federal government and funding was restored to the schools.

Wounded Knee

AIM began to address other controversial issues. American Indian fishing rights came under attack in Washington State. Violence was rampant. American Indians were assaulted by vigilantes, game officials, and the police. AIM began to address other issues of violence against American Indians, not only in Washington State, but throughout the country.

In 1973, AIM occupied Wounded Knee, South Dakota. The conflict, occurring on the Pine Ridge reservation of the Lakota Sioux in South Dakota was a significant event. Traditional Native Americans wanted a return to traditional social and political structures, while the progressives, with support from the federal government, wanted to exploit mineral exploration on Pine Ridge. The

occupation of Wounded Knee brought AIM into the national consciousness; the media began to take notice and the nation increased its focus on American Indian concerns.

AIM continued its work to maintain and develop institutions to promote sovereignty. By the mid-1970s, AIM was running a housing project, developing survival skills, and producing Indian news and information. During that time, AIM also brought education programs to incarcerated American Indian offenders in Minnesota. These programs became models for ones later used in other prisons. AIM promoted the American Indian Opportunities Industrialization Center to address the high unemployment issues that plagued many reservations and persuaded the parent company of the Pillsbury Corporation to support job training programs. The focus on education also continued, and AIM sued the Department of Education for underfunding, citing bias.

Divisions

The end of the 1970s also brought internal strife to the organization. By 1993, the American Indian Movement had divided into the National American Indian Movement, led by Clyde Bellecourt, and the International Confederation of Chapters of the Autonomous American Indian Movement. Despite the division, however, both movements have continued to promote American Indian rights involving education, treaties, land use, and the rights of indigenous peoples worldwide.

The American Indian Movement also took on the use of stereotypical images in school sports. In 1992, AIM organized a march on the Super Bowl at the Hubert Humphrey Metrodome in Minneapolis, Minnesota, between the Buffalo Braves and the Washington Redskins. AIM identified an unintended consequence of the use of Indian mascots and names in professional sports and pressured newspapers to quit using what it considered derogatory terms. The divided AIM organizations collaborated with other educational organizations, and the result has been a decrease in the use of Indian names as sports mascots in high schools and colleges.

The two groups have promoted the international sovereignty movement, and in 1996 met with the Zapata Liberation Movement to develop strategies to support sovereignty movements of

all Indigenous people and further developed the International Indian Treaty Council.

Natural resources and land use have always been a concern to AIM members, particularly because of their unique relationship with the U.S. government over the control of resources and sovereignty. The membership not only continues its fight for support of sovereignty in the United States but in recent decades has taken its cause to the United Nations Human Rights Council.

American Indian Religious Freedom Act (1978)

The American Indian Religious Freedom Act (AIRFA), passed by the U.S. Congress in 1978, points out the ambiguous place of American Indian religions within American jurisprudence. Acknowledging that the federal government had failed to honor its trust responsibility by protecting Native Americans' religious beliefs and practices, AIRFA sought to redress past wrongs and establish enduring principles. AIRFA recognized the "inherent right" of all American citizens to religious freedom; proclaimed the "indispensable and irreplaceable" role of religion "as an integral part of Indian life"; and directed government agencies to "protect and preserve for American Indians their inherent right of freedom to believe, express, and exercise" their "traditional religions."

Beyond these ideals, AIRFA cited the importance to Indian tribes of sacred sites in their traditional territories, endangered species normally protected by conservation statutes, and Native American ceremonies in prisons and schools. In all three areas Indian people were to be granted rights of access, usage, and participation.

The United States had rarely upheld American Indian religious rights. Indeed, the "right of discovery," on which the United States claimed its territorial sovereignty, explicated by Chief Justice John Marshall in the 1823 Supreme Court case *Johnson v. M'Intosh*, expressed the hegemony of "Christian people" over "natives, who were heathens." When 19th-century lawmakers passed the 1887 General Allotment Act, which forced Indians to alter their tribal land tenure, Christian spokesmen justified the coercion by stating, "Barbarism has no rights which civilization is bound to respect." Between the 1880s and the 1930s, the Bureau of Indian Affairs (BIA) and its reservation agents enforced codes prohibiting Indian rituals deemed offensive to Christian and capitalist sensibilities. When BIA Commissioner John Collier avowed Indian rights of conscience and rescinded the codified persecution of American Indian religions in 1934, Christian advocates accused him of fostering "paganism" and "fetishism."

By the 1970s many Americans were coming around to Collier's notions, legitimizing American Indian religions among the spiritual traditions of the world. Congress enacted AIRFA in this spirit, while recognizing American Indian tribal sovereignty, a concept unthinkable in previous eras. U.S. policymakers were willing to declare the religious rights of Indian nations, as well as individuals, risking the charge that AIRFA constituted an establishment of American Indian religions, making it possible for native nations to claim priority for their spiritual activities, above and beyond the shared rights of U.S. citizens.

Some felt that AIRFA was constructed too vaguely, and thus had no teeth. Several subsequent court cases seemed to corroborate this criticism. In *Lyng v. Northwest Indian Cemetery Protective Association* (1988), a case that arose in California, the Supreme Court determined that the Yurok, Karok, and Tolowa Tribes' "practice of religion" would not be endangered by constructing a road through public forests utilized by generations of Native Americans for vision questing (the ritualized search for personal contact with the divine). In like manner AIRFA did not defend Indian sacred sites in the Southwest from development, despite native protests.

In *Employment Division v. Smith* (1990), a case that originated in Oregon, the Supreme Court ruled that "minority" religions like the Native American Church, whose use of peyote comprises its central rite, cannot expect special exemption from general state laws like those regarding controlled drugs; furthermore, the states need not avow their compelling need for such laws, even when they infringe upon American Indian religious practices. When Klamath Indian Al Smith employed peyote in religious rituals, he was not only fired from his job at an alcohol and drug counseling agency, but he was also denied state unemployment benefits. He was not accused of any crime; however, the court determined that his behavior threatened a neutral, generally applicable drug law.

The *Smith* decision seemed to put the peyote religion in jeopardy, AIRFA notwithstanding; hence, public outcry ensued, not only from Indians, but also from mainstream religious groups. In response, Oregon passed a 1991 law allowing the religious use of peyote by American Indians in the state. The U.S. Congress enacted the Religious

Freedom Restoration Act in 1993, which required states to demonstrate compelling interest to validate any measure restricting religious practices. The Supreme Court struck down the act in 1997, however, saying that Congress lacks authority to engage in judicial review.

Despite these setbacks, AIRFA encouraged Indian tribes to assert their religious values in the face of public opposition. For example, at Bighorn Medicine Wheel and Devil's Tower, Wyoming, Plains Indians successfully protected their religious prerogatives on public lands, against non-Native American hikers and climbers. In both cases, they enlisted the help of federal agencies, as suggested by AIRFA. The Coast Salish and Makah Tribes in the state of Washington lauded AIRFA for inspiring them to carry out culturally restorative activities—canoeing and whale hunting, respectively.

AIRFA also led to the passage of other, more effective federal resolutions such as the National Museum of the American Indian Act (1989), the Native American Graves Protection and Repatriation Act (1990), and the Native American Language Act (1992). In 1994, Congress amended AIRFA, providing specific protections to peyotists and Indian sacred sites. Adding more teeth to AIRFA, President Bill Clinton's Executive Order 13007 (1996) sought to guard Indian religious practices on public lands by ordering federal agencies, including the Bureau of Land Management, the U.S. Forest Service, and the National Parks Service, to consult Indian officials in the management of their sacred places. Thus, AIRFA's influence has been relatively effective and ongoing.

American Indian– U.S. Government Treaties

To understand Indian treaties, or those agreements entered into between the United States and Indian nations, one must first understand what treaties are and the place of treaties in U.S. politics and government. A treaty is fundamentally a contract between nations. The content or terms of treaties are diverse. Some treaties have to do with negotiating the end of conflict between nations. Some treaties have to do with more specific goals such as nuclear disarmament while other treaties may focus on economic agreements between nations.

In the United States the president is authorized by the Constitution to enter into a treaty with consent of two-thirds of the Senate. Article II, Section 2 of the Constitution states that the president “. . . shall have power, by and with the advice and consent of the Senate, to make treaties, provided two thirds of the Senators present concur.” Furthermore, according to the Constitution, treaties are the supreme law of the land. Specifically, Article VI, Section 2 of the Constitution declares

This Constitution, and the Laws of the United States which shall be made in pursuance thereof; and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme Law of the Land; and the judges in every state shall be bound thereby, anything in the Constitution or laws of any state to the contrary notwithstanding.

Hence, only the federal government can enter into treaties, and they are superior to state law. However, treaties do not supersede the Constitution, and they cannot take away rights granted by the Constitution to U.S. citizens. Thus, as authorized by the Constitution, the United States entered into over 400 treaties (both ratified and nonratified) with Indian nations.

Terms and Provisions

Indian treaties are those treaties entered into by the United States and hundreds of American Indian tribes from 1778 to 1871. The individual terms and provisions of treaties are considerably different. While the majority of treaties had to do

with ceding of land, some treaties between the United States and American Indian tribes were related to the conflicts of early settler expansion. For example, the first treaty adopted between the fledgling United States and an Indian tribe—the Lenape, or Delaware—was a treaty to secure the Delaware’s alliance to the United States against other foreign interests of the time. There were also peace treaties signed between the United States and tribes such as the Fort Stanwix treaty signed between the United States and Haudenosaunee. The United States also helped broker peace treaties between warring Indian tribes. However, the central emphasis of treaties has to do with the ceding of Indian lands to the United States in exchange for a variety of obligations on behalf of the United States toward Indian Nations.

These promises or agreements include, for the most part, land set aside for the tribes (today’s reservations) and the promise to ensure the well-being of tribal members through the provision of services to tribes, such as providing food and clothing, education, health care, and economic development. Also explicit in these treaties is the recognition on the part of the United States of tribal sovereignty and the promise that the United States would protect tribes from being forcibly removed from their reservations.

However, the United States did not meet many of the guarantees found in the treaties. Moreover, many treaty commitments enumerated above have never been adequately funded. Finally, treaties entered into by the U.S. government with tribes have never been accorded the same status as treaties entered into between the United States and foreign nation-states. Indeed, a detailed review of the 367 ratified treaties entered into between the United States and Indian nations reveals a more complex picture. In fact, a common theme of treaties signed between tribes and the United States is the inconsistent way in which treaties are interpreted.

History

The history of the United States cannot be divorced from the relations and conflicts with the many Indian nations that eventually came to reside within the borders of the United States. The early history of the United States is steeped in conflict not only with European powers such as the English and French but also the military

Between the 1880s and the 1930s, the Bureau of Indian Affairs and its reservation agents worked to suppress Indian rituals deemed offensive to Christian and capitalist sensibilities, such as the Ghost Dance, shown here in a drawing from 1900. Participants gathered into a circle as the dance was performed; it was thought to bring peace, prosperity, and unity to Native Americans.

threat of tribes. During the late 18th and 19th centuries, Indian tribes were a military threat to the United States. Treaties entered into during this period thus had the goal of minimizing warfare with tribes.

The first treaty was signed between the United States and the Delaware in 1778, in order to secure the tribe's neutrality during the American Revolution and ensure passage for settlers across its lands. During the period of 1789 to 1849, the War Department was in charge of negotiating treaties. In 1824, the Office of Indian Affairs was created within the War Department to oversee Indian affairs. However, in 1849 the office (renamed the Bureau of Indian Affairs in 1947) was transferred to the newly created Department of the Interior, which oversees federal lands (including Indian affairs) and natural resources. This organizational shift also signaled a shift in the way the federal government treated tribes. Another shift in treaty making with tribes came in 1867 when Congress removed the process of treaty negotiations from the executive to the newly established

Indian Peace Commission made up of civilian and military personnel with expertise in Indian affairs.

On March 3, 1871, the passage of the Indian Appropriations Act effectively ended all treaty making between the United States and Indian tribes. The act established that Indian tribes were no longer to be treated as independent nations. Instead, tribes were to be thereafter treated as “wards” of the federal government. During the period of treaty making, 1778 to 1871, the Senate ratified 367 treaties with tribes. Another 45 were negotiated but never ratified by the Senate, though some of them have been accorded legal effect. Finally, there are no treaties with Alaska Native tribes, as the purchase of Alaska took place in 1867, followed closely by the cessation of treaty making with tribes.

Federal Indian Law and Policy

As established in the Constitution, Indian treaties are supposed to be considered the supreme law of the land and are thus foundational to Indian law and policy, in particular, federal-Indian trust

relationship—the obligation of the United States to protect Indian treaty rights and lands. Additionally, Article I, Section 8 of the commerce clause, of the Constitution explicitly states that Congress has the unique power to regulate commerce with tribes. This federal plenary power—the absolute authority Congress has to engage relations with tribes—is enumerated in the Constitution’s commerce clause and clarified in a series of Supreme Court cases such as *Ex parte Crow Dog* (1883). However, the role of treaties and the status of tribes as foreign nations have been altered in such a way as to make Indian treaties and thus Indian law and policy a unique blend of treaty rights, Supreme Court law, and legislation.

The origin of today’s federal Indian law is found in a series of cases heard by the Supreme Court in the early 19th century. These cases, together referred to as the Marshall trilogy, not only enumerate some fundamental aspects of federal Indian law, they also establish the extent of federal power over states in dealings with tribes. In the first of these cases, *Johnson v. McIntosh* (1823), the Supreme Court decided whether an individual non-Indian who purchased land directly from the Piankeshaw tribes before U.S. independence had obtained valid title. The court decided that the individual non-Indian settler had not obtained valid title because the land was not the tribe’s to sell, reasoning that the United States had become owner of all the land by virtue of discovery and conquest of the North American continent by its European ancestors. This is known as the “doctrine of discovery.” According to this doctrine, the act of discovery granted ownership and title of American lands to European nations, which were transferred to the United States following the American Revolution. Because European predecessors had the right to extinguish Indian ownerships and claims to lands, it followed that the United States also has this power. The court held, however, that tribes have the right to continue to occupy and use their traditional lands.

In *Cherokee v. Georgia* (1831), the Cherokee nation sought an injunction against the state of Georgia, contesting a series of laws enacted by Georgia to dissolve the rights of the Cherokee in order to compel them to leave the state. The Cherokee argued that as a foreign nation they were not subject to the laws of Georgia. The Supreme Court

held that they did not have jurisdiction in the case because the Cherokee were not a foreign nation but instead a “domestic dependent nation,” more akin to a “ward to his guardian.” Finally, in a later case, *Worcester v. Georgia*, (1832), the court clarified its position regarding the ability of states such as Georgia to regulate tribes. The court held that the Cherokee were a distinct community, and only the federal government had the power to regulate them, not the states. These three cases laid the foundations of the legal status of American Indian tribes. While the power of treaties was diminished tribes, to this day tribes retain some sort of nationhood status.

Thus, the protection of treaty rights is a critical part of the federal–American Indian trust relationship. Treaties exchanged tribal land for certain protections and benefits. These treaty rights often include, among other things, hunting and fishing rights for tribal members that may extend beyond reservation boundaries, education of tribal children, protection from the state by the federal government, and first priority to water rights. However, many treaties contain vague language regarding the extent of such rights and, over time, this vague language developed into a disadvantage for tribes attempting to actualize treaty promises, particularly in relation to natural resources. While the emphasis of treaties with tribes was to take lands from Indian nations in exchange for a series of guarantees, few treaties spelled out the rights tribes retained. Frequently, states and tribes have gone to court to clarify the vague meaning of such language in treaties. Many of these conflicts, including whether tribes continue to have the right to hunt and fish on their lands, have made their way to the Supreme Court.

Fundamentally the court has stated that Indian treaties are not a grant of rights to tribes. Instead treaties are a grant of rights from tribes to the United States. The rights of tribes are thus multiple, extending beyond those enumerated in treaties. In other words, any rights not extinguished by a treaty are said to be “reserved” to the tribe. This is called the reserved rights doctrine. For instance, a tribe keeps the right to hunt or fish in its territory even if that right is not explicitly enumerated in a treaty. However, this aspect of treaty interpretation concerning the rights of tribes is not explicit in treaties and has led to many disputes.

Thus, in interpreting treaties, the Supreme Court has established a number of rules that guide treaty interpretation. First, the Supreme Court has established that any ambiguities in treaties must be interpreted in the favor of tribes. Second, the court has established that treaties must be interpreted as the tribes would have understood them at the time they were negotiated. Finally, treaties must be interpreted in favor of tribes.

Navajo Treaty of 1868

The number and character of treaties are diverse. The history and context of treaty negotiations and terms between the Navajo and the United States demonstrates that treaty making must be understood both within the historical specificities of individual treaties and the broader historical context of relations between the United States and tribes.

Before signing the treaty between the Navajo and the United States, the Navajo endured a brutal war led by General James Carleton, who wanted to remove the Navajo from their lands to access mining and grazing in the areas of Bosque Redondo and Fort Sumner. The infamous Kit Carson was in charge of the scorched-earth policy inflicted on the Navajo, which led to the surrender of many Navajos at Fort Defiance in Arizona. While Carson promised the Navajo food and security as part of their surrender, beginning in 1863, the Navajo were forced to walk to Fort Sumner in what is known as the Long Walk, a brutal 450-mile journey during which many Navajo died. Conditions at Fort Sumner were appalling. Disease and starvation were rampant. By 1868, over 1,000 Navajo had fled and over 3,000 had died. As a result of these conditions, General Carleton was relieved of his post, and treaty negotiations began with the Navajo.

On June 1, 1868, the Navajo signed a treaty with the U.S. government as a condition of their release back to their traditional homeland, which President Andrew Jackson signed on August 12, 1868. The famous Navajo political and spiritual leader Barboncito represented the Navajo; General William Sherman, a member of the Indian Peace Commission, represented the United States during treaty negotiations. The terms of the treaty went through multiple translations from English to Spanish to Navajo and vice versa. It is also

probable that much was lost through translation, particularly because many terms in Navajo are untranslatable into English. In setting aside the most important terms of the treaty, the borders of the reservation indicated by General Sherman were purposely vague, which resulted in subsequent challenges to reservation borders.

The treaty contains 13 articles, enumerating a number of promises made by the U.S. government to the Navajos. These are cessation of war between the United States and the Navajo; the boundaries of the reservation set aside for the Navajo; the building of a variety of structures on the reservation, such as a schoolhouse; the assignment of an agent to oversee the Navajo; terms for individual land distribution; education of all children; support for farming; provision of goods and payment of monies; agreement to allow railroads and federal facilities to be built on reservation land; and agreement to end all attacks on U.S. citizens. The treaty also included terms for future treaty making; relocation terms of Navajos back to a new reservation; appropriation of money and resources, such as livestock, for the Navajo; and finally, agreement by the Navajo to make the reservation their permanent home. The Navajo have relied on these terms to pursue aspects of self-government. For instance, Article 6, concerning the education of Navajo children, was the basis for Navajo mobilizing to create and control their own schools in the 1970s.

American Jewish Committee

The American Jewish Committee (AJC) is one of the oldest Jewish advocacy groups in the United States. It was established in 1906, and, at that time, focused on safeguarding the welfare and security of Jews around the world, with particular emphasis on those in the United States. Today, its focus is not just in the United States but worldwide. The organization has offices in 26 American cities and

nine overseas offices. The group has international partnerships with over 30 Jewish communal institutions around the world. Today, its major foci are building bridges of understanding; advancing the security of Americans and the democratic world; combating anti-Semitism, along with all forms of bigotry; supporting Israel's quest for peace and security; and advocating for energy independence and strengthening Jewish life.

History

In its early years, despite the focus on welfare and security of Jews worldwide, there was greater focus on the United States and on countries from which Jews were emigrating to the United States. Pogroms in Russia were the initial reasons for the founding of the organization. Well-known Jewish leaders from German backgrounds were important in the founding of the organization. Jacob H. Schiff, a prominent Jewish banker, Louis Marshall, an important Jewish lawyer, and Mayer Sulzberger, a Jewish judge, were among the founders of the organization. Then as now, the central office was in New York City. Although clearly a Jewish organization, one of the important early emphases of the organization was the position that prejudice was indivisible, and that the rights of all Jews in the United States would best be protected by a push for equality of all Americans. As part of this focus, early efforts included support of social science research into causes and cures of prejudice. Despite a recognition that Yiddish-speaking eastern European Jews were coming into the United States in large numbers and experiencing problems, the organization was very concerned about the public image of Jews in the United States. They did not want that image to focus on Judaism as a foreign culture transplanted into the United States.

Louis Marshall was an important early president of the group, serving from 1912 to 1929. The organization became the leading voice in the 1920s against immigration restriction, but it was not successful in preventing the passage of legislation that set quotas on the inflow of immigrants. Marshall had more success in stopping Henry Ford from publishing anti-Semitic literature and distributing it through his car dealerships, ultimately resulting in a public apology to Marshall by Ford. During World War I, the AJC helped

create the American Jewish Joint Distribution Committee to aid victims of World War I. After World War I, the AJC under Marshall pushed for language in peace treaty provisions that guaranteed the rights of minorities.

Another AJC effort in the 1920s was dealing with violent outbreaks of anti-Semitism in Poland and Romania. This type of effort became more important in the 1930s with the advancement of Hitler in Germany. The AJC tried to find places of refuge for Jews until World War II started. Once the war began, the AJC focused on viewing the war as a war for democracy and discouraged emphasis on Hitler's anti-Jewish policies and Jewish-specific issues, partially out of concern about any backlash against Jews in the United States. The Joint Distribution Committee, which had been started at the end of World War I, became very important in helping deal with Holocaust survivors and other Jews after World War II.

1960s to 1980s

By the 1950s and 1960s, major efforts of the AJC were participation in court briefs as part of civil rights efforts and working on dialogue with the Catholic Church. The role of the AJC in the early development of Israel was complicated. The AJC was officially non-Zionist until 1967 after the Six Day War, although it was one of the earliest American Jewish organizations to open an office in Israel. Important to the AJC was an agreement with Israeli Prime Minister David Ben-Gurion in 1950 that stated the political allegiance of American Jews was solely to their country of residence.

Following the 1967 war, the AJC transformed itself into a major defender of the Jewish state. By the 1970s, the AJC was one of the major organizations leading the fight to pass antiboycott legislation to counter the Arab League boycott of Israel. In 1975, the AJC became the first Jewish organization to campaign against the United Nations' (UN) Zionism is Racism resolution. The AJC worked on breaking Israel's diplomatic isolation at the UN and helped it gain acceptance in WEOG (West Europe and Others), one of the UN's five regional groups.

Another effort in the 1980s was working on the problem of Soviet Jewry and their wish to emigrate. The AJC was one of the founders of the specialized organization, the American Jewish

Conference on Soviet Jewry. It was a backer of the Freedom Sunday Rally on behalf of Soviet Jewry, which organized 250,000 people for a rally in Washington, D.C., demanding that the Soviet government allow Jewish emigration.

Publishing

In addition to these more political and organizing tasks, the AJC played a major role in Jewish publications until recent years. It was the publisher of *Commentary* from 1945 to 2007, a magazine focused on political and cultural commentary and analysis of politics and society in the United States and the Middle East. Though the initial image of this publication was liberal, the magazine has moved to the right and is now the voice of neoconservatives and independent of the AJC. The other publishing effort of the AJC from 1906 through 2008 was the *American Jewish Yearbook*, a detailed annual account of Jewish life in the United States, Israel, and other parts of the world.

International Involvement

In the last 20 years, the AJC has taken on a number of international efforts in addition to its U.S. concerns. One major international effort has been the opening in 2003 of the Transatlantic Institute in Brussels, Belgium. The goal of this institute is to foster improved relations between Europe, Israel, and the United States. It sponsors regular meetings with foreign diplomats, held both in the United States and in their home countries. The AJC started what has become known as the "diplomatic marathon," generally held in September each year; this is a series of meetings with high-level representatives of foreign countries that is held in New York during the UN General Assembly session. More than 70 nations have participated in this effort. As a way to remain involved in both domestic and international political decisions, the AJC annual meeting was moved from New York to Washington, D.C., to facilitate the involvement of government officials and foreign diplomats. In 2010, the meeting was renamed "The Global Forum." Additionally, Project Interchange, a previously independent body that ran seminars in Israel for influential Americans, became part of the AJC.

As the numbers of formerly Russian Jews living in the United States increased, another push has been the opening of a Russian Affairs Division to

help identify and train new leaders in American Jewish public advocacy. Continuing its tradition of focusing on broader humanitarian needs as well as specifically Jewish issues, the AJC contributed over \$2 million to relief efforts following Hurricane Katrina and the southeast Asia tsunami.

All these recent efforts have been led by Executive Director David Harris, who was named to that post in 1990. The push for more international involvement has been one of his goals. Another newer initiative for the AJC has been the advocacy of energy independence for the United States. This is seen as furthering overall positive goals for the United States with the additional benefit that by helping reduce dependence on foreign, especially Arab, oil it may contribute to greater stability in the Middle East, which would benefit all countries, especially Israel. In addition to urging the United States to focus more on the environment, the AJC has tried to push the private sector to be more energy conscious. To demonstrate its own commitment, the AJC has adopted green policies for itself institutionally, including earning LEED certification in 2011 through making its New York headquarters energy efficient and environmentally sound.

Pushes in the human rights area now occur through the Jacob Blaustein Institute for the Advancement of Human Rights (JBI), named for one of the two AJC leaders who pushed in the founding conference of the United Nations in 1945 to ensure that the UN Charter included international human rights guarantees. The JBI focuses on human rights issues of core importance to the Jewish community, such as combating religious intolerance, torture, discrimination (whether based on race, religion, sex, or other status), and preventing the indifference that can lead to genocide.

Recent Issues

An area of recent concern for the AJC, which covers both its interests in the human rights areas and in immigration, has been making policy statements about important immigration issues. The AJC has condemned Arizona S.B. 1070, and has viewed it as a setback in national efforts to achieve immigration reform. The public statements of the AJC about the law when it was under scrutiny by the U.S. Supreme Court were based on

the AJC's general approach that federal immigration reforms must meet the rule of law, include humane treatment of immigrants, and avoid any exploitation of undocumented workers.

In terms of recent issues related to Israel and peace in the Middle East, the AJC supports a negotiated two-state settlement of the Israeli-Palestinian conflict. The organization on its Web site argues that the current Palestinian strategy of unilateralism, to seek UN recognition for a state that does not yet exist, and to do so without talking to Israel, will harm the peace process. The AJC argues that returning to direct talks is the only path to peace.

In October 2011, the AJC issued a joint statement with the Anti-Defamation League urging American Jews to support a Joint Unity Pledge. The pledge states that "America's friendship with Israel is an emotional, moral and strategic bond that has always transcended politics." In addition, the statement urged that "now is the time to reaffirm that Israel's well-being is best served, as it always has been, by American voices raised together in unshakeable support for our friend and ally." The statement brought protest from Jewish opponents of President Barack Obama's reelection; they perceived it as a call to avoid criticizing the president's policies toward Israel.

In response to some of the criticism, the AJC's executive director David Harris said that the

These wooden plaques for the victims of Auschwitz were placed by the March of the Living, an annual program for students. The American Jewish Committee played an important role helping survivors of the Holocaust after World War II.

statement was intended to preserve the tradition of bipartisan support for Israel and prevent support from becoming subject to partisan politics. Harris recognized the right of people within the Jewish community to take a partisan position, but also stressed the need for both parties to remain strong advocates for Israel.

In recent years, with the growth of Internet-based media efforts, one major activity for the AJC is participation in op-ed pages, interviews, and Web-based publications. The executive director, David Harris, is a regular contributor to the *Huffington Post* and *Jerusalem Post*, in addition to maintaining a blog.

American Jewish Congress

The American Jewish Congress is an association of Jewish Americans organized to defend Jewish interests at home and abroad through public policy advocacy, using diplomacy, legislation, and the courts. This organization is sometimes confused with the American Jewish Committee, which generally goes by the acronym AJC, making it better

to refer to this organization as the AJCongress. Although the organization has a long, proud history, its present situation is difficult, because the bulk of its operating funds were invested with the Madoff group. Because of this, the AJCongress suspended its activities and laid off many of its staff on July 13, 2010. While the organization continues to maintain a Web site, it has not yet really recovered from the losses in operating funds held by the Madoff group. It continues with some activities such as its annual lunches for the Financial Services Industries Awards, with the 48th being held in October 2012.

The organization was started in 1918 by a mix of Jewish leaders, including those from recent immigrant community organizations and Zionist organizations. Its initial meeting was held in Independence Hall in Philadelphia. Prominent Jewish leaders at the time who were part of the initial meeting included Rabbi Stephen S. Wise, Felix Frankfurter, and Louis Brandeis, the first Jewish member of the U.S. Supreme Court. The original focus of the organization was to have a national democratic organization of Jewish leaders from all over the country to rally for equal rights for all Americans regardless of race, religion, or national ancestry. One of its stated goals was equal rights for all, and one of the pushes for the founding of the organization was to present a unified American Jewish position at the Paris Peace Conference in 1919.

Rabbi Wise became one of the important leaders of the group, leading to its effectiveness as a pressure group starting in the 1920s. He remained the president and chief spokesperson of the AJCongress until his death in 1949. The organization was very active in the 1930s and 1940s. It was one of the first Jewish organizations to boycott Nazi goods in the 1930s, despite the objection of many other Jewish groups. In 1936, the American Jewish Congress was instrumental in establishing the World Jewish Congress (WJC). While continuing in his position as president of the AJCongress, Rabbi Wise was also elected president of the WJC. During World War II, the AJCongress acted as a liaison between the U.S. government and the WJC on issues relating to rescue attempts made on behalf of European Jews.

In August 1942, Rabbi Wise received a cable from the WJC representative in Switzerland,

Gerhard Riegner, about Nazi plans to exterminate all of European Jewry; the Auschwitz-Birkenau camp was specifically mentioned in the cable. After the State Department confirmed the information, the AJCongress convened the Joint Emergency Committee, which tried to coordinate all major Jewish organizations in the United States in lobbying efforts with the Roosevelt administration. By December 1942, the AJCongress established a Planning Committee, although it was never more than marginally successful. It did hold a large rally at Madison Square Garden on March 1, 1943, with a crowd of 70,000, and some similar but smaller rallies in other U.S. cities.

The AJCongress was pro-Zionist in its platform and had overlapping leadership with the Zionist Organization of America (ZOA). During World War II, the two organizations agreed to concentrate on different tasks, with the AJCongress focused on rescuing European Jews while ZOA worked to establish a Jewish state in Palestine. After the war, the AJCongress was active in pushing for the establishment of the State of Israel in 1948; along with ZOA, it was one of the early organizations to support the founding of Israel as a Jewish state.

The AJCongress also pioneered the use of U.S. courts in the 1940s to defend Jewish rights, even though some other Jewish organizations cautioned that Jews should be less outspoken. Rabbi Joachim Prinz was president from 1958 to 1966, a period when a major focus of the organization was civil rights activities, many of which were linked to the movement for greater civil rights for African Americans. Rabbi Prinz served as a founding chairman of the 1963 March on Washington and spoke at the event.

The AJCongress was a pioneer in the struggle for Soviet Jewry—before it became a popular movement. However, the organization did experience a drop-off in its membership throughout the 1980s and 1990s. After that drop-off, the AJCongress focused more on constitutional issues domestically and supporting Israel and challenging anti-Semitism abroad. It has been involved in a large number of civil rights and religious freedoms cases, before courts at all levels of government, with a focus on federal courts and the U.S. Supreme Court. The AJCongress has advocated the removal of religious symbols from public life,

including Christian symbols but also public displays of menorahs during Chanukkah. The group has also monitored use of federal funds given to faith-based institutions to provide social services.

One additional area of focus for the AJCongress has been issues linked to the role of women in Jewish organizations and their inclusion in public life. It was the first mainstream Jewish organization with a membership of both men and women to devote great effort to women's issues, such as the establishment in 1984 of the Commission for Women's Equality. In 1996, the organization sponsored a conference, *Understanding the Genetics of Breast Cancer: Implications for Treatment, Policy and Advocacy*, under the direction of its Commission for Women's Equality. In 2000, the AJCongress held a session on Cancer Genetics in the Ashkenazi Community to explore medical breakthroughs since the first conference. In May 2006, a major women's conference was held in Tel Aviv, bringing together American and Israeli women.

American Revolution

Although colonial America was largely populated by people of English heritage, it also contained a multiplicity of others whose ancestry traced back to nearly every language group in Europe, as well as indigenous peoples and those of African

ancestry. It has been estimated that at the time of the Revolution about 85 percent of the white colonial population hailed from the British Isles, but not all were English. There were large contingents of Irish, Welsh, Scots, and Scots-Irish, not all of whom would consider themselves to be “English.” About 8.8 percent of the white population were of German ancestry, 3.5 percent of Dutch descent, and a smattering of other groups that may have had local significance but otherwise constituted quite small percentages.

Multicultural Influence

The multicultural influence on the American Revolution, and the corresponding influence of the revolution on American multiculturalism, can be defined in three categories. First, in some cases ethnicity appears to have been a factor in why some groups supported the revolution in greater proportion than others. Second, the assistance rendered to the new “United States” by traditional enemies, such as France and Spain, had an influence on how these nations and their cultures were viewed following the war, and thus the acceptance of French and Spanish cultural elements in America. And third, individuals who came to North America to support the Revolution left a lasting legacy that became, in different ways, a part of the American multicultural mosaic.

Among the diverse groups within colonial America, some contained sizable numbers of people who tended to be anti-English. The Scots-Irish, whose ancestors moved from Scotland to Northern Ireland, then on to North America, were mostly Presbyterians who settled in Pennsylvania and along the frontier edges of the southern colonies. In America, their dislike for the British government was compounded by their residence on the frontier or “backcountry” areas that were remotely located from the centers of political and economic power in the lowland areas. Residents of the backcountry often felt a sense of neglect, with a frequent complaint being that the only time they saw any evidence of government concern was when the tax collector arrived. For these reasons, the majority of Scots-Irish appear to have supported the American Revolution.

Historian James G. Leyburn noted in his *The Scotch-Irish: A Social History* that the largely

Scots-Irish community of Mecklenburg, North Carolina, declared its own independence a year before the Declaration of Independence when it adopted the Mecklenburg Declaration in 1775. It was the heavily Scots-Irish Virginia and North Carolina militia that won the critical Battle of Kings Mountain, which caused the British to abandon their Southern Campaign, leading eventually to the decisive defeat of the British at Yorktown. Leyburn quoted a British major general as stating that “half the rebel Continental Army were from Ireland.” He quotes a Hessian officer serving with the British forces in a similar vein: “Call this war by whatever name you may, only call it not an American rebellion; it is nothing more or less than a Scotch Irish Presbyterian rebellion.” No doubt these are exaggerations, but the comments nonetheless acknowledged the significant support of the Scots-Irish for the revolutionary cause.

In New York, the German and Dutch farmers in the Hudson, Mohawk, and Schoharie valleys were under the political control of English landlords, or in the case of the Hudson valley the descendants of the Dutch patroons who had formed a political alliance with the British to maintain their economic and political position. The Germans, and most of the Dutch, tended to support the revolutionary cause as a means of eliminating the political and economic control of the English landlords. This was clearly seen in the Mohawk and Schoharie valleys where the American Revolution quickly turned into a local civil war. The German and Dutch population, together with some English small farmers, forced the leading English families to flee to Canada, from where the Loyalists staged at least one major invasion of central New York and engaged in a brutal frontier civil war, with the colonials on one side and Loyalists and their Indian allies on the other, in attempts to regain their lands.

In Pennsylvania, by 1766, one-third of all the residents were of German birth or ancestry. They had a fierce loyalty to their language and heritage that led them to resist English cultural influences during the colonial era. Regarded as “inferior” by the English, and treated as such, the Germans in Pennsylvania proved to be strong allies of the revolution against British control. Like the Germans and Dutch of New York, they raised their own military units to serve in the revolutionary forces.

Iroquois Confederacy

Among indigenous peoples, the most important group during the colonial era were the tribes of the Iroquois Confederacy—Cayuga, Mohawk, Oneida, Onondaga, Seneca, and Tuscarora. As British allies during most of the French and Indian Wars, they were a powerful group whose influence spread as far west as modern Minnesota, Wisconsin, and Illinois, and as far south as Virginia. Furthermore, their strategic location in central New York controlled the vital trade routes to the west. During the Revolution the majority of the Iroquois remained loyal to the Crown, but the Oneida and a few scattered individuals from other groups allied with the revolutionaries.

The Iroquois provided significant military assistance to the British, while the Oneida sent men to fight with the local Mohawk Valley militia and in other campaigns such as Saratoga. However, the rift in the Iroquois Confederacy was the first time that the bonds between the tribes were broken. During the summer of 1779, General John Sullivan led an American army that devastated Iroquois villages in western New York, leaving an estimated 5,000 homeless and dependent on British assistance during the following winter. This, combined with the fact that most of the Iroquois sided with the British, largely destroyed their traditional military and political power. American promises to the Oneida were also largely discarded in the wake of the war as the former Iroquois land was systematically appropriated through spurious agreements and sold to white settlers.

Free Africans

Free Africans in the north often responded to the revolutionary cause by volunteering for service in New England militia units or as crew members on patriot vessels. Rhode Island, in particular, sought to enlist black troops, including enslaved people, into its Continental forces in lieu of white volunteers. On the British side, Lord Dunmore, governor of Virginia, issued a proclamation offering freedom to any enslaved person who would volunteer to fight with the British. An estimated 300 responded. In response, in 1776 the Continental Congress agreed to allow free blacks to enlist in the Continental forces, but some southern states

continued to refuse enlistment to Africans. Additionally, some Africans rendered valuable service to the patriot cause as spies, particularly in the Carolinas.

Following the war those who sided with the British were mostly evacuated when the British left, and resettled in Nova Scotia, London, or West Africa. It is estimated that about 10,000 slaves belonging to Loyalists were evacuated during the British withdrawal from Charleston and Savannah and relocated as enslaved people, mostly to Jamaica and St. Augustine. Some of those who fought for American independence gained their freedom, but others did not—it appears to have been a case of individual owners either honoring previous agreements or not. In other respects, African contributions were quickly forgotten and their lives remained largely unchanged.

Foreign Assistance and Cultural Influences

After a long series of wars, Britain expelled France from North America in 1763. Although the French were anxious for revenge, at the beginning of the American Revolution they did not wish to become embroiled in another costly war by openly supporting a revolt few thought had any chance of success. Nevertheless, the French were willing to supply arms, ammunition, and other materiel through a covert Portuguese trading company established for that purpose. France also supplied financial aid and allowed some of its trained military personnel, especially highly sought military engineers, to take a “leave of absence” during which they went to aid the colonists in North America.

Following the American victory at the Battle of Saratoga in late 1777, the French, convinced that the colonials could win their fight for independence, officially recognized the United States and openly came into the war as its ally. French troops and naval units were sent to North America where they proved crucial in the British defeat at the Battle of Yorktown, which ended large-scale military operations and eventually led to the Treaty of Paris guaranteeing American independence in 1783. After decades of hostility toward the Catholic French who were the major enemy during the French and Indian Wars, the English-speaking Protestants who populated the United States generally began to adopt a more accepting

Crispus Attucks, an American slave and merchant seaman, was the first person shot to death during the Boston Massacre in 1770. He became an icon of the antislavery movement and was held up as the first martyr of the American Revolution.

attitude toward things French. In the aftermath of the Revolution, French fashions, music, cuisine, and wine became popular, especially in the more eastern cities.

In 1775, England's primary rival for control of the Western Hemisphere was Spain. Although Spain did not seek war with England, like France it was more than happy to discomfit its rival through covert assistance to the rebels. Using its ports in Cuba and New Orleans, Spain cooperated with the French in shipping military supplies to the Americans, while denying the British usage of their port facilities and access to the lower Mississippi River, which might have allowed them to secure control of the areas west of the Allegheny Mountains early in the conflict.

Spain, like France, eventually declared war and acted aggressively to rid the Mississippi Valley and the Gulf coast of British forts and to capture

the important British base at Pensacola in Florida. When it appeared that the Siege of Yorktown might fail for lack of funds, a collection of some 500,000 silver pesos was taken up in Havana to support the continued operation.

Although Spanish cultural influences on America were not as pronounced as those of France—until after the Louisiana Purchase and the acquisition of Florida brought large numbers of Spanish-speaking people and their culture into the United States—one early contribution is often overlooked. In 1777, the Continental Congress adopted the *real*, or “Spanish dollar,” as legal tender in the 13 colonies. The Spanish dollar was again declared legitimate tender by Congress in 1793 and 1806 and remained a legal medium of exchange in the United States until 1857. Eventually, the qualifier “Spanish” was dropped, leaving the “dollar” the official U.S. monetary unit.

European Officers Aid the Revolution

Scores of European officers came to America to offer their services to the Revolution. Among them were some who left lasting legacies. One of the most important was the Marquis de Lafayette, who rendered distinguished service in Washington's army. Perhaps his most important contribution was his constant advocacy of the American cause, including a trip to France in 1779 to negotiate increased French aid. The result was a new French army of 6,000 troops dispatched to North America under General Jean-Baptiste de Rochambeau. In honor of his contributions to American independence, Lafayette's name has been affixed to roads, counties, and towns, as well as to Lafayette College in Pennsylvania and Mount Lafayette in New Hampshire.

Another French volunteer who served in the American army, Pierre Charles L'Enfant, stayed in America following the war. He redesigned New York's City Hall to accommodate the First Congress and is most noted as the person commissioned to draw up plans for a new city to serve as the capital of the United States in what is today Washington, D.C.

From the German states came Baron Friedrich von Steuben. During the famous winter at Valley Forge he developed a very effective system for training the American army. He is generally

credited with professionalizing the American army to be able to meet the British on equal terms. His home north of Utica, New York, is now the Steuben Memorial State Historic Site. Steuben Day is celebrated in many German American communities in September and the Steuben Society is one of the largest cultural and historical organizations for German Americans. Multiple U.S. cities were named after him and his statue is located, among other places, in Lafayette Park near the White House in Washington, D.C.

From Poland came Kazimierz Pułaski and Tadeusz Kosciuszko. Pułaski served as a volunteer aide at the Battle of Brandywine, where he distinguished himself by leading an attack that delayed the British, allowing time for Washington's army to escape encirclement. Promoted to commander of horse troops by Washington, he is often referred to as the "Father of the American Cavalry." He later created the Pulaski Legion, which he led in the Southern Campaigns until he was mortally wounded at the Siege of Savannah in 1779. He is one of only seven people to be awarded honorary U.S. citizenship. In 1929 Congress enacted legislation to create October 11 as an annual Pulaski Day. Various places have been named for Pułaski, as well as a U.S. submarine and Fort Pulaski in Savannah, Georgia.

Kosciuszko arrived in America in 1776 and his skills as an engineer were put to use on the defenses of the Delaware River near Philadelphia. In 1777 he was assigned to the Northern Army under General Horatio Gates. There he contributed significantly to the crucial American victory at Saratoga that led to the French Alliance. His next assignment was at West Point, where he was the chief engineer for the design of what would later become the U.S. Military Academy. After completion of West Point, he served with praise as the chief engineer under General Nathanael Greene in the Southern Campaigns. For his service, he was promoted to brigadier general, was granted American citizenship, and was admitted to the prestigious Society of the Cincinnati and the American Philosophical Society.

Returning to America in 1798, he penned a will in which he left his American property—including a cash settlement of his back pay for service in the Revolution and a large land grant just north and west of the present city of Columbus, Ohio—to

purchase the freedom of the American enslaved people and to educate them to become productive citizens. As executor of his will, he named his friend Thomas Jefferson. The first statue erected to honor an individual at West Point was dedicated to Kosciuszko, as was another in Lafayette Park across from the White House. The house he lived in on his return trip to America is now the Thaddeus Kosciuszko National Memorial in Philadelphia.

American-Arab Anti-Discrimination Committee

The American-Arab Anti-Discrimination Committee (ADC) is the oldest national Arab American organization still functional. Founded by Senator James Abourezk in 1980 as a general Arab American advocacy organization, ADC's recent and most important work has been focused on civil rights and civil liberties issues as they pertain to the Arab American community, and it frequently joins with other civil rights, Arab American, and Muslim American groups to advocate for the rights of Arabs and Muslims in the post-9/11 period. Although it has the highest national profile of any Arab American group, it has been subject to numerous controversies over its 30-year history.

The ADC's current work focuses on tracking instances of anti-Arab discrimination in American public life and working to eradicate the sources of this discrimination. There are three main foci to ADC's work: educational efforts focused on changing mainstream American perceptions of Arab Americans, legal work representing Arab American victims of discrimination and trying to intervene with the U.S. government on policies that frequently lead to discrimination against Arab Americans, and documenting and opposing acts of stereotyping in the media. Most of its work related to discrimination has been tied to official government policies and their particular abuses; for instance, ADC was central in opposing the National Security Entry-Exit Registration System, a new form of registering male immigrants from Middle Eastern and Muslim countries (and North Korea) that was billed as an antiterrorism action but in fact led to the deportation of 14,000 Arab and Muslim immigrants, none of whom were charged with any terrorism-related crimes. The ADC has also emphasized travel-related discrimination (often referred to as "flying while brown") and has worked with the Transportation Security Agency and other governmental bodies to try to eliminate the phenomenon. The ADC's annual convention is the largest Arab American political gathering and is a major organizational focus.

The ADC is headquartered in Washington, D.C., and has two major components, ADC and ADC-RI (Research Institute). While ADC handles most of the political and advocacy work carried out under ADC's mantle, ADC-RI is responsible for administering scholarship and internship programs and producing educational materials. ADC-RI has 501(c)3 tax-exempt status.

In addition to these two national components, ADC also has local chapters in areas with major Arab American communities. Currently, there are chapters in Arizona, California, Florida, Georgia, Illinois, Kentucky, Louisiana, Massachusetts, Maryland, Michigan, Minnesota, Missouri, Nevada, New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Tennessee, Texas, Washington, and Wisconsin, as well as a grassroots chapter in Washington, D.C. These chapters are a major part of what differentiates ADC from other Arab American organizations, which can largely be categorized either as national level, without grassroots connections, profoundly local, serving or representing a single geographically delimited community, or ethnically or religiously limited, serving one national-origin or religious group.

The ADC was founded by James Abourezk, a Democrat from South Dakota who served in the House of Representatives and the U.S. Senate, and who himself was the child of Christian immigrants from Lebanon. (Interestingly, he was succeeded as senator by James Abdnor, another second-generation Lebanese American.)

The original mission of ADC was to focus on U.S. domestic issues that were important to Arab Americans, although foreign policy issues were crucially important to many of its members and staffers. (At the time, the National Association of Arab-Americans had a foreign policy focus and lobbied around those issues; however, it faded from prominence in the 1990s and as of 2002 was absorbed formally by ADC.) However, it has always spoken out on foreign policy issues, particularly where they intersect with domestic issues, such as harassment and abuse of Arab American activists for Palestinian rights. For example, ADC provided much of the defense support for the case of the LA8, eight noncitizens who were arrested for their support of the Popular Front for the Liberation of Palestine, which led to the U.S.

Supreme Court case *Reno v. American-Arab Anti-Discrimination Committee, et al.*, wherein ADC and others argued that the laws used to prosecute the LA8 were unconstitutional. (The Supreme Court's ruling suggested that immigrants did not have full First Amendment rights, a position with which ADC did not agree.)

The ADC was the target of political violence in the 1980s. The most prominent example of this was the murder of Alex Odeh, ADC's West Coast regional director, at his office in Santa Ana, California, on October 11, 1985. Odeh was a Palestinian American, a naturalized U.S. citizen originally from the West Bank, and a father of two. He had made repeated television appearances in support of Palestinian causes, including one the night before his death to talk about the hijacking of the *Achille Lauro* by a group of Palestinian militants, who Odeh argued were not directed by the Palestine Liberation Organization. (The group that claimed responsibility was a minor offshoot of the Popular Front for the Liberation of Palestine.) Odeh's death was one of three incidents of violence against ADC in 1985; the others were a bombing of ADC's Boston office in August, and arson at ADC's Washington, D.C., office. Alex Odeh remains an important historical figure for ADC, and he is commemorated by its Alex Odeh Memorial Award for persons who have shown exceptional service to the Arab American community.

In 2011, ADC's annual convention was a source of controversy when Syrian American pianist Malek Jandali was first invited to perform and then had his invitation revoked. Jandali was planning to perform a song called "Watani Ana" ("I Am My Homeland"), which was viewed as a criticism of the Syrian regime, currently undergoing strong challenges from citizens. However, Jandali was asked not to perform the song; many speculated that it was because ADC has received funding and support both from Syrian Americans who are close to the regime and from the Syrian embassy in Washington, D.C. This led to calls for boycott of the convention from pro-democracy activist Arab Americans. The matter is still a source of tension for the ADC, but it has moved toward a more pro-Syrian-resistance position, with recent advocacy for Temporary Protected Status for Syrians in the United States

(a designation that allows them to remain longer because of unrest in their home country).

American-Islamic Relations, Council on

The Council on American-Islamic Relations (CAIR) is the largest American political advocacy and civil rights organization working on behalf of the American Muslim community. CAIR is a 501(c)(3) nonprofit organization that uses legal activism, political advocacy, coalition building,

and education to both advance the rights of Muslims in the United States and to better inform the American public about Islam. CAIR is headquartered in Washington, D.C., and has affiliates in 19 states, with more than 30 chapters in the United States and Canada.

Greater Involvement in American Society

Beginning in the early 1980s there was a marked shift among immigrant Muslim leadership away from isolationism and a foreign political focus toward greater investment and involvement in American society. At this time, large religious umbrella organizations were formed, such as the Islamic Circle of North America (1971) and the Islamic Society of North America (1982). These two groups created national connections among immigrant Muslim populations and ran parallel to large, preexistent African American Muslim national networks, specifically the Nation of Islam and the American Society of Muslims under Warith Deen Mohammed.

A general consensus emerged among the immigrant-focused Muslim community at this time that professional, bureaucratic organizations were the best choice for Muslims' advocacy work in the United States. These discussions occurred within the larger political atmosphere of identity politics, whereby ethnic and other minority or marginalized groups organized around shared political interests. American Muslims also organized around ethnicity and Arabs participated in the American-Arab Anti-Discrimination Committee, founded in 1980 and still the largest Arab American civil rights organization in the United States.

The Council on American-Islamic Relations was founded in June 1994 following the emergence of similar organizations in the late 1980s and early 1990s. Founders Omar Ahmad, Nihad Awad, and Rafeeq Jaber created CAIR to monitor discrimination against Muslims in the United States, to protect Muslims' civil liberties, to better educate the American public about Islam, and to encourage Muslim participation in politics and society. The three founders had previously worked together at the Islamic Association of Palestine (IAP), a nonprofit organization dedicated to improving welfare of the Palestinian people and advancing the campaign for a Palestinian state.

This connection would haunt CAIR later when particular pro-Israel groups claimed IAP and, by association, CAIR were a domestic front for the Palestinian Islamist party Hamas; no direct proof has been found to support these claims.

CAIR gained national recognition when it responded quickly to the initial and unsubstantiated blame placed on Muslims for the Oklahoma City bombing on April 19, 1995. In the few weeks following the event, CAIR recorded over 200 instances of hate crimes and harassment directed at Muslims, which it published in the report "A Rush to Judgment." CAIR continued to monitor and compile data on hate crimes and discrimination against Muslims and in 1996 began publishing an annual report, "The Status of Muslim Civil Rights in the United States."

In its first years of existence, CAIR established itself nationally as a prompt advocate in cases of civil rights violation and discriminatory action toward Muslims. CAIR also utilized the still-nascent World Wide Web, creating a resource-rich Web site and sending frequent listserv announcements that established a direct connection to its base. With its established public presence, CAIR was able to serve as a platform for Muslims to speak on legislation and with political candidates.

In 1999, CAIR joined with the Muslim Public Affairs Council (MPAC), the American Muslim Alliance (AMA), and the American Muslim Council (AMC) to create the American Muslim Political Coordinating Council (AMPCC). The four organizations work on an ad hoc basis and coordinate the division of labor on issues affecting the Muslim community. Coalitions like the AMPCC and other civil and human rights partnerships would prove vital to CAIR in the aftermath of the terrorist attacks of September 11, 2001. Muslims were targeted by widespread acts of violence and Islam was branded as a violent and un-American religion. Systematic discrimination against Muslims became normalized in schools and the workplace. And the Patriot Act and government intelligence created a culture of fear for Muslims as widespread surveillance and detention rocked communities.

In the wake of 9/11, CAIR publicly condemned the terrorist attacks as fundamentally against the principles of Islam and worked to counteract the

issues facing Muslims. In the two months after 9/11, CAIR recorded 1,700 complaints of harassment and hate crimes. In addition to creating literature and running workshops to educate American Muslims about their civil rights, CAIR worked with organizations such as the American Civil Liberties Union and the National Lawyers Guild to confront the hundreds of cases of detention. In 2003, it ran advertisements as well as commercials with the theme “I am American, I am Muslim” to challenge prevailing stereotypes of Muslims as foreign and unpatriotic.

In the decade since 9/11, CAIR has been actively engaged in civil rights work, government relations, Muslim political education, media relations, and interfaith works to improve the lives of Muslim Americans and generally to promote justice, civil liberties, and mutual understanding in the United States. CAIR processes hundreds of civil rights cases annually, runs Muslim voter registration drives, and has an active presence on Capitol Hill. It also conducts sensitivity training with government, law enforcement, workplaces, and schools. CAIR maintains partnerships both with civic groups, such as the National Association for the Advancement of Colored People (NAACP) and the Japanese American Citizens League, and with faith-based organizations like the National Council of Churches. CAIR has established a voice in local, national, and international media and has run two major public education campaigns on the Qur’an and the Prophet Muhammad.

Americanization

Americanization is the process through which people become American, which in this article specifically refers to adopting the culture of people within the United States. There are several competing ideas about what Americanization should entail, and these ideas have undergone substantial changes over time as the country has become increasingly ethnically and racially diverse. Two frequently discussed approaches to Americanization are the melting pot model and the multiculturalism model.

These two models have different implications for how dominant and nondominant groups in the United States maintain or abandon the cultural heritages of their countries of origin. In the United States, dominant groups historically have had relatively greater social, political, and economic power. Nondominant groups have historically lacked this power. Across U.S. history, a variety of policies have been instituted to enforce or encourage either the melting pot or the multicultural model of Americanization, which has shaped the ways that people from different groups view and represent themselves.

The Melting Pot Model

One approach to Americanization is based on the metaphor of a melting pot. In a melting pot, substances such as different metals are heated and fused together to become one. In the melting pot model of Americanization, people who immigrate to the United States are absorbed into American culture as they adopt the beliefs and practices of the dominant group, while some aspects of their culture, simultaneously, melt into the dominant American culture. The United States is comprised of people from diverse countries of origin, and aspects of these distinct cultures have been infused into one core culture that is referred to as American (U.S.) culture.

There are many dimensions of American culture across which the melting pot model may be observed, such as linguistic practices, artistic expression, culinary developments, and cultural institutions. In terms of linguistic practices, many words in the American English language are taken from other languages in the world. For example, “kindergarten” and “angst” are German;

“bagel” and “schmooze” are Yiddish; “ballet” and “fiancé” are French. With respect to artistic expression, the styles seen in American jazz incorporated aspects of musical traditions more commonly seen in Africa. The cuisine preferred in the United States is also heavily influenced by diverse cultures. Although certain foods such as hot dogs and hamburgers are commonly thought of as “American foods,” these foods are actually German in origin. Pizza is Italian, and many of the foods and ways in which Americans prepare meat is borrowed from the Native Americans. In addition, many cultural and legal institutions in the United States have been imported from other cultures. The American court system is derived from the British system.

Proponents of the melting pot model suggest that immigrants assimilate most of their identity into the host culture, and the host culture is inherently inclusive. Many have characterized the United States as a country that has borrowed the best aspects of many diverse cultures. Not all people, however, believed that immigrants should primarily abandon their cultural heritages in order to melt into the dominant U.S. culture.

Multiculturalism

The multiculturalism model is one that values and promotes ethnic/racial diversity. The term was originally coined in Canada and has become the official government policy in Canada since 1971. The multiculturalism model enables people to retain their immigrant cultures while simultaneously having a shared, superordinate identity as Americans. The influential academic scholar Fathali Moghaddam described two types of multiculturalism: *laissez-faire* multiculturalism and planned multiculturalism.

Laissez-faire multiculturalism describes a society in which government policies do not encourage or require immigrants to assimilate into the host culture. Instead, whether or not people abandon their cultural heritages is determined by economic opportunities and pressures within society. Under this model, some immigrants may choose to stop practicing their cultural traditions or languages in hopes of establishing economic, political, or social stability. For example, one way that people might assimilate is by replacing their surname with a surname that is more typical in the United States,

such as replacing Wong with Smith, in order to enhance their likelihood of being hired for jobs.

People following the *laissez-faire* multiculturalism model do not necessarily need to assimilate to become Americanized or economically stable. To combat ethnic or racial barriers to success, individuals may network with other people within their ethnic group to become successful in certain industries or by creating what is referred to as “ethnic economic enclaves.” For example, an immigrant storeowner may hire other immigrants and assist them in gaining economic security. Nondominant group members may economically and politically solidify to gain financial power, stability, and influence.

Planned multiculturalism describes a society in which the government institutes policies and programs that encourage nondominant group members to maintain their cultures. Nondominant groups have historically lacked social, political, and economic power. These government policies typically fund programs that assist racial and ethnic minorities. For example, funding may be set aside for start-up companies for nondominant groups, official government documents may be published in multiple languages, and university programs may be created to promote the study of the cultures, experiences, and challenges faced by nondominant group members.

Acculturation Strategies

The process of Americanization occurs in a number of ways. One process through which Americanization occurs is acculturation, when people and groups of people of different cultures alter their identities as a result of interacting with one another over an extended period of time. The melting pot and multiculturalism models provide different models for dominant and nondominant groups to acculturate. Another way of conceptualizing acculturation is through John Berry’s model of acculturation.

The Berry model of acculturation suggests that four strategies are used by dominant and nondominant group members to adapt to one another and to cope with stress that may arise from these interactions. The strategies are assimilation, integration, separation, and marginalization. Assimilation is utilized in the melting pot model and integration is utilized in the multiculturalism

model. Both the melting pot and multiculturalism models reject the separation and marginalization strategies.

Assimilation strategies are utilized when a non-dominant group member does not want to retain their own culture and instead completely adopts the cultural characteristics of the host culture. For example, an immigrant woman may go out of her way to appear more like a member of the dominant group. She may change her hair texture and hair color, change the eye color of her contacts, or dress in the way she believes the dominant group members dress. Dominant group members can also encourage or enforce a policy of assimilation by nondominant group members. For example, an American business owner may choose to hire only those African American women who straighten their hair, or Chinese immigrants who have perfected their English skills. The strategy of assimilation by both dominant and nondominant group members encourages, enforces, and reinforces the melting pot model.

Integration strategies are utilized when non-dominant group members value their own cultures and the host culture. This may only occur in multicultural societies where dominant group members value diversity. For example, many immigrants are able to adapt to the dominant culture in certain settings (such as work and school) while practicing and maintaining their culture in other settings (such as home and church). Correspondingly, dominant group members may be tolerant and accepting of diverse cultures. For example, a judge in the court system may be open and accepting of ethnic/racial minority languages and even take a class to learn a second language. Integration is one of the strategies that further the multiculturalism model by allowing nondominant group members to continue practicing and maintaining their cultures in society.

Separation strategies are utilized when non-dominant group members value only their own cultural characteristics and do not value the characteristics of the host culture. Nondominant group members in this category may minimize their interaction with the host culture. For example, the Amish have strict codes regarding who is and is not part of their community. They also have no desire to be part of the mainstream culture. Dominant group members who adopt

separation strategies impose segregation on non-dominant group members. An example of the dominant group imposing segregation strategies is when the United States imposed Jim Crow laws, which caused African Americans to lack access to education and resources. Separation strategies are not part of the melting pot or multiculturalism models.

Finally, when nondominant group members do not value their own culture or the host culture, they may be exposed to an unusual degree of stress, leading to marginalization. For example, refugees from war-torn countries may feel estranged from their home cultures and displaced in the mainstream host culture. Marginalization may occur when dominant group members are openly discriminatory toward nondominant group members. For example, a dominant group member may tell a refugee to go back to their home country and refuse to hire them. Both the melting pot and multiculturalism models aim to avoid marginalization of any groups.

Factors Encouraging the Melting Pot Model for Nondominant Groups

Factors that enforce or encourage the melting pot model may pressure nondominant group members to assimilate by replacing the cultural characteristics of their heritage and gaining those of the dominant culture. For example, one policy that enforces the melting pot model is the sole use of English for many important forms and requirements. Despite the fact that the United States does not have an official language, the oral test to become a U.S. citizen is conducted only in English.

Additionally, despite the fact that the United States does not have an official government-sponsored religion, many governmental activities and holidays cater to the dominant religious group. As a result, nondominant group members must familiarize themselves with the dominant group's religion in order to function within society. This form of assimilation also reinforces the melting pot model. For example, Christmas is considered a national holiday and most businesses and institutions are either closed or have shorter hours on Sundays because many Christians attend church or observe a day of rest on Sunday. Additionally, there are still a few schools that do not teach the theory of evolution or teach an incomplete version

of the theory out of deference to Christian groups that do not accept evolutionary theory.

There are a number of predominant factors influencing the melting pot model for nondominant groups.

English influences. The dominance of the English and Anglo values in U.S. culture is evident in the country's major institutions, demonstrating the melting pot model. One of these values is the Protestant work ethic, which is the view that work is an obligation of every individual and that hard work is a way of serving God. The Protestant work ethic dates back to the 1700s and still influences the work ethic and capitalistic culture in the United States. In other words, the economy is based on individuals who work and own businesses. The U.S. court system is also based on English common law. The English are a good example of how an immigrant group's culture and values can melt into a society.

Becoming white. Some immigrant groups have assimilated into the dominant U.S. culture by transforming their racial identity from nonwhite (and therefore nondominant) to white (and therefore dominant). In other words, one way in which historically nondominant groups have reinforced the melting pot model is by changing their racial identity. For much of U.S. history, Irish Americans and Italian Americans were considered nonwhite and faced extensive prejudice and discrimination.

One reason for this discrimination was that members of the dominant group in the United States were highly prejudiced against members of the Catholic faith. Italian Americans were viewed as a threat on multiple levels based on their religious and linguistic differences. Over time, the groups became more accepted by the dominant culture as they became increasingly assimilated into the dominant culture. Alfred E. Smith, a Roman Catholic, was nominated as the presidential candidate of the Democratic Party in 1928, and President John F. Kennedy was Catholic with Irish ancestry. Nancy Pelosi, an Italian American, was the first woman in U.S. history to become speaker of the U.S. House of Representatives, from 2007 to 2011.

Through years of supporting members of their own cultural groups, both Irish and Italian

Americans have assimilated into the dominant U.S. culture. These groups were once categorized as nonwhite but are now categorized as racially white. Cultural borrowing from the Irish and Italian cultures is seen today (such as consuming pizza and celebrating St. Patrick's Day). Irish Americans also have a significant presence in institutional sectors such as law enforcement, schools, and Catholic churches. Italian Americans have a significant cultural presence in major areas of the country such as New York City, and Italian is the fourth most common language taught in U.S. colleges.

African Americans. African Americans have a complex history in the United States because many did not choose to immigrate to the United States but were instead forced in through the slave trade. However, African American culture has still had a substantial impact on U.S. culture.

Mainstream American culture has borrowed extensively from African Americans and African cultures. For example, the banjo can be traced back to Africa. American music has also been greatly influenced by African American culture, particularly in terms of rhythm and beats. Genres such as jazz, rock 'n' roll, and hip-hop can be directly linked to African American culture. Artists such as Elvis Presley and Amy Winehouse are examples of members of dominant groups relying on and incorporating musical influences of this nondominant group. Hip-hop has a long history in U.S. musical styles and influences American culture in terms of popular dress and linguistic phrases. The influences of African American culture can also be seen on television and in movies. For example, Oprah Winfrey is one of the wealthiest, most powerful, and influential women in the country. Actors such as Denzel Washington, Will Smith, Halle Berry, and Samuel L. Jackson are household names. In this way, African Americans have influenced U.S. mainstream culture and demonstrate the melting pot model.

Asian Americans. In the 1800s, most Asian immigrants came in search of job opportunities. This led to discriminatory policies to limit Asian immigration, such as the Chinese Exclusion Act of 1882, the Asiatic Barred Zone Act of 1924, and the Immigration Act of 1924.

However, the U.S. government changed its policies to encourage a melting pot model rather than a separation strategy for the Asian American population. For example, the Walter-McCarran Act of 1952 abolished all anti-Asian federal laws and all federal laws prohibiting the naturalization of Asians in the United States. The Immigration and Nationality Act Amendment of 1965 abolished any racial/ethnic bias in immigration laws and quotas. Today, Asian Americans are economically and educationally rising in status and political representation. In fact, Asian American children often outperform their white counterparts in educational testing. In addition, Asian American women are the most likely of women from nondominant groups to marry Euro-American

men. Thus, Asian Americans have melted into the mainstream economic, educational, and home sectors of the country, demonstrating the melting pot model.

Hispanic Americans. Hispanic Americans have historically faced many hardships and challenges. However, the United States eventually enacted policies that encouraged the melting pot model among Hispanic Americans. The federal government typically uses the term *Hispanic* to refer to individuals of Central/South American, Cuban, Dominican, Puerto Rican, or Mexican descent. Hispanic Americans have faced decades of discrimination, such as the Mexican repatriation from 1929 to 1939, when hundreds of

Kentucky Fried Chicken and McDonald's restaurants on a street in Dongmen, China, suggest the extent of the presence of American culture and corporations on a global basis. Fast food is often viewed as a symbol of U.S. marketing dominance, and companies such as these have many outlets around the world. Outside the United States, the term Americanization is used to describe the influence the United States has on other countries and their culture, cuisine, technology, and business practices.

thousands of Mexican Americans were forced to leave the country.

Despite the political controversies over the role of Hispanic Americans in the United States, the dominant culture has absorbed a great deal of Latin American influences. Thus, Hispanic Americans also demonstrate the melting pot model. They have had a significant influence in American politics, educational institutions, music, movies, and fashion. The mayor of Los Angeles, Antonio Villaraigosa, is the third Mexican American to ever serve as a mayor in Los Angeles. Spanish is not only the most widely spoken second language in the United States, it is also the most widely taught in secondary schools. Notable Latino Americans in the U.S. entertainment industry include Jennifer Lopez, Eva Longoria, Mario Lopez, and Sofia Vergara. Conversely, the dominant culture has had an influence on Hispanic Americans. For example, the linguistic development of Spanglish, a blend of English and Spanish words and phrases. In this way, the English language has influenced Hispanic American culture. In addition, a number of Hispanic Americans have changed their surnames to assimilate to the mainstream U.S. culture (for example, Charlie Irwin Estevez goes by the stage name Charlie Sheen).

Factors Encouraging the Multiculturalism Model for Nondominant Groups

Factors that enforce or encourage multiculturalism typically promote diversity by promoting the maintenance of cultural heritages and practices of nondominant groups. One policy by government and private companies (such as banks, departments of motor vehicles, and medical offices) is to offer literature and telephone consultation in multiple languages. A second approach is to foster the development of “ethnic economic enclaves” in metropolitan U.S. cities, such as Chinatowns, Little Tokyos, Little Italys, etc.

A number of the ideals upon which the United States was founded supported diversity and the social and political rights of nondominant group members. These ideals are highly consistent with the ideals of the multiculturalism model. This is not to minimize the effects of slavery or other atrocities in U.S. history, but rather to highlight the past and present multicultural values of the nation. A minority of Founding Fathers did not embrace the

dominant form of Christianity. Article 11 of the 1797 Treaty of Tripoli states, “The Government of the United States is not in any sense founded on the Christian religion.” Thus, it is fair to say that some of the Founding Fathers believed in the notion that government should not force citizens to assimilate to a specific set of religious beliefs.

In more recent history, President John F. Kennedy enacted the New Frontier program. In terms of multiculturalism, the program aimed to reduce poverty, improve public transportation and housing, and increase the minimum wage and Social Security, all programs that assisted members of nondominant groups. In this way, nondominant group members felt they could maintain and practice their home cultures and therefore demonstrated the multiculturalism model.

One outgrowth of the civil rights movement is that many colleges created ethnic studies departments. These departments were instituted to study the cultures, experiences, and challenges faced by nondominant group members. The goal of these departments was to ensure the preservation of minority cultures. In this way, ethnic studies departments reinforce the multiculturalism model. A number of these departments were involved in student strikes and sit-ins in order to politically fight for the rights of nondominant groups. Ethnic studies departments were backed and funded by the institutions in which they functioned, many of which are funded by the state.

Additionally, the United States offers several federally funded programs that have the sole purpose of promoting diversity. For example, the McNair Program assists nondominant students with their pursuit of doctoral degrees. The United States also institutes antidiscrimination laws. Race is a federally protected class, and racial discrimination as well as hate crimes are serious offenses in the U.S. court system. These policies allow nondominant groups to maintain and practice their cultures and therefore encourage the multiculturalism model.

Amish

The Amish are followers of the traditionalist Christian church who are well known for their simple dress and lifestyle and who are reluctant to adapt to modern conveniences and technology. They form a subgroup of the Mennonite Church, a Protestant group based on the communities of

the Christian Anabaptist. In the United States, the Amish community primarily resides in areas of Pennsylvania. Day-to-day rules of Amish society include banning or limiting the use of electricity, telephones, automobiles, modern clothing, insurance, and government assistance. They are a tight-knit community, and members who do not conform to the expectations of Amish society are excommunicated or shunned, considered a form of shame within the community.

The roots of Amish Mennonite society descend from the Swiss Brethren, a 16th-century fellowship. The Swiss Brethren were Anabaptists, which by definition means “one who baptizes again.” These followers, part of the Radical Reformation, had been baptized when they were born, but later in life were baptized again. In 1693, a schism formed within the Mennonite fellowship. A man named Jakob Ammann, a Swiss Mennonite leader, favored strict church discipline and shunning and felt the followers were veering away from traditionalist teachings of the Mennonite Church. Mennonites across southern Germany and Switzerland became divided, and those who sided with Ammann, from which the Amish name is derived, withdrew.

The Amish Come to America

Amish Mennonites began migrating to the United States in the 1700s amid religious wars and persecution throughout Europe. The majority of early Amish settlers came to Lancaster County, Pennsylvania, although others later settled in Alabama, Delaware, Illinois, Kentucky, New York, Ohio, and Maine, among other states.

It was not until the mid-19th century that the discussion of retaining Amish identity came into play. In the 1860s, conferences within the Amish communities were held to discuss how the followers should adjust to a modern, emerging society. As the meetings continued, more traditionally minded bishops, referred to as the Old Order Amish, began to boycott the meetings, as more progressive leaders continued to congregate and eventually merged with the Mennonite Church. The progressive members accounted for nearly two-thirds of Amish society in America. One of the most controversial issues dividing the two sects was shunning.

By the end of the 1800s, the conservative Old Order Amish only had an estimated 5,000

An Amish man using horses to haul farm equipment in Lancaster County, Pennsylvania, around the late 1990s. While the farm equipment appears to be highly mechanized, it has steel wheels, which make it difficult to move. There are currently 27 Amish settlements in the United States and Canada; the community in Lancaster County is one of the largest.

members. Despite their small numbers dispersed across the continent, the Old Order Amish remained a remarkably close-knit community and retained commonality. They remained in contact not only through visits but newspapers that printed stories about different Amish communities.

The Old Order Amish is what dominates Amish society in the United States today. There are 27 communities in the United States and Ontario, Canada. The largest Amish populations are in Lancaster County, Pennsylvania; Holmes County, Ohio; and Elkhart and LaGrange counties in Indiana. Other sizable settlements are found in Missouri, Iowa, and Minnesota. There are, however, a number of Amish Mennonite groups that do not associate with the Old Order Amish, including the

Western Ontario Mennonite Conference, which no longer exists. Because their history is so deeply rooted in the European Mennonite Church, the Amish people have a Swiss-German ancestry.

A Culture All Their Own

The rejection of modern technology and luxuries is rooted in Amish mentality, which rejects pride, arrogance, and places a high value on humility. Access to electricity, automobiles, and modern appliances would theoretically create competition within the community for goods. Likewise, photographs or modern clothing might spark personal vanity. Particularly among Old Order Amish, weddings and ceremonies are simple events, and most do not even decorate a tree for Christmas.

One commonality among Old Order Amish communities is the strong sense of church tradition, which works to preserve family and community life. The Amish believe in bearing children and socializing with friends and family, as large families are viewed as a blessing from God. The Amish have a strong sense of community, and activities such as “barn-raising” bring them closer together. Barn-raising is a community effort in which all members of an Amish community gather at dawn at the site where a new barn is to be built. Typically, men are assigned work, women prepare meals, and children run around the site all day. In this community endeavor, a barn is built in one day.

As religion is the focal point of Amish society, the members celebrate most religious Christian holidays and often those not recognized by mainstream society. In addition to Thanksgiving, Christmas, Good Friday, and Easter, the Amish celebrate Ascension Day, Pentecost, and Whit Monday. However, their celebrations are modest, and observances include fasting and meditation on scriptures. On Christmas Day, the Amish have a solemn celebration; they observe a “second Christmas” on December 26, as a time to visit with friends and family.

Specifics within each Amish district differ. These may include the color of buggies and specifications to garments. Clothing remains the same among different Amish communities, as plain dress is seen as a sign of humility. In general, conservative Amish females wear modest dresses made from solid-colored fabric. Their garments include long sleeves, and dresses are never shorter than halfway between their knee and the floor. Rarely do they cut their hair, and it is kept fastened in a bun on the back of the head. To indicate they are single, women wear a black prayer covering, which looks similar to a bonnet, on their heads, while married women wear white ones. Likewise, males stick to plain fabrics for suits and often wear suspenders, black socks, and straw or solid black brimmed hats. Men typically grow beards after they marry.

There are three languages generally spoken by Amish followers. But the English language is becoming increasingly prevalent, particularly in the classroom setting, although Pennsylvania Dutch is used in group settings, and High German is used in church services.

Further distinguishing themselves from traditional society, the Amish do not pay into Social Security. In 1965, President Lyndon Johnson signed into law an amendment that exempted certain religious sects, including the Amish, from paying the tax. Based on religious principles, the Amish do not believe in insurance, either. They do pay sales and property taxes, as other citizens, although they are exempt from paying motor vehicle registration fees and motor fuel taxes because they only use bicycles and buggies on public roads.

Amish children are taught in a one-room schoolhouse operated by the Amish community. It is common that Amish children are not educated beyond the eighth grade, as it is thought that knowledge acquired up to that point is sufficient. There are few Amish children who go on to attend high school or college.

Rumspringa

In most communities, Amish teens experience a period of adolescence referred to as Rumspringa, which means to jump around, and is derived from the Pennsylvania Dutch verb *runspringen*. During this time, teens generally court and find a spouse and, moreover, decide if they want to stay with the Amish faith and become baptized or leave the community. While the majority choose to stay, those who leave experience modern conveniences and technology often for the first time in their lives.

This freedom sometimes leads them to experiment with drugs and alcohol, although this does not bar them from rejoining the community should they decide to be baptized. In Amish communities with a larger youth population, very often there are subgroups the more rebellious teens can join. The period of time one experiences rumspringa varies among different communities.

Popular Culture

There is often an interest or intrigue from outside the Amish culture regarding their lifestyle. Despite their aversion for modernization, the Amish have often been the subject of many popular culture songs, television shows, and movies.

In 1955, many caught a glimpse of Amish culture for the first time when the Broadway musical *Plain and Fancy* opened in New York City. In 1985, Amish culture was the plot for *Witness*,

a thriller featuring Harrison Ford that depicted a young Amish boy who witnesses a murder in Philadelphia while traveling with his mother. A policeman, played by Ford, goes into hiding with the family. The film received eight Academy Award nominations and won two for Best Original Screenplay and Best Film Editing.

On the small screen, the Amish became the subject of reality television when *Amish in the City* aired on UPN in 2004. The show depicted Amish teenagers living together in non-Amish society during Rumspringa and followed their decision of whether to join the church and be baptized. Although *Amish in the City* was controversial, another television show, *Breaking Amish* on TLC, with a similar plotline, aired in 2012. *Breaking Amish* follows five Amish people who have chosen to leave their roots and explore outside the strict Mennonite community. This show goes beyond following Amish youth on Rumspringa and shows individuals who have definitively decided they want to pursue careers and live outside the Amish community, although adjusting to a modern lifestyle is not easy. The show also gives a glimpse into the practice of shunning as these characters choose to leave their family and way of life behind.

Traditional Amish in a Modern Society

The Amish are one of the fastest-growing populations in the world with an average of seven children per family. The population had a 12 percent increase between 2008 and 2010, with a current population estimated at 249,000. Although statistics show the population steadily rising, it is difficult to accurately gauge how many members belong to the church, as Amish children are not baptized and therefore not considered members until they reach age 18. The community grew 84 percent from 1992 to 2008, and within that period 184 new settlements were established across six states.

As converts to Amish life are rare, and nearly all Amish descend from approximately 200 settlers from the 1700s, the population faces genetic disorders from inbreeding. Although rare, this form of inbreeding, known as the founder effect, primarily affects the mortality rate of children. Amish couples refuse to get genetic testing to discover if they have these disorders, however,

and accept this potential fate as God's will. Their orderly genetic history, however, is useful to researchers studying Alzheimer's, Parkinson's, and macular degeneration diseases.

Despite their growth, the Amish mentality continues to clash with the theme of individuality so predominant throughout American culture. Oftentimes, they have faced discrimination from their modern neighbors, including having stones thrown at their horse-drawn carriages. Conflicts have emerged between subgroups of the Amish community, as well. In September 2012, 16 members of the Bergholz, Ohio, Amish community were convicted of federal hate crimes for beard-cutting attacks against another Amish community. Although the police say attacks within the Amish communities are rare, the Amish are often reluctant to bring their cases to the local authorities and many cases may go undocumented.

Amnesty

An amnesty is an official act of forgiveness, or pardon, extended by the U.S. government for a past offense. Although various amnesties have been

issued by the government throughout the nation's history, such as President Jimmy Carter's 1977 unconditional pardoning of draftees who failed to comply with their military service obligations during the Vietnam War, the concept of amnesty in recent years has been most associated with illegal immigration. A controversial topic, some policymakers and media pundits have suggested amnesty as a possible solution to address the millions of undocumented aliens living and working in the United States, by extending legalized status to them. Such an idea generates intense opposition from critics of amnesty, who often counter that such a plan would serve as a reward, rather than punishment, for persons who entered the United States in violation of its immigration laws. Critics also claim that conferring amnesty to those living in the country illegally would encourage additional illegal aliens to settle in the United States by instilling in them the idea that they, too, might one day be beneficiaries of an amnesty. Supporters of legalization counter that under the status quo, several million undocumented aliens continue to live and work in the United States, which in and of itself represents a quasi-form of amnesty, even though the undocumented population is denied many rights and protections guaranteed to U.S. citizens and legal permanent resident aliens.

An estimated 11.5 million illegal aliens lived in the United States in 2011. However, more than 60 percent of this total had been residing in the nation since before 2000, thus indicating that many undocumented immigrants have established important social, cultural, employment, and familial connections in the United States. Although illegal immigrants come from virtually every nation of the world, Mexican nationals comprise the majority of undocumented aliens in the United States. Approximately 58 percent of the country's total undocumented population is from Mexico. Demographers and immigration scholars claim that net immigration from Mexico has stagnated, or possibly even declined, since 2010, as a result of worsening economic conditions in the United States that have impeded opportunities for undocumented aliens to find employment.

Nevertheless, the number of illegal aliens living in the United States increased 27 percent between 2000 and 2009, causing controversy and leading to concern and even anger in many local

communities throughout the nation in response to mounting fears regarding overcrowding, unemployment, crime, use of public services among the undocumented, shifting demographics, and the social, cultural, and linguistic impacts of migration on local towns and cities. As a result, immigration policy became a contentious political issue in the first decade of the 21st century, and President George W. Bush was forced to grapple with immigration more so than other presidents in recent decades. Growing opposition to illegal immigration led several states and local municipalities to enact their own versions of immigration reform over the past 20 years, although most of these ordinances were subsequently struck down as unconstitutional in federal courts. Amid this tense political climate, elected officials in both the Republican and Democratic parties sought to find a plausible solution to the nation's immigration policy dilemmas.

The 1986 Immigration Reform and Control Act

Should Congress approve an amnesty for undocumented aliens, it would not mark the first time in history that the nation conferred a mass legalization on millions of illegal immigrants. The number of illegal immigrants residing in the United States increased steadily throughout the 1970s and early 1980s, fueled by economic crises and growing unemployment in Mexico and the increased demand for low-wage, unskilled, undocumented labor by American employers. Following several years of debate in Congress, President Ronald Reagan signed the Immigration Reform and Control Act (IRCA) into law on November 6, 1986. Also known as the Simpson-Mazzoli Act after its two leading sponsors, Republican Senator Alan Simpson of Wyoming and Democratic Congressman Romano Mazzoli of Kentucky, IRCA represented a compromise between liberals and conservatives who held different positions on how the nation should best resolve the illegal immigration issue. In a nutshell, IRCA contained two major provisions: employer sanctions and a legalization program.

The 1986 law made it a federal crime for U.S. employers to hire illegal aliens and required employers to check a prospective employee's proof of legal residency before the time of hire. The act established sanctions in the form of fines issued by the Immigration and Naturalization

Service to punish employers who were found in violation of this provision. The employer sanctions plank had been advocated by labor unions and others on the political left since the late 1960s out of concern that large numbers of undocumented aliens undermined American workers through their willingness to accept significantly lower wages and poorer working conditions. Proponents of employer sanctions contended that most illegal immigrants entered the United States to find work; therefore, by making it illegal to hire undocumented aliens, the incentive to migrate would be eliminated and illegal immigration would decline.

The other major provision of IRCA established two categories of amnesty for undocumented aliens. The first category offered legalized status to those who could provide proof that they had lived and worked in the United States since at least January 1, 1982. The second amnesty, titled the “Special Agricultural Worker” program, granted legalization to undocumented aliens who had worked at least 90 days of agricultural labor between March 1985 and May 1986. Illegal aliens who qualified for the amnesty were given from May 5, 1987, to May 4, 1988, to complete the application process, and approximately 3 million undocumented workers attained legal permanent residency status under the 1986 act. Mexicans accounted for nearly three-quarters of those legalized.

Despite an initial reduction in Border Patrol arrests in the first few years after the enactment of IRCA, the law’s long-term effectiveness is highly questionable. The federal government has issued relatively few employer sanctions in the 25 years since the passage of IRCA, and such fines are so low (customarily \$1,000–\$1,500 per head) as to be largely inconsequential. Furthermore, the establishment of employer sanctions has given rise to the manufacturing of fraudulent Social Security and other identification cards. Opponents of amnesty point out that after the legalization of three million undocumented aliens under IRCA, the number of illegal immigrants in the United States increased to 5 million by 1996 and more than 12 million by 2009.

The McCain-Kennedy Bill

As illegal immigration grew substantially throughout the early years of the 21st century, the issue

emerged as one of the nation’s most controversial and emotion-laden social problems. In April 2005, a group of armed volunteers calling themselves the Minuteman Project began conducting citizen patrols along the southern Arizona border with Mexico to provide surveillance and assistance to the Border Patrol. Likening themselves to neighborhood watch groups, the Minutemen nevertheless drew criticism from immigrants’ rights advocates and even President George W. Bush, who referred to their tactics as vigilantism. The Republican-controlled House of Representatives passed H.R. 4437 in December 2005 along highly partisan lines, with most Republicans voting in favor the bill and most Democrats against. Nicknamed the “Sensenbrenner bill” after its leading sponsor, Wisconsin Congressman James Sensenbrenner, H.R. 4437 attempted to stiffen penalties on illegal immigrants and to increase scrutiny of certain legal immigrants by calling for the construction of a 700-mile fence along the U.S.-Mexico border, increasing undocumented presence in the United States from a civil infraction to a felony, and establishing criminal penalties for persons who “aided and abetted” undocumented aliens. The bill sparked massive protests among undocumented immigrants and immigrants’ rights supporters in New York, Los Angeles, San Francisco, Chicago, Houston, Phoenix, Atlanta, and other cities across the nation throughout spring 2006. Ultimately, H.R. 4437 did not make it out of the House of Representatives, as the U.S. Senate produced a very different immigration bill.

This bipartisan bill, sponsored by Republican Senator John McCain of Arizona and Democratic Senator Edward M. Kennedy of Massachusetts, made its way to the Senate floor in the spring of 2006. The McCain-Kennedy approach contrasted sharply with the Sensenbrenner bill in that it represented comprehensive immigration reform, which addressed many different aspects of immigration policy, rather than taking an “enforcement-only” approach. The McCain-Kennedy bill called for increased border enforcement, a crackdown on tourists and foreign students who enter the United States legally but overstay their visas once they expire (who account for 40 percent of all undocumented aliens), establishing stricter civil and criminal penalties on employers who hire undocumented workers, and establishing a

pathway to legalization for undocumented immigrants who paid a \$2,000 fine, learned English, and did not have a criminal record.

Despite strong support from President Bush and high-profile senators of both major political parties, such as Republicans Arlen Specter (Pennsylvania) and Mel Martinez (Florida) and Democrats Barack Obama (Illinois) and Hillary Clinton (New York), the McCain-Kennedy bill ultimately failed to pass in the Senate. The bill sparked condemnation from right-wing talk radio personalities, political pundits, and immigration control advocates, such as CNN host Lou Dobbs, who demanded a stringent, enforcement-only approach toward illegal immigration. An attempt to revive the McCain-Kennedy bill during the 2007 legislative session also proved futile.

The DREAM Act

An additional legislative bill aimed at legalizing the status of certain undocumented immigrants is the Development, Relief, and Education of Alien Minors (DREAM) Act, which has been introduced in several sessions of Congress over the past decade but has never been approved by both the Senate and House of Representatives. First introduced in 2002 as a bipartisan initiative by Republican Senator Richard Lugar of Indiana and Democratic Senator Dick Durbin of Illinois, the DREAM Act would grant legalized status to younger-generation undocumented aliens who were brought to the United States illegally during childhood by their parents or caretakers. In exchange for legal residency, such persons would be required to fulfill certain educational or military requirements. Different versions of the DREAM Act have been presented for debate in various sessions of Congress over the years. The last version, which came up for congressional vote in December 2010, contained the following stipulations to qualify for the DREAM Act: an individual must have entered the United States when they were 15 years old or younger, be between ages 12 and 35 to apply for legalization, must have lived in the United States for five years, and must hold a high school diploma or general education degree. Furthermore, such individuals must either earn a bachelor's degree from a four-year college/university or serve six years in a branch of the U.S. military with an honorable discharge.

Despite much optimism heading into the congressional vote, the DREAM Act failed to muster the mandatory number of votes for the president to sign it into law. The Democratic-controlled House of Representatives passed the DREAM Act by a 216–198 vote on December 8, 2010, setting the stage for the Senate's crucial vote on the bill. However, the Senate (also controlled by the Democrats) came up five votes short of overcoming a Republican-led filibuster designed to kill the measure. President Obama has repeatedly expressed his support for the DREAM Act, once declaring that the bill “is not only the right thing to do for a group of talented young people who seek to serve a country they know as their own by continuing their education or serving in the military, but it is the right thing for the United States of America.”

The challenge of passing the DREAM Act stems from the unyielding opposition of Republicans who decry the bill as another attempt to reward lawbreakers, the concerns of moderate Republicans and Democrats who fear that expressing support for the DREAM Act will result in a political backlash from their constituents, and the shrill anger against illegal immigration expressed incessantly on right-wing talk radio and other media outlets, which invokes discourses of Spanish-speaking migrants as a “threat” to the United States and constructs illegal immigration as an alleged “life-and-death” struggle for the nation. One California Republican congressman referred to the bill mockingly as the “Nightmare Act” during the House debate.

Recent Developments

Despite its defeat in 2010, supporters of the DREAM Act remain hopeful that the U.S. Congress will eventually pass the bill. During the 2011–12 Republican presidential primaries, former Massachusetts Governor Mitt Romney repeatedly expressed his disapproval of the DREAM Act. In December 2011, Romney declared that he would veto the DREAM Act if he were elected president, and in a televised September 2011 debate in Florida, Romney criticized Texas Governor Rick Perry, a conservative Republican, for Perry's support of the DREAM Act. On June 15, 2012, President Obama issued an executive order that suspended the deportations of young undocumented

migrants who were brought to the United States before the age of 16 but who are younger than 30 years of age, have earned a high school diploma or have served in the military, and do not have a criminal record. Romney criticized Obama's order as an election-year political stunt, although Romney eventually softened his tones on the DREAM Act and immigration policy while attempting to court Latino voters in the later stages of the 2012 election.

It is also important to note that illegal immigration, particularly from Mexico, has decreased significantly in recent years. The estimated 11.5 million undocumented aliens residing in the United States in 2011 marked a decline from more than 12 million in 2007. Experts also contend that illegal immigration from Mexico was at net zero in 2012, as a result of fewer Mexican workers entering the United States and an increased number of Mexicans returning to their homeland amid worsening economic conditions and job prospects north of the border.

Amos 'n Andy Show, The

Originating at WGN in Chicago, *The Amos 'n Andy Show* was one of the longest-running and most successful radio shows in the history of American broadcasting. At the peak of its popularity the show attracted between 30 million and 40 million listeners a night, six nights a week. It was required listening for legions of faithful followers. But the historical significance of the radio show is often overshadowed by debates regarding the racial politics surrounding the television version of *Amos 'n Andy*, which was created in 1951 and aired for two years until 1953. The legacy of both the radio and television programs is a contentious subject for many people who argue about the show's racial representations and the program's influence on listeners and viewers.

Freeman Gosden and Charles Correll, the creators of *Amos 'n Andy*, first met in Durham, North Carolina, where they began their lifelong relationship as professional collaborators and close friends. Gosden, originally from Richmond, Virginia, and Correll, from Peoria, Illinois, worked together for the Joe Bren Producing Company traveling the country as performers. By 1926, they capitalized on this experience by creating and starring in the *Sam 'n Henry* radio show for WGN in Chicago. The two white actors played the roles of black men. They created these characters because they felt strength in their performance abilities rested in imitating the black southern voices they had become familiar with through their travels.

Sam 'n Henry became a popular radio show in Chicago, and Gosden and Correll wanted to expand the show's reach to additional areas of the country. After proposing the new concept of national syndication to WGN, they were turned down and decided to move on after their contract expired. The pair then teamed up with WMAQ, which was willing to take a chance on syndication. The characters of Sam and Henry were the property of WGN so the pair developed two new characters—Amos Jones and Andy Brown. Despite initially tough reviews, *Amos 'n Andy* gained popularity and in 1929 the program expanded to a national audience on NBC, becoming the first nationally syndicated radio show.

The stories of *Amos 'n Andy* were centered on the two men, who had relocated from Atlanta, Georgia, to Chicago, Illinois. In 1929, when the show went national, the location was changed to the Harlem section of New York City. Plot lines varied over the years, focusing on different characters and story lines that ranged from the romantic to the comically absurd. The main characters have been classified as stereotyped caricatures of African Americans. They included Amos Jones, a cab-driving family man; Andrew "Andy" Hogg Brown, his gullible friend; George "Kingfish" Stevens, a schemer and con man; Algonquin J. Calhoun, a shyster lawyer, Lightnin', a slow-moving and slow-talking janitor; Sapphire Stevens, wife of Kingfish; Sapphire's Mama, a domineering mother-in-law; and Madame Queen, Andy's girlfriend.

The historical significance of the radio program can be attributed to several facets of the show. *Amos 'n Andy* was groundbreaking radio because of its use of the serial format. It is credited as being the first radio program to use a continuing storyline in addition to continuing characters. Gosden and Correll devised new storytelling techniques that captivated audiences. Additionally, the show and its creators were pioneers in the concept of syndication, which is still in use today.

Seeking to capitalize on the success of the radio program, Gosden and Correll spent years redeveloping their show for television, and in June 1951 *Amos 'n Andy* first appeared on television. Actors were hired and the show featured the first all-black cast on television. The importance of an all-black cast was significant during a time when blacks were primarily found in supporting roles and portrayed as maids and chauffeurs. Now they were playing the roles of doctors, lawyers, and businessmen. In a period before civil rights events such as the Montgomery Bus Boycott, the Greensboro sit-in, and the March on Washington for Jobs and Freedom, the show provided hope by representing potential progress for race relations in the United States.

Despite this positive outlook by some, others held an opposing perspective of the show. The National Association for the Advancement of Colored People (NAACP) led a charge that the characters on the show were harmful stereotypes, and they called for the cancellation of the show. In an August 1951 Bulletin, they presented their

arguments that the characters showed Negro doctors and lawyers as unethical, women as vulgar, and men as lazy, dishonest, and inferior. They feared that these images would lead white people to think this was an accurate depiction of all black people.

After just two years, *Amos 'n Andy* the television show was cancelled. The radio program, in various forms, remained on the air until 1960 and reruns of the television show aired until 1966. In the decades since the shows concluded, there has been no consensus on how history should remember *Amos 'n Andy*. Whether the show was an insulting return to the days of blackface and minstrels or if it should be appreciated for its advances to radio and television will continue to be debated. Whatever the answer, the controversy highlights the changing and increasing complexity of race relations in America and brings attention to debates about the possible social impact of television representations.

Ancient Order of Hibernians

Founded in New York City in 1836, the Ancient Order of Hibernians is a fraternal organization for

Irish Catholics; it takes its name from the classical Latin name for Ireland. Fraternal organizations in the United States, evolving from tradesman organizations and Catholic “third orders” (religious orders of laymen), rose in popularity in the 19th century. They exploded in popularity around the turn of the century, when about half of all adult men belonged to at least one fraternal organization, with the average man belonging to two.

The use of Greek and Latin—as in the word *Hibernia* or the Greek letters used to identify the newly developed college fraternities—was common, as were claims of ancient origins, which were usually symbolic rather than literal. The word *fraternity* was consciously used to invoke the Greek word *phratry*, a social division within Greek tribes. While fraternal organizations of men bound together by religious faith or field of work continued, the trend of the 19th century boom in fraternal organizations was the growth in groups bound together by other criteria.

Rise of the Hibernians

In the case of the Ancient Order of Hibernians (AOH), the criterion was ethnic background. One of the largest groups of recent immigrants in the 1830s, when immigration from southern and eastern Europe had not yet picked up speed and the use of Chinese laborers by railroads and mines had not yet inspired the formation of anti-immigrant labor parties, the Irish faced considerable discrimination and poor treatment in the United States. Irish Catholics were the most numerous and the least assimilated, as Catholicism was viewed with suspicion in much of the United States.

Even Irish Protestants rarely associated with Irish Catholics because of frictions originating in their homeland. Furthermore, American public schools frequently used the King James Bible as a main textbook, and at the time, Catholics were forbidden by their church to read this Protestant translation. Given the enmity between Irish Catholics and the English Protestant culture out of which the King James translation had developed, this was an especially sore point for Irish Catholics.

The Know-Nothings and the Molly Maguires

The Know-Nothing movement developed in the 1850s, when the AOH was still young. The

Know-Nothings, an explicitly anti-Catholic political movement that sought to bar Catholics from public office, was responsible for many of the “Irish Need Not Apply” signs memorialized in photographs at places of employment. Anti-Irish discrimination and its effect on employment led to the development of the stereotype of the Irish as a laborer underclass, occupied mainly by construction and cleaning jobs, because these were the fields least likely to discriminate.

The benefits of the protection and camaraderie offered by a fraternal organization were significant. The AOH originally operated as a secretive group, as many fraternal organizations did. Its motto was “Friendship, Unity, and Christian Charity.” The group’s goals included promoting equal rights for Irish Catholics, ending discrimination against Irish Catholics, and furthering the cause of financial security for its membership. Groups like this provided networking opportunities and crowd-sourcing, which were otherwise unavailable to persecuted religious and ethnic groups.

The AOH is often associated with the Molly Maguires, and a number of men were members of both. The Molly Maguires was a secret society of coal miners that originated in Ireland and often employed violent vigilantism to pursue its aims. Members of the Molly Maguires formed a sister group in the United States, the nature of which has long been contested by historians. Many agree with the view that the American Molly Maguires were largely violent, with some further claiming that the AOH served mainly as a seemingly legitimate cover for the Maguires. This is the view of any historian defending the actions of the Pinkertons, the detective agency hired as violent strike breakers during the coal-miner wars of the late 19th century.

Other scholars either see a clearer divorce between the violent Maguires and the social organization of the AOH or see the actions of the Maguires in a less-critical light, especially in view of the conditions faced by coal miners and the tactics employed by mine owners. The negative view of the connection between the AOH and the Maguires often depends on contemporary accounts, which did not distinguish between labor union membership and violent vigilantism; both were threats to mine owners and other exploitative employers.

Home Ties

As with many ethnic fraternal organizations, the AOH retained ties to groups back home. It was related to the Catholic agrarian movements in Ireland in the 1700s and 1800s (groups that were the institutional ancestors of the Molly Maguires) and to the 1798 rebellion against British rule. An Ancient Order of Hibernians formed at some point in Ireland; history is not clear as to whether it predated the American branch, but it did attain significant numbers by the end of the 19th century. Later in the century, the AOH had strong ties to the Home Rule League, which was founded in 1873 to further the cause of home rule for Ireland and developed into the modern Irish Parliamentary Party.

Controversy and Growth

The AOH experienced a tumultuous period of division in the 1880s when the head of the order, National Delegate Jeremiah Crowley, became unpopular with much of the membership after authorizing some much-protested expenditures. The dissidents appointed Francis Kiernan as Crowley's interim replacement in 1883, pending the national convention in May 1884. At that convention, one of Crowley's cronies, Henry Sheridan, was elected by a slim margin. Within three months, a new national convention was held, in which the national board was expelled by the membership over an assortment of issues, most of which concerned the American AOH's unacceptable degree of involvement in Irish politics. This led to a temporary split as various chapters aligned themselves with one of two different organizations, both of which claimed the right to be called the Ancient Order of Hibernians. The split continued until 1898, at which point the original leadership of each organization had left the spotlight and public life behind. Irish American Bishop James McFaul was able to mediate a reconciliation.

The dispute had created an animosity between the American and Irish orders, which remained for most of a century as the Irish insurrection of 1916 made Irish politics more controversial than ever among Irish Americans. The American community was deeply divided between those who wanted to support the insurrectionists in search of home rule and those who adopted a

noninterventionist attitude, which was especially strong in that era.

In 1981, American AOH President Jack Connolly made a symbolic visit to the AOH in Ireland, beginning the process of rebuilding diplomatic relations between the two bodies. Since then, Irish AOH members have participated in American St. Patrick's Day parades, and the two organizations have begun several joint projects, including a memorial to the victims of the Irish famine (which precipitated much of the Irish immigration to the United States).

The national convention of the order in 1908, held in Indianapolis, provided this definition of the order in the preamble to its constitution as follows:

The members of the Ancient Order of Hibernians in America declare that the intent and purpose of the Order is to promote Friendship, Unity, and Christian Charity among its members by raising or supporting a fund of money for maintaining the aged, sick, blind, and infirm members, for the payment of funeral benefits, for the advancement of the principles of Irish nationality, for the legitimate expenses of the Order, and for no other purpose whatsoever . . . Friendship shall consist of helping one another and in assisting each other to the best of our power. Unity, in combining together for mutual support in sickness and distress. Christian Charity, in loving one another and doing to all men as we would wish that they should do to us.

At the time of the convention, the order had 127,254 members, with an additional 56,000 or so belonging to the Ladies' Auxiliary. Today, despite the considerable decline in the popularity of fraternal organizations, the order has about 80,000 members.

The Ladies Auxiliary of the Ancient Order of Hibernians was formed in Omaha, Nebraska, in 1894, at which point the AOH had expanded considerably. The Ladies' Auxiliary went on to raise the money necessary to build the sculpture *Nuns of the Battlefield* in Washington, D.C., as a tribute to the nuns who tended to soldiers in the U.S. Civil War. Created by Irish sculptor Jerome Connor and finished in 1924, *Nuns of the Battlefield*

helped serve as a reminder of the benevolent actions associated with American Catholicism.

Architecturally significant buildings associated with the AOH include the St. James Church in New York City, where the order was first formed; Hibernia Hall in Davenport, Iowa, built in 1891; Hibernian Hall in Boston, built in 1913; and Hibernian Hall in Charleston, built in 1840 and listed as a U.S. national historic landmark.

Angel Island

Angel Island is the largest island in the San Francisco Bay and best known as an immigration station that operated between 1910 and 1940. The main gateway to the United States on the Pacific seaboard, Angel Island was a major point of landing for Asian immigrants, particularly the Chinese.

At the Angel Island Immigration Station, newcomers went through interviews with immigration officers, medical inspection, and temporary

detention in accordance with American immigration law. Some of them were denied admission and sent back to their country of origin. Angel Island illuminates the selective manner in which the United States admitted ethnically and culturally diverse immigrants to the nation in the first half of the 20th century.

By the early 20th century, Congress had passed a series of immigration laws that provided for the exclusion and deportation of foreigners on the grounds of prostitution, poverty, criminal offenses, contagious diseases, and subversive political beliefs. The Chinese Exclusion Act of 1882 in particular prohibited the entry of Chinese laborers into the United States. The Angel Island Immigration Station was built in January 1910 largely for the purpose of enforcing the Chinese exclusion laws, though the station processed other Asian, European, and Latino/a immigrants as well.

The implementation of immigration law at Angel Island consisted of several steps. When a vessel arrived in the port of San Francisco, a team of United States immigration and medical officers examined the condition of passengers and determined who could land instantly and who needed further inspection at the landing station. While cabin passengers, mostly European visitors or white American citizens, received inspection in the privacy of their rooms on the ship and were usually allowed to land without difficulty, steerage passengers, most likely to be Asian immigrants, endured humiliating and exhaustive public medical examination at Angel Island. Immigrants were also interrogated about their eligibility to enter the country. Europeans, returning residents who had proper documentation, and Japanese and Korean women who were joining their husbands in America were admitted relatively easily. Chinese immigrants, however, experienced longer and more detailed hearings because of the Chinese exclusion laws.

While their applications for admission were being processed, immigrants were detained at racially segregated residential facilities on Angel Island. At detention barracks, husbands and wives were separated and not allowed to see each other until they were admitted to the United States or ordered to return to their homeland. Mothers were allowed to stay with their children

who were under the age of 12, but boys over 12 were detained in the men's section. Life in detention was characterized by boredom and anxiety. Immigrants spent their time gambling, reading newspapers and books, or playing sports in the yards. Some detainees expressed their frustration by writing poems on the walls of barracks.

The Angel Island Immigration Station has been popularly called the Ellis Island of the West, but there were important distinctions between Angel Island and the landing station in New York. Ellis Island mainly processed immigrants from Europe, and most of them spent only a few hours or at most a few days at the station. Immigrants were

A large group of Asian boys gathered on the porch of the hospital on Angel Island in 1923. Detention on Angel Island could last for weeks and sometimes for more than a year.

selectively refused admission, but the overall purpose of Ellis Island was to let them in the country. Angel Island, by contrast, was designed chiefly for the reception of Asian immigrants, and its foremost purpose was the exclusion of Asians deemed undesirable. Also, detention on Angel Island could last for as long as weeks and even more than a year.

The operation of Angel Island came to a sudden end when a fire destroyed the immigration station in 1940. The remaining building was left abandoned for more than two decades. Beginning in 1970, community activists and descendants of Angel Island detainees developed a campaign to restore the history of Angel Island and preserve the station. In December 1997, the Angel Island Immigration Station was officially named a National Historic Landmark. With funding from the federal government and the National Trust for Historic Preservation, Angel Island was restored and opened as a historical site in February 2009.

Legacy

During its three-decade operation from 1910 to 1940, the Angel Island Immigration Station processed over half a million immigrants from 80 countries. The treatment of newcomers at Angel Island was driven by the racial, cultural, and economic ideology of who could, and could not, become members of American society. Like Ellis Island, Angel Island might have been a door to new freedom and economic mobility for immigrants. Yet for those who were denied admission, and probably for those who were admitted after harrowing inspections and detentions as well, Angel Island was a bitter indicator that not all immigrants were equally welcomed by the United States. Angel Island reminds us of the contested views of immigration that shaped the historical development of multicultural America.

Anglo-Powhatan Wars

When English settlers arrived on the eastern shore of Chesapeake Bay in 1607, they found a confederacy of around 30 Algonquian-speaking Native American tribes who took their name from the powerful Powhatan, the paramount chief. While the English were establishing Jamestown, Powhatan was expanding his area of dominance. From July 1607 to 1609, a policy of accommodation generally governed the relationship between the settlers and the Powhatan natives. The English needed the corn grown by the Powhatan-controlled tribes, and the Native Americans were interested in English goods. Trade between the two groups was disrupted only occasionally by outbursts of violence. By 1609, Powhatan was no longer satisfied with copper and beads; he wanted to trade maize for muskets.

It was also becoming clear that the Powhatans' view of land as communal was at odds with the English view of land as private property that could be claimed by walls and fences. The English, unwilling to trade in arms and stirred by a new charter that challenged them with converting the natives to Christianity, obtained the corn by force. For the next quarter century, except for brief periods of peace, Powhatan's confederacy and the English settlers were at war with each other. Three Anglo-Powhatan wars left the Powhatan chiefdom successively weaker until, by the end of the third war, it was destroyed.

Conflicts between the English and Powhatan's forces intensified in the fall of 1609, beginning the First Anglo-Powhatan War (1610–14). As

the colonists encroached on Algonquian land, it became clear to Powhatan that the English would not be content with Jamestown as a trading post. Powhatan laid siege throughout the following winter, leading to what came to be called the Starving Time. Rather than attacking the settlers directly, the Powhatans cut off their food supply. They slaughtered their hogs penned on an island a short distance down the river. They penned the settlers inside the fort, making it impossible for them to hunt, fish, or bargain for food.

As settlers began dying of malnutrition, survivors resorted to eating horses, rats, and snakes. According to some accounts, some even resorted to cannibalism. The English were at their most vulnerable at this point, but rather than attacking, Powhatan ended the siege in May 1610 so that the Native Americans could begin their spring planting. On May 24, survivors of the *Sea Venture* wreck arrived after a year marooned in Bermuda. They found only 60 of the Jamestown settlers alive.

With the arrival in June 1610 of a ship from England bearing reinforcements and a year's supplies, the English were reinvigorated. They attacked, burning Powhatan villages and executing women and children. They defeated the Nansmonds and Kecoughtans at the mouth of the James and the Appamattucks near the falls. In April 1613, Captain Samuel Argall captured Pocahontas, the daughter of Powhatan. Pocahontas converted to Christianity, and in April 1614 the English brought the message to Powhatan that his daughter planned to marry John Rolfe. The marriage sealed the peace.

Three years after the English victory in the First Anglo-Powhatan War, Powhatan abdicated his position of principal chief in favor of his brothers Opitchapam, the peace chief, and Opechancanough, the war chief. Pocahontas died in England in 1617, and Powhatan died the following year. The English used the years of peace to expand settlements and establish tobacco plantations along the James River. The English grew complacent. Then on March 22, 1622, Opechancanough's warriors attacked the colony and killed about one-third of the settlers. The Second Anglo-Powhatan War (1622–32) had begun.

The English responded by destroying Indian villages and crops. Attack and counterattack

became the pattern over a 10-year period. In sustained battles, Native American arrows proved no match for English guns. In one two-day fray with the English outnumbered more than 12 to one, the Native Americans suffered heavy casualties while the English had only 16 wounded soldiers. In 1632, a truce was arranged but tensions remained high. The attitude of the English toward Native Americans had been changed significantly by the second war. The idea of a people whom they could convert to Christianity and Anglicize in order to live harmoniously with them was gone. The goal now was to obliterate or enslave. The colonists continued to expand their settlement inland.

An aged Opechancanough watched the Powhatan population declining and his people being pushed farther and farther westward. Whether the Powhatans abandoned their land or surrendered to the English, the Powhatan culture was endangered. Opechancanough ordered another attack in 1644, the first attack of the Third Anglo-Powhatan War (1644–46). Fatalities among the colonists were higher than in the

surprise attack of 1622, but the English population had increased to around 15,000. The loss was less than 10 percent, and Jamestown was safe. The English counterattacked, burning buildings and crops and killing any natives they captured.

Within six months, the English had reclaimed all the plantations they had abandoned during the initial attacks, and they forced the Powhatans to retreat. Opechancanough was captured in late summer 1646 and shortly afterward was shot in the back in his jail cell in Jamestown. His death marked the end for the Powhatans. His successor, Necotowance signed a peace treaty in October 1646, ceding most of the tribes' remaining land to the English. The once powerful confederacy was forced to retreat to a reservation north of the York River.

In this sculpture, Pocahontas is shown saving John Smith, one of the founders of Jamestown, Virginia, from being clubbed to death in 1607. Chief Powhatan was Pocahontas's father, and is shown seated at the left. The first war between the Powhatans and English colonists lasted from 1610 to 1614. In 1612, Pocahontas was captured and held for ransom for peace. Peace was finally accomplished and sealed by the marriage of Pocahontas to colonist John Rolfe in 1614. This was the first known inter-racial marriage in Virginia.

Anglos

The term *Anglo* derives from the appellation *Anglo-Saxon*, which refers to the language and culture of the English-speaking inhabitants of the island of Britain in the historical era between the end of the Roman Empire and the Norman Conquest of 1066. In America, the expression more commonly designates Caucasian citizens of northern European descent. *Anglo-Saxon* has been in use since the 19th century, while the print usage of *Anglos* dates initially from ca. 1835–45.

In contemporary usage, Anglo is used to differentiate American citizens of non-Hispanic or non-Latino descent, particularly those who live in areas of the country with a substantial Hispanic or Latino/a population. This term is not limited to citizens of northern European descent but rather to those whose primary language is English and who self-identify as white. The term was popularized in the 1970s and was most used by Hispanic and non-Latino citizens to describe white Americans, and more broadly, white American culture. The term is not often used in areas of the country without a sizable Hispanic or Latino/a population. Additionally, the ethnic groups viewed as comprising the Anglos have varied, often for geographical and/or historical reasons.

The Colonial Era

Anglo-Americans formed the economic and political elite very early in the colonial era.

Nonetheless, early America was ethnically and culturally diverse. There remained a sizable Dutch population in New York and New Jersey, for example. However, though the terms *Anglo* and *Anglo-Saxon* had yet to gain prominence, ethnic, national, and sectarian tensions were long present between Anglo citizens and non-Anglo citizens. Roman Catholic migration was not encouraged by northeastern Anglo Protestants; they instead settled in Maryland and Philadelphia. Later, there were incidents of English mobs rising against Irish and Scots-Irish immigrants.

English became the primary language in virtually every colony by 1775. In 1790, when the first American census was conducted, it is estimated that 75 percent of the population was of an Anglo background, with the majority of this population tracing their lineage to England. These English Americans formed 48.3 percent of the total population of America, but they held numerical sway only in the northeast. In the mid-Atlantic and the south, they were a minority, although still influential as a political and social class.

The New Frontier and Texas

As the frontier expanded in succeeding decades, some areas were settled by nonwhite ethnic groups while other regions, such as Spanish-settled Florida and French-settled Louisiana, possessed an existing non-Anglo majority. By 1820, Anglo settlers had crossed through Louisiana and into the region then known as the internal province of Texas, a part of the Empire of New Spain. It was here that Anglos first encountered its Spanish-speaking, Catholic citizens. Over the next two decades, interactions between Anglo settlers and *Tejano* and *Mexicano* residents would shape culture, history, and national boundaries on both sides of a shared borderland.

Anglo-American migration increased after 1821 when Texas became part of the new nation of Mexico, now independent of the Spanish Empire. The political leaders of this region initially encouraged trade with the burgeoning Anglo community in order to bolster its own economic development. This was true not only of Texas, but also of the other northernmost areas of this country, including future New Mexico and California.

Texas, being the closest to the southwestern frontier of the American republic, was one of the

first areas to receive an influx of Anglos, including both small-time farmers as well as those seeking to transplant the large-scale cotton cultivation present in the American Deep South. While Anglos also branched out to the Spanish-Mexican settlements of the far Pacific coast and created the Santa Fe Trail linking Missouri with the Mexican state of Chihuahua, a great influx of Anglos had settled in this region by the 1830s, with some estimates citing 25,000 American citizens living in East Texas alone.

If any single event could be said to have had vast repercussions on the future Anglo-Mexican relationship, then the 1821 land grant to Anglo Stephen F. Austin remains pivotal. It not only sparked the Anglo settlement boom in Texas, it set in motion events that led to the Anglo establishment of the Republic of Texas in 1836. In 1820, Spanish authorities granted permission for 300 Anglo families to settle on a large tract of land situated between the Colorado and the Brazos rivers, a decision that the Mexican authorities then finalized the following year upon winning independence from Spain. Austin agreed with the Mexican authorities that Anglo settlers should adhere to the legal and religious codes already present. For their part, Anglo settlers were agreeable to emigrating from the United States, lured by vast areas of cheap land available at a fraction of the price of land in the United States. These initial Anglo settlers are often referred to as the “Old Three Hundred.”

Another reason for the initial welcome given to Anglo-Americans was that this region had only been sparsely inhabited by Tejano and Mexicano alike, due in part to attacks on each by the Plains Comanche. Some estimates of the Tejano population of 1821 are as low as 4,000 citizens. As there was little interest among Mexican citizens in resettling to these relatively wild and desolate northern provinces, this appeal to Anglo immigration appeared a prudent move. However, as Anglo settlement concentrated in Texas, the Mexicans began to rethink their initial overtures, fearful that a growing Anglo presence would undermine their own governing and cultural traditions.

Even in this initial phase of Anglo settlement, local authorities in what was then known as the Mexican state of Texas and Coahuila, sought to

codify its initial agreement with Austin via its passing of, in March 1825, a colonization law. This law reiterated that Anglos were to follow the existing system of governance, legal codes, and religious practice.

Meanwhile, Austin settled additional land grants with the authorities; by 1830, the Anglo colonies grew to 1,500 families. On April 6, 1830, Mexico prohibited further Anglo immigration. However, by this time other *empresarios* began to recruit Anglo settlement and, unlike Austin, they were less concerned whether these new arrivals would act in accordance with existing Mexican laws and social norms. Many of this second wave of colonists began to arrive after 1830, and tensions soon grew among the Tejanos already in the province, as well as with the central government in Mexico City.

Growing Tensions

Anglo-American settlement was also continuing apace throughout the West beyond Mexican Texas during this time period. Manifest Destiny, as Reginald Horsman points out, possessed a racial element in which the Anglo-American elite constructed the idea of whiteness as a marker of cultural and political superiority. As a term, *Anglo-Saxon* gained a new currency by the middle of the 19th century; bringing Anglo-Saxonism was often used as a rationale to annex lands west of the Mississippi River, including not only Texas and the southwest but also the Great Plains and the northwest. The term *Anglo*, inspired perhaps by American usage of the term *Anglo-Saxon*, began to be used along the southern borderlands by the Mexican authorities.

There were other factors present that were not strictly race related, particularly in Mexican Texas but throughout the borderlands, which delineated the Anglos from the Mexican and Spanish. For example, many Anglo immigrants continued to favor English and made no efforts to learn Spanish, which remained the official language for legal and business matters.

Second, while Austin’s 300 families agreed in principle to embrace the Roman Catholicism that was the state religion of the republic, many Anglos strayed from this promise early on. Considering that subsequent waves of Anglo settlement tended to be from nearby Deep Southern

states such as Alabama, Mississippi, and Louisiana in which the vast majority of Anglos were not only Protestant but from fundamentalist religions such as Southern Baptist and Methodist, which had long viewed Catholicism as outright heretical, a widespread unwillingness to practice Catholicism was inevitable.

There were also contrasting beliefs with regard to legal and military matters, with the Spanish long having favored an approach to each that was antithetical to the Anglo-American traditions rooted in British norms. Simply put, Anglos tended to favor democracy and individualism while the Mexicans tended to favor the authority of the church and state alongside communalist practices in which the family was foregrounded.

All told, differences between the Anglos on one side and Tejanos and Mexicanos on the other grew throughout the 1830s, culminating in the Texas Revolution and the establishment of the Anglo-dominated independent Republic of Texas in 1836.

Manifest Destiny and Anglo-Saxonism

One reason that the establishment of Texas Republic was successful lay in the sheer number of Anglos living there by 1836; by some estimates, 30,000 Anglo-Americans resided alongside an estimated 5,000 citizens of Mexican Tejano descent. For its part, the Mexican authorities refused to accept the new Anglo-dominated state on its northern border and skirmishes between the two entities continued until the formal annexation of the new Texan nation by the United States in 1845.

Here again, Manifest Destiny was in play, with the additional wrinkle that in order to annex Texas, the United States found itself fighting a war with Mexico between 1846 and 1848 after President James K. Polk made clear his intention to occupy part of the Texas Republic still contested by Mexico.

There had been a strain of hemispheric expansionism toward the south that had periodically expressed itself in American political and diplomatic circles. In 1767, Benjamin Franklin argued for Anglo expansion not into only Texas but Cuba. Later, President John Quincy Adams proposed to buy Texas for \$1 million in 1828; while he was thwarted by his diplomatic minister who feared a Mexican refusal and further deterioration of relations, the following year Andrew Jackson would

make another offer to the Mexicans. This offer was turned down.

Nonetheless, as American troops fought the Mexicans across Coahuila, Nuevo México, Chihuahua, and Alta and Baja California, it was only northern provinces that ultimately proved to be of Anglo interest, despite the brief flowering in 1846 of a movement known as the All Mexico movement, which advocated the annexation of the entire Mexican state. The proponents of the All Mexico movement in part saw it as a power play against the slaveholding states of the Deep South.

As with similar proposals made during this era to annex Cuba and the Yucatán, Anglo opinion preferred annexation of the relatively empty lands of New Mexico and California to the acquisition of a large, non-Anglo, population farther south. This alternative opinion was voiced in 1848 by South Carolina Senator John C. Calhoun, who opposed the annexation of Mexico for explicitly racial reasons. Despite the fact that proponents of Texas settlement and eventual annexation cited the spread of democracy and progress that would flourish in the wake of “Anglo-Saxonism” being brought to these regions by the Americans, there remained a contentious debate among the Anglo-American elite as to where and under what circumstances Anglo ideology should be exported.

After the War

The 1848 Treaty of Guadalupe Hidalgo ended the Mexican-American War and created the present social and political boundaries of the United States and Mexico. It also led to the new era of relations between the now dominant Anglos and the new Latino/a Americans, estimated to number 80,000 when the treaty was signed. While at times harmonious and at times fraught, this relation would prove enduring, well into the 20th century.

Across the new American southwest, Anglos settled in increasing numbers. While there were occasional episodes of violence between Anglos and Latino/a in Texas and northern California in 1850, 1860, and the 1870s, elsewhere relations were more peaceful. This tended to be particularly evident in the New Mexico Territory and in southern California where—as in the early days of Mexican Texas—there were relatively fewer

inhabitants overall as these areas of the country proved remote.

Nonetheless, there was a sizable contingent of Latinos living in New Mexico throughout the 19th century; Spanish presence in the region dates back to the settlement of Santa Fe in the 17th century. While some Hispanos—before and after 1848—hoped for better relations with the Anglo community, there were occasional outbreaks of conflict, including the Hispano–Pueblo Indian uprising in Taos in 1847. While the Anglo community remained small in number, U.S. forces won a series of battles and the region became the territory of New Mexico in 1850. As in neighboring Texas, the Hispano/a and Latino/a communities attempted to preserve their long-standing cultural and religious practices amid a burgeoning Anglo hegemony.

The arrival of the transcontinental railroad in the 1870s opened up these last areas to Anglo settlers. While border relations between Anglo-Americans and Mexico remained at times fraught with turmoil, by the end of the 19th century, relations appeared to improve. In the borderlands, the Latino/a population continued to grow, particularly in New Mexico, Arizona, and Texas.

Anglo Ideology in the Twentieth Century

As Latino/a citizens were gradually absorbed into the American mainstream, by the 1920s, the melting pot theory of assimilation began to gain currency among social scientists, an idealistic model with roots in both J. Hector St. John de Crèvecoeur's 1784 *Letters From an American Farmer* and Frederick Jackson Turner's 1893 "The Significance of the Frontier in American History," among others. This dovetailed with a new influx of immigrants from southern and eastern Europe that began in the late 1800s. Anglo identity broadened to include all northern European Caucasian ethnicities, which now identified itself in opposition to European ethnicities of southern, central, and eastern Europe. As the 20th century progressed, many of these ethnicities began to be absorbed in a larger Anglo identity, while non-white ethnic groups such as American Indians, African Americans, and Mexican Americans still resisted assimilation.

However, Anglo ideology has also been reassessed; some social scientists claim that American

history has been studied with many attempts to impose this model of Americanism upon non-Anglo citizens. A more recent term for this paradigm—one applied in a broader context than in Anglo-Latino/a relations—is Anglo-conformity. Anglo-conformity assumes that the presence of ethnic groups is subordinate to a single dominant group—in this instance, represented by the Anglo. Anglo culture was often conjoined with the ideology of "Anglo-Saxonism" throughout the 19th century, as we have seen. In contrast with the 18th and the 19th centuries, this ideology has now been critiqued on its own merits.

By the 1990s, there was a growing interest in a new field in ethnic studies, variously called white studies, whiteness studies, or white culture studies. One of the purposes of this field is to examine how Anglo racial-cultural modes have played out in American history. Mexican Tejanos used the term *Anglo* in the early and middle decades of the 19th century to denote the differences between their Spanish-Mexican cultural practices and the Anglo-American practices that gradually supplanted them. The term *Anglo* thus denotes a unique relationship between two ethnic groups with a specific history rooted in the conflicts that arose between the nascent Mexican Republic and the United States throughout the borderlands that separated the two countries.

Ethnic Classification in the 2010 Census

The 2010 census confirmed recent trends in population growth. Continuing the practice established in the 2000 census in allowing participants to identify as more than one race, the results of the census confirmed that 75 percent of the white population growth was accounted for by the whites who also identified as being of Hispanic origin. Meanwhile, the race group designated as "white alone" grew from 211.5 million in 2000 to 223.6 million in 2010. The percentage of the white alone group as a percentage of the total U.S. population declined slightly, however, in 2010: 72 percent rather than 75 percent as reported in 2000.

As defined by the census, the race "alone" population group refers to respondents who self-identified as one race on the 2010 census. This comprises individuals who marked only the "white" category and not one of the alternate "white-and" combinations. Also in 2010,

“Hispanic or Latino” was amended; it now stated “Hispanic, Latino or Spanish origin.” Finally, greater emphasis was made on the difference between race and ethnicity; for the purposes of the census, Hispanic origin was defined as an ethnicity and not as a race.

However, population of white “alone” or otherwise non-Hispanic whites declined in 15 states; two-thirds of northeast states, half of the states in the midwest, and several states in the south reported declines in Anglo population.

The white or Anglo population continues to be the largest American race group, even as it grows at a slower rate than the overall population. Here, the “white-and” race group signals a significant trend. Between 2000 and 2010, whites who identified as being of Hispanic origin increased by 56 percent.

Annie Hall

Annie Hall is a 1977 American feature film, written and directed by and starring Woody Allen in the lead role of writer Alvy Singer. The film’s tagline is “A Nervous Romance.” In the character of Alvy Singer, *Annie Hall* perfects the stumbling, neurotic New York Jew that Woody Allen had created as a character for delivering his stand-up

comedy routines. The film served to maintain and perpetuate many of the stereotypes in liberal New York Jewish culture, and would become one of the key texts referenced by later Jewish comics and in television series, such as *Seinfeld* (1990–98) and *Curb Your Enthusiasm*, which began in 2000 and is still running.

Woody Allen was born Allan Stewart Konigsberg on December 1, 1935, in Brooklyn, New York, the son of Martin and Nettie Konigsberg. As a teenager he began writing jokes for a local newspaper and went on to write his own material to perform as a stand-up comic. He wrote his first screenplay *What’s New Pussycat* in 1965 and directed his first film *What’s Up, Tiger Lily* the following year. He has had a prolific career, achieving considerable success as a writer, director, playwright, and musician. Allen has been nominated for 18 Academy Awards and won four.

Annie Hall won four Academy Awards in the 1978 Oscar ceremony: Best Actress in a Leading Role (Diane Keaton), Best Director (Woody Allen), Best Picture (producer Charles H. Joffe), and Best Original Screenplay (Woody Allen and Marshall Brickman). Woody Allen was also nominated for Best Actor in a Leading Role. Although *Annie Hall* is widely critically acclaimed, it is Allen’s later film *Manhattan* (1979) that more often features in the canons of the greatest films ever made.

Synopsis

Annie Hall is a fictional film that follows a few years in the life of Alvy Singer (Woody Allen). Alvy is contemplating his failed relationships, particularly dwelling on his affair with Annie Hall (Diane Keaton). Alvy and Annie are introduced by mutual friend Rob (Tony Roberts). They become romantically involved, Annie moves into Alvy’s apartment, and he encourages her to go into therapy, which she does. Their relationship sours, and Annie moves to California. Alvy visits her there but is unable to persuade her to reconcile with him. They argue, and he returns to New York. A few years later, they meet and reminisce about their time together.

Cultural Commentary and Criticism

Through a series of direct addresses to the camera, voice-overs, and flashbacks, *Annie Hall* presents

Woody Allen won an Academy Award for best director in 1978 for *Annie Hall*. In 2004, *Comedy Central* ranked Allen fourth on their list of the 100 greatest stand-up comics.

Alvy Singer as a neurotic man unable to find satisfaction in either his romantic relationships or in life more generally. In the title role, Diane Keaton as Alvy Singer's girlfriend Annie Hall won critical acclaim for her performance, and her distinctive unisex costume in the film sparked a fashion trend for androgynous clothing. Allen and Keaton were in a relationship for several years in the early 1970s, and he wrote the role of Annie for her. Like many of Woody Allen's films, *Annie Hall* is often interpreted as being an autobiographical account of his life and relationship with Keaton. He has stressed that this is not the case.

Annie Hall established Woody Allen as an auteur director with a distinctive style. In addition to frequently working with the same production team and actors, his trademark features include the use of long- and medium-range shots, as opposed to close-ups; the use of jazz and a

soundtrack by Dick Hyman; psychoanalysis; voice-over narration or direct addresses to the camera; and multiple references to cinematic classics. As in *Annie Hall*, the vast majority of Allen's films have been set in Manhattan, with California portrayed as a culturally impoverished and commodity-obsessed counterpart to New York's chic urban cosmopolitanism. Alvy claims that Hollywood is a city where "the only cultural advantage is being able to make a right turn on a red light." When Annie says that California is very clean, Alvy retorts that the reason is "because they don't throw their garbage away, they turn it into television shows."

Annie Hall is an intertextual and self-reflexive movie. It is intertextual because it refers to other media texts. For example, waiting for Annie outside a cinema, Alvy is hounded by an Italian American man who recognizes him as a celebrity. When Annie arrives, Alvy is relieved, claiming, "I'm standing with the cast of *The Godfather* here." This is a horizontally intertextual reference because it invites the audience to draw on their knowledge of stereotypical portrayals of Italian Americans in mainstream-genre movies. It is also vertically intertextual as it refers to a specific film in the genre, *The Godfather* (1972). Finally, it is self-reflexive because Diane Keaton, starring as Annie in *Annie Hall*, also played Kay Corleone in *The Godfather*. By inviting the audience to believe that Alvy is talking to Annie about *The Godfather*, a text in which the "real" Annie would know stars the actor being played by herself, the script draws attention to its own artifice and construction as a media text.

Anti-Defamation League

The Anti-Defamation League (ADL) is an organization that advocates nondiscrimination and equality of all people, with a special focus on Jewish people, culture, and heritage. Based in New York City, the ADL has 29 offices in the United States and three offices in other countries. The ADL was founded in October 1913 by Sigmund Livingston with the support of the Independent Order of B'nai B'rith, a Jewish service organization. The league's original motto was "to stop, by appeals to reason and conscious, and if necessary, by appeals to law, the defamation of the Jewish people."

The current motto of the league is "to stop the defamation of the Jewish people [and] to secure justice and fair treatment to all." The change of wording in slogans over the years illustrates how the organization evolved over time. As it exists today, the ADL attempts to fight anti-Semitism and other forms of bigotry; defend democratic ideals and protect civil rights; advocate support for Israel with policy makers, the media, and the public; and defend the security of the state of Israel and Jews worldwide. The ADL's ultimate goals are to secure justice and fair treatment for all citizens and to put an end to unfair discrimination against any body of citizens.

Goals of the League

The goals of the ADL are many, but they focus on the general goal of promoting tolerance for all peoples. The stated goals of the ADL are as follows: fighting anti-Semitism, bigotry, and racism; promoting civil rights; maintaining the separation of church and state; defending other religions; tracking extremism; and promoting Holocaust awareness and defending the State of Israel.

In its efforts to fight anti-Semitism, bigotry and racism, the ADL has opposed groups or

individuals considered to be anti-Semitic or racist. These groups and individuals include the (original) Nazis, the Ku Klux Klan (its factions and subfactions), Henry Ford, Mel Gibson, neo-Nazis, the American militia movement, and white-power skinheads. The ADL raises public awareness of these hate groups by releasing information and responses to public acts of bigotry. These releases include a yearly analysis of anti-Jewish activities in its annual *Audit of Anti-Semitic Incidents*. The ADL has long been a very strong proponent of civil rights not only for Jews but for a variety of other minority groups as well. During the 1960s the ADL was one of the organizations in the forefront of the civil rights movement for African Americans in the American southeast. In recent times, it has fought for fairness in Hispanic affairs, especially in the case of equal opportunity for immigrant children.

The ADL puts a major focus on religious freedom for people of all faiths; it expresses this by emphasizing the separation of church and state. As part of this emphasis, the ADL has taken a firm stance against teaching intelligent design in science classrooms. The league opposes these pseudo-theories on grounds that creationism and intelligent design are closely tied to religious beliefs and that government is prohibited from endorsing beliefs; thus, they should not be taught in science class. The league also opposes public school Bible curriculum. In a similar position, the ADL supports the legal precedent deeming displays of the Ten Commandments in public facilities unconstitutional, despite the prominence of the Commandments in Judaism.

In a merger of goals, the ADL supports the rights of lesbian, gay, bisexual, and transgender (LGBT) people to be married and legislation that would label crimes against LGBT people as hate crimes on grounds that many of the struggles of LGBT people are the result of bigotry and an improper relationship between church and state. The ADL was strongly opposed to Proposition 8, which would make same-sex marriage illegal in the state of California. The ADL also proved influential in the passage of the 2009 Matthew Shepard Act by Congress. This law makes it possible to define a criminal act as a hate crime if it was motivated by actual or perceived sexual orientation, gender, gender identity, or disability.

In addition to passing hate crime legislation and supporting same-sex marriage, the ADL seeks to end discriminatory employment practices based on sexual orientation.

While a primary concern of the ADL is to protect Jewish people, another key goal of the organization is to defend other religions. As part of this objective, the ADL has periodically made statements against the misrepresentation of other faiths. One such statement was in regard to the anti-Mormon film *The God Makers*. The ADL said that the statements in this film regarding Mormons and Mormonism would be unacceptable if they were made in relation to other religions (i.e., Catholicism or Judaism). The ADL continued by stating that films such as *The God Makers* were “a challenge to the religious liberty of all.”

The last, but certainly not least, goal of the Anti-Defamation League is Holocaust awareness and defense of Israel. The ADL firmly and consistently stresses the importance of remembering the Holocaust to prevent such an event from happening again. To these ends, the ADL vehemently fights Holocaust deniers and revisionists who seek to diminish the severity of the genocide against Jews and other groups during World War II. In recent times, the ADL has actively opposed ethnic cleansing and genocide in Bosnia and Darfur. In defense of Israel, the ADL opposes the development of nuclear weapons by Iran due to the repeated threats that Iran’s government has made against Israel. This goal is also pursued by supporting U.S.–Israel cooperation to strengthen the security of Israel.

Tracking Extremists

A major activity of the ADL is the tracking of extremists and the documenting of their stated goals and organizational culture. Toward this end, the ADL issues *Extremism in America: A Guide*. This publication is an encyclopedia of American extremists and it is continually updated. The guide provided information on topics as diverse as racist skinhead culture as it reached its peak in the 1990s and documentation of the illegal immigration debate strengthening neo-Nazi organizations.

As part of its programs that monitor extremists, the ADL assisted the Bureau of Alcohol, Tobacco, and Firearms (ATF) in an investigation

of individuals who planned to assassinate then presidential nominee Barack Obama. This investigation led to the arrest of two men with ties to the Supreme White Alliance hate group on charges of plotting to murder dozens of African Americans and plotting to assassinate Obama.

Notable Members

The accomplishments of the Anti-Defamation League would not be possible without its members. While many of the original members of the ADL came from legal backgrounds, the league of today also incorporates researchers, investigators, public relations specialists, and innumerable volunteers. The following individuals have played a particularly influential part in the activities of the ADL.

Sigmund Livingston (December 27, 1872–June 13, 1946) founded the Anti-Defamation League in 1913. His family emigrated from Germany in 1881, and he became a naturalized citizen of the United States in 1888. Over the course of his career, Livingston served as an attorney in the Chicago area, authored numerous books, and tirelessly addressed negative Jewish stereotypes. In the defining moment of his life, Livingston represented a Jewish factory manager in Georgia named Leo Frank. Frank was accused of murdering a young female employee. After being found not guilty, the manager was lynched by a mob unhappy with the outcome. Livingston established the ADL in 1913 in direct response to this incident.

Abraham Foxman has been the national director of the Anti-Defamation League since 1987. He was born May 1, 1940, in Baranovich in the Soviet Union (now located within the borders of Belarus). Facing heavy persecution, his parents were forced into a ghetto during World War II. Seeking to protect him, Foxman’s parents gave Abraham up for adoption to a Catholic family. While with this family, Abraham was baptized, given a new name, and raised as a Catholic. In his adult life, Foxman has received many awards from both nonprofit organizations and statesmen. However, for all his success, Foxman has often found himself in the middle of controversy. His most contentious public stances on issues include his support for LGBT rights, his opposition to an Islamic cultural center near Ground Zero of the World Trade Center attacks in New York City,

his criticism of former president Jimmy Carter's comparison of the separation of Jews and Palestinians in Israel to apartheid in South Africa, the portrayal of Jews in *The Passion of the Christ*, and other issues.

Robert Sugarman is currently national chairman of the Anti-Defamation League in the United States. He was educated at Yale University, then went on to Yale Law School. As an attorney, Sugarman specialized in First Amendment matters. Outside work, he is active in community and philanthropic work. Sugarman has also served as past president of Hillel of New York, among many other prominent positions. Sugarman claims a deep understanding of global terrorism, democratic values, and the State of Israel.

A Hub for Combating Prejudice

Due to the broad scope of projects pursued by the ADL, the organization has been involved in many hate-fighting projects. Organizations founded by the ADL include the Braun Holocaust Institute and the Hidden Child Foundation. The ADL also supports other groups that foster interfaith and intergroup relations, research groups, working groups, and advocacy organizations.

Over the course of its history, the scope and nature of the ADL's work has shifted several times. When the ADL was first established in 1913, it served to provide legal defense for Jews. Over its first decade, it also branched into battling the bigotry of the Ku Klux Klan and other American anti-Semitic organizations. During the 1930s and 1940s, the ADL joined coalitions to counter global anti-Semitism and established the fact-finding operations that would eventually become a core component of the organization.

After the Six-Day War, and continuing to the present, the ADL had put significant resources toward advocating for the State of Israel. Since then, the ADL has committed itself to fighting what it sees as Arab-originating anti-Israel propaganda and keeping America informed on facts about the Jewish state. The ADL currently puts much of its effort toward antiterrorist efforts both domestic and abroad. Groups targeted by the ADL include the Palestine Liberation Organization and the Ku Klux Klan.

The ADL goes to great lengths in developing and promoting educational projects. Topics for

these programs include law enforcement training regarding hate groups, youth leadership, anti-bias teacher training, and Holocaust awareness, among others. As part of its public education objectives, the ADL releases a variety of publications. One such publication was a list of the "ten leading organizations responsible for maligning Israel in the US." In the 1990s, the ADL regularly released reports on anti-Semitism and extremist activities from far left and right in its periodical *The Militia Watchdog*. This publication ran from 1995 to 2000; back issues of this publication are available on the ADL's Web site.

Since the Internet has become commonly accessible, hate groups have used it to espouse their views and grow in membership. For this reason, the ADL dedicates significant resources to online activities and has a significant presence on the Web. As part of its online activities, the ADL both monitors hate on the Internet and documents its findings for the benefit of the public. This documentation includes an extensive online visual database of hate groups and their symbols, logos, tattoos, and other aspects of their organizational culture. Data collected in this database include graphic symbols, acronyms, number symbols, tattoos, anti-Semitic conspiracy theories, recruitment tactics, and white power music.

The ADL also works to prevent acts of hate on the Internet through a variety of prevention programs. These activities include the online publication of the "Parents Guide to Hate on the Internet," which explains various aspects of cyberbullying and other problematic behavior. In addition to this guide, the ADL engages in an educational initiative on trickery, trolling, and other online threats. The ADL also maintains the Law Enforcement Agency Network, which serves as a resource for law enforcement agencies in combating hate groups and hate crimes.

Criticisms and Controversy

Though its stated goal is the advancement of all people, the activities of the ADL are not without conflict with individuals or groups. These conflicts range wide on the political spectrum, from the Far Left to the Far Right. Over the course of its long history, the ADL has come into conflict with many individuals and groups over a wide variety of issues.

In the later part of the 20th century, a concept arose among the leaders of the ADL that gave birth to much controversy. The concept is called the New Anti-Semitism. It states that anti-Semitism has revived itself among leftists and academics in their overly harsh criticism of the State of Israel and its right to exist. Those who insist on the existence of the New Anti-Semitism hold that critics of Israel often make unfair statements about Israel that would not be made if not for Israel's tie to Judaism. Proponents of the New Anti-Semitism argue that these criticisms are simply manifestations of suppressed feelings of hatred toward the Jewish people.

Critics of the concept of New Anti-Semitism argue that it too closely ties criticisms of Israel with anti-Semitism. They also argue that the concept of New Anti-Semitism trivializes the meaning of the term *anti-Semitism* and exploits the concept to silence debate. The ADL has repeatedly claimed that Israel should be open to criticism, but some criticism is indeed anti-Semitic. However, the difference between anti-Semitism and objective critique of Israel has often proved difficult to differentiate.

Noam Chomsky, the ardent leftist author and activist, has criticized the ADL for its responses to leftist critiques of the State of Israel. He states that the ADL is all too ready to label any criticism of Israel as anti-Semitic. Chomsky points out that this is particularly absurd due to the human rights philosophies held by the individuals and organizations the ADL has labeled anti-Semitic. Over the course of his human rights work in the 2000s, former president Jimmy Carter came into conflict with the ADL. In his book *Palestine: Peace, Not Apartheid*, Carter compares the treatment of Palestinians in Israel to the treatment of blacks in South Africa during apartheid. The ADL saw this as an unfair and unjust characterization of the State of Israel with potential anti-Semitic origins.

Another controversy regards not the theory of the ADL but its tactics. The ADL has been known to deploy heavy surveillance techniques on other groups in efforts to root out hate groups. As a result, it has been accused of repeatedly overstepping appropriate boundaries with other organizations. Because extremist groups are secretive, the ADL admits that it uses undercover sources

who function in a manner much like investigative journalists. In this regard, the ADL states, "Our mission is to monitor and expose those who are anti-Jewish, racist, antidemocratic, and violence-prone, and we monitor them primarily by reading publications and attending public meetings."

In the 1990s, some aspects of the ADL's monitoring activities became controversial, particularly the ADL's surveillance of nonextremist groups. These nonextremist groups include the National Association for the Advancement of Colored People (NAACP), the Council on American-Islamic Relationship, the Nation of Islam, the Jewish Defense League, the American Civil Liberties Union (ACLU), the United Auto Workers union (UAW), *Mother Jones* magazine, Greenpeace, Jews for Jesus, and others.

Anti-Miscegenation Laws

Anti-miscegenation laws criminalized both marriage and sexual relationships between people of European descent and non-Europeans, typically indigenous people and people of African descent. Colonial legislatures passed the first anti-miscegenation laws in the British North American colonies of Maryland and Virginia in the second half of the 17th century; assemblies in other British colonies quickly followed suit. These laws bolstered a racial divide that would persist from the colonial era through the 1960s.

The Supreme Court eventually ruled in *Loving v. Virginia* (1967) that anti-miscegenation laws violated the Constitution's equal protection clause. The *Loving* decision marked a permanent shift in U.S. race relations and has been regarded as a major victory for advocates of civil rights and marriage equality.

Effects on Politics, Economy, and Culture

Anti-miscegenation laws have played a critical role in the nation's political, economic, and cultural history. During the 17th century, the colonies of Virginia and Maryland grew increasingly dependant on plantation agriculture. Many laborers first arrived from England as indentured servants, contractually bound to work in the tobacco fields for a period between four to seven years. On completing their indenture, many of these former servants, often at odds with Native populations, settled the backcountry.

As a response to the impermanence of white servitude and conflicts on the frontier, colonists looked to Africa for a permanent source of labor. Within a generation slavery became associated with blackness, as whiteness became associated with freedom. Throughout this time, white lawmakers passed anti-miscegenation laws to clarify and strengthen the social hierarchy and segment the labor force into wage-earning, free white men and enslaved blacks; they also criminalized sexual partnerships with Native Americans, thus formalizing racial segregation. At the same time, individual rights, such as the vote and the acquisition and transfer of land and property (including indentured servants), configured U.S. citizenship

as a category almost exclusively reserved for white, able-bodied men.

Growth of Slavery

After the American Revolution, the relationship between race and slavery solidified further. Cotton supplanted tobacco as America's most profitable export, and many planters moved west to plant the crop in the fertile ground of the Mississippi Delta. By the middle of the 19th century, the southern economy was wholly dependent upon slavery, and many of the region's lawmakers, plantation owners, and writers grew ever more strident in their defense of the institution. Sociologist George Fitzhugh and influential politicians like John C. Calhoun, Alexander H. Stephens, Jefferson Davis, James Henry Hammond, and others asserted that people of African descent were inferior. Accordingly, miscegenation posed a threat to the labor system and the social order, both of which were rooted in a white supremacist ideology.

Eventually, the Civil War brought about the abolition of slavery by the end of 1865, and with it, new possibilities for freedom and equality emerged. Radical Reconstruction led to an unprecedented level of black political participation. Mississippi elected the nation's first two black senators (Hiram Rhodes Revels and Blanche Bruce), and southern states sent integrated delegations of representatives to state and federal governments.

Ku Klux Klan and Jim Crow

Due to the success of Republican-led Reconstruction efforts, disaffected Confederates organized paramilitary groups like the Ku Klux Klan (KKK) and the White Leagues. These organizations initiated a campaign of political terrorism against black politicians, Reconstruction advocates, and their white allies; they sought to "redeem" the south and to restore white rule. The KKK leveraged deadly violence, targeting anyone who was involved or expressed solidarity with Reconstruction. Black southerners, under the threat of death or torture, ultimately submitted to yet a new formation of white supremacy: Jim Crow. After white southerners suppressed African American political involvement, they passed several new measures that ensured segregation into the foreseeable future.

After reclaiming control of the south during the 1870s and 1880s, the so-called redeemers passed additional anti-miscegenation laws, or they simply reinforced the old ones. The Supreme Court legitimized these efforts in the *Pace v. Alabama* ruling (1883). Here, the court unanimously sided with Alabama's Jim Crow law prohibiting interracial marriage. The ruling declared anti-miscegenation laws constitutional and provided states the authority to criminalize all forms of interracial relationships. The court's decision rested on the interpretation of the Fourteenth Amendment's equal protection clause. Since "each offending person . . . white and black," the court ruled, received the same punishment, there was no violation of the amendment. This influential case presaged *Plessy v. Ferguson* (1896), when the court famously upheld racial segregation under the guise of "separate but equal." Together, the two rulings ushered in an era of federal nonintervention, paving the way for white-led state governments to pass racially discriminatory laws as they saw fit.

By the turn of the century, every western state (with the exception of Washington) had passed some form of anti-miscegenation law, criminalizing physical intimacy between whites and African Americans, as well as between whites and Asians, Asian Americans, and Native Americans. Meanwhile, every state in the former Confederacy had banned under the law all sexual encounters between two people who did not share a common race or ethnicity. At the same time, the north and most midwestern states maintained relatively liberal policies toward interracial, heterosexual partnerships. New York, Connecticut, Vermont, New Hampshire, Minnesota, and Wisconsin had never instituted anti-miscegenation laws; Pennsylvania, Massachusetts, Iowa, and Kansas overturned theirs before the Civil War; Illinois, Ohio, Rhode Island, and Maine had legalized interracial sex and marriage during the 1880s. Congress, on three separate occasions, voted against a constitutional amendment that would have made miscegenation a federal crime.

Mann Act of 1910

However, Congress did pass the Mann Act in 1910. The act provided law enforcement expansive powers to target anyone they believed to have engaged in sex trafficking, prostitution, or

"immorality," broadly defined. In practice, the act functioned as a means for federal authorities to police miscegenation. One example involved a famous African American boxer, Jack Johnson. In 1912 Johnson was arrested for allegedly violating the act. Yet, Johnson never engaged in sex trafficking or solicitation as his arrest seemed to have suggested. Rather, it was Johnson's consensual sexual relationship with a white woman named Lucille Cameron that authorities declared immoral. Facing jail time, Johnson and Cameron skipped bail and fled the country. Johnson eventually returned and served one year in federal prison.

The case illustrated the national taboo associated with interracial sex, particularly between black men and white women. Indeed, persistent stereotypes of lascivious black men provided much of the impetus for anti-miscegenation laws as legislators vowed to protect white women from what they claimed were the sexually predatory instincts of black men.

Vigilantism, Lynch Mobs, Eugenics, and Sterilization

The pervasiveness and strict enforcement of anti-miscegenation laws during the last quarter of the 19th century and first quarter of the 20th were part of a larger decline in the nation's race relations. Beyond the criminal justice system, vigilantism and extralegal violence was common. Lynch mobs attacked, maimed, or killed men of color accused of rape, sexual assault, or even consensual sexual encounters with white women. The KKK routinely terrorized black communities, in many instances receiving material assistance or tacit approval from local police departments throughout the south and midwest.

The Birth of a Nation, a successful major motion picture and landmark achievement in the history of American cinematography, presented the mythic narrative of white redemption following the Civil War, and it culturally sanctioned brutal violence directed toward African Americans. The movie, adapted from Thomas Dixon's novel, *The Clansman* (1905), depicted the rise of the Klan as a necessary and positive force that protected white society from so-called inferior African Americans who allegedly lusted for young, white women. The movie glorified and perpetuated white supremacy and fueled the

belief among many white Americans that punitive anti-miscegenation laws were required to maintain social order and keep African Americans from “mixing” with whites. The film remains an emblematic expression of the nation’s early-20th century racial nadir.

After World War I, the courts, as well as state and federal lawmakers, did not loosen restrictions on interracial marriage or other anti-miscegenation measures. In fact, racism gained a renewed intellectual standing as a result of the eugenics movement. Eugenics gained widespread acceptance in the American academy, and noted racial theorists such as Lothrop Stoddard, Madison Grant, and Harry Laughlin proposed that the “Anglo-Saxon race” faced decline if the nation permitted interracial and interethnic relationships. These figures lobbied federal and state government, and the courts bolstered anti-miscegenation and segregation laws and even ordered the sterilization of those who were deemed “unfit.”

In 1923, the Supreme Court ruled that Bhagat Singh Thind (*United States v. Thind*) was not “a white person” and thus ineligible to be a legal citizen of the United States. This ruling called into question whether white citizens could legally marry an “Asiatic,” all of whom were presumably not recognized citizens and thus subject to anti-miscegenation laws. Months following the *Thind* decision, Virginia passed its Racial Integrity Act in 1924 and began sterilizing citizens who were alleged to be “imbecilic” or racially contaminated. In reality, the state targeted mostly poor women (many of whom were white) who had given birth outside marriage.

The most famous victim of forced sterilization was Carrie Buck. After undergoing the invasive procedure, Buck sued Virginia for damages, and she demanded that the commonwealth halt the practice. The Supreme Court eventually ruled against Buck, upholding the right of Virginia authorities to sterilize citizens who allegedly compromised the state’s racial integrity. On the eve of World War II, 30 other states had passed, strengthened, or maintained some form of anti-miscegenation or sterilization laws.

Post-World War II Desegregation

Only after World War II did the popular consensus about interracial sex and marriage begin to

Boxer Jack Johnson with Lucille Cameron around 1921. Johnson’s relationship with Cameron, whom he later married, led to his arrest and eventual imprisonment under the Mann Act.

shift. The ideology of Hitler’s Third Reich was in fact based upon many of the same suppositions as the U.S. eugenics movement. Both deployed racial pseudo-science and biological determinism as means to justify power and control over minority peoples. Upon uncovering the horrific crimes carried out by the Nazis, the eugenics movement lost much of its credibility as European and American leaders recognized the genocidal impact of racist public policy.

At the same time, millions of people of color and their white allies demanded an end to Jim Crow, and they pressured elected leaders as never before to fulfill the nation’s democratic promises. Between 1948 and 1965, Harry Truman ordered the desegregation of the armed forces; the Supreme Court overturned *Plessy v. Ferguson*; and under President Lyndon Johnson, Congress passed civil rights and voting rights legislation. Still, southern lawmakers clung fastidiously

to their anti-miscegenation laws, making the policies among the last vestiges of Jim Crow era racism.

This changed in 1967, after an interracial couple, Mildred and Richard Loving, successfully challenged Virginia's Racial Integrity Act. A few years earlier, Virginia police had arrested the Lovings for violating the act, a felony charge that could have resulted in a one-year prison sentence. In response, the couple alleged that Virginia unlawfully discriminated against interracial couples. After quickly ascending the lower courts, the case was heard by the Supreme Court. Unanimously, the high court ruled in favor of the Lovings, thus reversing the 80-year precedent set by *Pace v. Alabama*. Anti-miscegenation laws, Chief Justice Earl Warren ruled, violated the Fourteenth Amendment's equal protection clause.

Accordingly, it was no longer lawful for states to ban heterosexual couples, regardless of whether they shared a common racial, ethnic, or religious identity, from marrying or engaging in consensual sexual relations. The *Loving* decision thus ended nearly 300 years of anti-miscegenation laws in both British North America and the United States.

Anti-Racist Education

Anti-racist education, also referred to as, anti-racist pedagogy, oppositional pedagogy, and antiracism education, is an educational movement that seeks to expose, critique, and eliminate racism, especially covert racism, in prekindergarten through 12th-grade schooling in order to bring about educational equity and equality for racial and ethnic minority students. Within anti-racist education, racism is understood not as a function of individual racial prejudice, but as an economic and social order built on the false notion that humans can be classified as biologically superior or inferior based on race.

Consequently, anti-racist education situates understanding of racism inside an often-unacknowledged classist system that reveals race as a social construct designed to perpetuate white privilege, rather than a biological reality. While the biological efficacy of race and, therefore, racism has long been scientifically debunked, because it has in the past served, and continues today to serve, to justify violent economic and governmental practices, its influence on modern-day societal organization persists, including in educational realms.

Racism as a Historical and Theoretical Problem

While anti-racist education has historically been, and continues today to be, discussed and practiced in myriad educational arenas in the United States, it has gained incrementally more acceptance in Canada and the United Kingdom. However, worldwide over it is still generally considered to receive far less attention and acceptance in mainstream educational contexts than other forms of antibias-oriented education. The marginalization of anti-racist education is a function of the perception, popularized through the neoliberal "color-blind" philosophies emerging in 1960s America, that paying overt attention to race is, in and of itself, racist. Perhaps ironically, this perception allows racism to persist unfettered by critical analysis or corrective action.

Anti-racist education is often described as a "radical" form of multicultural education, or as in contrast to the most prevalent forms of multicultural education. While progressive multicultural educators argue that a core feature of

multicultural education is that it is anti-racist, anti-racist educators maintain that this feature of multicultural education is, at best, subordinated in mainstream practice. As a consequence, the gap in academic performance, largely between Native American, African American, Latina/Latino, and Asian American students from particular ethnic groups, and most white students endures. From the perspective of anti-racist education, this disparity persists precisely because the most prevalent applications of multicultural education are divorced from a sociopolitical context and, therefore, do not take into account relations of power in society that produce, reproduce, and perpetuate educational inequities and inequality based on race and class.

According to anti-racist education scholar Julie Kailin, reformist multicultural education focuses on the symptoms of racism or on describing how things are, rather than on the causes of racism or by asking why things are the way they are or if they have to be that way. Anti-racist, multicultural education scholars Gloria Ladson-Billings and William Tate contend that this happens because scholars across academia have not yet developed a cogent theory for understanding race and racism. Going one step further, Marxist scholars argue that, in addition to being theorized, race and racism must also be “historicized,” or located in a historical context, so that “political economies” or the “structural relations of production” out of which race and racism have emerged are made transparent.

Conceptualizing Anti-Racist Education

Anti-racist education scholar and practitioner Enid Lee has historically and theoretically conceptualized anti-racist education as needing to engage and eradicate three racial and economic gaps: in academic performance, in academic experience, and in community responsiveness. She argues that power and its unequal distribution is responsible for the emergence, proliferation, and persistence of these gaps. While the racial and economic gap in academic performance is well known, it is often referred to as an achievement gap rather than a performance gap. As an achievement gap, the problem of poor educational performance of working-class students and students of color is located with, or blamed on,

the students themselves, their families, and larger economic and cultural communities, as well as the associated perceived lack of value for education among all members of these groups.

As a performance gap, the problem of these students’ academic underperformance is situated in the larger contexts of societal classism and racism, structural inequality in schools, and related discriminatory educational practices. Related to the academic performance gap, the academic experience gap examines the differential manners in which students from non-dominant economic and racial/ethnic groups are treated in schools, despite coming into schools with similar technical and dispositional preparation to succeed in school as their dominant group classmates. The experience gap reveals that school policies, structures, curricula, and personnel are predisposed to engage and affirm educational readiness in white middle-class students, but that they not only fail to do the same for these students’ minority counterparts, they also fail to even recognize that this readiness is present in minority students.

These failures are a function of the third gap, the lack of school-system responsiveness to working-class and/or minority communities, even when those communities are the geographic hosts to entire school districts, and even when the children from these communities constitute all or a significant majority of school student populations. Accordingly, rather than intentionally and proactively developing educational practices that seek to interrupt and dismantle negative social and economic trends in minority communities, schools are often the cause of these trends. For example, the erroneously perceived achievement gap in schools leads to student-experience gaps, which leads an array of talented students to leave school before graduating, leading these students into lower-paying and less intellectually satisfying lines of work, which leads, disproportionately, to the disenfranchisement of working-class and/or minority communities.

Other anti-racist educators characterize anti-racist education as a pedagogical approach for critically investigating, from the lens of societal power relations, the knowledge bases that inherently constitute and reconstitute class and race oppression. The goal of this investigation

is to deconstruct these knowledge bases in order to erect alternative views of reality that expose unequal relations of power and the institutional structures that enable them to persist. This conceptualization of anti-racist education also advocates moving beyond mere theorizing to engagement in transformative action in order to actually bring about a more economically and racially just social order. Accordingly, students are taught to think critically about injustices in the world in relationship to their learning across the curriculum, and then to apply this learning by taking “real world” action aimed at dismantling those injustices.

Kailin recognizes that in order for students to be able to think and act in these ways, teachers must be prepared to facilitate their development accordingly. Toward this end, she has articulated a conceptualization of anti-racist teacher education. In order to become anti-racist educators, pre- and in-service teachers must be engaged in varied examinations of racism and classism at the individual and institutional levels. Individual-level examinations must focus teachers on acknowledging and understanding their own class and race backgrounds, the social construction of “whiteness” and associated white privilege, their perceptions of classism and racism and the causes of both, classist and racist labeling and/or victim blaming, manifestations of racism in their relationships with students and their families, and their own teaching practice.

Anti-Racist Teacher Education

Institutional-level examinations must educate teachers about the history of race and racism in the United States and in U.S. schools; teacher and student demographics, school resegregation and the corresponding unequal distribution of educational funding and related resources, institutional racism and the organization of schools, manifestations of racism in schools and both student and teacher reactions to these manifestations, past and continuing representations of people of color in the media and the curriculum, student and parent perspectives on education and schooling, the negative impact of racism on white students, the working conditions of teachers, and the impact of standardization on teacher credentialing and student learning.

While realization of such an anti-racist teacher education program may seem idealistic or impractical, both anti-racist and anti-racism, multicultural educators maintain that the only real impediment is societal will; American educational policy makers, scholars, and practitioners have the knowledge, skills, and resources to make this vision a reality; what they lack is the resolve to do so. As a result, racial and economic gaps in education and related social problems continue, ensuring that the current oppressive social order remains intact.

Pioneering antioppression educator Paulo Freire argues that the persistence of structural oppression is a function of “false generosity.” Because those with the power to bring about institutional change are too well served by current

Anti-racist education is an educational movement that seeks to expose, critique, and eliminate racism, especially covert racism, in order to bring about educational equity and equality for racial and ethnic minority students.

social norms, even when they articulate commitments to change they fail to enact those commitments. Similarly, founding critical legal scholar Derrick Bell contends that “interest convergence” precludes significant transformation of the societal organization for the working class and/or people of color. To the extent that such transformation does occur, it does so only because it is perceived to, and actually does, benefit those already privileged by race and class stratification.

Generative Critiques

Critiques of the anti-racist education paradigm suggest that it is, at once, both buoyed and troubled by the persistence of racial categorization and racism in society. On the one hand, the case for anti-racist education is made; on the other hand, the possibility is raised that the approach is ineffective. Anti-racist education simultaneously argues that race is not real, but that it has inescapable impact on social power relations and the corresponding order. Accordingly, anti-racist education maintains that working-class students and students of color are quite educationally capable, but largely incapable of being educationally successful because of classism and racism in schools and society. A consequence of these juxtapositions, critics charge that anti-racist education has no real merit if nothing can change or, at least, if nothing significant does change.

However, similar contradictions emerge when change, however insignificant or significant it is perceived to be, does occur that could point to the efficacy of anti-racist educational efforts over the long term. For example, the election of President Barack Obama as the first president of known African descent in the United States has led critics of anti-racist education to proclaim that racism no longer exists, but not to conclude that anti-racist and other forms of antidiscriminatory education have played any part in reducing the individual and/or institutional prejudices that may have precluded this from happening sooner. Likewise, Obama’s presidency has been heralded as a sign of the declining significance of race in a now “postracial” American society, instead of being analyzed as an extraordinary exception to the continuing rule of racism: Obama was elected in spite of racism, not because racism no longer exists.

Anti-racist education has played an important role in bringing about greater educational equity and social justice, especially for students from historically underrepresented racial and ethnic groups in U.S. schools.

Anti-Semitism

Anti-Semitism refers to prejudice, discrimination, persecution, and/or hatred directed toward Jews on the basis of their ethnic or religious heritage. Although anti-Semitism dates back thousands of years to the persecution of Jews in ancient times by the Egyptians and Romans, hostility toward Jews in Western societies holds a particularly pernicious history since the medieval era. During the 14th and 15th centuries, for example, Jews throughout the predominantly Christian European continent were blamed for causing the bubonic plague (also known as the black death), accused of poisoning the wells and thereby contaminating the drinking water for Christians, and rumored to kidnap and eat Christian children. Popular myths at the time also held that Jewish men menstruated and that Jews were the offspring of Satan and, therefore, inherent enemies of Christianity.

The United States

Unlike European societies, the government of the United States has never institutionalized official anti-Semitic practices. However, this has not curtailed prejudice toward, suspicion of, or mistreatment of Jews in American society. Being of Jewish faith and heritage in an overwhelmingly Christian society marks one as an outsider to a certain degree, but many American Jews do not actively participate in religious practices. Throughout the history of the United States, Jews have experienced anti-Semitism on both religious and nonreligious grounds, ranging from ethno-religious slurs and name-calling to more malicious conspiracy theories, incidents of vandalism, and acts of violence.

As opposed to various monarchies and empires across Europe, the U.S. government never persecuted Jews or adopted anti-Semitic laws. Instead, anti-Semitism in the United States has consisted of privately held and informal prejudices, beliefs, stereotypes, and distrust of Jews, along with acts of violence and vandalism against Jewish persons and property. Although the federal government has never implemented anti-Jewish policies, various states enacted “blue laws” during the 18th and 19th centuries, which required businesses to remain closed on Sundays in accordance with its tradition as the Christian Sabbath and a day of rest. Such policies impacted Jewish merchants by

forcing them to close their businesses on a day that they otherwise could have worked. Most blue laws have since been repealed or are unenforced.

Anti-Semitism Before World War II

American anti-Semitism reached its peak during the 1920s and 1930s amid a social context of large-scale immigration, the “red scare” of communist revolution, and the economic despair of the Great Depression. Jews do not share a uniform physical appearance and are not a distinct biological “race,” but proponents of immigration restrictions and scientific racists during the early 20th century nevertheless labeled Jews as members of an allegedly inassimilable “Hebrew race” who posed a threat to the nation’s Anglo-Protestant cultural core. Such theories were advanced by Madison Grant, a prominent anthropologist and head of the Immigration Restriction League, who ominously warned that the nation was committing “racial suicide” through the influx of Catholic and Jewish immigrants from southern and eastern Europe. The Ku Klux Klan, the oldest active hate group in the United States, reached its all-time peak in membership during the 1920s, boasting an estimated four million dues-paying and robed Klansmen by 1925. The Klan had previously been confined to the south, where it persisted as a vehemently antiblack organization, but in the early 20th century, amid a heavy period of immigration, the Klan expanded its geographic reach into the northern and midwestern states and broadened its tactics to espouse an anti-Catholic, anti-Semitic, and anti-immigrant agenda.

Franz Boas, the father of American anthropology and himself a German Jewish immigrant, publicly challenged anti-Semitic and racist ideas. However, anti-Semites attempted to discredit Boas’s critiques of popular notions of racial inferiority by pointing out his Jewish heritage which, they claimed, delegitimized his work. Despite Boas’s challenges to anti-Semitism and racism, President Calvin Coolidge in 1924 signed a restrictive immigration act that severely limited immigration from southern and eastern Europe. Since most Jewish newcomers at the time hailed from Russia, the 1924 act dramatically reduced Jewish immigration to the United States.

Other prominent anti-Semites of the early 20th century included automobile industrialist Henry

Ford and aviator Charles Lindbergh, both of whom advocated Jewish conspiracy theories. Ford published volumes of articles titled “The International Jew: The World’s Foremost Problem” in his weekly newspaper, *The Dearborn Independent*, between 1920 and 1927 that accused Jews of a sinister plot to take control of the governments of different countries throughout the world.

The Nazi regime used these publications as propaganda during the 1930s, and the Third Reich awarded Ford the Grand Cross of the German Eagle (the Nazis’ highest accolade for a foreigner) in 1938. Adolf Hitler admired the automobile mogul for both his business acumen and rabid anti-Semitism, and a portrait of Ford hung inside the Führer’s private office. Ford later apologized for his anti-Semitic views. Lindbergh accused Jews of trying to persuade the U.S. government to abandon its position of neutrality and enter World War II so Jewish bankers and entrepreneurs could profit from industrial wartime production demands.

Father Charles Coughlin, a prominent Roman Catholic priest and radio personality, also drew praise from Nazi Germany for his fiery accusations on the airwaves proclaiming Jewish domination of American financial institutions. Coughlin also tried to justify the 1938 Nazi persecution of Jews during Kristallnacht. Ford and Coughlin each published versions of *Protocols of the Elders of Zion*, a Russian propaganda essay first written in 1903 that accused Jews of attempting to take control of all the governments of the world.

Jews also endured discrimination via exclusion from educational, professional, and social institutions in the first half of the 20th century. Harvard University and other elite private colleges and universities maintained strict quota systems to limit the number of Jewish students on campus and within faculty ranks, and many fraternities and sororities excluded Jews from membership.

Country clubs also commonly either barred Jews outright or limited Jewish membership to a minimum, as did professional occupations such as medicine, teaching, and engineering. Despite the pervasive stereotype of conspiratorial Jewish bankers, Jews were actually underrepresented within high-level management positions in the nation’s banking and insurance industries.

Anti-Semitism After World War II

Public opinion polls have consistently demonstrated that explicit anti-Semitic attitudes have diminished considerably among Americans over the past 50 to 60 years. For example, today nearly 90 percent of Americans say they would vote for a Jewish candidate as president, as opposed to less than 50 percent during the 1950s. Nearly two-thirds of Americans surveyed also agreed that Jews have enhanced the cultural life of the United States. On the other hand, one-quarter of Americans surveyed in 2004 blamed the Jews (rather than the Romans) for the crucifixion of Jesus, a 19 percent increase since 1997. Some scholars attribute this trend to the popularity of the 2004 film *The Passion of the Christ*, which has been criticized by some who believe the film portrays Jews as callous and ultimately responsible for Jesus’s death.

Although overt displays of animosity toward Jews may have diminished in American society following World War II, anti-Semitism has not disappeared from the nation’s social fabric. More than 1,700 anti-Semitic bias incidents occurred nationwide in 2005, including acts of vandalism, harassment, assault, and desecration of synagogues and Jewish cemeteries. On August 10, 1999, a 37-year-old white supremacist, Buford Furrow, opened fire inside the lobby of the North Valley Jewish Community Center in Los Angeles. Furrow’s rampage left one person dead and five more injured, and he later confessed that he intended the incident to serve as “a wake-up call to America to kill Jews.”

After declining in size and significance throughout the 1970s and 1980s, white supremacist organizations have reemerged over the past 15 years, facilitated tremendously by the relative anonymity of the Internet, which enables their rage-filled rhetoric to reach an ever-wider audience. White supremacist ideology is viciously anti-Semitic, rehashing long-standing conspiracy theories of Jews controlling the U.S. government (termed “Zionist Occupied Government”), along with the nation’s media and banking industries, as well as accusing Jews of promoting integration, multiculturalism, and “race mixing” in order to allegedly erode the nation’s white Christian heritage. Sociologist Abby Ferber observes that Jews represent the ultimate enemy for white supremacists, while

Martin Marger notes that stereotypes of Jews as “greedy” and “obsessed with money” remain common. Some white supremacists accused American and Israeli Jews of masterminding the terrorist attacks of September 11, 2001, in order to prompt the U.S. military to eradicate Israel’s adversaries in the Middle East. Adherents of this conspiracy theory erroneously assert that Jewish employees of the World Trade Center were instructed in advance to remain home from work on the day of the attacks.

The nation’s most notorious white supremacist and anti-Semite of the post-civil rights era, former grand wizard of the Ku Klux Klan David Duke, attempted to reform the Klan’s image in the 1970s by dressing in three-piece suits rather than the customary hooded robe and eschewing the nocturnal burning of crosses in rural fields in favor of making televised appearances on talk shows such as *Donahue* and *Jerry Springer*. Duke, who won election to the Louisiana House of Representatives in 1989, once suggested in an issue of his self-published newsletter that the United States should be redistricted into distinct “race nations” to segregate the different major racial/ethnic segments of American society. Duke called for the nation’s Jewish population to be relocated to Manhattan and Long Island, a territory he mockingly dubbed “West Israel.” Duke has repeatedly dismissed the Holocaust as a lie, hoax, or conspiracy invented by Jews, and his 1998 autobiography, *My Awakening: A Path to Racial Understanding*, alleges that Jews are responsible for most of the evil throughout the world’s history, that Jews control the national and global economies, and that Judaism is in a declared state of war with white Christianity.

While anti-Semitism remains ubiquitous in white supremacist ideologies, it also factors prominently into the rhetoric of some black nationalist figures, most notably Louis Farrakhan of the Nation of Islam. Over several decades, Farrakhan has referred to Jews as “bloodsuckers” in reference to accusations that Jews controlled and profited most from the transatlantic slave trade and the subsequent oppression of blacks in the United States. Like Duke and other white supremacists, Farrakhan has likewise claimed that Jews run the nation’s banks and media outlets. On *Meet the Press* in 2000, Farrakhan openly questioned the

patriotism of U.S. Senator Joseph Lieberman, the nation’s first Jewish vice presidential nominee, because he suspected that, if elected, Lieberman might exhibit greater loyalty to Israel than to America. During a speech delivered in June 2010, Farrakhan claimed that Jews were attempting to manipulate President Barack Obama, the nation’s first black president, from recognizing that blacks, rather than Jews, are the true descendants of the Israelites mentioned in the Bible and that blacks, therefore, have an inherent right to Israeli territory.

Tensions between Jews and African Americans came to a head during the Crown Heights riots in Brooklyn in the summer of 1991. On August 19, a station wagon driven by a Jewish man, Yosef Lifsh, struck two black children. One child, 7-year-old Gavin Cato, died in the hospital of injuries sustained during the accident. However, rumors circulated that the initial ambulance on the scene neglected to provide medical assistance to the wounded children in favor of treating Lifsh. These rumors enraged many black residents and led to three days of angry protests in which demonstrators chanted “Jew! Jew! Jew!” and threw bottles and rocks at police and bystanders. As it turned out, two police officers instructed medical personnel to remove Lifsh from the site in order to ensure his safety from the angry crowd, a move that was interpreted by onlookers as an indication that greater emphasis had been placed on a Jewish man’s safety than a black child’s life.

A 29-year-old Jewish man, Yankel Rosenbaum, was stabbed multiple times by a black protester during the first night of the riot; he died a few hours later in the hospital. The riot and its aftermath strained relations between Jews and African Americans in New York City, and one historian from Brandeis University labeled the 1991 Crown Heights riots “the most serious anti-Semitic incident in American history.”

Anti-Semitism has drawn the attention of Hollywood and independent filmmakers in recent years. The 1992 period piece *School Ties*, starring Brendon Fraser and Matt Damon, takes place at an elite, private, all-male preparatory school during the 1950s and illustrates how David Greene (Fraser), an outstanding quarterback recruited by the school for his athletic talent, struggles to conceal his Jewish identity from his inner circle

of bigoted Anglo-Protestant and Roman Catholic friends, as well as his white Anglo-Saxon Protestant girlfriend, who also holds anti-Semitic views. *American History X* (1998), a brutally honest look at white supremacist ideology starring Edward Norton, showcases the manner in which a good-natured teenage boy comes to adopt his vulgarly racist and anti-Semitic beliefs en route to becoming a murderous neo-Nazi. *The Believer* (2001), starring Ryan Gosling, is based on the real-life case of an Orthodox Jew who hid his true ethnic and religious heritage in order to join a neo-Nazi organization.

Apache

Apache are a group of related Native American nations of the southwest and the Plains states. In contrast, Apachean refers to both Navajo and Apache, who share related languages and traditional creation beliefs deeply rooted in their sacred land of the southwest.

Due to linguistic similarities across the Pacific northwest and northwestern Canada, some historians suggest that a migratory hunter-gatherer group descended from Canada to the southwest of what is now the United States from 1000 to 1500 C.E. and splintered off into several Apachean

Two Native American men stand in a doorway on the Mescalero Apache Reservation in New Mexico around 1936. Two Apache reservations, Fort Apache and San Carlos, were among the 10 largest reservations in terms of population in 2010.

groups. Regional, cultural, and linguistic groupings of Apaches include the Western Apache, Chiricahua Apache, Mescalero Apache, Jicarilla Apache, Lipan Apache, and Plains Apache. Federally recognized contemporary Western Apache Nations are now all located in central or western Arizona and include the Yavapai-Apache Nation of the Camp Verde Reservation, the Tonto Apache Nation, the White Mountain Apache Tribe of the Fort Apache Reservation, and the San Carlos Apache Tribe. Federally recognized Chiricahua Apaches are located with the Mescalero at the Mescalero Reservation in New Mexico, at the Fort Sill Apache Nation of Oklahoma, and at the newly acquired Fort Sill Apache Reservation in Arкета, New Mexico. Jicarilla Apache are located in New Mexico on the border with Colorado.

The Apache Nation of Oklahoma is the only exclusively Plains Apache people, although the

Lipan Apache of Texas came to occupy the southern plains of Texas and deserts of New Mexico and Mexico and as of a 2009 gained state recognition; they are headquartered near the southernmost Texas-Mexico border. A minority of unrecognized bands of Apaches still struggle for recognition throughout the southwest.

Apache Religion

Traditional religious beliefs among Apaches involve various related creation beliefs. For example, the Jicarilla recount how Black Hactin, the child of Black Sky and Earth Woman, created humankind, who eventually emerged from a lower world on sunbeam ladders into the present world. Apache origins have many variations that involve a creator, sometimes known as Giver of Life or Ussen; White-Shell Woman, White-Painted Woman, or Changing Woman; and her two children, Killer of Enemies and Child of Water, who rid Earth of evil represented by various monsters. Commonalities across Apaches include a belief in power gained by nonhuman spirits, an avoidance of ghosts, and the girl's puberty ceremony.

Apache spiritual leaders or medicine people can acquire their power through dreams, visions, and contact with power through physical manifestations, such as animals, or by the learning of complex songs and rituals. Apaches may approach a different healer, shaman, singer, or medicine person to ask for protection from enemies and illness, for the diagnosis of an illness, and for curing it. For many Apaches, Crown Dancers traditionally embody the Mountain Spirits who help guide Apache life on earth. Core ceremonial and historical knowledge is embedded in the landscape and can be evoked by place-names in ceremony, story, or song. In many Apache traditions, ghosts are avoided because they can harm the living unless helped along in their transition through a four-day ceremony.

In the girl's puberty ceremony among Western Apache, the transitional girl embodies Changing Woman and gains some of her healing and creative abilities, and longevity. The cane that the girls use in the ritual represents the long life that the ceremony will help them achieve. A second aspect of the girl's puberty ceremony, sometimes called a sunrise ceremony, is to maintain a pleasing, harmonious behavior through the rigorous

four-day event. Maintaining this demeanor is necessary for the ceremony to go well and serves as training to keep her balanced during future duties as matrilineal head of the family. A third aspect of the ceremony is to provide growth and physical endurance. Every day, the girl must run, perform household tasks, and undergo ceremonial molding by her godmother in order to develop into a strong and capable woman. Finally, the ceremony helps ensure abundance in the girl's future, as she gives gifts in abundance to the attendees and is showered with blessings of corn meal or corn pollen throughout the ceremony.

Apache Resistance in the 1800s

Like many Native Americans, Apaches have various long histories of military, political, and cultural resistance to colonization and assimilation. The Chiricahua Apaches are most famed for centuries of military resistance, even though many leaders sought earnestly to establish peace with the unpredictable United States, Mexican, and Spanish governments. In the 1800s, Mangas Coloradas (Dasoda-hae) was a famed leader of the Chihenne band of Eastern Chiricahuas. Cochise (Cheis) subsequently rose up as a leader of his Chokonen band of the Central Chiricahua.

Although not originally a war chief, Geronimo (Goyaałé) was of the Bedonkohe band of the Southern Chiricahua and a medicine man who gained fame in the last Native American prolonged war in the United States. Geronimo was a spokesperson for the Ndéndai war chief, Juh. He was aided by Lozen, a woman warrior, medicine woman, and sister to the Chihenne war chief Victorio. Lozen is one example of how Apache gender roles were sometimes flexible.

Contemporary Times

After decades of internment on reservations or prisons, assimilationist boarding schools, and U.S. control, Apaches slowly gained political power and recouped numbers lost to illness and war in the 1900s. The 2010 census listed the Fort Apache Reservation as the third-largest American Indian reservation in population at 13,014 and the San Carlos Reservation as the sixth-largest reservation in population at 9,001.

Like most Native American peoples, the majority of Apaches circulate through urban areas.

Contemporary Chiricahua Apache political leaders have included Wendell Chino, who was also half Mescalero Apache. He was elected leader of the Mescalero Apache Nation from 1955 to 1998, in an era that expanded Apache control over its own resources by expanding infrastructure, industry, and tourism. As president of the National Congress of Indians, Chino also became a national and international spokesman for tribal sovereignty. Another noted leader was Mildred Cleghorn (En-Ohn or Lay-a-Bet). Born during the imprisonment era of Chiricahuas, she lived to see federal recognition of her people and to become the first chairwoman of the Fort Sill Apache Nation.

Apollo Theater

Historical landmark and African American cultural symbol, the Apollo Theater at 253 West 125th Street in New York City was the most important venue for African American entertainers from the 1930s to the 1970s. A roll call of those who performed there reads like a history of popular music of the 20th century. One of its legendary attractions was Amateur Night, begun in 1934. It was both testing ground and launching pad for African American artists who defined

musical genres. The glory days ended by the mid-1970s, but a decade later the Apollo received landmark status. On Christmas Eve 1985, Amateur Night was reinstated, and in 2001, the Apollo began a major restoration and renovation of its façade and marquee and a new chapter in its illustrious history.

Origins

The building that became the Apollo Theater was an Irish music hall in the years after it was built in 1913. A few years later, it was Hurtig and Seamon's Burlesque Theater, where mostly white females, including most notably comedienne and musical star Fanny Brice, performed for an audience that excluded African Americans. In 1932, reformers closed burlesque theaters. Sidney Cohen bought the building in 1934 and reopened it as the Apollo Theater. Cohen's Apollo Theater was the first to provide entertainment by African American artists for an African American audience.

Frank Schiffman and Leo Brecher took over the Apollo in 1935. The Schiffman and Brecher families operated the theater until the late 1970s. During these years, African American legends and rising stars entertained Apollo audiences. In 1935, Bessie Smith, known as the Empress of the Blues, appeared for four weeks; they were her only live performances that year. Count Basie made his first appearance in 1937, but he regularly returned, entertaining Apollo audiences several times a year. In 1946, Lionel Hampton's band proved so popular that they played seven shows a day for seven days. In 1962, Berry Gordy brought the Motown Revue to the Apollo, with emerging stars like Marvin Gaye, Diana Ross and the Supremes, Smokey Robinson and the Miracles, Little Stevie Wonder, the Temptations, and Martha and the Vandellas. Aretha Franklin performed in 1971 for a series of sold-out concerts, and, in 1977, Parliament-Funkadelic, the funk music collective, became the last artists to appear under the Schiffman management of the Apollo.

Not all the stars were musicians. Comedians from Jackie "Moms" Mabley (the first female comic to play there) to Bill Cosby to Whoopi Goldberg to Chris Rock appeared on the Apollo stage, as did dancers such as Bill "Bojangles" Robinson and Maurice and Gregory Hines. The Apollo's own chorus line was considered the best

in the city. The theater was also the first, and for a time the only, theater in New York City to hire African Americans in backstage positions.

Amateur Night

But it is the theater's Amateur Night for which it is most widely known. Ralph Cooper is credited with starting the talent contest. He also served as the first master of ceremonies. It was his idea to use comedy to move the less talented offstage. Norman Miller was the first to don a costume and with a hook chase offstage contestants who earned the disapproval of the audience. Later, Bob Collins and Howard "Sandman" Sims took on the part. In the 1980s, C. P. Lacey, dubbed the Executioner by Cooper, assumed the role that he still held in 2012. Amateur Night at the Apollo became a Harlem institution. Broadcast by radio station WMCA early on, it was soon syndicated in 21 cities. The Apollo had a national audience.

From the beginning, the rowdy audience, who could embrace talent with wild enthusiasm or jeer contestants with raucous disdain, was an important part of the mix. Performing at the Apollo took courage. Luther Vandross was reportedly booed offstage four times before winning the audience on his fifth try. A 15-year-old Ella Fitzgerald was so intimidated by the dance act that preceded her that she changed her mind and sang instead. She won first place and a job as vocalist with the Chick Webb Orchestra that night. Within weeks she was recording "A Tisket, A Tasket," which became her breakthrough hit and a jazz standard. Sarah Vaughn quipped that she was more interested in the \$25 the winner received than discovery. She got both. First-time winners received \$200 in 2012. Gladys Knight and the Pips drove from Atlanta, Georgia, to New York for their chance on the Apollo stage, and Joe Jackson drove his five young sons from Gary, Indiana, to compete. Both groups went on to become Motown legends.

The list of artists whose careers launched from the Apollo stage on Amateur Night includes the most celebrated African American talent: Billie Holiday, Pearl Bailey, Otis Redding, Wilson Pickett, James Brown, Stevie Wonder, and Lauryn Hill. And their influence rippled in ever-widening circles to shape nearly eight decades of American popular music.

By the 1970s, support for the Apollo was declining. Social changes had opened new doors to African American artists, and pressure for Harlem businesses to be owned and operated by African Americans was growing. In 1977, the Schiffman family closed the theater. It was bought by the Harlem Urban Development Corporation in 1981. As Harlem's oldest theater, it received landmark status at federal, state, and city levels in 1983. Amateur Night was revived, and in 1987, *ShowTime at the Apollo*, the television show based on the original Apollo Amateur Night, began airing in syndication.

The Apollo Theater Foundation was established in 1991 through the joint efforts of state and local governments and the private sector. The foundation has honored the Apollo's legacy even as it has renovated the building, restored it as a leading performing arts venue, and extended its community outreach. The Apollo remains Harlem's top attraction, drawing 1.3 million visitors annually and inspiring the dreamers who still come hoping the magic of the Apollo will work for them.

Appalachians

The name *Appalachian* came from the word *Appalachee*, the name of an American Indian tribe in northern Florida, and can also refer to a mountainous region or its inhabitants. The Appalachian people come from a diverse group that includes Native Americans and migrants from England, Ireland, Scotland, Poland, Germany,

and North Africa. The Appalachian Mountains encompass a 200,000-square-mile region from southern New York to northern Mississippi, representing 410 counties and 23 million people.

History and Migration

Before the migration from Europe and Africa, the Appalachian region was populated by the Cherokee and Shawnee Indians for more than a thousand years. When settlers arrived in the 1600s, they found the coastal areas were overpopulated, so people started moving farther west and settled in the Appalachian Mountains. Due to the isolated geography, the Appalachians lived in an almost unchanging world from the 1600s to the late 1800s.

The majority of settlers in the southern Appalachian region came from England, Scotland, and Germany in the 1700s, seeking land, freedom, and new opportunities. By the late 1800s, large-scale logging and coal mining found their way into the dense, lush forests that held an abundance of fossil fuels. The technological advances of the era went largely unused and unnoticed by the native inhabitants. During the 1800s and 1900s, more people arrived from Ireland, Wales, France, Italy, Holland, and Africa, turning the area into a rich, multicultural region. It is difficult to make an accurate assessment of Appalachians because the group is not a recognized subcategory on the U.S. census. However, in recent years, many Appalachian counties in eastern Kentucky and West Virginia have experienced a population decline, according to 2010 census data, as this population began to move to midwestern cities like Chicago, Cincinnati, and Detroit, where they created entire urban neighborhoods with a distinct Appalachian culture.

Mystery of the Melungeons

While the Appalachian population includes people from Europe and North Africa, one group, the Melungeons, has been referred to as the lost race of Appalachia. There has been a mystery surrounding the origins of these dark-skinned Appalachian residents. Some speculate they descended from Portuguese explorers, or perhaps from enslaved Turks or from Gypsies. The term *Melungeon* has been used as a slur for a number of groups of mysterious mixed-race ancestry from New York to Louisiana. The claims of the

people that they were of Portuguese descent was likely used so they would remain free and retain the privilege of being white.

Census data from the Appalachian region during the 1800s shows a large number of people listed as “free persons of color,” neither black nor white. During this time, laws were put in place to penalize the mixing of races, and several court cases arose from the Melungeon designation. The idea of Africans or people of color owning land or working had negative connotations. A recent DNA study in the *Journal of Genetic Genealogy* has found that the families historically called Melungeons are the offspring of sub-Saharan African men and white women of northern or central European origin. It is estimated that there are several thousand descendants of the historical Melungeons today.

Values and Culture

The 20 million Appalachians today are by no means homogeneous. They may be found in rural or urban areas, work in coal mining, steel industries, farming, or holding positions as ministers, rabbis, artists, or lawyers. The communities of the central Appalachian region maintain the distinctive culture of miner-mountaineers. In its traditional aspects, this culture places a value on rural lifestyle and relative isolation. The people also place a strong importance on personal relationships and the church.

Mountain families are typically large and tend to settle close to one another. It is not unusual today to find families with four generations living side by side. They have their own music (bluegrass and folk), history, art, oral tradition, dialect, religious beliefs, and ideas of justice, education, and health. Competitiveness and boasting tend to be frowned on in rural Appalachia, and although success is not discouraged, people are expected to play down their achievements and not act as if they are “above” everyone else. Appalachians have distinct speech patterns, usually described as slow drawls. Many urban Appalachian youth are now mixing their Appalachian slang and dialect with that of the urban African Americans. Examples can be heard in the music of artists such as Eminem and Kid Rock.

Appalachians consider themselves proud Americans, yet seem to be less politically active than the general population. This may be due to

the historically harsh treatment of mine workers by their employers. Their American pride is sometimes expressed in the form of racism, in which nonwhites are seen as inferior or intruding.

Religion is valued highly by Appalachians and most Appalachians think of themselves as Christians. Because Appalachians treasure their rich oral traditions, these can conflict with educational institutions. Rather than viewing schooling as learning new knowledge, many Appalachians fear that schools may cause their children to give up or lose the traditional ways of life. This clash has led to lower educational attainments and high poverty rates in the region. Urban Appalachians live in highly polluted, low-income industrial areas (such as Detroit), and many rural Appalachian areas lack basic amenities, like running water and indoor plumbing.

Economy and Employment

The southern Appalachian Mountains have a great deal of natural resources, including, iron, coal, limestone, shale, oil, gold, silver, copper, lead, and marble. Because of these resources, Appalachians have an abundance of industrial jobs. Other jobs may include crafting and farming, although the basic geography of the region makes this sometimes difficult. Some of the major crops are tobacco, corn, cotton, hay, fruits, vegetables, and wheat. One of the biggest industries in Appalachia is coal mining. Due to this history of mining and the way in which coal mining companies control all aspects of the area (including housing, shopkeeping, and workloads), many miners do not trust people from outside their world. In the craftmaking industry, Appalachia is known for basket weaving, quilting, woodcarving, and making musical instruments, such as dulcimers and fiddles.

American economic trends since the mid-1980s have caused changes in the type of jobs and the level of pay available to those in Appalachia. Jobs in high-paying manufacturing and blue-collar occupations have declined, while jobs in the low-wage service sector increased. For many displaced workers who are able to find work in the service industries, they experience cuts in wages and benefits and a loss of seniority and the potential for advancement. Even within the service industries, automation is replacing the traditional workforce. Without access to higher paying jobs, the

majority of Appalachians have problems maintaining adequate incomes.

Media Portrayal

Several stereotypes have been developed over time regarding the Appalachian people. Sometimes referred to as hicks, rednecks, and hillbillies, the media has portrayed Appalachians as uneducated, backward, and slow.

No other region or group of people have been so misrepresented by the mass media. Cartoon characters, such as Li'l Abner and Snuffy Smith, and television shows like *Hee Haw*, the *Beverly Hillbillies*, and *Green Acres* have indelibly attributed these stereotypes of natural stupidity to anyone with an Appalachian accent. One only has to mention the movie *Deliverance* to trigger feelings of fear and violence in connection with this isolated group of people. Still, the region's fame or infamy has forced writers and critics to dwell on what has been done to Appalachia, rather than what Appalachia has contributed to the world. The region has contributed best-selling authors, such as Barbara Kingsolver, Charles Frazier, Homer Hickam, and Robert Morgan; entertainers (Lucille Ball), musicians (Patsy Cline), and

A farming couple near Barbourville, Knox County, Kentucky, in 1940. The 2010 census found that the population of Appalachian counties in eastern Kentucky and West Virginia is now declining.

scholars (Henry Louis Gates, Jr.). While television shows like *The Waltons* portrayed kind and loving families, most featured hillbillies trying to buy the White House, cuddling a pig, or rising from a corn patch to tell jokes.

Conclusion

The United States is home to many cultures. The fact that one group does not fit perfectly into the construct of Americanism does not necessarily merit a full-scale revision of multicultural paradigms. Appalachian Americans are not generally discussed in multicultural textbooks or thought of as a distinct cultural group, yet they exhibit major cultural differences when compared to the common social construct of white America. For this reason they continue to be marginalized, even in a time when acceptance of ethnic minorities and ideals of a pluralistic society are the norm.

founded in 1985 by James Zogby, a second-generation Arab American who was actively involved in Democratic Party politics, particularly the Rainbow Coalition. Zogby had previously been executive director of the American Arab Anti-Discrimination Committee, but had left after a conflict with its founder, James Abourezk, and founded the AAI as a way of continuing his activism. Zogby is the brother of John Zogby, a respected pollster and also a Democratic party activist. The AAI is divided into two segments, the AAI and the AAI Foundation, which are legally distinct but are highly integrated in their actions. AAI is highly focused on federal U.S. policy, and has a strong focus on actions in Washington, D.C., with a less substantial presence on the ground in other Arab American communities.

The AAI is a lobbying and policy-monitoring body. Bipartisan in framework, it focuses on monitoring U.S. policy toward Arabs in the United States and the Middle East. AAI publishes an annual Congressional Scorecard, which provides information about the voting records of all members of Congress on issues that it deems important to Arab Americans. In 2011, the relevant issues were the Arab Spring, Palestine, Lebanon, civil liberties, and immigration reform; From 2009 to 2010, they were Palestine, Lebanon, Iraq, civil liberties, immigration reform, and other pieces of legislation that were specific to the Arab world. AAI also assists Arab American candidates for office in their elections and keeps records of Arab Americans in elected offices, from the local to the national level. Finally, AAI conducts occasional opinion polling of Arab Americans, and is generally considered a prime source for information about Arab American public opinion.

Since 2001, the AAI has made statements opposing the restrictions on civil liberties imposed by the Patriot Act, the U.S. invasion of Iraq, Israeli policies toward Palestinians, and other elements of U.S. foreign policy. These are consistent with AAI's pre-2001 positions. These criticisms have earned the organization the ire of many U.S. citizens; in particular, in 2006 the organization received a series of violent threats in the form of voice mails and e-mails. However, AAI has also been criticized by members of the Arab American community for not speaking out on the issues in stronger terms.

Arab American Institute

The Arab American Institute (AAI) is one of the two most prominent Arab American lobbying organizations in Washington, D.C. The AAI was

The AAI Foundation focuses on education and research. First, it provides the most detailed demographic analysis of the Arab population in the United States available to the general public, although it is limited by its use of U.S. Census Bureau data. Second, it sponsors Yalla Vote, a voter-registration and get-out-the-vote campaign in major Arab American communities and swing states with Arab communities during the years in which there are presidential elections. Third, it helps organize the Arab American Day of Service, along with the National Network of Arab American Communities. Finally, it is involved in educational and public opinion outreach to non-Arab Americans, with the intention of improving understanding of Arab communities, culture, and life among non-Arabs.

The AAI Foundation has been involved with the Census Bureau as part of attempts by the Arab American community to alter the way that Arab Americans are racially and ethnically categorized by federal data. Since the 1990 census, AAI has been involved in efforts to encourage Arab Americans to respond to census instruments and give full information. This is particularly important because it is widely believed that official Census Bureau statistics drastically undercount the number of persons of Arab descent in the United States. (In its own estimates, the AAI triples the federal estimates.)

In advance of the 2000 census, in particular, the AAI was involved in a campaign to disaggregate the “white” designation to allow non-European persons classified as white to mark themselves as North African or Middle Eastern. This campaign was not successful. However, AAI has remained involved with the Census Bureau, and continues to advocate for better ways of counting Arab Americans. AAI remains a census information center for the Arab American community, and produces materials in Arabic and English about the census. Helen Hatab Samhan, former executive director of the AAI Foundation, regularly provides testimony before Congress and to the Census Bureau about the Arab American community.

The AAI has been criticized by members of the Chaldean, Assyrian, and Maronite Catholic groups for including these groups among its counts of people of Arab ancestry in the United States. The three groups are Christian minorities

in the Middle East; unlike other groups such as the Kurds and Armenians, they are Arabic-speaking, but remain culturally distinct.) In its demographic work, the AAI continues to include those groups in its estimates, but does so while explicitly mentioning their different identities.

Arab Americans

Arab Americans, those of Arab descent who share common language and heritage, can be traced to geographic areas outside the United States that encompass 22 countries in the Middle East, North Africa, and southwestern Asia. Arabs, primarily Christians, immigrated from Syria and other Arab countries to the United States in the 1880s during the period of the Ottoman Empire. They

worked as petit merchants and were illiterate in both Arabic and English.

A second wave of Arab immigrants, primarily Muslims, arrived after World War II. Since the 1940s and 1950s many Arabs arrived in the United States seeking education and economic opportunities, and most of them remained in the new homeland. Palestinians immigrated to the United States in great waves, especially during the displacement policy of the late 1930s and 1940s. However, the racial hierarchy in the United States and the political system that maintained it proved to be a grave hindrance to Arab immigrant assimilation until the 1940s. By the 1960s, several factors facilitated the rapid immigration of Arabs to the United States, including the Immigration Act of 1965, which eliminated restrictions on immigration; the Israeli-Arab war of 1967; and other conflicts in the Middle East.

The population of Arab immigrants in 1990 was 860,354. It reached 1,250,000 in 2000, an increase of 38 percent. By 2010, the population reached 1,680,000 million. More than 82 percent of Arabs in the United States are U.S. citizens. Despite the rapid growth of Arab Americans, they still make up less than half of 1 percent of the overall U.S. population, which, according to the 2010 census numbered 308,745,538 in 2010.

It is important to note that census data on Americans of Arab descent are classified either as "White" or "Other" with reference to their ethnicity or ancestry. However, there is no box for Arab Americans in the ethnicity section as there is for Asians or Hispanics. Thus, about 80 percent of Arabs are classified as white, while 17 percent are classified as white and another race.

Further, the U.S. census does not classify Arabs as a minority group. Yet many Arabs who have recently immigrated to the United States often tend to associate themselves with American minorities. Some authorities state that the data from "ancestry" responses still undercount the Arab American population, which, they argue, has climbed to almost 3.5 or 4 million.

Arab Americans live in all 50 states: 26 percent reside in the northeast, 24 percent in the midwest, 27 percent in the south, and 23 percent in the West. Arab Americans live mostly in California, Michigan, New York, Florida, Texas, New Jersey, Illinois, Ohio, Massachusetts, and

Pennsylvania. However, the majority of Arab Americans are concentrated in metropolitan areas such as Detroit (mainly Dearborn, Michigan, a suburb of Detroit), Los Angeles, New York, Chicago, Washington, D.C., and New Jersey. According to the American Community Survey (One-Year Estimates) conducted in 2010, Dearborn, in the Detroit metropolitan area, has the largest proportion or concentration of Arab Americans in the United States, accounting for nearly 41.7 percent (40,788 people) of the city's population in 2010. Comparatively, Arab Americans represent 0.9 percent of the population of New York and 1.1 percent of Los Angeles.

National Origins of Arab Americans

According to the 2010 U.S. census, the Lebanese, ranking first among Arabs with a population of 504,000, constitute almost 30 percent of the total population of Arab Americans. With a population of 197,000, Egyptian Americans are ranked second (more than 12 percent of Arab Americans), while Syrians, with a population of 159,000 are ranked third (constituting 9 percent of the population of Arab Americans). Ranking fourth are the Palestinian Americans, with a population of 104,000 (6 percent of the Arab population), while Iraqis ranked fifth, constituting 5 percent of the Arab American population. The Iraqi population in 2000 was 37,714, but in 2010 it increased to 101,000 due to the influx of refugees as a consequence of the American invasion and occupation of Iraq in 2003. Arab communities with smaller populations include those of Moroccan (78,000) and Jordanian (68,000) descent. The category of "other Arabs," whose population is 286,000, includes even smaller communities such as Yemeni, Sudanese, and Saudi Arabian, among others.

According to the 2000 U.S. census, 63 percent of Arab Americans were born in the United States. The Arab population was 57 percent male, whereas the total population of the United States was 49 percent male. Furthermore, the proportion of Arab males is larger than that of Arab females in all age groups through age 64.

Creating an Arab American Culture

Early Arab Americans recognized the importance of cultural societies and organizations in providing them with information and services necessary

for coping with their new American environment. They established the first Arabic newspaper, *Kawkab Amireca*, in the United States in 1892, followed in the early 20th century by societies such as the Syrian American Club and the Syrian Education Society, among other institutions, that served, supported, and united the communities. Other contemporary organizations established between 1960 and 2000 include the American-Arab Anti-Discrimination Committee (ADC), the Arab American Institute (AAI), the Arab American Action Network (AAAN), the Arab American National Museum (AANM, Dearborn), the Arab American Heritage Council (AAHC, Flint, Michigan), the Arab Community Center for Economic and Social Services (ACCESS, Dearborn), the Arab Cultural and Community Center (ACCC, San Francisco), and the National Association of Arab Americans (NAAA). Arab media and newspapers, such as Arab television and radio programs and the *Arab American News* (in both English and Arabic languages), have been established to actively serve Arab Americans in different communities.

Arab Americans are politically active and have been elected to political positions serving their communities. As voters, Arab Americans are concerned with jobs, health care, and the economy. Arab Americans are selective with regard to their political party affiliations. According to the Arab American Institute's report of a poll titled "Arab American Voters in 2010: Their Identity and Political Concerns," Arab Americans have shown a continually increasing trend toward support for the Democratic Party. In 2002, for example, 39 percent identified as Democrats, while 31 percent were Republicans. By 2010, Arab Americans who were Democrats constituted 50 percent of the Arab population, while those who were Republicans constituted 25 percent.

The Impact of September 11

The identity of Arab American is a forceful element unifying all Arabs living in the United States. Indeed, Arabs from different Arab or Middle Eastern countries have become familiar faces in many cities or areas across the country. The term *Arab American* connotes unity, notwithstanding the implicit multiplicity of these citizens. Arab American identity has especially become visible

since the events of September 11, 2001. Arab Americans have experienced a variety of forms of discrimination and stereotyping based on factors such as race and ethnicity, dress (especially the turban, veil, and headscarf), customs, and religion. Arab Americans have been viewed by Western media and many non-Arab Americans as being antidemocratic or in sympathy with terrorism. However, Arab Americans have seen in such crisis an opportunity to speak out, having faith in the pluralistic and free society of the United States, to educate and share information about their faith, lifestyle, and motivations. Additionally, the events of 9/11 have motivated people, Arab and non-Arab, to develop significant interest in the Arabic language. More than 50 percent of Arab Americans report speaking a language other than English. To be more specific, the number of Arab Americans who speak the Arabic language at home is 845,390, nearly 50 percent of the total Arab American population.

The negative stereotyping has further united Arab Americans to counter negative images and to portray themselves not only as Arab but also as American. In the mid-1990s, 51 percent of Americans of Arab descent described themselves as Arab Americans. However, the number of those who identified themselves as Arab Americans substantially increased to 62 percent in 2010. The percentage of Arab Americans who have stated that they are proud of their ethnicity exceeds 90 percent. Arab Americans have a strong belief that Arabs in the United States are more united than the Arabs in the Middle East.

Hybrid Identity

Arab immigrants have developed and expressed their Arab American hybrid identity in both public and private sectors. An Arab American hybrid identity has been shaped by many factors but particularly by continuing interactions between the culture of the new homeland and the traditions and conditions of the old homeland, as well as by the interplay between Arab Americans' perceptions of themselves and how others see them. However, the original identity gets weaker the longer Arab Americans are away from their country of origin.

Arab Americans have a mixture of Arabic tradition that extends beyond a specific country or

homeland. They have experienced a gradually emerging sense of unified identity, or reconfiguration of identities, framed by the American culture as well as by the deep consciousness of the tradition of the old homeland, encompassing, for example, the Arabic language, traditions or social customs, intimate family relations, religious values, cuisine, art, and music. With their multicultural orientations, Arab Americans have made significant contributions to American culture in science, philosophy, history, art, and literature.

Arab Americans are currently more visible through their success in economic, educational, political, and public domains. Many Arab Americans have achieved prosperity in business, academia, engineering, and other fields and as such have been successful and mainstreamed into U.S. society and politics. Arab Americans are more affluent than the U.S. population as a whole. For example, the median income for Arab American households in 2008 was \$56,331, compared to \$51,369 for all households in the country. Mean individual income was 27 percent higher than the national average of \$61,921.

Similar to the U.S. average, 60 percent of Arab Americans are in the labor force, with 5 percent being unemployed. Seventy-three percent of working Arab Americans are employed in managerial, professional, technical, or administrative positions, while 14 percent are employed in service jobs, compared to 17 percent of Americans overall. Most Arab Americans (88 percent) work in the private sector, while 12 percent are government employees. A larger number of Arab Americans (33.4 percent) than non-Arab Americans (17.9 percent) are involved in sales-related services.

Arab Americans are younger than the general U.S. population. Moreover, they are better educated than the average American. Over 89 percent of Arab Americans have obtained a high school diploma and 45 percent have obtained a bachelor's degree or higher. (On average, only 28 percent of Americans have obtained bachelor's degrees). In addition, 18 percent of Arab Americans have a postgraduate degree, nearly twice the American average of 10 percent; 89 percent of Arab American adults have at least a high school diploma. Moreover, according to the Arab American Institute, Arab American women

Over 82 percent of Arabs in the United States are U.S. citizens and 63 percent were born in the country. The overall Arab American population is 57 percent male, as opposed to 49 percent for the total population of the United States.

are some of the most highly educated women in the United States.

Family Relationships

Strong and intimate family and kin relationships are a common feature among Arab Americans. For example, more than 65 percent of the members of the working community in Dearborn came to the area because they had kin there. The strong commitment to family relations is also reflected in the fact that Arab Americans are more likely to be married than the total U.S. population; 61 percent of Arab Americans are married, compared to 54 percent of total Americans. The divorce rate among Arab Americans is 13 percent, compared to 19 percent among average Americans. Further, Arab American family size is larger than that of

the general American population. Arabs prefer to live in close neighborhoods, exchanging visits and showing hospitality and generosity.

Arab and non-Arab Americans openly share and participate in Arab International Festivals (in Detroit), Annual New York Arab American Comedy Festivals, Annual Arab Cultural Festivals (in San Francisco), and Arab American Festivals (in Phoenix), among other multicultural events. People from different Arab or home countries (such as Egypt, Jordan, Iraq, Lebanon, Palestine, Syria, and Yemen) may come together at the local mosque to pray for and lament the loss of young Arabs (or Arab Americans) who died while they visited their home countries and/or were killed in the war. Common features of the Arab culture identify the bond between Arab Americans and their homeland. For example, in many cities with substantive Arab communities, many grocery stores, bakeries, and restaurants have Arabic names such as Al-Amir, Baraka, Halal Pizza, the Shaikh, Mezza, Shatila, and New Yasmeen, among others.

Another common feature among Arab Americans is their ability to choose which elements of their original cultures they wish to keep and which they want to reject. They can choose how far they want to incorporate and assimilate into the mainstream American culture. For example, they enjoy sports, such as American football and hockey, have participated in sports, and eagerly talk about sports.

“Half and Half”

Although Arab immigrants share common culture, there are many differences among Arab Americans as individuals and as ethnic groups. For example, they adhere to different religions, including Islam, Christianity, and Judaism. They are also diverse in terms of economic, political, educational, and professional backgrounds and preferences.

Arab Americans encompass a highly diverse people ranging from the Egyptians, whose ancestry goes back 4,000 years, to people who more recently arrived as refugees. Many Arabs claim mixed ancestries. For example, there are Arab Irish Americans, Arab Italian Americans, and Arab German Americans. Arab Americans have multiple or “half and half” identities associated with particular Arab homelands such as Egypt,

Iraq, Jordan, Lebanon, Palestine, Syria, and Yemen, among others. However, Arab Americans do not say such phrases as “half Arab and half American,” but rather they use phrases such as “half Egyptian and half American,” “half Syrian and half American,” and “half Lebanese and half American.” Such statements are applicable to those who are born, for example, to an Egyptian father and British American mother, or a Lebanese mother and French American father.

As opposed to the term *Arab American*, which connotes unity, phrases such as “half Egyptian and half American” signify diversity and multiplicity. Within the American multicultural milieu a young Arab American may attempt to trace the chain of his origins further, claiming, for example, that he is “one-fourth American, one-fourth Lebanese, one-fourth French, and one-fourth Syrian.” It is not a matter of divided loyalty leading to split personality, but rather a matter of longing for roots, real or imagined, in the fatherland and full recognition or acceptance in the new land.

Interestingly, there is opportunity for segregated communities, such as Yemeni and Lebanese, to exist within an Arab American community such as Dearborn and to interact on a high level. These communities comment on each other on personal and social levels. These comments can relate to fashion, dialect, and certain social customs such as gender segregation at wedding ceremonies. The dialectal differences between Arab Americans from different homelands also generate interesting topics of conversation among them.

Some Arab Americans, such as those belonging to Yemeni communities, follow strict traditional behavioral rules when compared with other Arab Americans. While some Arab American women wear traditional clothes, including veils, other Arab women have adopted a more Western style of dress. They may express their preference for wearing trendy Western clothes such as capri pants and short shirts or blouses that fall just below the waist. They talk about how they tease each other during such traditions and celebrations as Ramadan, and about their religious, cultural, and dialectal differences.

The U.S. Census Bureau does not include or track religion. Surveys show that Arabs make up less than 25 percent of the Muslim population,

including Sunni and Shi'a, in the United States. Further, there are various sects within the Christian population including the Maronite Christians from Lebanon and Coptic Christians from Egypt, among others. It seems that there is a relationship between adherence to a specific religion and intensity of discrimination. For example, a poll, conducted in 2010 by the Arab American Institute, showed that 62 percent of Arab Americans who identified themselves as Muslim reported having been discriminated against, compared with 35 percent of Arab Americans who identified themselves as Christian.

Some Arab Americans have mixed feelings regarding their immediate environments. They express their pride at being American, and enjoy and defend the freedoms found there. They like the innovative and inventive spirit, as well as the science and technology characterizing America. But they have problems with certain aspects of American society regarding the racial stereotyping of certain segments, including Arabs. Despite their differences, Arab Americans are aware that their unified identity forms a unique blend of both the traditional and "new" or modern life. Their new hybrid identity is a combination of sameness and difference. It is like the same person speaking two or several languages. All in all, the configuration of Arab American identity generates an enduring force unifying all Arabs living in the United States. However, this unified identity of Arab Americans does not negate multiple identities being identified with their particular Arab homelands.

Arapaho

The Arapaho Indians (Inuna-Ina, or "Our People") were Native American nomadic tribes that, from the 17th century, lived throughout the plains of Colorado, Wyoming, Nebraska, and Kansas. They followed and hunted buffalo and also survived on elk, deer, fish, chokeberries, and, when times were tough, their own dogs. They were deeply rooted in certain spiritual beliefs and celebrated the summer solstice with the Sun Dance Festival and practiced the popular, cross-tribal Ghost Dance.

Before Europeans arrived on the shores of America, the Arapaho were located in the eastern woodlands of Minnesota and parts of North Dakota. They had permanent villages and were sedentary people who were agriculturally based, with corn their primary crop. However, when the white man arrived and started taking over their territory, they were forced to move westward. It

was then that they developed a nomadic lifestyle, following the seasonal migration of buffalo herds.

They used the buffalo for everything, from food to clothing. They even used the skin to make their tepees, which were lightweight and easy to break down and transport. The tepees were originally only 12 feet high, but once the tribes started using horses, they built them twice as high. Women, who were in charge of cleaning and cooking, were also in charge of these make-shift houses. They had to erect them and take them down, toting the heavy poles during their travels. A whole village could be packed up and ready for transport in an hour.

Dividing Roles, Duties by Gender

Men and women had different roles in the tribes. While women were the caretakers of the home, men were the warriors and hunters, responsible for defending their families and providing food. However, both genders shared in the rich oral storytelling, traditional medicine, music, craftwork, and artwork. They were renowned for their beadwork and quill embroidery, used on moccasins, clothing, bags, and tepees. The tribal members existed in small bands that were determined by birth. They could move between the bands at will. They used dog-pulled *travois* (drag sleds) before Europeans introduced them to horses. They became expert horseback riders and traveled much greater distances with horses. Their primary weapon was the bow and arrow, but they were also skilled with spears and used hide shields to protect themselves.

Men and women also dressed differently. Even though each gender wore their hair in two long braids, usually wrapped in fur, the women sometimes painted their hair red, while the men attached feathers to their hair. At times the men mimicked the Sioux and wore impressive headdresses. The women donned long buckskin dresses or split skirts, while the men wore leggings and breechcloth. Both wore moccasins and buffalo hide robes to stay warm. They used bright paint on their faces for specific occasions, like religious rituals, festive decorations, or war.

They were deeply spiritual people who believed in the connections between themselves, animals, and the land. They also revered the wisdom of the elders. The nucleus of their beliefs revolved

around the *Be He Height* (Overall Creator). They exercised their spiritual beliefs in dance rituals, which provided them with visions and a link to their ancestors.

Factions and Conflict

By the mid-1850s, the tribes had split into northern and southern sects, the latter moving to the mountains and the former to the plains. They were primarily in Colorado, Wyoming, and Montana, encompassing the Platte and Arkansas Rivers. They were close with the Cheyenne, Sioux, and Gros Ventre tribes, and warred with the Crow, Kiowa, and Comanche.

Unlike the Cheyenne, they had an accommodating temperament. They traded with all tribes of the Great Plains, particularly the northern Lakota and the southern Comanche, and used Plains Indian Sign Language to communicate.

An 1899 portrait of an Arapaho man in mostly traditional dress holding a shield. Both men and women wore their hair in two long, decorated braids, and men added feathers as well.

They also traded with the white man, who eventually destroyed the buffalo. They were not peaceful with everyone, though, and were often at war with other tribes, particularly the Shoshone. Their concept of war, unlike the Europeans, revolved around exhibiting courage, not claiming territory, so there were very few casualties. They had war parties, where they would *count coup* (touch an adversary in battle without harming him). They would also steal an enemy's horse or weapon or simply force the enemy to retreat.

The tribe's most prosperous times were in the late 1820s, and this ended with the arrival of European immigrants. Despite signing the Fort Laramie Treaty in 1851, the Arapaho had their land encroached by gold miners and settlers, then were attacked and killed by Colorado militia in what became known as the Sand Creek Massacre of 1864. The Arapaho waged war against the United States. Peace treaties were signed in 1865 and 1867, with the Arapaho given a reservation in Kansas. Life was never the same for them again.

Culture and Contemporary Life

One of their most important ceremonies was the Offerings Lodge or Sun Dance, which celebrated the Summer Solstice for eight days. They would put a pole in the middle of the lodge with tepees surrounding it. Participants painted their bodies and wore an apron, wristlets, and anklets. As they danced, they stared at the sun, becoming hypnotized. Then, tiny sticks were used to puncture the skin and impale their bodies to the pole. The object was to show no sign of pain. If the tribal member did not show pain, he would receive visions from the Great Spirit. The Arapaho were also avid practitioners of the Ghost Dance and peyotism.

Despite a cultural revival during the 1960s, 1970s, and 1980s, the group and its traditions face extinction due to government policies enforcing tribal "termination," through English replacing their traditional Algonquian language and the fading of their oral storytelling. Their population as of 2013 was 5,000 and they maintain their deeply spiritual beliefs by carrying on the tradition of the Sun Dance.

Argentine Americans

The Republic of Argentina is a Spanish-speaking nation located in the southernmost portion of South America, covering more than 15 percent of the continent. With a population of over 40 million in 2010, Argentines have traditionally considered themselves Europeans, reflected in the fact that about 90 percent are descended from Italian and Spanish immigrants, with the balance whose heritage traces to Germany, Poland, Russia, Ireland, Hungary, France, and a number of other European countries.

Prominent non-Europeans came from Syria, Lebanon, Japan, Korea, and the neighboring nations. About 90 percent are Roman Catholic, with the balance comprised of mostly Jews and Protestants. According to the 2010 U.S. census, there were 224,952 Argentine-born people residing in the United States, although the extent of the population with one or both parents of Argentine ancestry is largely unknown because of insufficient records.

Historical Development

Throughout most of its history, Argentina has been a receiving nation for immigration. The earliest discernible Argentine migration to the United States, beyond a few individuals, occurred between 1910 and 1930, but being small in number, these were generally incorporated into the category "Other Hispanics" in U.S. data. Larger Argentine immigration began only in the late 1950s and 1960s, when the search for greater

economic opportunities served as a primary motive, especially among college-educated professionals. A second phase of recent immigration began in the mid-1970s, when a larger number of Argentines began leaving their country to escape the “Dirty War” (1976–83), during which a military dictatorship began persecuting and murdering political opposition.

Hyperinflation in the 1980s contributed further to migration. The result has more than doubled the number of Argentines in the United States from 44,803, recorded by the 1970 census, to 92,563 in 1990, and 136,578 in 2000. Most of these migrants settled in urban areas, especially New York, whose 17,363 Argentines in 1990 represented 18.8 percent of the total new arrivals in the United States; Los Angeles came second with 15,115 (16.3 percent). Aside from these large metropolitan areas, the largest area of Argentine concentration is in south Florida.

Deteriorating economic conditions in Argentina, beginning in 1998, led to renewed interest in economic migration, largely to Spain, Italy, the United States, Canada, and Israel. U.S. census data from 2000 indicated the newer arrivals have settled increasingly in California (20.3 percent), Florida (20.1 percent), New York (13.8 percent), Texas (7.5 percent), and New Jersey (6.2 percent), with the communities of south Florida emerging as an Argentine American cultural center. North Miami Beach, often referred to as “Little Buenos Aires,” is home to restaurants, bakeries, cafés, travel agencies, and a variety of other Argentine American establishments. Tango music permeates the streets along with the aromas of *parrillas* (steakhouses), while local ethnic groups and the Argentine Arts Organization, located in Lake Worth, sponsor music, art, and other cultural events.

Cuisine

An important cultural influence is readily seen in the cuisine available in larger urban areas where Argentines have settled. *Empanadas* (turnovers stuffed with a meat mixture) are readily found in Argentine communities, and the cuisine is beginning to make inroads into the general population. Traditional *asado* (grilled meats and ribs) and *parrillada* (a mixed barbeque) have become popular, with some restaurants advertising meat imported directly from Argentina as a means of

distinguishing themselves from other restaurants promoting themselves as Argentine or Brazilian steakhouses.

Another typical Argentine creation, *dulce de leche* (a thick caramel), can be found in grocery stores throughout the United States as an ingredient in leading ice cream brands and chocolate candies, as a topping for toast or bread, or as dessert to be served and enjoyed by itself. *Mate*, a traditional tea-like beverage made from the *yerba mate* plant, is increasingly found not only in specialty shops but also in larger grocery stores.

Cultural Contributions

Argentine contributions to the musical arts in the United States include composer Lalo Schiffrin who, among other achievements, wrote the music for the popular television series *Mission Impossible*. Mildred Couper was one of the first musicians in America to experiment with the use of quarter-tones, using this technique in the ballet *Xanadu* in 1930.

Duilio Dobrin founded the popular LatinPops series of the Florida Philharmonic Orchestra and was honored by Pope John Paul II in 2000 for his contributions to the development of liturgical music. Violinist and composer Terig Tucci performed on NBC Radio, Voice of America, and for RCA Victor, eventually heading the profitable RCA Victor Latin American programs and becoming musical arranger for the CBS Pan-American Symphony Orchestra.

Opera director Tito Capobianco served as director for the Cincinnati Opera Festival (1961–65), the Cincinnati Opera (1962–65), the San Diego Opera (1976–83), and the Pittsburgh Opera (1983–2000). Guillermo Gregorio was influenced by the modernistic spirit of 1960s Buenos Aires, where he first engaged in the activities of the Fluxus-like performance group Movimiento Música Mas, the Experimental Group of Buenos Aires, and the Group of Contemporary Music of La Plata. After moving to the United States founded the Madi Ensemble, which is concerned with the bases of various Argentine avant-garde styles. His CDs have appeared under the label ART.

Other contributors include fashion photographer Fernando Bengoechea, whose work appeared in *Vanity Fair*, *Harper's Bazaar*, *ELLE*, and *Oprah*. Among America's most prominent

and influential architects is Argentine César Pelli, famous for designing especially tall buildings, such as the Petronas Twin Towers in Kuala Lumpur, Malaysia. Among his many works are the World Financial Complex in New York, the U.S. Embassy in Tokyo, One Canada Square in London, the Arnoff Center for the Performing Arts in Cincinnati, the expansion of Reagan National Airport in Washington, the Kurayoshi Park Square in Japan, Two International Finance Center in Hong Kong, the Connecticut Science Center in Hartford, and the residential tower over the Museum of Modern Art in New York. For his work, Pelli was honored with the American Institute of Architects' Gold Medal and an honorary doctorate from Yale University.

In the fields of performing arts, one of the most prominent actors and directors for years was Fernando Lamas. His lengthy list of film credits includes *The Avengers*, *The Merry Widow*, *The Girl Who Had Everything*, *Rose Marie*, *The Lost World*, *Revenge of the Musketeers*, *A Place Called Glory*, *The Lonely Profession*, and *The Cheap Detective*. Most of his directing took place on television on *Mannix*, *Starsky and Hutch*, and *Falcon Crest*. His son, actor Lorenzo Lamas, had starring roles in the television series *Falcon Crest*, *Renegade*, and *The Bold and the Beautiful* before moving on to various roles in stage productions. Film director and producer Alejandro Agresti is best known for the movie *Valentín*, which garnered a host of awards, and *The Lake House*, starring Sandra Bullock and Keanu Reeves. Alejandro Rey starred in *Fun in Acapulco* with Elvis Presley, was a regular on the television series *The Flying Nun*, and appeared in several other television productions. Miguel Mas played roles in the popular television daytime series *Days of Our Lives* and *General Hospital*, while Jacqueline Obradors had several television roles, including Detective Rita Ortiz on the popular drama *NYPD Blue*.

Novelist and playwright Ariel Dorfman, a professor at Duke University, wrote the play *Death and the Maiden* about an encounter between a victim of torture and her former torturer that was made into a movie in 1994. His works have been performed in some 100 countries in 40 languages and have been honored with two Kennedy Center Theater awards. Dorfman became a Chilean citizen, and beginning in 1990, he divided his time

each year living alternately in the United States and Chile.

Journalist Andrés Oppenheimer of the *Miami Herald* has his column, "The Oppenheimer Report," syndicated in some 60 newspapers worldwide. He is the author of five best-selling books and a co-winner of the 1987 Pulitzer Prize for his work on the Iran-Contra Affair. Human rights activist Alicia Partnoy was among the first to write about the disappearances in her native land and has testified before committees of the United Nations, the Organization of American States, Amnesty International, and the Argentine Human Rights Commission. Susana Torre edited *Women in American Architecture: A Historic and Contemporary Perspective* and was co-founder of *Heresies, A Feminist Journal on Art and Politics*.

Contemporary Argentine Americans

Generally speaking, Argentines appear to assimilate quite readily into American life. According to U.S. census data, among the primary differences are that Argentines exhibit a higher level of educational attainment than the American average, especially for females, and a much higher percentage of whom are actual immigrants, more than five times greater than the U.S. average. They also average about 10 percent higher household incomes. The growing institutional infrastructure includes the Argentine-American Chamber of Commerce in New York; the Argentine Association of Los Angeles; the Argentine–North American Association for the Advancement of Science, Technology and Culture in New Jersey; Casa Argentina in Chicago; the Argentinean Information Service Center (AISC) in New York; and the Sociedad Sanmartiniana de Washington in McLean, Virginia.

Arizona Support Our Law Enforcement and Safe Neighborhoods Act (2010)

The Arizona Support Our Law Enforcement and Safe Neighborhoods Act (Arizona Senate Bill 1070) is an immigration law that was passed in the state of Arizona and signed into law on April 23, 2010, by Governor Janice Brewer. Originally scheduled to take effect on July 29, 2010, the law was controversial because it implemented the most sweeping anti-illegal-immigration provisions in the United States at the time. As a result, the law garnered significant national media attention and was the subject of multiple legal challenges, including one from the U.S. Department of Justice that reached the U.S. Supreme Court.

Controversial Provisions

Arizona S.B. 1070 was passed by the Arizona legislature with the professed intent of enhancing cooperative enforcement of federal immigration law between local government actors. However, several of its provisions actually went beyond federal legal requirements and penalties for noncitizens residing in the country without the appropriate legal documentation. U.S. federal laws require that all noncitizens over 14 years of age who remain in the country for longer than 30 days register with

the U.S. government, and retain the registration documents in their possession at all times. This is the federal requirement that distinguishes a non-citizen who is considered "documented" from one who is considered "undocumented." Arizona S.B. 1070 broadened the documentation requirements by making it a state misdemeanor for such individuals to be in Arizona without possessing the required documentation.

A number of the act's other provisions also garnered controversy. In particular, the act's requirement that state law enforcement officials make efforts to determine an individual's immigration status during lawful stops, detentions, or arrests, or whenever an officer has a "reasonable suspicion" that the individual may be an illegal noncitizen, became a subject of scrutiny as critics argued that these provisions encouraged racial profiling. Politicians and civil rights organizations rallied against this provision, with the result that within a week of the act's signing, it was amended by Arizona House Bill 2162 to include language prohibiting the use of race, color, and national origin by law enforcement as criteria for suspecting that an individual may be in the country illegally. However, many critics continued to maintain that the provisions encouraged racial profiling even as amended.

Other aspects of the act that courted controversy included a provision allowing law enforcement officials to arrest a noncitizen without first obtaining an arrest warrant when the official had "probable cause" to believe that the individual had committed a public offense that would lead to the individual's deportation from the country; and other provisions that imposed criminal penalties on persons assisting in the transport, housing, or hiring of individuals found to be in the country illegally. For example, one section of the law required employers in the state to verify, through online government databases, that every new employee had "federal work authorization," which is a special visa for noncitizens granting them authorization to work in the country. All of these provisions were the subject of legal challenges that reached the Supreme Court.

Boycotts, Protests, and Legal Challenges

The passage of Arizona S.B. 1070 led to nationwide protests and organized boycotts, particularly in the tourism sector. One single-day protest

This protest was held outside the downtown Minneapolis Hilton in response to the Arizona S.B. 1070 law, which drew protests and boycotts nationwide on May 1, 2010. A number of lawsuits were also filed challenging the constitutionality of the law.

occurring on May 1, 2010—one week after the bill’s passage—involved hundreds of thousands of people organizing in over 70 U.S. cities. Around the same time, a number of lawsuits were filed challenging the constitutionality of the act, including one by the U.S. Department of Justice seeking an injunction against the law’s enforcement. A federal judge in the state of Arizona granted an injunction blocking Arizona government officials from enforcing most of the controversial provisions of S.B. 1070 just one day before the law was scheduled to take effect.

Supreme Court Ruling

The only controversial provision that was not subject to the injunction was the one that criminalized assistance in the transportation of illegal noncitizens. The state of Arizona appealed this injunction unsuccessfully with the Ninth

Circuit Court of Appeals, and again with the U.S. Supreme Court, which issued a ruling on the constitutionality of the law on June 25, 2012.

In a 5–3 ruling, the Supreme Court held that a number of the law’s central provisions were unconstitutional. These included the provision making it a state misdemeanor for a noncitizen to be present in Arizona without appropriate documentation, the provision allowing state law enforcement officials to make arrests without obtaining a warrant, and the provision making it unlawful for a noncitizen to apply for employment without federal work authorization. The court held that each of these provisions was “pre-empted” by federal law, meaning that federal laws already existed that were unconstitutionally broadened or undermined by the provisions.

However, the court voted to uphold the controversial provision requiring Arizona law enforcement officials to inquire as to the immigration status of any lawfully detained individual, when reasonable suspicion existed that the individual was in the country illegally.

The court reasoned that the provision contained limitations that should, in practice, prevent law enforcement officials from violating the Constitution (e.g., the requirement that race and national origin not be used as criteria), and stated that if the provision, upon coming into effect, were to be applied by officials in an unconstitutional manner, it might be subjected to further legal challenges in the future.

Armed Forces, U.S.

The U.S. Armed Forces consist of the Army, Navy, Marine Corps, Air Force, and Coast Guard. All branches are controlled by the Department of Defense with the exception of the Coast Guard, which is under control of the Department of Homeland Security. Each state also has a National Guard, which began as colonial militias and is the oldest section of the armed forces, celebrating 375 years in 2011. The president serves as the commander in chief and overall head of the military.

The Continental Congress created the first official standing military force in 1775, and named George Washington as commander in chief. There was not a large standing military force until after World War II. The National Security Act of 1947 reorganized the U.S. military and intelligence agencies and created today's military structure. The act unified the Navy and War departments under the new Department of Defense (DOD) and created the National Security Council (NSC) and the Central Intelligence Agency (CIA). The U.S. military has grown steadily since 1947. The 2010 U.S. defense budget was \$663.8 billion dollars, 27 percent of the overall federal budget. This accounts for 43 percent of global military spending and is six times more than the next-highest military spender, China. Even per capita spending is the highest globally at \$2,000, compared to the global average of \$200.

Personnel

The total number of military personnel (including Active Duty military, Active Duty Coast Guard, Ready Reserve, Coast Guard Reserve, Retired Reserve, and Standby Reserve) is over 3.6 million, making it the largest employer in the United States. According to the DOD report "Demographics 2010 Profile of the Military Community," there are 1,458,697 Active Duty and Coast Guard service members. The Active Duty force comprises 14.4 percent women and 85.6 percent men. Women comprise a slightly higher percentage of the Reserve and Guard (Selected Reserve) members at 17.9 percent, compared to 82.1 percent for men. Thirty percent of Active Duty service members identify as belonging to a racial minority (Black/African American, Asian, American

Indian or Alaska Native, Hawai'ian or Pacific Islander, Multiracial, or Other/Unknown). The Selected Reserve has a slightly lower proportion of minorities, only 24.1 percent. As Latino is categorized as an ethnicity, it is analyzed separately. Latinos make up 10.8 percent of the Active Duty force and 9.5 percent of the Selected Reserve. Minorities make up only 27.6 percent of the total U.S. population according to the 2010 census, yet are slightly overrepresented in Active Duty and Selected Reserve forces. This is not the case for women and Latinos, however. Women comprise 50.8 percent of the total U.S. population and Latinos 16.3 percent. The Navy has the largest percentage of minority personnel (37.9 percent) and the Marine Corps the smallest (21.4 percent).

The number of minority enlisted personnel compared to minority officers remains disproportionate. While minority Active Duty commissioned officers doubled between 1977 and 1997 (7 percent to 15.3 percent), in 2010 there were just seven minority enlisted personnel to every minority officer. Blacks represented 18.5 percent of enlisted personnel but only 9.5 percent of officers; Asians, 3.7 percent enlisted and 3.8 percent officers; Native Hawai'ian and other Pacific Islanders, 0.7 percent enlisted and 0.2 percent officers; Native Americans and Native Alaskans are 1.9 enlisted percent and 0.6 percent officers; Multiracial groups comprise 2.3 enlisted and 0.9 percent officers; and Other/Unknown are 4.4 percent enlisted and 7.7 percent officers. In total, in 2010, 22.7 percent of officers and 31.4 percent of enlisted members identified themselves as a minority.

Racial and Ethnic Diversity

Racial and ethnic minorities have always been a part of the military, including blacks, Asians, Native Americans, and Latinos. Both enslaved people and free blacks served on both sides during the Revolutionary War (1775–83) and over 180,000 blacks served with the Union forces during the Civil War (1861–65). Enslaved people provided labor but did not fight with the Confederates. Asian Americans have fought in every war since the War of 1812 (1812–15), and on both sides during the Civil War. Latinos have also fought in every U.S. conflict, and approximately 9,900 Mexican Americans fought during the Civil War in integrated volunteer units.

Many racial and ethnic minorities also served during World War I (1914–18), but usually in segregated units. More than 350,000 blacks served in segregated units, and a black infantry regiment, known as the Harlem Fighters, served six months on the front lines, the longest length of time of any U.S. unit. Asian Americans also served in segregated units, but Latinos served in integrated units. Native Americans joined the Armed Forces in World War I, even though they did not have U.S. citizenship (citizenship rights were not granted until 1924). The first use of Native American languages in coded communications was during World War I in which 14 Choctaw men in the U.S. Army's 36th Division (known as the Choctaw Code Talkers) used their language to send coded radio and telephone transmissions. These men were influential in several key battles in France.

World War II (1941–45) increased the participation of racial and ethnic minorities, albeit still in segregated units as the military could no longer exclude much-needed recruits. During World War II, 4 percent of recruits were black, 2 percent were Mexican American, approximately 2 percent were women, almost 3 percent were Puerto Rican, and less than 1 percent were Japanese American, American Indian, and Chinese American. One of the most famous segregated black units to serve during World War II was the Tuskegee Airmen, a noncombat, operational unit that flew 200 out of 205 bomber escort missions without the loss of an aircraft.

Native Americans again played a crucial role in battlefield communications, using native languages to send coded military communications. Both the Army and the Marine Corps utilized Native American languages and servicemen during World War II. These men became known as the Code Talkers. The Army formed its code-talking unit one year before the Marines, using the Comanche language. There were 17 Comanche Code Talkers during World War II. These men were part of the 4th Signal Company of the 4th Motorized Infantry Division and were involved in many of the major battles that led to the end of the war. The 4th Division was involved in the liberation of Paris in August 1944 and the Battle of the Bulge (December 16, 1944–January 25, 1945).

The best-known code talkers are the Navajo Code Talkers. There were 400 Navajo Code Talkers

in World War II. The Navajo code was the only U.S. code not to be broken during the war and was paramount in winning the war. Other Native languages were also used during World War II, such as Cherokee, Choctaw, Lakota, and Meskwaki. Following World War II, President Harry S. Truman formed a committee to investigate civil rights violations and racial violence. In 1947, the Committee on Civil Rights urged the president to desegregate the Armed Forces and Truman, under Executive Order 9981, racially desegregated the U.S. Armed Forces on July 26, 1948. Desegregation did not occur quickly, not only because of logistics, but also because of resistance. Segregated units still served during the Korean War (1950–53), but interestingly Korean Americans served in integrated units. The most decorated unit was the 442nd Infantry Regiment, comprised mainly of Japanese American enlisted men. The last all-black units were not disbanded until September 1954.

Following World War II, the U.S. Armed Forces served in a variety of theaters, including the Korean War (1950–53), the Vietnam War (1964–75), the Persian Gulf War (1990–91), and the War on Terrorism (2001–present). During the Vietnam War, the U.S. government focused on racial discrimination. In 1963, the DOD issued the first equal opportunity directive and created civil rights offices to address racial discrimination and the unequal treatment of minorities within the Armed Forces. The unpopularity of the draft and the Vietnam War led President Richard Nixon to end the draft in 1973. The U.S. Armed Forces is now an all-volunteer force, with more racial and ethnic minorities and women joining than ever before. The Armed Forces officially maintains a zero-tolerance policy toward racism and racial discrimination.

Women and Women of Color

Women have always served in the military and taken part in every major war. In the early wars such as the Revolution and the Civil War, women followed the troops on marches providing cooking, laundry, and supplied the troops with water, food, and other necessary supplies during battles. It is estimated that 20,000 women served in these supporting positions during the Revolutionary War. Women also served as soldiers and spies during this time. For example, Deborah Samson disguised herself as a man and joined the military as

Robert Shurtlieff during the Revolutionary War, and Harriet Tubman, one of the most famous members of the Underground Railroad, served as a Union spy and nurse during the Civil War.

Historically, nursing is the most common way for women to serve in the military. Approximately 21,000 U.S. women served as military nurses during World War I, and about 1,800 African American nurses signed up with the Red Cross to be military nurses, although they were not allowed to be part of the military during the war. Native American nurses, however, were allowed to serve. Nurses did not become full members of the Armed Forces until 1947.

The biggest influx of women in the military came in May 1942, when Congress passed Congresswoman Edith Nourse Rogers's bill, creating a women's corps for the Army, the Women's Army Auxiliary Corps (WAACs), but later dropped the "A" for auxiliary and became (WACs). Other branches followed closely behind, forming their own female units. The Navy formed the Women Accepted for Volunteer Emergency Service

This November 29, 1943, photo shows African American nurses in the U.S. Army receiving their first batch of mail from home at their station in the southwest Pacific. The Army actively recruited black women, but only 500 served in the Army Nurse Corps.

(WAVES), the Coast Guard formed *Semper Paratus* (SPARs), meaning always prepared, and the Marines straightforwardly titled its unit Marines. During World War II, 350,000 women served in these units, as well as in the Army and Navy Nurse Corps. This is approximately 10 times the number of women that served in World War I. Only the Army made an effort to recruit black women. More than 4,000 black women served in segregated black units as WACs. Only 500 black women served in the Army Nurse Corps and only a few in the Navy Nurse Corps. The Women Airforce Service Pilots (WASPs) and Marines had no black women. The WAVES and SPARs allowed black women to serve near the end of the war, and made history by serving in integrated units for the first time. Other women of color were allowed to serve without being segregated.

The Vietnam War changed women's role in the military, including more and more available positions and rank within the forces. In 1967, Congress repealed the law passed in 1948 that limited women to 2 percent, and by the end of the 1970s, three times more service women were on duty than during the 1960s. In 1991, Congress lifted the ban on women flying combat missions, and additional opportunities opened for women in 2010 when the ban on women serving on submarines was lifted. As of 2010, there are 203,695 (14.4 percent) women in the Armed Forces.

The female Active Duty force is more racially and ethnically diverse than the male force. In 2010, 53 percent of Active Duty enlisted women identified as white (compared to 71 percent for men), 31 percent black (16 percent for men), 4 percent Asian (4 percent for men), 13 percent as Latino (12 percent for men), and 7 percent mixed/other (5 percent for men). Close to 50 percent of Active Duty enlisted women identified themselves as belonging to a racial or ethnic minority group.

Armenian Americans

According to the U.S. Census Bureau, approximately 485,000 Americans of Armenian ancestry resided in the United States in 2009. The size of this ethnic population increased nearly one-third since 1990, when the census bureau counted 385,488 Armenian Americans. Although often overlooked in discourses of U.S. multiculturalism, Armenian communities have existed in the United States for well over a century. The earliest waves of Armenian immigrants began to arrive on American shores during the late 19th century when Armenia was under Turkish rule as part of the Ottoman Empire. More than 60 percent of Armenian Americans today live in the western states, with the largest concentration in California, particularly within the greater Los Angeles area.

Migration and History

The major wave of Armenian immigration dates to the 1890s, driven by large-scale massacres of ethnic Armenian Christians by Islamic Turkish nationalists, who killed nearly 300,000 Armenians during 1894–95. Strong anti-Armenian sentiments stemmed from their status as both a religious minority and the high proportion of wealthy entrepreneurs within the Armenian population in lands under Ottoman rule. More than 60,000 Armenians fled to the United States between 1890 and the outbreak of World War I in

1914. Two more waves of genocide in 1915–18 and 1920–22 resulted in the massacre of approximately 1 million ethnic Armenians within the Ottoman Empire and diminished the geographic distribution of Armenians to the area around Constantinople. Nearly 31,000 Armenians who escaped the Turkish death throes fled to the United States between 1920 and 1924. Most of these early Armenians settled in New York City and Boston, where many became concentrated in the carpet industry. Other Armenian communities emerged within Chicago and Detroit. However, the restrictive Immigration Act of 1924 severely limited immigration from southern and eastern Europe. The 1924 act reduced Armenian immigration to an annual quota limit of 150 persons.

The Immigration Act of 1965 overturned the exclusionary quotas of the 1924 law, resulting in an increase in Armenian immigration. During the 1980s, for example, more than 60,000 Armenians immigrated to the United States. Since the 1970s, the majority of Armenian newcomers have established residence in California. Fresno and Los Angeles each have large Armenian communities. In October 2000 the City of Los Angeles officially designated a neighborhood in East Hollywood "Little Armenia," with a street sign bearing the moniker posted at the intersection of Hollywood Boulevard and Vermont Avenue.

The Armenian Genocide

The Turkish massacres of the late 19th and early 20th centuries remain an important subject for many Armenian Americans. Protests aimed at raising public awareness of these massacres and designed to pressure the Turkish government to officially acknowledge this genocide have occurred in several U.S. cities with significant Armenian communities, such as Los Angeles, Fresno, New York City, Washington, D.C., and Philadelphia. Demonstrators have called on President Barack Obama to officially declare the massacres acts of "genocide," thereby placing greater pressure from the U.S. government on the Turkish government to acknowledge the atrocities.

Several celebrities have taken up this cause, including George Clooney and Kim Kardashian. Clooney, his father, and four members of Congress were arrested at a March 2012 protest

sponsored by the Armenian National Committee of America, while Kardashian blogged in 2011:

Until this crime is resolved truthfully and fairly, the Armenian people will live with the pain of what happened to their families and the fear of what might happen again to their homeland.

Notable Armenian Americans

Many Armenian Americans have achieved positions of influence in politics, literature, sports, music, and the entertainment industry. George Deukmejian served as the 35th governor of California from 1983 to 1991 after serving four years as the state's attorney general. Author William Saroyan won the Pulitzer Prize and the Drama Critics' Circle Award in 1939 for his play *The Time of Your Life*. The content of Saroyan's books, plays, and short stories often focused on the social and cultural experiences of Armenians.

In sports, tennis legend Andre Agassi, of Armenian and Iranian descent, is one of only seven players in the history of the game to win the U.S. Open, the French Open, the Australian Open, and Wimbledon championships. Head coach Jerry "The Shark" Tarkanian led the University of Nevada, Las Vegas Runnin' Rebels to the 1990 NCAA Final Four championship and is widely regarded as one of the greatest coaches in college basketball history.

Cherilyn Sarkisian, better known by her stage name Cher, rose to stardom in the 1960s in the pop music duo Sonny & Cher before establishing a solo career that has spanned nearly 50 years and generated a hit single on the Top 100 music charts in six consecutive decades. An accomplished actress, Cher has starred in movies such as *Mask*, *The Witches of Eastwick*, and *Burlesque* and won the Academy Award for Best Actress for her role in the 1988 film *Moonstruck*.

The late Robert Kardashian was a noted defense attorney who gained nationwide recognition during the 1995 O. J. Simpson trial. His daughter Kim Kardashian is a leading Hollywood socialite and fashion entrepreneur. Kim, along with her sisters Kourtney and Khloé and their mother Kris currently star in the reality television program *Keeping Up With the Kardashians*.

Armenian Network of America

Founded in 1984, the Armenian Network of America (ANA) is a professionally based, non-profit community organization dedicated to promoting the interests of Armenian Americans and Armenians all over the world. The ANA provides a forum for Armenian American professionals to interact and advocate on behalf of the larger Armenian American and global Armenian community. The organization also creates a space for networking within the Armenian American community using a computer base; this computer-networking component sets the ANA apart from other Armenian American groups.

The U.S. Census Bureau estimated in 2010 that there were approximately 474,500 people of Armenian ancestry in America. The first main wave of immigrants from Armenia was in the late 19th and early 20th century as refugees fled the Ottoman Empire to escape persecution. The second wave was a result of violent military conflicts in the region that caused many more Armenians to relocate to the United States. As a result, there are large numbers of both recent immigrants and those Armenian Americans who come from families who settled in the United States generations ago. This cultural perspective gap within the Armenian American community is one of several that the Armenian Network of America strives to bridge. Ironically, the largest population of Armenian Americans is centered in the Los Angeles, California, area, which does not have a chapter of the ANA.

The Armenian Network of America was started by a group of four young Armenian American adults after they got together in August 1983 and determined that there was a need in their community that they could meet. This founding group comprised Levon Boyajian, Greg Postian, Edele Hovnanian, and Michael Kasparian. A central theme they sought to address was a perceived tension between being Armenian and being an American professional; the four founding members, who all had experience in the Armenian American community and in other Armenian cultural groups, envisioned the ANA helping reconcile this tension and help themselves and others like them.

At its inception, the ANA had one chapter located in New York City. Today there are two chapters, one in New York City and one in Washington, D.C., and a national board of directors, which manages the corporate business of the non-profit. The current vision of the ANA has continued to embrace online relationships and networking and has expanded to promote a more generalized, global sense of Armenian American culture and cohesiveness.

Much of the ANA culture is social and collegial. Both the New York and Washington, D.C., chapters regularly sponsor mixers such as happy hours and picnics. At times the chapters host joint events such as baseball game outings when New York and D.C. teams meet on the field. There are also events with a more professional feel such as resumé-building seminars and more formal networking events. The ANA also sponsors Armenian cultural events, including book lectures by Armenian American authors, Armenian music concerts, and various guest speakers from the Armenian American community. The ANA periodically also spotlights through its Web site various member professionals.

The impact of the ANA on Armenian American culture is notable. One of the ANA's most important activities is its mentorship program. This program brings Armenian American students and business professionals together with other professionals and successful members of the Armenian American community so that they can grow their careers in tandem. The mentees in the program receive professional guidance, assistance with communication problems and the contacts, support, and advice from a more senior member of

the Armenian American community. The mentors also benefit from the program in that they hone their leadership skills and develop as professional coaches while contributing to their community. Furthermore, more seasoned ANA members find in the group a forum for their guest speaker and publication events.

The Armenian Network of America also impacts mainstream American culture. The ANA allows individual Armenian Americans to meet their full potential in society while retaining a sense of cultural identity; this in turn makes Armenian American professionals a positive and influential force in U.S. society. In addition, cultural events sponsored by the ANA have a broader impact on American culture. For example, the ANA promotes Armenian cultural events such as food festivals. The ANA also liaises with other Armenian American groups to bring events like an Armenian night at the theater to the larger community.

The focus on online networking perseveres within the ANA. Each chapter of the ANA has an active Facebook presence and the New York chapter also Twitters. Recent events sponsored by the ANA have highlighted political issues along with technological concerns. For example, the Washington, D.C., chapter has put on a panel discussion on "Transparency in the Armenian Environmental Context" that shows a continued dedication to the welfare of Armenians around the world, as well as a focus on social media and technological issues; the chapter's president, Alex Khachaturian, made a statement to the press expressing the support of the ANA for Armenian environmental protections. In this way the ANA continues to ally itself with Armenians all over the world from all walks of life while advocating for the more specific professional agenda of the membership.

Art and Ethnic Diversity

Pre-Columbian art varied from tribe to tribe, and often used materials that were the by-products of activities necessary for the tribe's survival, like hunting. Painting on animal hides was common, for instance, using pigments derived from minerals and plants. In northern regions, among whaling cultures, elaborate carvings were often made from whale or walrus ivory. The earliest of these carvings were made for shamanic ritual purposes. The northwest tribes carved both totem poles and, like many tribes elsewhere, ceremonial masks, which are intricate and advanced in their carving techniques and served religious purposes. In some cases, artistic pursuits were gendered. Among the Plains tribes, women typically painted their buffalo hides with geometric designs, either abstract or to serve as maps. Men painted theirs with depictions of visions they had had or battles they had fought.

Early American Art

American art has often been consciously concerned with American identity. In the paintings of the young republic, for instance, portraiture is very prominent as are paintings of significant historical events as well as contemporary events of historical significance.

The Pennsylvania-born painter Benjamin West (1738–1820) was known for his paintings of events of the Revolutionary period. West claimed to have been taught as a child by a Native American friend and he maintained a lifelong interest in the aesthetics of Native American culture, amassing a collection of artifacts that he used as references. *General Johnson Saving a Wounded French Officer From The Tomahawk of a North American Indian*, completed in 1768, is an oil painting on canvas portraying an event from the French and Indian War. The British General Johnson intervenes to stop a Mohawk warrior from scalping the wounded Baron Dieskau, Johnson's French enemy. West was praised at the time for his attention to detail in his portrayal of the Native American, whose tattoos

and clothing were carefully researched and are noticeably more meticulously detailed than the white subjects in the painting.

Of course, West's interest, while it may have been more than aesthetic, is not exactly sympathetic to the Mohawks and other Native Americans he portrayed. *General Johnson* clearly portrays the Mohawk warrior as a savage who needs to be restrained, in contrast with the civility of the British officer who defends the very enemy he has defeated—despite the fact that the real-life General Johnson was known as the “White Savage” because of his brutality. Key to understanding the painting is not only the portrayal of Indians as wild savages, but the debate during the French and Indian War over the appropriateness of Europeans allying themselves with Indians in wars. The practice was opposed because Native Americans were seen as savages who could not be trusted to treat civilians and the wounded properly, who would not abide by gentlemanly rules of combat, and who in essence represented a form of violence considered improper and inhumane even in war, just as certain classes of weapons are viewed today.

Nineteenth-Century American Art

Over the course of the 19th century, American art developed further and embraced a wider range of subjects and approaches, soon shifting from its focus on the “Great Men” of history. The influx of immigrants, primarily from Europe, also helped shake the country out of its early strict adherence to British painting traditions. Rural American landscapes were favored by painters from the Hudson River school, as well as the later luminists and tonalists, and the natural beauty of the continent was hailed as a distinctively American subject.

One of the major Hudson River painters was Robert Seldon Duncanson (1821–72), an African American painter born in New York to freed slaves from Virginia. Duncanson taught himself to paint by copying prints of other works, and when he was 21, three of his portraits were included in an exhibition in Cincinnati, then an important center of the arts. His later work included not only portraits but the landscapes associated with the Hudson River school and scenes from literature, including an early painting *The Trial of Shakespeare* (1843) and *Uncle Tom and Little Eva* (1853), a commissioned depiction of a scene from

Harriet Beecher Stowe's abolitionist novel *Uncle Tom's Cabin*.

Historical paintings like those of Benjamin West were out of fashion in the 19th century, but as American painters became increasingly fascinated with the western frontier, Native Americans again became popular as subjects. George Catlin (1796–1872), born in Pennsylvania as West had been, is one of the better-known painters of Native American portraits. Like West, he was a collector of Native American artifacts. Employed as a lawyer as a young man, he followed his artistic impulses in his 30s and set out to visually document America's "vanishing race" of Indians. From 1830 to 1836 he visited 50 tribes, including several that reported very limited previous contact with white culture. He produced hundreds of paintings of the communities he visited and later assembled many of them into his Indian Gallery, with which he traveled throughout the country on the lecture circuit. Though most of the Indian Gallery is now owned by the Smithsonian American Art Museum, Catlin was unable to interest the government in purchasing his work; he sold much of it to pay his debts.

A contemporary of Catlin's, John Mix Stanley (1814–72) was similarly an artist-explorer. Much of his work was lost in an 1865 fire while being exhibited at the Smithsonian, but what survives suggests a serious figure in the history of American art. Unlike West and Catlin, Stanley's interest in Native Americans seems to have developed later. Stanley's first travels to the southwest were for the express purpose of painting Native American portraits. He attended the 1843 council of 17 Indian tribes meeting with representatives of the Republic of Texas to seek peace, and spent a month among the thousands of Indians who had gathered, making numerous paintings. Stanley was the first of the major Indian portraitists to include Hawai'ians in his work. He traveled to Hawai'i in 1848, shortly after a trip through the northwest territories, and spent a year producing portraits of the royal family of King Kamehameha III, the first Hawai'ian king to govern as a constitutional monarch. His surviving works are held by several national and regional museums, including the National Portrait Gallery, the Metropolitan Museum of Art, and the Smithsonian American Art Museum.

Paintings of Native American individuals and culture continued as a vital focus in American

painting throughout the century, following Catlin's and Stanley's examples. Seth Eastman (1808–75) produced numerous paintings of Native American life, especially as illustrations for his wife Mary Henderson Emerson's book on Dakota life and Henry Rowe Schoolcraft's six-volume *Indian Tribes of the United States*. Elbridge Ayer Burbank (1858–1949) was formally trained as an artist in Chicago and produced over 1,000 Native American portraits, including the only painting of Geronimo drawn from life, as well as notable paintings of Sitting Bull, Red Cloud, Blue Horse, and Chief Joseph. W. Langdon Kihn (1898–1957) spent years among various Indian tribes to document their culture in his paintings and drawings and was admitted as a member of the Blackfoot tribe. Perhaps no one was more associated with a fascination with the American West than Frederic Remington (1861–1909), a distant relative of Catlin, whose treatment of the frontier was to painting what the westerns of Owen Wister were to literature.

One Indian portraitist, Joseph Henry Sharp (1859–1953), founded the Taos Society of Artists. Taos, New Mexico, has long been an important center of the arts, and in 1893 Sharp was one of the first white artists to visit it. His reputation was built on the strength of his portraits of Plains Indians and warriors from the Battle of Little Bighorn (200 of which were commissioned by President Theodore Roosevelt). The Taos Society was founded in 1915, and for 12 years was a commercial cooperative that launched Taos into a significant art colony.

Native Americans in most areas had traditionally painted on animal hides, but in the late 19th century, an art movement later called ledger art developed among the Plains Indians. The buffalo whose hides had been used as an art medium, had been hunted nearly to extinction as a result of federal policies. Plains Indian artists turned to other media, including muslin bags, canvas, and paper from accounting ledger books. These artists now had access to watercolors, fountain pens, and pencils, and produced numerous landscapes and scenes of historical importance, especially depicting battles, hunts, and religious ceremonies.

Twentieth-Century Developments

The influx of a broader variety of immigrants in the late 19th and early 20th centuries may well have contributed to the change in the American

art world as the 20th century dawned. The period is especially known for the Ashcan school, a group of artists who rebelled against the kind of romanticism embodied by Remington and the general westward-looking, rural-loving ways of the 19th century in favor of a grittily realistic portrayal of urban life, ash cans and all. One of the prominent Ashcan painters was George Luks (1867–1933), the son of central European immigrants who left a career in vaudeville to study art in Europe. When he returned, he embarked on an illustration and painting career marked by paintings of crowded street scenes that included immigrant pushcart peddlers, varieties of ethnic dress, and the open-air markets of New York's ethnic neighborhoods. The Ashcan school provided some of the earliest portraits of the immigrants who settled in New York City and other cities, and of the neighborhoods in which they lived. While the Ashcan school failed to win over much of the country, its realistic approach to its subjects was still comprehensible compared to the styles introduced at the Armory.

The 1913 International Exhibition of Modern Art is better known as the Armory Show, having been held at the 69th Regiment Armory in New York City before traveling to the Art Institute of Chicago and Boston's Copley School of Art. It was the first major show introducing experimental modern European styles of art to an American audience, and the most significant event in 20th-century American art history. Displayed works included the cubism of Marcel Duchamp and his brother Jacques Villon as well as examples of futurism and fauvism. Although modernism was rejected by most of the American art scene, it left a permanent mark and directly influenced later movements like abstract expressionism. It established a divide between the art world and the public that has not diminished since: when Theodore Roosevelt declared of the cubist, odd-looking works at the Armory Show, "That's not art," he spoke a proclamation that has been repeated in museums of modern art daily by people who do not appreciate art styles that appear nonrepresentational.

The Harlem Renaissance began immediately after World War I, blossoming in the 1920s and lasting until the mid-1930s. Based around Harlem but encompassing the African American community and Francophile blacks in Paris, it was a flourishing of black arts that followed generations of

African Americans' striving for civil rights and the upheaval of the Great Migration. It coincided with a number of events important to African American life and history, including the release of the film *The Birth of a Nation* and the subsequent creation of the second Ku Klux Klan; the rejection by African Americans of minstrel shows and blackface, even as new forms of racial stereotypes took root in the new medium of radio; the return of black soldiers from World War I; the maturation of northern black neighborhoods like Harlem; the birth of jazz in New Orleans; the growth of northern African American churches; and the influx of black Caribbean immigrants, largely to New York City.

The central figure of works of the Harlem Renaissance, in any medium, was the "New Negro," a term used at the time to describe an African American self-image, one who resisted Jim Crow laws and other forms of white oppression, and one who was self-confident and assertive. While Hudson River painter Duncanson had been supported primarily by white patrons, especially abolitionist supporters, the artists of the Harlem Renaissance were significantly supported by African American patrons—though the height of the Renaissance's commercial success also depended heavily on the interest of whites exploring "primitive cultures."

Harlem Renaissance artists included the multi-talented Henry Bannarn (1910–65), who was primarily known as a sculptor and had worked for the Works Progress Administration; Beauford Delaney (1901–79), who was also an important figure later in abstract expressionism; illustrator and painter Prentiss Taylor (1907–91); Aaron Douglas (1898–1979), sometimes called the Father of African American Arts, who painted both murals and canvases and illustrated major Harlem Renaissance magazines; photographer James Van Der Zee (1886–1983), who shot portraits of black New Yorkers; Romare Bearden (1911–88), who worked in collage, cartooning, and painting; the muralist and sculptor Charles Henry Alston (1907–77); Lois Mailou Jones (1905–98), a painter who became the most prominent female artist of the Harlem Renaissance. Other well-known Harlem Renaissance artists included Norman Lewis (1909–79) and dynamic cubist Jacob Lawrence (1917–2000), as well as Archibald Motley (1891–1981), whose realistic portrait paintings aimed to affirm African

American racial pride by breaking out of the stereotypical exaggerations of white caricatures. Another Harlem Renaissance artist, Augusta Savage (1892–1962), was the subject of a scandal when a French-government-sponsored art program rejected her application because of her race.

Influence of the Great Depression and World War II

The commercial height of the Harlem Renaissance ended with the Great Depression, but the New Deal programs enacted in the 1930s to remedy the Depression helped popularize and support numerous art movements. The Works Progress Administration's (WPA) Federal Art Project in the mid-1930s provided funding for unemployed artists, turning their talents toward public works like murals on government buildings. One result was the introduction of the influence of Mexican muralism, a school of politically motivated art in Mexico beginning in the 1920s, to the United States, in part through the immigration of Mexican artists. Antonio Garcia and Xavier Gonzalez are among the most prominent muralists of the era, with Garcia especially remembered for his work *March on Washington*, a mural depicting President Herbert Hoover's failure to deal with the Depression, followed by President Franklin Roosevelt's job creation programs (such as the WPA).

The real prominence of Mexican muralism in the United States, though, came in the 1960s in the form of the Chicano mural movement, primarily in the southwestern United States. Murals were painted on public buildings, schools, churches, and the grounds of housing projects, concerned with Hispanic cultural iconography like pre-Columbian heroes and mythology and Mexican revolutionaries, as well as strong Catholic imagery. Like the Harlem Renaissance, the Chicano mural movement was a direct address on the matter of ethnic identity, and, importantly, it was on public display.

After World War II, abstract expressionism developed—the first American art style to attain international status. Growing out of surrealism, abstract expressionism goes a step further than cubism and futurism by focusing on nonrepresentational art—paintings that do not attempt to depict reality. Abstract art is not itself an American invention; however, abstract expressionism may be thought of as an American school of abstract

art (especially painting) that encompasses both the anarchic drip paintings of Jackson Pollock and the Color Field paintings of Mark Rothko.

Color Field painting makes color the subject of the painting, and is most associated with Rothko (1903–70), who immigrated to the United States in 1913 from the Russian Empire. A modernist painter in the 1920s and 1930s when modernism was out of fashion, Rothko continued to develop his style and embraced elements of surrealism in the late 1930s and early 1940s, when surrealism was in the spotlight because of the immigration of war-fleeing artists like Salvador Dali to the United States. He became known especially for oil paintings on large canvases consisting of rectangles of color placed in proximity to each other. He has since become one of the two artists, along with Pollock, most closely associated with abstract expressionism, by both its critics and its advocates. Another major figure in abstract expressionism, somewhat less known to the general public, is Dutch immigrant Willem de Kooning (1904–97), who innovated the subfield of action painting. After immigrating to the United States in 1926, de Kooning emerged as a leader of abstract expressionism in the 1940s. De Kooning's expressionist work, like Pollock's drip painting, emphasized the importance of the painter's gestures and movements in creating the painting.

Many the prominent artists of abstract expressionism were European immigrants or born to immigrant parents. Armenian immigrant Arshile Gorky (1902–48) arrived in the United States in 1920, having fled the Armenian Genocide with his mother, who died of starvation before they could leave for America. An impressionist painter in the 1920s, he became friends with de Kooning and produced abstract works influenced by the horrors of the genocide. Surrealist and expressionist William Bazotes (1912–63) was born to Greek immigrants in Pennsylvania and was a WPA artist. Theodoros Stamos (1922–97) was also the son of Greek immigrants, developing a style as a young man that combined earth tones with imagery suggestive of geological formations or sea life.

Numerous art movements followed abstract expressionism. The use of appropriation has become increasingly prominent, as has graffiti art. Graffiti provides artistic expression for young people who might not otherwise have the means

to express themselves in a public visual medium. Jean-Michel Basquiat (1960–88), a Haitian American born in New York, was one of the most significant painters of the 20th century despite his early death; he began as a graffiti artist and noise rock musician before developing his neoexpressionist painting style.

Since the maturation of the American art scene after World War II, minority groups have sometimes been forced to work outside the mainstream art industry. In the 1950s, for instance, a group of African American artists in Florida grouped together and called themselves the Highwaymen, after the US 1 and A1A coastal highways. Unable to find galleries willing to display and sell their work, they sold directly to the public, putting on their own exhibitions and selling paintings out of the trunks of their cars. Some of the surviving members continue to paint in the 21st century.

One of the most influential artists in the 21st century is Kara Walker (b. 1969), an African American painter. Born in California, Walker moved to the south as a teenager and attended both the Atlanta College of Art and the Rhode Island School of Design. Her early installation *Gone: An Historical Romance of a Civil War as it Occurred Between the Dusky Thighs of One Young Negress and Her Heart*, a mural of cut-paper silhouettes exhibited in 1994, remains a classic. Much of her work evokes the violence of the Old South.

Japanese American Mine Okubo (1912–2001) was born in California and worked as a mural artist for the Federal Art Project and the Works Progress Administration before being interned in a camp along with many other Japanese Americans in 1942. She was released after two years, as part of an arrangement under which she was hired as an illustrator by *Fortune* magazine. Her first published work accompanied a *Fortune* article on Japan. Her illustrations from her time of confinement were published as the groundbreaking *Citizen 13660*.

Asian American art experienced a renaissance in the 1990s, and catalyzed by the pan-Asian American civil rights concerns of the Asian American movement, a surge in Asian immigration, and the shifting political and economic relationships between the United States and Asian nations. Much of this art addressed themes of displacement, the Other, and diaspora culture. Chinese American sculptor Ming Fay, born in Shanghai

in 1943, became known for his commissioned public art installations and glass mosaics. Tomie Arai has explored race and gender issues through visual narratives and memoir. Artist and activist Hanh Thi Phnam, who arrived in the United States after her family was evacuated from Saigon in 1975, has in her photography explored her identity as an Asian, lesbian, and immigrant.

Contemporary Latino art is often influenced or informed by the art community and artistic movements of Latin America, including the “Rupture Generation” of post-World War II Mexican artists who embraced international trends, and the long shadow of Mexican surrealists like Frida Kahlo. Cuban-born Carmen Herrera was an active participant in the New York art world in the heyday of abstract expressionism and continued to develop her own geometric style, though she has spent most of her career in obscurity and did not sell her first paintings until the 21st century. Amalia Mesa-Bains often draws on both her Mexican American heritage and her Catholic upbringing in constructing her altar installations, which include both modern and pre-Columbian influences and materials. Her 1987 altar *Grotto of the Virgins* was created as a cave through which the viewer walks to visit three consecutive chapels devoted to three women: Frida Kahlo, Mexican actress Dolores del Rio, and Mesa-Bains’s grandmother.

Aryan Nations

The Aryan Nations, established in 1974, was founded as the political arm of the Church of Jesus Christ–Christian, a white supremacist and self-identified Christian Identity organization. The church was founded in 1946 by Wesley Swift, a former Methodist minister, in California. Swift's successor, Richard Butler, organized the Aryan Nations, after relocating to Hayden Lake, Idaho. Aryan Nations is the most publicly recognizable arm of the Christian Identity movement, itself encompassing a variety of white supremacist groups and individuals throughout the United States. The Aryan Nations' efforts throughout the latter quarter of the 20th century were aimed at establishing itself as a headquarters for this larger movement.

History

The theological background of Christian Identity has its origins in British Israelism, a movement that grew to some prominence in the late 19th century. According to British Israelism, nations with their genesis in Great Britain are descendants of the biblical Twelve Tribes of Israel. As a result, when adherents to this philosophy read scriptural prophecies concerning the Jews, they interpret them as references to themselves. Christian Identity took an anti-Semitic turn by introducing the "two seed theory." In short, the theory claims that modern Jewish peoples are descended from Satan. Coupling these theological ideas with anti-Jewish conspiracy theories, the Aryan Nations subscribe to a belief that the world's governments are controlled by a Satanic "Zionist" cabal.

Christian Identity is also a millenarian movement with a belief that the apocalypse would be brought about in the wake of a dramatic race war between descendants of Adam (the white race) and descendants of Satan (Jewish people). The Aryan Nations saw themselves as responsible for preparing for this coming conflict. As a result, the movement promoted survivalist training, and its compound was host to paramilitary drilling. In the meantime, the Aryan Nations envisioned an independent white supremacist homeland in the Pacific Northwest. Butler encouraged his sympathizers to relocate to the region.

The Aryan Nations focused on outreach. They established a mail-order service distributing tracts and cassette tapes of sermons to interested parties. Most importantly, the Aryan Nations held an annual meeting at Hayden Lake inviting all of like mind-set to spend the weekend for the Aryan Nations' World Congress. At other times of the year, white supremacists, including youths, gathered to Hayden Lake as a pilgrimage to visit Butler and the movement's headquarters. Hayden Lake would serve as an ideal location for paramilitary training and other festivities in relative private. The Aryan Nations also devoted their energies to distributing their ideas throughout the nations' prisons. This led to an increase of membership, but may have also directly influenced the creation of the Aryan Brotherhood, one of the most violent white supremacist prison gangs.

Militant rhetoric predicting a future apocalyptic "race war" was common under Richard Butler, but it was not until a new group emerged from Aryan Nations' members that actual violence was perpetrated by members of the movement. In 1983, Robert Jay Matthews, a member of the Aryan Nations, was inspired by reading *The Turner Diaries*, a Christian Identity novel depicting the coming of a "Second American Revolution" and subsequently organized a group of antigovernment revolutionaries known as the Order. The Order would be responsible for various armed robberies, counterfeiting, bank heists, as well as the murder of Alan Berg, a Jewish radio show host. In the coming year, members of the Order were convicted on a variety of charges. On December 8, 1984, Robert Jay Matthews died in a shootout with the Federal Bureau of Investigation (FBI) in Washington state.

The Aryan Nations were understandably linked to the Order. Members were residents of Hayden Lake and had used Aryan Nations facilities as part of their effort to print counterfeit monies. Although Richard Butler was not involved in the perpetration of the Order's violent crimes, in 1987 he was tried for sedition alongside Order members. The Fort Smith, Arkansas, jury eventually acquitted all the accused of those charges.

Lawsuit

In 2000, the Aryan Nations lost a \$6.3 million lawsuit initiated by the Southern Poverty Law Center in behalf of Victoria and Jason Keenan. The

Keenans had an encounter with the Aryan Nations while travelling past the Hayden Lake compound. When their car backfired, armed guards believed that the occupants of the vehicle had fired at the compound. They followed the Keenans, forcing their vehicle off the road and subsequently detaining them at gunpoint. After the lawsuit, Aryan Nations was required to sell the 20-acre estate that housed the Aryan Nations at Hayden Lake before Butler himself declared bankruptcy. Structures on the compound were subsequently demolished, and the Keenans were awarded the trademark for the name “Aryan Nations” in 2001. After this dramatic turn of events, Butler lived in a donated home nearby until his death in 2004.

There are currently at least three movements claiming to continue the legacy of the original Aryan Nations. These rival groups are in conflict both concerning the means that should be employed to achieve their goals and, perhaps most importantly, whether Aryan Nations should remain tied with the Christian Identity movement or should encompass other forms of “racialist” religion.

that grew out of the social movements of the 1960s. While the African American civil rights movement had developed as a response to the common lot of African Americans, the Asian American movement developed more slowly because of the more heterogeneous nature of the community. Chinese Americans, Japanese Americans, Filipino Americans, and others had very different histories and had faced different challenges, but all had faced unusually high levels of discrimination as well as being lumped together both by laws (especially immigration and miscegenation laws) and popular thought, which perpetuated stereotypes about “inscrutable Orientals” and Asian passivity.

The development of a pan-Asian American civil rights movement was inevitable, but its growth in the 1980s was precipitated by the violent death of Vincent Chin, a Chinese American whose killing was motivated by anti-Japanese sentiment.

Asian immigrants faced an unusually high level of discrimination as their numbers grew in the 19th century. Asian laborers, mostly Chinese, were imported for major works of manual labor, including the work of the California Gold Rush, the building of the railroads, and numerous mining operations in the Pacific Northwest. Employers typically paid Chinese workers significantly less than white workers, and white workers in turn were displaced from work, or perceived that they were. This fueled resentments, leading to waves of anti-Chinese violence throughout the west from roughly the 1870s to the turn of the century, including several infamous massacres.

Anti-Chinese sentiment—the so-called Yellow Peril, the specter of Asian immigration transforming through sheer numbers the culture of the United States—was also instrumental in the formation of 19th-century labor unions and workingmen’s political parties. Labor unions sought to stabilize wages and prevent employers from being able to hire Chinese workers at lower wages than white workers. Workingmen’s political parties sought the passage of laws requiring the same thing. Both also supported legislation like the Chinese Exclusion Act, which suspended Chinese immigration to the United States in 1882. The Scott Act in 1888 went further, preventing Chinese immigrants who had previously immigrated to the United States from reentering the country once they left—effectively requiring them to choose between countries.

Asian American Movement

The Asian American movement is a pan-Asian American civil rights and social justice movement

This sign reading "I am an American" appeared in the window of an Oakland, California, store owned by a Japanese American on December 8, 1941, the day after Pearl Harbor. The store was closed and the owner interned with other Japanese Americans.

Exclusion was repealed in 1943, though many immigration restrictions were not lifted until 1965, and other race restrictions remained in force—like state laws preventing Chinese from marrying whites—many of which remained in force until the Supreme Court ruled in *Loving v. Virginia* that all anti-miscegenation laws were unconstitutional.

Popular Culture

Even at a time when many other racial caricatures, and the racist nature of blackface shows, were falling out of favor, Asian caricatures became a stock in trade of American popular culture. Pulp stories of the 1920s, 1930s, and 1940s used numerous caricatured Asian villains, depicted via phrases like "slanted eyes," "satanic cunning," and "moon-like yellow faces," the most famous of which is Fu Manchu. Boris Karloff played Fu Manchu in one of the film adaptations, *The Mask of Fu Manchu*. The alien warlord Ming the Merciless in the Flash Gordon comic strip and later film serial was another Asian caricature villain playing on Yellow Peril fears. Like Fu Manchu, he was typically depicted by white actors, as was Charlie Chan, the heroic but highly caricatured Asian American detective portrayed in most films by Swedish actor Warner Oland or American actor Sidney Toler. The use of makeup to turn white actors into Asian caricatures is sometimes called "yellowface," an echo of the

shoe polish and other means by which white actors are turned into African American caricatures. One of the most egregious examples still seen in many airings on TV is Mickey Rooney's buck-toothed portrayal of a Japanese neighbor in the film adaptation of *Breakfast at Tiffany's*. And of course, during World War II, Japanese Americans (and in some cases, non-Japanese Asian Americans) were not only mistreated by many of their neighbors but were rounded up in large numbers and placed in internment camps.

Vincent Chin

In the 1970s and 1980s, the economy of Japan prospered while the U.S. economy declined, helping motivate anti-Japanese attacks in the political and business spheres. Japan was not merely an economic rival. It was frequently described as crafty, sneaky, cunning, and inscrutable—characteristics associated with Asian stereotypes. The image of the *ninja* was frequently invoked by outspoken anti-Japanese like Chrysler chairman Lee Iacocca. It was in this context that anti-Japanese sentiment led to the killing of Chinese American Vincent Chin.

A Detroit man celebrating his bachelor party, Chin drew the ire of Ronald Ebens and his stepson Michael Nitz, recently laid-off Chrysler auto workers. Ebens, Nitz, and others got into a fight with Chin's party at a bar, filled with racial invective. Ebens and Nitz followed Chin out of the bar and beat him unconscious; he died four days later. After a plea bargain, the assailants were sentenced to three years probation and a fine. The Detroit Asian American community reacted angrily, bringing greater national attention to the killing and the trial. Numerous Asian American groups and individuals were instrumental in applying pressure to the government, leading to a federal case in which Ebens and Nitz were charged with violating Chin's civil rights, because of the racial motivation of the crime.

Eventually, Nitz was acquitted, as was Ebens after a retrial when his original conviction was overturned. Civil suits for unlawful death were more successful, but beyond dealing with these two assailants, a greater good had been wrought: the Asian American movement had been born, developing out of the cooperation of previously disparate Asian American interest groups.

“Remember Vincent Chin” was a rallying cry far beyond Detroit and long after 1982.

Organizations and the Civil Liberties Act

Major groups that have been instrumental in the Asian American movement include the New York-based Asian American Legal Defense and Education Fund founded in 1974, which was part of the national campaign demanding justice for Chin and which since 1988 has conducted the Asian American Exit Poll to make up for the lack of data on Asian American voting patterns produced by the mainstream media; the nonprofit Asian American Action Fund founded in Washington, D.C., in 1999 to encourage Asian American political activity; the Chinese American Service League in Chicago; the Japanese Americans Citizens League founded in 1929 and instrumental in assisting those who were interned; the Asian Pacific American Labor Alliance, an organization of Asian American labor union members; and the Brooklyn Chinese-American Association.

In 1988, the Civil Liberties Act was signed into law, granting reparations to Japanese Americans who had been interned during World War II and formally recognizing the injustice of Executive Order 9066, the order that resulted in the internment. The act was sponsored by California Democratic congressman Norman Mineta, who had been interned as a child, and was signed into law by President Ronald Reagan, who had served in the military in World War II (albeit as a liaison to the First Motion Picture Unit). Two years later, in 1990, President George H. W. Bush declared May 1990 Asian Pacific American Heritage Month, commemorating the arrival of the first Japanese in the United States (in 1843) and the completion of the transcontinental railroad (in 1869).

Asian American Studies

Though the academic field of Asian American Studies dates to the 1960s when the study of different ethnic communities in the United States began to gain traction in the academic world, the founding of Asian American Studies programs in universities did not take off as quickly as those of African American or Latino Studies programs. This has been one of the causes taken up by the Asian American movement. Today, most of the major programs are in California,

where San Francisco State University includes a College of Ethnic Studies, and not only a bachelor's degree and department in Asian American Studies but one of the only master's degrees in Asian American Studies. Major programs outside California include Cornell University's, which was the first Ivy League Asian American Studies program (founded in 1987), the State University of New York (SUNY) Stony Brook, the University of Washington, the University of Colorado, the University of Illinois at Urbana-Champaign, and Columbia University. In the Asian neighborhood of Flushing in New York City, Queens College, City University of New York, is home to the Asian American Center and the Asian American/Asian Research Institute. In 1998, the *Journal of Asian American Studies* was founded, published triannually by Johns Hopkins University Press.

The Japanese American National Museum was opened in 1992 in the Little Tokyo neighborhood of Los Angeles, California, to preserve the history and culture of Japanese Americans. Its motion picture archive includes numerous home movies of Japanese Americans from the 1920s, 1930s, 1940s, and 1950s, and over 130 years of Japanese American history are documented.

Since 2009, Asian Americans have overtaken Hispanics as the fastest-growing ethnic group in the United States, and they are generally better educated and better employed than whites, blacks, or Hispanics. Anti-Asian sentiment continues to be prominent in American culture. Fears of China's competition with the United States as it expands its free trade activities, or of the implications of the United States owing money to China, are much sharper and expressed in much grimmer terms than fears—rarely even voiced—of similar competition from Russia and Brazil, which are experiencing similar economic growth, just as fears of West Germany's economic prosperity were rarely expressed as strongly as fears of Japan in the 1970s and 1980s.

Asian Americans

The Asian population in the United States is the nation's fastest-growing major race group, increasing by 46 percent between 2000 and 2010, and reaching an estimated number of 17.3 million, or 5.6 percent of the total population. Asian Americans are categorized by ancestral roots in an area that covers more than one-third of the Earth, a region that includes the Far East, south-east Asia, the Indian subcontinent, and a list of nations such as Cambodia, China, India, Japan, Korea, Malaysia, Pakistan, the Philippines, Thailand, and Vietnam, among others. While a majority of Asian Americans are Christian, in total, the community practices a diverse range of faiths—Sikh, Islam, Hinduism, and Buddhism—and languages. Chinese (23 percent), Asian Indians (19 percent), and Filipinos (15 percent) comprise the largest Asian populations in America.

U.S. residents of Asian descent form the majority in some towns, cities, and states, with the highest concentration of Asian populations residing in California (5.6 million), New York (1.6 million), Texas (1.1 million), New Jersey (0.8 million), Hawai'i (0.8 million), Illinois (0.7 million), Washington (0.6 million), Florida (0.6 million), Virginia (0.5 million), and Pennsylvania (0.4 million). Overall, the Asian population grew in every state across the country between 2000 and 2010. Of the total number of U.S. residents of Asian descent, 14.6 million reported belonging to one Asian population alone and 2.6 million claimed

Asian heritages in combination with some other group, with both totals increasing dramatically over the last decade. The median age of the total Asian population is 37.2 years, with 22 percent of the Asian population under the age of 18 and less than 10 percent over the age of 65.

In spite of a history of U.S. laws that prevented the naturalization, immigration, and enfranchisement of Asian Americans or targeted the community for prosecution and internment, Asian Americans have been active contributors to our national patrimony and are a vital and dynamic set of our citizenry, highlighted by a record number of Asian Americans serving in the U.S. Congress in 2013 and achievements and innovations in almost every sector of America. However, misconceptions about Asian Americans and their long history in the United States—for example, that Asian Americans are a “model minority” or “forever foreigners”—continue to obscure the understanding of the Asian American experience and the recognition of the central roles that Asian Americans have played, as heroes or foils, in the national story.

Furthermore, the diverse ancestral origins and varying waves of immigration and cultural histories means that Asian Americans are far from a monolithic community or linked by a continuous and monolithic narrative; the Asian American population is the summation of a growing and diverse set of classes, cultures, ethnicities, histories, languages, and religions that are intertwined with other populations, Asian and non-Asian alike, mixed race and via adoption. Indeed, the mixed-race Asian population and the adopted Asians, a practice beginning with Korea and continuing with Vietnam and China, are growing segments of the American population.

The Asian American experience is central to the understanding of a multicultural America, but the story is a set of discontinuous threads. The challenge is to provide, in a coherent and balanced manner, a comprehensive and workable Asian American narrative, even while the term *Asian American* continues to hold symbolic and political power. To paraphrase a work by Lisa Lowe, a scholar of Asian American studies, Asian Americans are marked by their heterogeneity, hybridity, and multiplicity. These concepts describe the Asian American experience and demonstrate the

need to recognize Asian Americans as a complex, changing, and growing set of communities in need of deeper study and greater attentiveness to the nuances of their experiences.

Pre-1965: Roots and Representations

Since 1860, the U.S. government has collected data on the number of people of Asian descent, beginning with the counting of “Chinese” in California—reportedly 36,000 in number—and then growing to a list of seven race categories for Asian in 2010: Asian Indian, Chinese, Filipino, Japanese, Korean, Vietnamese, and Other Asian. However, the migration of Asians to the Americas predates the founding of the republic; Asians arrived as part of trade between the new colonies, old empires, and Asia. Reports of a Chinese barber appeared in Mexico City as early as 1635. In 1587 reports were written about the Spanish vessels arriving at the California coast’s Morro Bay with Filipino ship hands. By the 1760s, Filipino settlements populated areas near New Orleans. While the early wave of Asians in the Americas was linked to maritime trade, the majority of Asian migration fulfilled the slave-like labor needs of a nascent democratic and industrial society emerging from an age of empires.

In the late 18th century, Chinese men, driven by the search for a better life in the wake of China’s defeat by France, the United Kingdom, and the United States in the Opium War of 1842, began arriving in larger numbers in the Kingdom of Hawai’i to work in the archipelago’s plantation system. The arrival of the Chinese was the start of a larger wave of Asian immigrant labor—Koreans, Japanese, and Filipinos—that would continue farther eastward to service the industrialization of America.

By the mid-19th century, Asians, predominantly Chinese, formed the bulk of labor used in the mining of gold and other natural resources as well as in the construction of the transcontinental railroad. Eventually, they provided low-end domestic labor, performing tasks such as cooking and laundry. During the American Civil War, Asians served on both sides, an action that received attention from the U.S. House of Representatives in 2003, which briefly considered declaring these soldiers of Asian descent to be honorary citizens. In the late 19th century and into the early 20th century, Chinese,

Filipinos, Japanese, Koreans, and South Asian Indians—Hindus and Punjabis—had become part of America’s growing agricultural industry, toiling on farms, plantations, canneries, and fisheries in Hawai’i and across the American West.

These early waves of Asian migration form the foundation for the geographical concentration of Asians in Hawai’i, along the West Coast, and in areas near or in New York City and the emergence of urban ethnic enclaves, such as Chinatowns or Japantowns, in major metropolitan cities and ports. Though Asians provided the labor needed by the American economy and served in the U.S. military during this period, working conditions were harsh, and the economic, political, and social mobility of Asian people was severely limited. The sentiments against Asians were sometimes expressed violently. In the western states, some Asians were driven out of cities and towns, or killed by mobs. The view of Asians at the time was stated in derisive terms that circulated widely through newspapers and popular culture. Asian workers, especially the Chinese, were called Coolies, a term used to dehumanize Asians. They were called the Yellow Peril, embodying the fear that Asians in America were a threat to jobs, families, and the American way of life. Promoted by groups like the Asiatic Exclusion League, these stereotypes and others, such as Asian bodies being diseased or untrustworthy, formed the complex of American orientalism, a blend of pseudoscience, xenophobia, and wild exoticism, to justify the exploitation, persecution, and/or confinement of Asians. Immigration stations, such as the Angel Island Immigration Station off the coast of San Francisco, become a place of prolonged detention and forceful scrutiny to stem the immigration of Asians to America.

Actions to prevent the settling of Asians in America included limiting immigration to men or preventing familial immigration, taxing Asian immigrants, and enacting laws against the ownership of property. As a result, some Asians did return to Asia. A majority of the ones who stayed were men who performed manual and/or domestic labor during a time when gender sharply divided vocations. Under these circumstances, these early immigrants began families with Asian and non-Asian populations. Punjabis and Filipinos married Latinos in California. In Hawai’i,

Asians intermarried across ethnicities and with Native Hawaiians.

In 1882, President Chester Arthur signed the Chinese Exclusion Act to curtail Chinese immigration to the United States, including the reentry of residents of Chinese ancestry, and naturalization. In 1907, the Empire of Japan and the United States agreed to the Gentlemen's Agreement whereby the United States would not impose restrictions on Japanese immigration if Japan prevented Japanese from immigrating to America. The National Origins Act of 1923 severely limited immigration from Asian countries. An exception were Filipinos, who, because of the Spanish American (1898) and Philippine American (1899–1913) Wars, were declared U.S. nationals vis-à-vis their status as U.S. colonial subjects.

In 1943, the year when China officially became an Allied nation during World War II, the Chinese Exclusion Repeal Act (also known as the Magnuson Act) allowed the limited immigration and naturalization of Asians. Korean immigration increased during the Korean War (1950–53), enabled by the War Brides Act of 1946 and the McCarran-Walter Act of 1953 that allowed the limited immigration of Koreans to arrive as war brides, professional workers, and students, or through adoption as orphans of the war. It was only with the Immigration and Nationality Act of 1965 (also known as the Hart-Celler Act) that the United States no longer considered national origins and quotas as criteria for immigration. The Hart-Celler Act introduced an emphasis on skills and family relationships for the basis of immigration and established conditions that greatly shaped the characteristics of Asian America today and the formation of modern multicultural America.

Pre-1965: Becoming American

Asian American responses to their disenfranchisement are quintessential elements of the American story of civil rights. The Supreme Court decision in *United States v. Wong Kim Ark* (1898) affirmed birthright citizenship as written in the Fourteenth Amendment of the U.S. Constitution. Born in San Francisco to Chinese immigrants, Ark challenged the U.S. government's refusal to recognize his American citizenship. The 1906 San Francisco earthquake opened an unusual way for

Chinese to immigrate to the United States—the earthquake destroyed records of people's citizenship and immigration status. The 1882 Exclusion Act allowed the immigration of foreign-born children of U.S. citizens to join their fathers. Without records, many Chinese could claim to be the “paper sons” of Chinese Americans and immigrate to America. In 1913, India-born A. K. Mazumdar became a naturalized U.S. citizen but had his citizenship revoked by the Supreme Court decision in *United States v. Bhagat Singh Thind* (1923), which ruled that south Asian Indians were ineligible for naturalization due to their non-Caucasian status. Prior to the *Thind* case, in *Takao Ozawa v. United States* (1922), the Supreme Court ruled that the Japanese were also not “white.”

Asian communities organized themselves in response to anti-Asian sentiment and the harsh living conditions. In the late 19th century, Chinese communities formed the Chinese Consolidated Benevolent Association, serving San Francisco and New York City. Indian immigrants formed community-based organizations such as the Ghadr (“revolutionary”) Party, the India Congress Association of California Farmers, the India Welfare League, the Indian American Association of America, and the India League of America. These organizations worked to improve conditions and opportunities for South Asian Indians in the United States and in colonial India and, in some instances, linked opportunities for Indians in America with India's independence from the British.

Many of these Indian groups lobbied Representative Clare Booth Luce, a Republican, and Representative Emmanuel Celler, a Democrat, to introduce bills changing U.S. immigration laws, leading to the Luce-Celler Act in 1946, which permitted the naturalization of Asian immigrants and limited immigration from Asia. The political success of this coalition of Indian American organizations continued with the political life of Dalip Singh Saund, the founder of the Indian American Association of America. In 1956, Saund, a Democrat, became the first Asian American member of the U.S. Congress.

In 1929, the Japanese formed the Japanese American Citizens League to work on issues related to civil rights. However, in 1942, President Franklin D. Roosevelt issued Executive

Order 9066 (EO 9066), the presidential action that allowed the internment of Japanese Americans and immigrants during World War II. As a result, 120,000 people of Japanese descent were interned along the Pacific Coast, from Washington to Arizona. California-born Japanese American Fred Korematsu challenged the legality of his incarceration and his case made it to the Supreme Court—but lost. Although the Supreme Court ruled against Korematsu, he maintained his position against EO 9066. Decades later, Korematsu's case led to a presidential inquiry, a Congressional apology, and reparations for the internment of Japanese Americans and the vacation of his conviction.

EO 9066 also influenced the Japanese Americans to serve in the U.S. armed forces during World War II. Japanese Americans served in the storied 442nd Regimental Combat Team and 100th Infantry Battalion, and some served in the Military Intelligence Service. The 442nd Regimental Combat team became the most decorated regiment in the history of the U.S. Army. In 2011, Congress awarded the Medal of Honor to the Japanese American veterans who served in these units.

During the same year of the transformative Hart-Celler Act, Filipino American labor leaders like Philip Vera Cruz and Larry Itliong and their Agricultural Workers Organizing Committee (AWOC) joined Latino labor leader César Chávez and the predominantly Mexican American National Farm Workers Association (NFWA) to participate in the Delano grape strike and boycott to improve working conditions for farm workers. Filipino Americans had a long history of organizing around labor, dating back to the 1920s in Hawai'i and continuing to labor associations on the West Coast, such as Seattle's Cannery Workers' and Farm Laborers' Union in 1933. Together, the AWOC and the NFWA formed the iconic United Farm Workers of America (UFWA), which was a force for labor and minorities and a model for a multicultural coalitional labor politics.

1965 to 1982: Awakening and Change

In 1960, the U.S. Census Bureau reported almost 900,000 Asians in the United States, or less than half a percent of the total population, recording only residents of Japanese, Chinese, and Filipino descent. However, the 1960s were a significant

The engraving shows a violent mob attack on the Chinese inhabitants of Denver, Colorado, on October 31, 1880. Two years later, President Chester Arthur signed the Chinese Exclusion Act to restrict Chinese immigration to the United States.

decade for Asian Americans and multicultural America, seeing significant changes to laws regarding race, immigration, and citizenship. The passage of the Hart-Celler Act and the coalition between Filipino Americans and Latinos can be read as narrative pivot points in the Asian American story. The lifting of restrictions on Asian immigration and naturalization permitted a steady increase in the Asian American population and a more vibrant cultural identity. The minority labor movements, such as the UFWA, resonated with the civil rights movements of the 1960s to become a catalyst for the power movements, including the Asian American movement that emerged later in the decade. The formation of a diasporic or pan-Asian political consciousness during the late

1960s corresponded with the decolonization and third world revolutionary movements in Asia, a spirit that was intensified by the escalation of U.S. military involvement in Asia.

Asian Americans joined African Americans, American Indians, and Latino Americans in a quest for the full enfranchisement of America's minority communities and the recognition of their essential roles in the American story. Chinese, Filipinos, Japanese, and other Asian Americans began organizing around a shared experience, narrative, and political identity as Asian Americans. In 1968, Asian Americans joined a multicultural coalition of students and student groups committed to social justice to begin one of the longest student strikes in American history in support of open admissions and the establishment of a department for Ethnic Studies at San Francisco State University. In 1969, a similar multicultural coalition of students and student groups staged a strike at the University of California, Berkeley in support of ethnic studies. In each of these student protest movements, Asian Americans were key voices and leaders. The movements to establish the discipline of ethnic studies gained deeper institutionalization with the founding of the Association for Asian American Studies in 1979, which promoted the research and teaching of Asian American studies. Overall, the strikes established a blueprint for political action and underscored the importance of pan-Asian American community advocacy alliances and organizations. The Asian American movement was born.

The revolutionary awakening and cultural pride of the Asian American movement were part of a larger redefinition of Asian America. The award-winning and innovative architectural designs by Massachusetts Institute of Technology- and Harvard University-trained Chinese American Ieoh Ming Pei (I. M. Pei) began to take root across the United States and around the world. His contributions to the American landscape took hold during the 1960s and 1970s, beginning with the National Center for Atmospheric Research in Boulder, Colorado (1961–67), the East Building of the National Gallery of Art in Washington, D.C. (1968–78), and the John Fitzgerald Kennedy Library in Boston (1965–79), among other institutions. The contributions of Asian Americans to American architecture continued with Chinese

American Maya Lin's award-winning design for the iconic Vietnam War Memorial in 1982.

1965 to 1982: Film, Television, and Literature

On movie and television screens, new representations of Asian Americans, especially representations of Asian American men, were in popular circulation. These characters reflected the idealism and revolutionary feelings of the era. American-born George Takei played Sulu in the multicultural science fiction television series *Star Trek* (1966–69). During 1966–73, American-born martial artist Bruce Lee popularized Hong Kong martial arts cinema in the United States and around the world, producing films and characters with political and physical kinetics. In 1965, Asian American actors in Los Angeles established the East West Players theater organization to produce work that offered Asian American stories beyond popular stereotypes. Six years later, activists and filmmakers in Los Angeles also established Visual Communications with the objective of supporting Asian American filmmaking. In 1976, activists and filmmakers in New York City formed Asian CineVision to support Asian American filmmaking on the East Coast.

In 1980, activists and filmmakers in San Francisco created the National Asian American Telecommunications Association (now the Center for Asian American Media) to promote independent Asian American filmmaking and Asian American productions for public broadcasting in cooperation with the Corporation for Public Broadcasting and the Public Broadcasting Service. In 1981, Wayne Wang released the groundbreaking film, *Chan Is Missing*. The innovative film offered fresh and clever takes on Asian American experience that stood in contrast to the Hollywood blockbusters that characterized the 1980s. In 1995, *Chan Is Missing* was named to the National Film Registry, a list of films deemed “culturally, historically, or aesthetically significant.”

In 1973, Chris Kando Iijima, Nobuko JoAnne Miyamoto, and William “Charlie” Chin, musicians and activists in New York City, recorded *A Grain of Sand: Music for the Struggle by Asians in America*, the first album of Asian American music. Through their music, the singers shared the Asian American experience and political consciousness—from immigrants to citizens to

activists responding to discrimination—in ways that resonated with the revolutionary spirit of the times.

In 1974, two edited works laid the foundation for the emergence of Asian American literature: David Hsin-fu Wand's *Asian American Heritage: An Anthology of Prose and Poetry* and Frank Chin, Jeffery Paul Chan, Lawson Fusao Inada, and Shawn Wong's *Aiiieeeee! An Anthology of Asian-American Writers*, recovering and collecting representative selections. Asian American literature would become a rich medium for Asian American cultural criticism, scholarship, and expression.

1965 to 1982: Impact of the Vietnam War

Like the Korean War, the Vietnam War (1955–75) had a similar impact on Asian migration and Asian America. The war and its aftermath displaced millions of southeast Asians, bringing some to the United States as refugees whose experience and profile differed from immigrant groups and patterns that had previously defined Asian America. Cambodian, Chinese, Hmong, Laotian, and Vietnamese refugees from Vietnam, Laos, and Cambodia sought refuge in the United States, fleeing political persecution and the U.S. military campaign in southeast Asia. The 1975 Indochina Migration and Refugee Assistance Act allowed these refugees to enter the United States and to receive special assistance from the government, and there were other initiatives, such as Operation Babylift, a limited program to evacuate thousands of Vietnamese orphans for adoption by American parents.

Many southeast Asians continued to seek shelter in the United States for many years after the fall of Saigon, some assisted by the United States Refugee Act of 1980. The initial waves of refugees were processed in temporary resettlement camps housed on military bases in Arkansas, California, Florida, and Pennsylvania. In some cases, these southeast Asian refugees were resettled in states in the midwest, such as Illinois, Iowa, Minnesota, and Wisconsin, and in the south in states such as Texas and Louisiana. According to the 2010 census, Vietnamese communities now register in large numbers in Los Angeles, San Jose, and Houston; Cambodians in the Boston-Cambridge-Quincy area; and Hmong in the Minneapolis–St. Paul–Bloomington area. While many southeast Asian American refugees

have been able to live the American Dream, many continue to be less well off than the general population of Asian Americans. Cambodians and Hmong are almost twice as likely to live in poverty. Cambodians, Hmong, and Laotians are almost twice as likely to be unemployed, and all have lower rates of college attendance and graduation.

Asian Americans and the Asian American movement made progress during the 1960s and 1970s. Near the end of the 1970s, Asian Americans were slowly joining the mainstream and being celebrated as part of America's multicultural fabric. In 1977, Congress designated a week in May as Asian-Pacific Heritage Week. In 1978, President Jimmy Carter designated the weeklong celebration as an annual event. In 1990, President George H. W. Bush declared the entire month of May as Asian Pacific American Heritage Month. May was chosen because it also commemorates the first immigration of the Japanese to the United States and the completion of the transcontinental railway.

However, it was in 1982 that Asian Americans rallied around another tragic event to increase their political impact. A week before his wedding, 27-year-old Vincent Chin was beaten into a coma by two autoworkers in Detroit, Michigan. The autoworkers cursed Chin, a Chinese American, as a foreign "Jap" who caused unemployment in the United States and proceeded to beat him with a baseball bat. Four days later on June 23, 1982, Chin died of his injuries. The perpetrators were fined and sentenced to probation. This injustice and its tie to the erroneous notion that Asian Americans are "forever foreigners" outraged many, and Chin's death became a catalyst for forming a united Asian American coalition out of the many Asian community and advocacy groups in the United States. This coalition pushed for a civil trial for Chin's death and formed the groundwork for hate crimes legislation.

1980s to Present: Ethnic Suburbs, Pioneers, and Tensions

Through the 1980s, many Asian Americans were enjoying a modest version of the American dream and finding or creating opportunities in business, science, engineering, technology, and other professions. Asian Americans were also moving away from urban centers to settle in suburban settings, resituating ethnic enclaves as centers of

community and culture to the suburbs. Notable suburbs included Monterey Park, California, and other suburbs of Los Angeles; Silicon Valley and surrounding suburbs of San Francisco, California; Edison, New Jersey; and Flushing, Queens, New York. The amenities of the suburbs and their opportunities attracted young immigrant families, even though tensions persisted in some communities. Monterey Park, considered the first suburban Chinatown, passed or attempted to pass English-only ordinances. The vibrant community of Indian Americans in Edison held large protests against continued harassment by local law enforcement. The deepest antipathy in the 20th century surfaced during the 1992 riots in Los Angeles between African Americans and Korean Americans, amid the overall violence throughout the city.

Following the election of Dalip Singh Saund, Asian Americans, historically disenfranchised, began to have a steady, albeit small, number of

members serving in the U.S. Congress and in governorships and state legislatures across the country, with the states of Hawai'i and California electing the most members of Asian descent to public office. With statehood in 1959, Hawai'i sent the first Americans of Chinese and Japanese descent to the U.S. Senate, beginning with Senator Hiram Fong in 1959 and Senator Daniel Inouye in 1963. The state of Hawai'i also elected the first Asian American woman to Congress in 1965, Representative Patsy Matsu Takemoto Mink.

Senator Inouye served with the highly decorated 442nd Regimental Combat Team and served as president pro tempore of the Senate, making him the highest-ranking Asian American politician in American history and one of the Senate's longest-serving members. Senator Inouye started as one of Hawai'i's first two members elected to the House of Representatives, joining Representative Spark Masayuki Matsunaga, making them

Asian Americans in New York City drawing attention to human rights issues in the Philippines beside other immigrant groups at one of the many May 1, 2010, immigration reform rallies held across the United States. Asians are the fastest-growing major race group in the United States; their numbers increased 46 percent between 2000 and 2010, making up an estimated 5.6 percent of the total population. Approximately 22 percent of the Asian population is under the age of 18.

the first Japanese Americans to serve in the U.S. House of Representatives.

In 2008, Louisiana elected Representative Joseph Cao, the first Vietnamese American to serve in Congress. Cao was a refugee from the Vietnam War. In 2012, the state of Hawai'i elected Mazie Hirono to the U.S. Senate, making her the first Asian American woman as well as the first Buddhist to serve in the Senate. In 2012, the highest number of Asian Americans elected to Congress is also one of the most diverse. Tulsi Gabbard (D-HI) became the first Hindu to be elected to Congress, Mark Takano (D-CA) became the first openly gay person of color to be elected to Congress, and Tammy Duckworth (D-IL) became the first Thai American woman to be elected to Congress and the first to represent the state of Illinois.

Norman Mineta, a Japanese American who was interned during World War II, became the first Asian American to serve in a presidential cabinet and did so under two presidential administrations. Mineta was appointed by President Bill Clinton in 2000 to serve as secretary of commerce and by President George W. Bush in 2001 to serve as secretary of transportation, overseeing dramatic changes to the nation's travel security in the wake of September 11, 2001. President Bush also appointed the first Asian American and Chinese American woman to a cabinet position with his selection of Elaine Lan Chao to serve as secretary of labor in 2001. President Barack Obama also appointed the largest number of Asian Americans to cabinet positions in U.S. history: Secretary of Commerce Gary Locke, Secretary of Energy Steven Chu, and Secretary of Veterans Affairs Eric Shinseki.

In 1994, Ben Cayetano was the first Filipino American governor when he was elected in Hawai'i. In Washington State, Gary Locke became the first Chinese American to be governor of an American state in 1997. In Louisiana, Bobby Jindal became the first Indian American to be governor of a U.S. state in 2007.

Conclusion

The post-1965 era enabled a generation of Asian Americans to be pioneers in arts, business, cuisine, culture, education, fashion, film, military, media, medicine, music, politics, sciences, sports,

technology, and television. These high-achieving individuals are the faces for a longer story of the Asian American pioneers. While Asian Americans are ascending in all aspects of American life, the overall recognition of their contributions remains relatively unknown or underrepresented in popular discourse and in institutions of national patrimony. Moreover, the achievements of some Asian American communities as well as the affluence of some Asian Americans are often assumed to be true for all Asian Americans, in spite of the heterogeneity constitutive of the total population and the census data that prove otherwise.

The stereotype of the "model minority" remains a challenge to understanding Asian Americans. Some Asian American communities may excel in specific fields but experience discrimination or denigration in popular culture. South Asian Indians were the target of harassment, profiling, and/or violence in the years following September 11, 2001. Competitive tensions between the United States and China are fodder for political campaign materials in ways that resonate with the "yellow peril" xenophobia that was pervasive during the late 19th and early 20th centuries. The stereotype that Asian American values are either antithetical to or emblematic of the American spirit distorts the understanding of the Asian American experience and obscures the overall representation of racial minorities in an emerging multicultural America. As one of America's fastest-growing and heterogeneous populations, Asian Americans are a major thread of America's multicultural story and will remain so for generations.

Asiatic Exclusion League

Organized May 14, 1905, in San Francisco, the Asiatic Exclusion League (AEL) was a white supremacist group committed to ending the immigration of Asians to the United States. Although Japanese immigrants were the primary target, the league opposed the immigration of all Asians, including Koreans and Hindu Indians. Delegates from 67 groups participated in the founding of the league, but organized labor, fearful of losing jobs, was at the forefront. By 1908, the league claimed 100,000 members and 238 affiliated

organizations. The AEL's influence was not limited to California. Members successfully lobbied on the national level as well, and discriminatory laws that were a legacy of the AEL remained in effect until the 1960s.

Emigration from Japan was rare before the late 19th century. Thus, it wasn't until after 1884, when pressure from Hawai'i sugar plantation owners resulted in an increase in exit visas, that Japanese began immigrating to Hawai'i and, in smaller numbers, to California. By 1890, 2,000 Japanese resided in the United States, excluding those in Hawai'i, which was not a territory of the United States until 1900. The Chinese Exclusion Act of 1882 had barred all Chinese immigration, and the Japanese evoked the same prejudices and fears that had led to that legislation. Differences in religion, language, and physical appearances exacerbated the fears of substantial job losses, particularly in agriculture and related industries.

Labor and School Segregation

The AEL was not the only anti-Asian organization, but it took the lead in coordinating anti-Japanese action. Labor unions were the source of AEL's executive board and its financial resources. Olaf Tveitmore, the first president and one of the founders of the AEL, was recording and corresponding secretary of the San Francisco Building Trades Council, editor of its weekly journal, and general secretary treasurer of the California Building Trades Council. Abraham Yoell, recording secretary of the International Brotherhood of Electrical Workers, served as AEL's financial secretary, the league's only full-time, salaried position. The labor connection intensified AEL's political power at local, state, and federal levels.

In 1906, the San Francisco Board of Education ruled that Japanese and Korean children must attend the Oriental School established in 1884 for Chinese children. Such segregation remained legal until the mid-1940s. Rising crime rates and drug usage were also attributed to the Japanese. The league lobbied to boycott Japanese goods and to exclude Japanese from certain kinds of work, such as agricultural jobs. After the San Francisco earthquake of 1906, newspapers advertised places designated as areas where only whites would be allowed to build homes and own property.

Gentlemen's Agreement

Through official channels, the government of Japan objected to discrimination against its citizens. The result was the Gentlemen's Agreement of 1907 in which Japan agreed to cease issuing passports to workers wishing to immigrate to the United States, and the United States agreed to end discrimination against Japanese already in the United States. The unofficial agreement excluded wives and children of men who had already emigrated, and it did not restrict the Japanese entering the United States from Hawai'i. By 1910, there were more than 40,000 Japanese immigrants and *Nisei* (second-generation Japanese born in the United States) living in California, and Japanese formed the largest minority in Washington State.

The AEL began pressuring Congress in 1907 to restrict Japanese immigration from the territory of Hawai'i. The league's staunchest ally in Congress was E. A. Hayes, representative from California's Fifth District. Hayes, who with his brother owned the *San Jose Mercury* newspaper and a prune ranch in South San Jose, employed Japanese labor in his orchards. He also delivered passionate anti-Japanese speeches in Congress in which he used propaganda generated by the AEL that painted the Japanese as a growing threat to the sound economy and morals of the United States. Such tactics led to the California Alien Land Laws, the first of which was passed in 1913, which barred Asian immigrants from owning land in the state.

Citizenship Denial and Internment Camps

In *Takao Ozawa v. United States* (1922), the Supreme Court denied Japanese immigrants the right to become citizens. President Calvin Coolidge signed a federal immigration law in 1924 that ended the immigration of all Asians into the United States. The law subverted the Gentlemen's Agreement of 1907. Japan, in protest, declared May 26, 1924, the effective date of the legislation, a day of national humiliation. Tensions between the two nations increased.

Although influence of the AEL increasingly weakened after 1911 and soon completely disintegrated, other organizations less dominated by organized labor continued the work begun by the league. Anti-Japanese groups were organized all along the West Coast. One of the largest and most active was the San Francisco Japanese Exclusion

League. In February 1942, two months after Japan bombed Pearl Harbor prompting President Franklin D. Roosevelt to declare World War II, Roosevelt signed Executive Order 9066 that directed all Japanese and Japanese Americans living on the West Coast to be removed to internment camps, in what some historians saw as a predictable conclusion to more than three decades of efforts to eliminate the presence of Japanese in the United States.

Association for the Study of African American Life and History

Headquartered in Washington, D.C., the Association for the Study of African American Life and History (ASALH) is the oldest scholarly organization dedicated to the study of black history and culture. Currently the ASALH maintains over 20 branches across the United States. Founded in 1915 as the Association for the Study of Negro

Life and History (ASNLH) by African American historian Dr. Carter G. Woodson (1875–1950) and minister Jesse E. Moorland (1863–1940), the organization changed its name to the Association for the Study of African American Life and History in 1972. Through its annual conference and publications, ASALH provides venues for new research to be presented to the public. ASALH is responsible for determining the annual theme for Black History Month, which is celebrated nationally in February. The organization disseminates scholarship to a wide audience that ranges from school-aged children, the general public, and academics. In doing so, ASALH educates Americans about cultural diversity.

Born in 1875, Carter G. Woodson is widely hailed as the father of black history because of his lifelong commitment to promoting the subject in academic and nonacademic circles. In 1912 Woodson, the son of former slaves, earned a Ph.D. in history at Harvard University. When he graduated, he became the second African American to receive a doctorate from Harvard, preceded by prominent scholar W. E. B. Du Bois, who graduated in 1895. Woodson played an instrumental role in obtaining professional recognition of African American history during an era where the majority of historians did not believe African Americans had a history, let alone one worth studying. Woodson believed that racial tension was the result of lack of historical and cultural understanding. He sought to use the ASALH as a vehicle to combat intellectual racism by promoting the academic study of African American history and culture. After Woodson's death in 1950, Howard University history professor Rayford Logan was named executive director of the ASALH. The ASALH operated out of Woodson's home from 1915 until 1970, when the Carter G. Woodson building opened in Washington, D.C. The National Trust for Historic Preservation designated Woodson's home as a National Historic Landmark in 1976.

Woodson's goal was to elevate African American history, first within academic circles and then within the larger African American community. To achieve this aim Woodson founded the *Journal of Negro History* (JNH, now the *Journal of African American History* [JAAH]) in 1916. Modeled after the *American Historical Review* published by the American Historical Association, the JNH

was the first scholarly journal dedicated to African American history and retains its premier status today. In 1921, Woodson created Associated Publishers, which provided a publication venue for books on African American and African history that were being ignored by mainstream publishing houses. In 1937, Woodson established the *Negro History Bulletin*. Now the *Black History Bulletin*, the publication is targeted toward secondary school teachers and publishes articles on African American, African, and African diaspora history.

One of the key organs through which the ASALH advances multicultural understanding is the annual Black History Month and its predecessor, Negro History Week. In 1925, Woodson announced plans for a Negro History Week, which would promote the achievements and contributions of African Americans to American society. The first Negro History Week was celebrated in February 1926, chosen to include the birthdays of two important figures in African American history—President Abraham Lincoln (February 12) and abolitionist and orator Frederick Douglass (February 17). Negro History Week was unique with its focus on black youth audience. Since its launch, the ASALH has distributed instructional materials to schoolteachers and the leaders of civic organizations. Woodson envisioned Negro History Week expanding to a yearlong exploration of African American history and culture. It was not until 1976 that the weeklong event became a monthlong celebration. Every U.S. president since 1976 has proclaimed February as Black History Month.

In 2005, ASALH founded *The Woodson Review*, which provides information on the national Black History Month theme. Past Black History Month themes include Neglected Aspects of Negro History (1931), The Use of Spirituals in the Classroom (1947), Great Negro Educators (1952), African Art, Music, Literature: A Valuable Cultural Experience (1972), The Afro American Family (1985), African Americans and Civil Rights: A Reprisal (1997), and Carter G. Woodson and the Origins of Multiculturalism (2008).

The ASALH organizes an annual academic convention based on the Black History Month theme. Each year scholars from across disciplines convene to present new scholarship in the field. Other ASALH activities include the hosting of an annual luncheon, the maintenance of a speaker's

bureau, and the administration of an annual essay contest for undergraduate and graduate students. In 2012, ASALH launched its newest endeavor *FIRE!!! The Multimedia Journal of Black Studies*, which is unique in its publication of work that uses multimedia evidence.

Audacity of Hope, The

Published in October 2006, *The Audacity of Hope* is the second book by then Senator Barack Obama, who was later elected president in 2008 and reelected for a second term in 2012. Unlike his autobiography published in 1995, his second book focuses more on his views and beliefs on politics, racial dynamics, faith, economics, family values, and other current topics. The book was ranked as a best seller on Amazon.com and by the *New York Times* and has been translated into more than 30 languages. The audiobook version won the Grammy Award for Best Spoken Word Album in 2008. However, critics in general agreed that *The Audacity of Hope* lacked the candid voice that his autobiography *Dreams of My Father* possessed. Nonetheless, the book helped Obama establish his brand as an "American Idol" and paved his path to the White House.

The origins of the book exist in the 2004 Democratic National Convention, where Senator

Obama delivered the keynote address. Influenced by his former pastor, Jeremiah Wright, who had used the phrase "audacity to hope," Obama titled his address "The Audacity of Hope." Although the speech lasted less than 20 minutes, Obama became a national icon whose message resonated with many Americans, and even people around the world. Although Obama had yet to announce his candidacy for the presidency, even at the moment of publication of the book, its publisher Three River Press had reportedly paid the author \$1.9 million as a part of the advance contract for three books. According to Nielsen BookScan, the book sold close to 70,000 copies during its first two weeks of sales. The sales boomed, especially after Oprah endorsed the book on her show.

Impact on Presidential Election

Although Obama wrote the book as a senator, he touched upon many of the contentious issues that would become heated debating points during the presidential campaign. The book covered the welfare system, President George W. Bush's administration's view on national security against terrorism, criticism of Bush for the war in Iraq, American dependency on oil, and other matters. Obama emphasized the importance of collaboration between the two major political parties. He argued that Americans have been dissatisfied with strong partisanship, are seeking reconciliation for the sake of greater national good, and that flexibility is one of the keys to achieving these goals.

He argued that while the two parties need to adhere to their respective core values, they also need to collaborate with each other. Similarly, based on his knowledge as a scholar of constitutional law, he stated that the historical document sometimes needs to be interpreted and applied with flexibility within the context of current society. In addition to these philosophical ideologies about the political system, the book discusses Obama's more concrete visions regarding public school system reform, compensation for teachers, and other issues that could generate opportunities for youth and disadvantaged populations.

Obama's essays encompassed topics beyond those that typical policy makers would write. He argued that faith will continue to be a significant ingredient in American national identity and can

enable a bridge between two parties while requiring tolerance and diversity. He also underscored the importance of family, acknowledging the reality that in many families both parents have full-time jobs and that an appropriate amount of social support is necessary for family stability and the healthy growth of children.

Influence on Race and Foreign Relations

Obama's reference to race in *The Audacity of Hope* reflects the intricacy of American racial politics that many critics have identified, especially for Obama whose mother was a white American and whose father was Kenyan. They argued that for Obama to be a viable presidential candidate, it was important that he did not alienate white voters while also not disappointing African American and other minority populations. On one hand, Obama argues that there remains much to be done to improve the experiences of racial minorities. On the other hand, he states that many of the prejudices stem from an unfamiliarity and lack of knowledge, rather than from racism. Obama denounces racism and the victim mentality at the same time.

More than five years after its initial publication, *The Audacity of Hope* has supplied a portion of the income for the Obama family. Obama earns 15 percent of hardcover sales and 7.5 percent of paperback sales in the United States. On his 2010 joint tax return, he claimed \$100,001 and \$1 million in royalties for hardcover and paperback books, respectively. In addition, he claimed \$1 million and \$5 million, respectively, in royalties for his first hardcover and paperback autobiography.

The U.S. government has used Obama's books as a part of its soft power. The U.S. embassy in Indonesia, for example, has spent close to \$4,000 to purchase Indonesian copies of *The Audacity of Hope* and \$4,800 for copies of Obama's autobiography. U.S. embassies in Turkey, France, and other countries have also recorded between \$3,000 and \$9,000 for similar purchases.

Australian Americans

According to the 2010 census, Australian Americans number 67,000. Their origins can be traced to several waves of immigration to the United States, most notably in the gold rush of the 1840s, the 1870s, and the post-World War II war brides. This immigrant group has integrated into U.S. culture so well that there is little that can be said to be distinctively Australian.

Colonial Australia's Beginnings

The 1770 exploration and colonization of Australia by the English is credited to James Cook, captain of the HMS *Endeavor*. He was followed by Arthur Phillip, who became the first governor. Australia was an official English penal colony from 1778 to 1823; the last prisoners were sent there in 1868. In total, 162,000 male and female prisoners were transported, primarily from England, Ireland, and Scotland. The large number of prisoners sent to Australia provided cheap labor to create a colony and naval base, and reduced the population of an England experiencing poverty and prison overcrowding.

The first 780 prisoners arrived in Sydney Cove, known as Botany Bay, near Sydney, New South Wales, in 1780. By 1830, almost 60,000 convicts had been settled in Australia. Over 50,000 Irish convicts were sent to Australia between 1791 and 1870. Irish seeking a better life from the potato famine also immigrated to Australia. The Irish accounted for 25 percent of the population in Australia by 1870. A "white Australian" culture that was a blend of Anglo-Celtic cultures

emerged. The Anglo-Irish brought Christianity with them, and the majority of Australians still identify as Christian.

Australians who came to the United States during the gold rush in the 1840s settled in California, largely in the San Francisco and Los Angeles areas. The promise of striking it rich and untapped economic opportunities lured 6,000 to 8,000 Australians to make the 8,000-mile, one-month voyage. Some of these voyagers included former convicts, seeking to leave Australia.

Anti-immigrant sentiment in the press labeled these Australians “Sydney Ducks” and blamed them for starting organized crime in the San Francisco Bay area. The California legislature tried to pass laws to make it illegal for former convicts to enter California. Many of these Australians returned to Australia.

In the 1870s, another wave of immigration began. The economy in Australia was good, and regular ship travel between Australia and the United States was possible. Between 1871 and 1880, 10,000 immigrants came to the United States. Until World War II, Australian immigration was insignificant.

War Brides

The next noticeable influx of Australian immigrants came after World War II. The United States had one million troops stationed in Australia during World War II, following the fall of Singapore and the Battle of the Coral Sea in 1942. Approximately 10,000 to 15,000 Australian and New Zealand war brides came to the United States between 1945 and 1947. Since the war, about 2,000 to 3,000 Australians have immigrated each year.

Culture, Food, Sports, and Music

As Australians have assimilated so well into U.S. culture, evidence of Australian culture among persons who claim Australian descent is reminiscent of the Anglo-Celtic heritage of Americans of the same descent. The perceived personality of Australians is being laid-back, casual, sarcastic, brash, and individualistic. A media figure who embodies these characteristics is the *Crocodile Dundee* character portrayed by actor Paul Hogan, who was likened to the Davy Crockett folk hero of U.S. pioneer days. Dundee popularized a

distinctive icon for Australian dress—the khaki bush hat with a wide brim.

Cuisine brought to the United States and retained by Australian Americans includes barbecues of steak and lamb, Anzac biscuits (cookies), pavlova—a meringue dessert named after a Russian opera singer—meat pie, baked beans on toast, and Vegemite. Vegemite is an Australian cultural phenomenon akin to peanut butter in the United States. From childhood on, Australians at home and abroad consume this spread, a red-brown paste made from leftover brewer’s yeast, spices, and vegetables and most likely an acquired taste.

Australian beer and wines have become very popular in the United States. Australia is the world’s sixth-largest producer of wine, and over a quarter of that goes to the United States. Australian lagers are imported in great quantities in the United States.

Outdoor sports favored by Australian Americans include swimming, sailing, tennis, rugby, and cricket. Australian Americans gather to watch the Melbourne Cup horse race, the Rugby League grand final, and the Australian-rules Football League grand final. Golfer Greg Norman and tennis greats Rod Laver and John Newcombe have commanded significant followings in the United States.

The music of Australian Americans reflects their Irish and British antecedents. School-age children in the United States associate kangaroos, wallabies, kookaburras, and boomerangs with Australian culture as they learn “Waltzing Matilda,” “Kookabura Sits in the Old Gum Tree,” and “Tie Me Kangaroo Down, Sport.” Many Australian musicians have enjoyed great success in the United States, including Dame Joan Sutherland, Helen Reddy, Olivia Newton-John, country music singer Keith Urban, and the rock groups AC/DC and Men at Work. One of the most prominent Australian Americans is media czar Rupert Murdoch, who was born in Melbourne and became a U.S. citizen in 1985.

Austrian Americans

It is impossible to correctly estimate the number of Americans of Austrian descent, though the 2000 U.S. census reported 735,128 Americans or 0.3 percent of the 2000 population. The difficulty in determining an exact number is introduced by Europe's fluctuating borders, and the rise and fall of its states throughout American history. A Habsburg-dominated Austria grew out of the Holy Roman Empire and became a major European power around the 17th century, while North America was being settled; it was proclaimed an empire in 1804 and reorganized as Austria-Hungary in 1867. That empire collapsed with the end of World War I in 1918 and was succeeded by six states, including the modern republic of Austria, which was annexed by Germany in 1938 and didn't regain sovereignty until 1955.

The earliest Austrian settlers in North America seem to have arrived in the early 18th century. Hundreds of Protestant Austrians from Catholic Salzburg settled in the colony of Georgia in 1734, establishing the town of Ebenezer near Savannah. The first governor of Georgia after independence, Johann Adam Treutlen, was an Austrian American. In the mid-19th century, 48ers immigrated to the United States following the uprisings in Austria in 1848, prompted by liberal intellectuals. A number of them became involved in the abolition movement, as they settled in northern cities like New York. Skiing was popularized in the United States in part because of Austrian Americans, who introduced alpine skiing, which became a

competitive sport in 1861. Common occupations of 19th-century Austrian Americans included laborers, the service industry, and the growing steel industry.

The timing of an immigrant's arrival to the United States (or the pre-Revolution colonies) affects the likelihood of that new American identifying and being identified as Austrian. German speakers from anywhere in Europe were often counted as Germans by U.S. immigration officials in the 19th and early 20th centuries, regardless of their ethnicity. Immigration statistics from Austria-Hungary were not subdivided according to the empire's major ethnic groups, of which there were about 15. Nor were immigrants classified consistently; the same family might be classified as Austrian or Serbian depending on the immigration official. Many Austrians continued to be categorized as German until well after World War I.

In the chaos following World War I, over 18,000 Austrians immigrated to the United States from 1919 to 1924, at which point new immigration laws restricted Austrian immigration to 785 per year (bumped up to 1,413 per year in 1929). Until 1937, 16,000 more immigrated from that point; Austrian immigration to Canada also increased steeply because of American restrictions. In 1937, when the federal government relaxed immigration restrictions for refugees at the behest of President Franklin D. Roosevelt, numerous Austrian Jews came to the United States—over 30,000 before 1941. Some of this immigration was reversed in the 1960s as postwar Austria stabilized. Today, annual immigration from Austria is in the low hundreds.

The greatest concentration of Austrians settled in New York City, which today has a community of 93,083 Austrian Americans as of the 2000 census. Large groups also settled in Pennsylvania's Lehigh Valley (58,002 in Pennsylvania as a whole) and New Jersey (45,154). California (84,959) and Florida (54,214) have high concentrations of Austrian Americans, principally from later interstate migration from the northern cities. By percentage, the American communities with the most Austrians are in Wisconsin (Waterville: 12.1 percent, Durand: 9.2 percent, Rock Creek: 5.2 percent, Drammen: 4.4 percent, Mondovi: 4 percent), Pennsylvania (Coplay: 10.6 percent, Northampton: 5.2 percent, Upper Nazareth

Township: 4.2 percent, Shuykill Township: 4.2 percent), and the Mid-Atlantic.

Austrian Americans include a number of prominent entertainers, including Natalie Portman, Fred Astaire, Hedy Lamarr, animators Max and Dave Fleischer (responsible for the Superman and Popeye cartoons), and Arnold Schwarzenegger, who followed in Ronald Reagan's footsteps by turning his fame as a movie star into a career as the Republican governor of California. (The similarities even extended to both governors being succeeded by Jerry Brown.) So great was Schwarzenegger's popularity in the Republican Party early in his first term that there was serious talk of attempting a Constitutional amendment to permit all American citizens to run for president (rather than just natural-born citizens).

The Austrian directors Fritz Lang, Otto Preminger, and Billy Wilder migrated to the United States in the middle of the 20th century. Wilder would go on to have his greatest fame in the United States, directing such films as *The Apartment* and *Some Like It Hot*. The movie *The Sound of Music* is based on the true story of the von Trapp family, Austrians who immigrated to the United States.

Austrians were generally quick to assimilate in the United States, which is not to say that their ethnicity has been forgotten. In most areas they assimilated more completely than their German counterparts, and more easily than their Hungarian counterparts. Many Austrians, like Germans and others, changed their last names to English-sounding names during World War I, when Anglo-Americans scornfully called many central European Americans (without much concern for specifics) Dutchy, from the German *Deutsch*. But the Austrians influenced American culture while assimilating into it: they popularized the importance of the fir tree in American Christmas celebrations, and the practice of bad children receiving a lump of coal. The hymn *Silent Night* was written by Austrians Joseph Mohr and Franz Gruber in 1818 and was translated into English in 1859, becoming a staple of American churches. Today, the Austrian Cultural Institute (funded by the Austrian government) represents Austrian culture in the United States, and publishes the bimonthly *Austria Kultur*.

Aztlán

Aztlán, or much less commonly, *Aztatlan*, is the legendary, mythical ancestral homeland of the Nahua peoples of Mesoamerica; it includes most of Mexico and a majority of the Central American countries. Usually identified as Aztecs, the Nahua are a loose grouping of ethnic and cultural subpopulations and city-states. The relationship is that the Nahua share a common Uto-Aztecan or Nahuatl linguistic origin. The word *Aztec* is, in fact, the Nahuatl word for people from Aztlán. The meaning of the name *Aztlán* is much less certain, but most Nahuatl linguists have often translated it as the "place of whiteness." Because Aztlán is the Spanish pronunciation and translation of the original Nahuatl, the literal meaning may have changed.

Because of the loss of some of its tangible history, descriptions of Aztlán are subject to various interpretations, accounts, and histories. In Nahua accounts, Aztlán's location is much less important than the story of a great migration from Aztlán to Tenochtitlán, the present-day Mexico Federal District (Mexico City). Mesoamerican historians approximate that this migration began in the year 1064, which is also the first year of the Aztec solar calendar. According to Aztec legend, the Mexica, the group most identified as Aztecs, were the last group to settle (or conquer) the area; they eventually settled near Lake Texcoco, an area already occupied by other high civilizations.

The movement southward into Tenochtitlán takes on a very important and symbolic history. The legend is that the Aztecs were to build a city at the location where they spotted an eagle

perched on a prickly pear cactus and devouring a serpent with its beak and talons. The image, now an important Mexican national symbol, is widely recognized as the coat of arms of Mexico and is included in the country's national flag.

Contemporary Use of the Term

After the Spanish conquest of Mesoamerica, the legend of Aztlán gained value and significance in mythological proportions as a paradise, existing somewhere in the far north. These stories stimulated Spanish expeditions and conquests into what is now the U.S. southwest. Since then, explorers, anthropologists, treasure seekers, and many others have attempted to locate Aztlán, speculating that the location could be anywhere in North America.

The concept of Aztlán has also become a symbol for varying indigenous Mexican, Mexican nationalist, and Chicana/o and Mexican American movements. In particular, the Chicano movement's many and various strains used the name Aztlán to refer to the former lands of northern Mexico, the present-day U.S. southwest, lost because of the Mexican-American War (1846–48). Consequently, Aztlán became a physical, primordial, and in some cases legal symbol for Chicana/o activists, as the homeland.

To exercise this right to the homeland, some Chicana/os have proposed the creation of a new country, while others have suggested that the area be returned to Mexico. Many have taken these options seriously, but what we have seen is a symbolic return of Aztlán to Chicana/os. In other words, the threat has not been a military *reconquista* (reconquest), but instead a demographic and cultural one.

Aztlán as a Metaphor

Chicano/a activists have often imagined the greater U.S. southwest as Aztlán—a legendary/historic homeland for Chicano/as. Thus, many use it as their primary icon. For these activists, Aztlán has great symbolic currency, becoming a cultural metaphor and a permeable connection between Mexico and the United States. In Chicana/o nation building, Aztlán symbolizes a shared cultural, indigenous heritage, and a common language. In other words, Aztlán provides a place and space

with a mixture of Spanish, English, and some use of various indigenous languages; it symbolizes a connection to and ownership of the land, and a political, social, and later historical displacement from that land. As the Chicano/a homeland, Aztlán then becomes a unifying concept and base for Chicano/a nationalist discourse and of cultural pride, identity, and presence in the United States, as well as a basis of commitment toward acknowledging and claiming indigenous imaginations as part of the Chicano/a reality.

Aztlán may not be visible on a map, but it is a region unto itself and is full of complexities, ambiguities, and contradictions. Aztlán suggests both a melding and divergence of many cultures. Primarily, Aztlán is a geographical area first settled by a number of indigenous nations that have maintained a territorial tie to the land. Because of historical providence, Aztlán is also a unique enclave of Mexican and Chicana/o cultural identity and the emblematic homeland of Chicano/as.

No one knows where Aztlán is located. Regardless of the legitimacy of Aztlán, it is a rallying point for a people who feel that they have been left without a homeland. It is also an attempt to find an identity, culture, and homeland that many Chicana/os feel has been denied, as not only a symbol of hope, but also as physical proof that Chicana/os belong somewhere.

Back to Africa Movement

The Back to Africa movement, also known as emigration or repatriation, refers to the desire of people of African descent in the Western Hemisphere to return to their native land. Since the beginning of the transatlantic slave trade, which resulted in the forced migration of an estimated 12 million Africans from the 16th to the 19th centuries, people of African descent have long desired to return to Africa. From the very inception of the slave trade, African men and women actively revolted against their captors, demanding their return to their native land—literally and metaphorically. In the United States, in particular, people of African descent have led a variety of movements to return to Africa, although such efforts were often supported by whites.

The 19th Century

One of the earliest organized efforts to advance emigration to Africa was led by Paul Cuffe, a wealthy African American businessman. Born in 1759 near Bedford, Massachusetts, Cuffe became an avid sailor, traveling extensively to and from West Africa during the early 1800s. In 1811, he visited Sierra Leone, where he began to forge ties with the nation's leaders and arrange plans

for relocation. Convinced that African Americans could not live without discrimination in the United States, Cuffe worked tirelessly to recruit black men and women willing to emigrate. In 1815, he successfully led a group of 38 Africans from the United States to Sierra Leone, using his own funds to cover expenses. While his plans for additional trips fell through as a result of his untimely death in 1817, his actions sparked a growing interest in emigration. In the years following Cuffe's voyage, the Back to Africa movement gained significant momentum throughout the United States.

One of the most significant efforts to send African Americans back to Africa was led by members of the American Colonization Society (ACS). A religious organization, the ACS was initially founded in 1816 by Reverend Robert Finley and a coalition of white slave owners and Quakers who opposed slavery in the United States. Finley, a Presbyterian minister from New Jersey, believed that slavery was a national sin and openly called for its abolition. While Finley and the other members of the ACS supported abolitionism, they maintained certain racial prejudices and founded the organization on the premise that blacks and whites could not peacefully coexist.

Believing that emigration was the next viable step after abolitionism, members of the ACS played a central role in relocating African

The history of Liberia is unique and began when private societies started founding colonies for free blacks from the United States. Liberia had an elected black government and offered free land to African American settlers, making Liberia the most common destination for emigrating African Americans in the 19th century. American influence is often seen in the culture and architecture of Liberia. This former Masonic lodge is located in Monrovia, Liberia.

Americans to West Africa. Between the period of 1817 and 1866, the ACS sent an estimated 13,000 African Americans to Liberia and established the nation as a colony for free blacks in 1847. During the Civil War and the early years of Reconstruction, emigration from the United States to Liberia gradually declined as African American leaders such as Frederick Douglass openly criticized the ACS and African Americans' efforts to relocate.

While the Back to Africa movement declined during the mid-1860s, black leaders such as Bishop Henry McNeal Turner helped revive it. Born in Newberry, South Carolina, in 1834, Turner became an itinerant preacher in the African Methodist Episcopal (AME) Church in the late 1850s. During the Civil War, he became

pastor of Israel Bethel AME Church in Washington, D.C., and was appointed one of the first African American U.S. Army chaplains by President Abraham Lincoln. In the years following the war, Turner became actively involved in the Republican Party, serving as a delegate to Georgia's constitutional convention in 1868. After his political prospects abruptly ended when all black members of the state legislature were removed, Turner began advocating emigration.

Disheartened by his experiences and convinced that extinction was the only alternative to emigration, Turner appealed to African Americans to leave the country, using various outlets, including his newspapers, the *Voice of Mission* (established in 1892) and the *Voice of the People* (established

in 1901). While Turner advocated emigration to Africa as the best means to improve the social and economic conditions of African Americans, he also believed that it would bring Christianity and civilization to the continent. His efforts resulted in the emigration of an estimated 500 African Americans to Liberia during the late 1890s.

Although the ACS was no longer the central organization for emigration during this period, many African Americans in the south continued to seek aid from the organization, especially after the formal establishment of Jim Crow segregation laws. In the state of Arkansas, where more than one-third of Liberian emigrants originated, an estimated 100 black residents relocated to Liberia with the aid of the ACS during the late 1890s. This marked one of the last ACS-funded groups to relocate to the country after the U.S. Civil War. By 1900, the organization focused exclusively on education and missionary activities until its closing in 1964.

The Twentieth Century

During the early 20th century, the Back to Africa movement would thrive as a result of the teachings of Marcus Mosiah Garvey. More than any other proponent of emigration, Garvey's message resonated with black men and women, especially members of the working class. Born in St. Ann's Bay, Jamaica, in 1887, Garvey founded the Universal Negro Improvement Association (UNIA) in Jamaica in 1914 with the assistance of Amy Ashwood, who would later become his first wife. In the years following its relocation to Harlem in 1916, the UNIA became the largest and most influential black-led organization in the African diaspora, attracting an estimated 2 million members during its heyday. While Garvey advocated social, political, and economic empowerment through a variety of business ventures, he was also an avid supporter of emigration and promoted the establishment of an autonomous black nation state in West Africa.

Using the pages of the *Negro World*, the UNIA's official newspaper, Garvey encouraged supporters to invest financially in the creation of the Black Star Line Steamship Corporation (BSL). The largest UNIA business venture, the BSL was established, among other things, as the primary means of relocating people of African descent to West

Africa. In only a matter of months, Garvey raised sufficient funds to purchase the first BSL ship, the *Yarmouth*, for \$165,000 by selling shares of stocks for \$5 each. In November 1919, the *Yarmouth* embarked on a voyage to the Caribbean, drawing crowds of enthusiastic supporters. Within a few short years, Garvey purchased two additional BSL ships, the *Shadyside* and the *Kanawha*, with plans to transport people of African descent to Liberia and Sierra Leone.

Garvey's plans would be cut short on July 12, 1922, when he was arrested for mail fraud, allegedly using the U.S. mail to promote and sell BSL stock for ships that had not yet been purchased. In 1923, he was found guilty of the charge, and two years later began serving a five-year term at the Atlanta Federal Penitentiary. After numerous appeals, Garvey was ultimately pardoned by President Calvin Coolidge in November 1927, but ordered to leave the country. On December 2, 1927, in the presence of more than 500 supporters in New Orleans, Garvey was deported to his native Jamaica. He died in London on June 10, 1940.

The Contemporary Scene

Although Marcus Garvey was unsuccessful in his efforts to lead a mass movement of African-descended people to West Africa, he left an indelible mark on black men and women throughout the African diaspora. In the decades after Garvey's deportation, the desire to return to Africa remained an integral part of the African American community. During the 1960s and 1970s, a number of black leaders, including Louis Farrakhan, Malcolm X, and Stokely Carmichael, advocated the return to Africa (literally and figuratively) in solidarity with African liberation struggles. While the interest in returning to Africa has significantly declined in the 21st century, many African Americans continue to migrate to West Africa intent on finding their way back home.

Bangladeshi Americans

The modern nation of Bangladesh was formed in 1971, when the region of East Pakistan won its independence from Pakistan, which itself had been created in 1947 by the British partition of India. One of the provisions of the division was to subdivide the province of Bengal, previously part of British India, between India (West Bengal, predominantly Hindu) and Pakistan (East Bengal,

predominantly Muslim). An independent Bengal state was immediately proposed as an alternative, for reasons of both cultural continuity and economic pragmatism (most of the province's industry was in the west). The proposal failed. Though most East Bengalis shared a religion with the rest of Pakistan, cultural and language differences led to their oppression, and political dissent organized almost immediately, culminating in the war for independence. In the aftermath of the war, refugees fled—many of them crossed the border to West Bengal in India, while others left for the West, including the United States. (The Los Angeles Bangladesh Association, which printed a newspaper and helped serve the interests of the city's Bangladeshi community, was founded in 1971, the same year as Bangladeshi independence.)

Bengali Immigrants to the United States

Most Bangladeshi immigration to the United States is even more recent than that, increasing in the 1990s; in New York, for instance, the Bangladeshi population rose from about 5,000 in 1990 (half of the Bangladeshi American population) to 28,269 in 2000. The U.S. Census Bureau announced in 2007 that there were 143,619 Bangladeshi Americans, which represents 0.065 percent of the American population. While early immigrants were motivated by escaping the political turmoil of newly independent Bangladesh, more recent immigrants have been motivated principally by the country's employment opportunities. Most are under 40, and about half of immigrating adults are married.

Nearly all Bangladeshi Americans are Bengali (though not all Bengali Americans are Bangladeshi Americans) and include Muslim, Hindu, Christian, and Buddhist Bangladeshis. The Bengali language is one of the world's major languages, with over 200 million native speakers and its own script.

The first Bengali immigrants to the United States arrived in the early 1900s and worked as lumberjacks in the Pacific Northwest and railway workers in California. There numbers were small because of the discriminatory immigration quotas in place at the time. A small number of Bengali and Indian immigrants were able to challenge those quotas on the grounds that modern

anthropology considered them Caucasian, but this loophole was eliminated in 1924, and Bengalis living in the United States had restricted citizenship rights until 1946.

Around the 1940s, Bengali immigrants began to settle in New York City and San Francisco; these were often merchant sailors who had abandoned their ships. The largest Bangladeshi population is found in the New York City area, though at the dawn of the 21st century a sizable percentage of the New York Bangladeshi population relocated to the thriving Muslim American community in the Detroit metropolitan area. A similarly large population is in Paterson, New Jersey, and the Dallas, Texas, Bangladeshi population is larger, proportionally, than New York's. The Dallas community founded the Texas Bangladesh Association in 1997, with 500 members. In recent years, the Bangladeshi community has been dispersing from its traditional metropolitan centers; from 1990 to 2000, for instance, the Bangladeshi population in Georgia grew from 135 to 1,283, mostly as a result of migration from other states.

These numbers reflect documented Bangladeshi Americans, and there is a great deal of speculation about the number of undocumented Bangladeshis. Numbers as high as 50,000 for the New York City area, and about three times that for the country as a whole, have been suggested. Compared to other ethnic groups, Bangladeshi Americans are more likely to be first-generation immigrants and less likely to speak fluent English. However, they are also likely to intermarry with other ethnic groups; many second- and third-generation Bangladeshis are multiracial, their fathers or grandfathers having married African American or Hispanic women when prohibited by 20th-century miscegenation laws from marrying white women.

Notable Bangladeshi Americans

Second-generation Bangladeshi American Hansen Clarke was elected one of Michigan's representatives to Congress in 2010. The first Bangladeshi American congressman, he is a Democrat (as are most Bangladeshi American registered voters) and had previously served in the state House of Representatives and the Michigan Senate. His father, Mozaffar Ali Hashim, had emigrated from Bengal before the partition of India and married an

African American woman, Thelma Clarke, who raised Hansen after his father died while he was a child. Clarke now represents one of the country's poorest congressional districts and introduced a bill to forgive a portion of student loan debt.

Other significant Bangladeshi Americans include YouTube cofounder Jawed Karim, Fordham University space historian Asif Azam Siddiqi, *American Idol* semifinalist Arianna Afsar, the U.S. Navy's first imam, Abuhena Saifulislam, World Series of Poker winner Saif Ahmed, *Atlantic* associate editor Reihan Salam, and activist Rais Bhuiyan. Born in Bangladesh, Bhuiyan came to the United States to study, and was shot by Mark Anthony Stroman in September 2001, during Stroman's 9/11-motivated shooting spree of those he believed were Arabs. Bhuiyan was shot in the face with a shotgun, and after going deeply into debt to pay for the surgeries required to reconstruct his face, he began a charity to save Stroman—who had killed several others—from the death penalty. (Appeals failed, and Stroman was executed in 2011, hours after Bhuiyan spoke to him by telephone to forgive him.)

Today, the North American Bengali Conference is held every year to celebrate the culture of the Bengali diaspora in the United States, including Bangladeshi Americans.

Barrio

In the United States, the word *barrio* is used to denote a Latino or Hispanic neighborhood within a city, typically a lower socioeconomic class or working-class neighborhood. Derived from the Arabic *barri* (meaning “outside” or “wild”), the word *barrio* is used throughout much of the Spanish-speaking world to refer to neighborhoods, districts, or municipal divisions within a city, regardless of socioeconomic status. Found in urban centers throughout the country, barrios have been at the heart of the development of Latino communities and Latino culture in the United States for over a century. They have also faced issues of poverty, discrimination, infrastructure and schooling deficiencies, crime, and gang activity typical of many American inner-city areas.

While most barrios today include a mix of Latinos from various national origins, traditionally they have been dominated by one immigrant group, which varies according to region or city. For example, Mexican American barrios are strongly concentrated in Texas and the southwest; Puerto Ricans are the majority in New York City and Philadelphia barrios; and Cubans are concentrated in Miami. Barrios in many parts of the country (particularly in the southwest) have a particular look and cultural landscape that makes them different from other urban neighborhoods, including brightly colored houses, fences enclosing house properties, colorful murals in residential and commercial areas, and ethnic shopping centers. Housing stock is also older in barrios than in other parts of the city, with houses having been passed down from generation to generation.

In terms of demographics, a barrio has been defined as an ethnic neighborhood where at least 40 percent of the population are of Latino origin and at least 40 percent of the residents live in poverty. Because of this link between barrios and poverty, historians have typically attempted to fit barrios into a “ghetto model,” which has created a generalized image of the barrio with pejorative meaning. In other words, a barrio is portrayed as a place where people are forced to live and where residents are unskilled, poor, ill educated, and ignorant about the means of getting ahead in American society. However, scholars such as Ricardo Romo have revisited this distorted ghetto

image, arguing that the majority of Latinos, for reasons of language, kinship, and folk customs, chose to live together in barrios. These communities have provided, particularly for new immigrants, a sense of identity into the homeland and a transition into American society, acting as “agents of localized acculturation.” That being said, restrictive real estate covenants and prejudices have historically prevented barrio residents from moving into Anglo neighborhoods.

Historical Development

While Hispanic barrios already existed in towns across Texas, California, and other predominantly Hispanic areas in the 19th century, it was the early 1900s that saw the consolidation of these ethnic communities, as cities all over the region experienced major industrialization and unprecedented population growth. Barrios grew as a result of increased Mexican immigration driven by the Mexican Revolution (1910–20) and the demand for workforce that arose during this period—marked by World War I and the United States’ rapid industrialization.

In the early 1900s, the two main Mexican American urban centers were El Paso and San Antonio in Texas. Other cities developed distinct barrios, including Santa Fe, Albuquerque, and Las Vegas in New Mexico; Durango, Pueblo, and Denver in Colorado; and Tucson and Phoenix in Arizona. Along the south Rio Grande Valley, Laredo, Mercedes, Brownsville, and Corpus Christi were the main urban barrios. In general, barrio formation during this period was tied to segregation patterns, and housing and infrastructure within barrios were poor. In an era of dense urban configuration, barrios were on the immediate periphery of downtowns and manufacturing zones.

San Antonio was home to the largest urban barrio in the southwest during this period. The city’s West Side barrio was established directly adjacent to the city’s civic center, separated by San Pedro Creek. The barrio’s labor force was a major factor in maintaining San Antonio’s dominance over the regional economy in banking, manufacturing, commerce, and culture. The barrio economy itself was an important center of commerce, opportunity, and business formation for minority entrepreneurs—helping San Antonio to boast the most significant Chicano business ownership patterns

in the southwest during the first half of the 20th century. In the past few decades, the city's Mexican American section has also been responsible for a growing Tejano music industry as well as a thriving Spanish-language media sector. Despite all this, the West Side barrio has been the most impoverished zone of the city during the past century, becoming the site of San Antonio's first public housing development.

It was California and not Texas, however, where the most significant urban barrio in the United States would emerge. The East Los Angeles barrio was formed in the 1900–30 period, when the city grew from 100,000 people to a metropolis of over a million. Mexicans adapted to this industrialization process and contributed to the creation of an ethnic community in one of America's fastest-growing cities. By 1930, the East Los Angeles barrio had gained fame as the largest Mexican community in the United States, with more than 90,000 residents. This concentration of Mexicans on the east side took place as the city became decentralized thanks to improved urban transportation, with Anglos and European ethnics beginning to move to the suburbs. Mexicans then bought or rented homes in the old Italian, Jewish, and Russian neighborhoods. By 1950, either by choice or as a result of exclusion from Anglo communities, most second-generation Mexican Americans still lived on the east side. In the 1950s, the barrio was carved up by the construction of freeways and public structures, prompting relocation of residences and division of old communities. The barrio was a central site of student protests, anti-war demonstrations, and picketing of area supermarkets by the United Farm Workers union in the 1960s and 1970s. Today, according to the 2010 U.S. census, East Los Angeles has a population of 126,496—97 percent of which is Latino.

San Francisco and San Diego are home to two other important California barrios. In San Francisco, the Mission District has been recognized as the city's barrio since the mid-20th century. From the beginning of San Francisco's development, Mission Dolores, south of the city center, was an area of working-class housing linking labor to the harbor. Initially multiethnic in character, the composition of this area changed with the out-migration of European Americans into new suburbs. By the 1920s and 1930s, Spanish and Mexican

American cultural influences dominated the Mission District, and the concentration of Chicanos changed the economic and social milieu of the zone. Meanwhile, San Diego's present-day barrio had its origins during the 1910 to 1930 period due to the influx of Mexican laborers to southern California. In order to be closer to worksites in the waterfront district, many Mexican families moved into Logan Heights, previously a middle-class suburb. Thus, the Barrio Logan quickly replaced the city's Old Town as its main Mexican American neighborhood. Today, the San Diego inner-city barrio, located southeast of downtown, is comprised of three neighborhoods: Barrio Logan, Logan Heights, and Sherman Heights. The barrio's population is 68 percent Latino, with 40 percent of residents living below poverty level, according to census figures.

In the northeast, the largest barrio is New York City's Spanish Harlem. Unlike Latino communities of the southwest, Spanish Harlem is mostly Puerto Rican—in fact, it is the country's oldest and largest Puerto Rican barrio. Previously an area inhabited by German, Irish, Jewish, and Italian immigrants, East Harlem changed in the late 1920s as these ethnic groups began to move out. Thousands of Puerto Rican immigrants, driven by the lack of economic opportunities on the island, migrated to New York City and began to move into the area. By 1960, 600,000 Puerto Ricans lived in New York City. Bodegas, or neighborhood stores, have traditionally been a distinctive feature of East Harlem and other Puerto Rican barrios, becoming important business and social spaces for barrio residents. According to the 2010 census, there were 723,621 Puerto Ricans in New York City—making it the largest Puerto Rican city after San Juan. Philadelphia is also home to an important Puerto Rican barrio, numbering 121,643 residents, or 8 percent of the city's population, according to the 2010 census.

In the midwest, the city with the largest barrios has historically been Chicago. According to the 2010 census, Chicago has the third-largest population of Mexican Americans after Los Angeles and Houston (576,857 residents), and the third-largest concentration of Puerto Ricans after New York City and Philadelphia (102,703 residents). A lesser-known, but equally significant barrio is St. Paul's Lower West Side. This Minnesota

community became the most important Mexican barrio of the upper midwest starting in the early 1900s, as workers came to the city attracted by agricultural labor, particularly in the sugar beet fields. Meanwhile, in the south, Miami is home to Little Havana, one of most important Cuban barrios in the country. Little Havana is noted as the center of social, cultural, and political activity in Miami among Cuban immigrants, who began settling there after the 1959 Cuban revolution. In addition to Cubans, Little Havana has also attracted large numbers of Nicaraguans and other Central American immigrants.

Recent Developments

Barrios are by no means static communities, constantly morphing their characteristics and ethnic makeup along with the immigration and demographic changes experienced by the United States in the past few decades.

Starting in the 1980s, immigrants from El Salvador and other Central American nations besieged by civil war and poverty began pouring into the United States, many of them settling in neighborhoods that were traditionally Mexican or Cuban. According to the 2010 census, close to 4 million Central Americans call the United States home—close to a fourfold increase since 1990. More than half a million Central Americans reside in Los Angeles, especially in neighborhoods such as Pico Union, the Westlake district, and Watts. Central American immigrants have also poured into Texas, changing barrio demographics in cities such as Houston. Today, a significant percentage of the population of Magnolia (Houston's traditional Mexican barrio) is Central American.

Moreover, since the 1990s, many cities in the midwest and south that historically attracted few Hispanics have experienced an unprecedented Latino population growth. One example is North Carolina. Mexican Americans have become the ethnic majority in Charlotte neighborhoods such as Eastland. In the Raleigh area, newly formed barrios now house Mexicans, Central Americans, Dominicans, and other Hispanics. While many Latinos have been leaving Hispanic-concentrated neighborhoods in large numbers in the past two decades, new immigrants are moving into those spaces and creating new ones. While it may look different, the barrio is likely to continue to be an

important feature of an increasingly multicultural urban America.

Baseball and Ethnic Diversity

Baseball has been among the most popular sports in the United States during the last 170 years. Indeed, the sport has been identified as part of a an iconic tripartite of American identity (baseball, mom, and apple pie). In the 1800s, there was much speculation and debate as to whether baseball was adapted from a British game (rounders) or a uniquely American creation. A commission determined that the game was created by Abner Doubleday (a U.S. citizen) in 1839. This decision was later overturned for lack of corroborating evidence, and no single individual has ever been credited with the game's creation.

However, the initial organization of U.S. baseball has been attributed to Alexander Cartwright. He is credited with writing the first set of baseball rules and creating the team of Cartwright's Knickerbockers in 1846. Since then, the relationship between baseball and U.S. culture has remained

strong. To some extent, the history of baseball presents a mirror into ways in which the United States has been culturally inclusive or exclusive over time.

Early Baseball, Ethnicity, and Race

Professional baseball teams, in which players are paid employees, have existed since 1869. Although the majority of professional teams comprised exclusively white/Caucasian Americans, there were rare exceptions. In 1884, the Toledo Blue Stockings had two African American players, brothers Moses Fleetwood and Weldy (sometimes referred to as Weldy) Wilberforce Walker. The team was part of Major League Baseball, as it that existed at that time.

In 1871, Esteban Ballán debuted with a team known as the Troy Haymakers (the predecessor of today's San Francisco Giants). Ballán was born in Havana, Cuba, but emigrated to the United States and is credited with being the first Latino American professional baseball player. Four years later, he returned to Cuba and helped organize baseball teams and leagues, and was a player/manager for a team that won several national Cuban championships. This was one of the earliest records of U.S. baseball principles being exported to another country.

Louis Sockalexis played for the Cleveland Spiders in 1897 and has been identified as the first Native American (Penobscott Indian) to play in the major leagues. Adolfo Luque, who played for various teams over a 20-year period, is credited with being the first Hispanic/Latino player in a U.S. World Series (on the 1919 Cincinnati Red Sox team).

A Segregated Game

From the 1880s to the 1940s, most baseball teams were racially segregated. The restrictions were consistent with the era's Jim Crow mores, a series of laws, social practices, and rules of etiquette that emphasized the superiority and separateness of white/Caucasian Americans. By restricting access and life opportunities, the Jim Crow system worked to relegate other racial/ethnic minority groups to second-class citizenship. These restrictions were so specific that in Alabama it was illegal for black and white individuals to play board games (e.g., dominoes, checkers) together. Comparatively, the restrictions for racially segregated

baseball were more severe. Although Jim Crow is commonly associated with restrictions placed on African Americans in the south, similar separatism was enacted toward Native Americans, Asian Americans, and Hispanic Americans in various regions across the country.

If players had a biracial heritage, they were denied access to the white teams. For example, Jimmy Claxton played two games for an Oakland team in 1916. After it was discovered that his parents were an interracial couple, Claxton was released from his contract. Vincent Nava had a somewhat similar experience. Nava's parents were an interracial couple. (There are conflicting reports as to whether Mr. Nava was born in Cuba, the United States, or Mexico). However, there appears to be consensus that he had some Hispanic/Latino heritage. He began playing baseball in California in 1882 under the name Irwin Sandy. During the time that he played for East Coast teams (e.g., Providence Clubs), he revealed that his name was Vincent Nava. Nava played his last professional game in 1886. There has been speculation that he was released from professional

Jack Roosevelt "Jackie" Robinson was the first black Major League Baseball player, breaking the "baseball color line" when he played for the Brooklyn Dodgers in 1947. He was instrumental in bringing an end to segregation in baseball.

teams because his name change exposed his biracial/Hispanic family background.

During this segregationist period, different baseball leagues emerged. Although the term *Major Leagues* was often used to describe the white/Caucasian American teams, these were not the only leagues. African Americans formed leagues in northern and southern states. Hispanic American players created their own leagues and game series in the southwestern United States/northwestern Mexico regions. Hawai'i (when it was a U.S. territory, prior to statehood) had a Japanese American baseball team as early as 1899. Native Americans also created their own baseball league. This emergence of separate leagues was consistent with the development of other social infrastructures (e.g., schools, hospitals) by racial/ethnic groups that were segregated from white sports teams. Thus, the baseball leagues fit with the self-empowerment movements to build upon strengths and enhance well-being within disenfranchised communities.

European Immigrants and Sports

In contrast to African Americans and Hispanic Americans, white European immigrants (e.g., German, Polish, Italian) had an easier time entering the Major Leagues. During the Civil War (1861–1865), thousands of immigrants were recruited to join the Union army. Their military service was considered an indication of their allegiance to their new country and its culture. Integration into the army units gave them opportunities to rapidly learn about U.S. culture, including sports. There are reports that soldiers (including immigrant and first-generation soldiers) played baseball as a recreational activity. After the war, some individuals were so skilled that they were able to join professional teams. For example, Oscar Bielaski, who learned baseball in the army, became the first Polish American to enter the major leagues in 1872.

From the 1880s to 1920, there was a significant increase in European immigrants to the United States. Although many of these immigrants were white/Caucasian and did not face racial prejudice, they faced cultural prejudice. Negative stereotypes and caricatures of Irish, Jewish, and Italian immigrants were common in the media of the time. Many immigrants and their first-generation descendants found themselves blocked

from certain areas of employment (e.g., “No Irish Need Apply”). Comparatively, baseball was more open and players' inclusion into the field was rapid. For example, nearly half of the Giants' team roster in the 1890s was composed of Irish and Irish Americans.

Within the U.S. mainland, games were sometimes played between teams of different leagues. In the 20th century, improved sea transport (and later plane transport) made it possible for white/Caucasian teams to travel to Caribbean islands, South America, and Pacific islands. At these locations, games were played between teams of various racial/ethnic groups. These games were for exhibition purposes—“real baseball” was still a segregated game. Still, it has been argued that these games had an important social impact. Players and coaches of the white/Caucasian American teams saw the talent of players on other (more racially/culturally diverse) teams. It has been reported that during the 1930s, some coaches and managers were advocating the recruitment of these players and a dismantling of the segregated team system. Thus, it is possible that these exhibition games were not meaningless events. Rather, such games might have helped break down prejudices and social barriers between players of various leagues.

It is common to associate the civil rights movement with the 1960s. However, there were significant movements toward equality during the 1930s and 1940s. A series of events contributed to recognition that Jim Crow segregation and later “separate but equal” principles were morally wrong. Some players took the position that their ethnic/religious identity had important social value. For example, Hank Greenberg (the first Jewish American baseball superstar) was mindful of his social responsibility to reflect a positive image of Jews and Judaism. This importance became magnified during the rise of Nazism in 1930s Europe. Greenberg noted that his baseball success countered Hitler's negative messages about Jewish people. Similarly, Joe DiMaggio was the son of Sicilian immigrants and seen as an important social symbol of Sicilian/Italian pride within the United States. He had a 56-game hitting streak in 1941 and was voted the Greatest Living Player in 1950. He was such a powerful presence that his team has been referred to as

“DiMaggio’s Yankees.” DiMaggio retired from baseball in 1955, but is still considered one of the best players of all time and a national treasure.

During World War II, the service of elite units such as the Tuskegee Airmen and Navajo Code Talkers, demonstrated the intelligence, dedication and exemplary skill of individuals from several racial/ethnic groups. President Harry Truman is credited with supporting equality initiatives in housing and employment, and ordering the racial/ethnic integration of the military. The National Association for the Advancement of Colored People (NAACP) won several legal cases that dismantled some forms of separation and served as the foundation for the more famous cases of the 1950s. Thus, it has been argued that such events fostered a social context that facilitated the acceptance of racially integrated baseball teams. For example, Allie Reynolds (a Native American player) joined the Cleveland Indians in 1942. Within four years, five other Native Americans had joined the Major Leagues: Cal McLish, Brooklyn Dodgers; Charlie Cozart, Boston Braves; Jessie Pike, New York Giants; Pat Cooper, Philadelphia Athletics; and Jim Gladd, New York Giants.

Integrating the Majors

Jackie Robinson was the first African American player to play continuously in the Major Leagues. He joined the Brooklyn Dodgers in 1947 and remained part of this team for 10 years. Jackie Robinson was (posthumously) awarded the Presidential Medal of Freedom, the highest award that can be granted to a U.S. civilian who did not serve in the military. After Jackie Robinson’s arrival, many African American players were able to enter (and remain) in the leagues. For example, John Wright (Brooklyn Dodgers), Larry Doby (Cleveland Indians), and Willard Brown (St. Louis Cardinals) joined their teams in 1947, as well. Jackie Robinson and Dan Bankhead were the first African American players in the World Series (1947). The Boston Red Sox was the last team to hire an African American player, Elijah “Pumpsie” Green, in 1959. Some players, such as Leroy “Satchel” Paige, had had impressive careers during the segregated era before becoming part of the first wave of players to integrate the Major Leagues.

Similarly, a rapid integration of Hispanic/Latino players began during the same period. In 1948,

Saturnino Miñoso, from Cuba, joined the Cleveland Indians and played in the 1951 World Series for the Chicago White Sox. By 1950, there were more than 50 Hispanic/Latino players who had played in the Major Leagues. Roberto Clemente was recruited from Puerto Rico in 1955 to join the Pittsburgh Pirates and was part of this team when it won the 1960 World Series. This rapid inclusion of Hispanic/Latino players is partly attributed to an active recruitment system that was built between U.S. team managers/owners and scouts in the Caribbean and South American countries.

The inclusion of Asian and Asian American players has been relatively slower. In 1956, Bobby Balcena was the first Filipino American to enter the Major Leagues. He played briefly for the Cincinnati Reds, but the majority of his career was spent in the minor leagues. Nine years later, Masanori Murakami became the first Japanese player to join a professional U.S. team. He played for the San Francisco Giants for one year, but then returned to Japan, where he played baseball for an additional 18 years. It has been argued that there was less emphasis on Asian Americans to join U.S. Major League teams when opportunities to play baseball in other countries (e.g., Japan) were available.

For some people, there was a presumption that equality and integration were achieved by the 1970s. In 1971, the Pittsburgh Pirates had all major positions for the starting lineup filled by African Americans. In 1975, Ryan Kuroski played for the St. Louis Cardinals, and he is recognized as the first Japanese American player in the Major Leagues. However, there were still some barriers to social acceptance and incidents of racism and discrimination. In 1974, Henry “Hank” Aaron hit his 715th home run, exceeding Babe Ruth’s home run record set in 1935. As it became apparent that Aaron might break Ruth’s record, he received a great deal of attention from the general public. Some individuals and groups were highly offended that an African American player would exceed the success of a white/Caucasian American player. Aaron received many derogatory messages, including death threats. This incident highlights the vehemence with which some portions of society still held segregationist and discriminatory views. For some, Aaron’s experience marks a turning point in U.S. baseball. Since then, there

has been an expanded effort—including training within the professional baseball leagues—to build support for players from racially and culturally diverse groups. One sign of social progress was the comparatively better experience Sammy Sosa (a Hispanic/Latino player) received in 1998, when he surpassed Roger Maris's home run record.

During the past few decades, the range of racial and ethnic diversity has varied. The peak of Major League membership for African Americans was reached in the 1970s, when approximately 25 percent of players were African Americans. In 2012, this membership had dropped to less than 10 percent. By comparison, there was a higher percentage of African American Major League players in the 1950s than during the current decade. There does not appear to be a consensus on the reasons for this decline and on ways to reverse this trend.

An estimated fewer than 5 percent of current U.S. Major League players are of Asian, Asian American, or Pacific Islander heritage, yet the internalization of baseball has contributed to the development of strong and active major leagues in Asian countries, such as Japan and South Korea. And some U.S.-born athletes have moved to Asian countries to play baseball in these leagues. Baseball almanacs identify three current Native American Major League players. Comparatively, Hispanic/Latino athletes have a larger presence in the U.S. professional baseball, with an estimated 25 percent of current players of Hispanic/Latino or Mexican American descent.

Women and Professional Baseball

For most of U.S. history, baseball was considered a man's game. However, there was a brief period from 1943 to 1954 when women were a significant part of the professional baseball industry. In World War II, millions of men joined the military. Their military service was considered a patriotic act, but it also represented a depletion for the baseball leagues of both players and fans. To maintain cultural interest in the sport, the All-American Girls Professional Baseball League was formed. The league was composed of multiple teams, and all players were women. Although there was speculation that teams were initially formed as a novelty/comedic act, players clearly demonstrated athletic skill and baseball prowess.

For example, Dorothy Schroeder had an RBI (runs batted in) rate of .431, which met or exceeded the rate of many male players. Joanne Weaver was the league's batting champion for three consecutive years.

Yet, the league required that women's athleticism be balanced with traditional standards of femininity. The players were required to attend charm school to learn proper etiquette (e.g., manners, appearance, behavior). On the field, female players wore skirts rather than pants. Off the field, players were expected to behave in a demure and "ladylike" manner.

Notably, some of the racial segregation exhibited in men's baseball was also present in women's baseball. African American women were not permitted to join the American Girls Baseball League. So, some of these women joined the extant men's teams, creating mixed-sex teams. For example, when Hank Aaron left his team in Indianapolis to join the Boston Braves, a woman named Toni Stone was hired as his replacement. A year later, Stone was traded to the Kansas City Monarchs, and Constance Enola Morgan became her replacement. Mamie "Peanut" Johnson also played on a mixed-sex team for two years, from 1953 to 1955.

The women's league teams were mostly disbanded by the late 1950s. For the next four decades, more attention was given to softball as a sport for female players. In 1992, the American Women's Baseball Foundation was formed. This foundation works to promote opportunities for women to play competitive baseball. There are similar organizations in other countries (e.g., Women's Baseball Association of Japan), and various teams engage in international tournaments. It is possible that such associations will build a sustainable presence for women in professional baseball again.

Conclusion

Throughout its history, there has been a significant transformation in the degree of racial and cultural diversity within Major League baseball. Up to the first half of the 20th century, baseball reflected the challenges faced by underrepresented groups to gain equality and respect within U.S. society. The successes of some players allowed individuals of their respective racial and ethnic groups (e.g.,

Italian, African American) to share pride in their accomplishments. Although individuals might not have known the players personally, they felt connected to them via a common ethnic/religious identity. Simultaneously, the social acceptance of players by teammates, other players, and fans is credited with lessening prejudice and segregation. Consistent with parasocial contact principles, positive views of specific players were extended to positive views of their racial/ethnic/religious groups in the larger society.

Since the second half of the 20th century, there is greater integration among players of diverse ethnic groups. The Institute for Diversity and Ethics in Sport has rated Major League Baseball as good-to-excellent in racial and gender diversity. As professional baseball is a sport that has typically been played in large venues and received media saturation, it has a significant and influential presence on the societal stage. Given its prominence in the general society, baseball has been a venue through which cultural issues of exclusiveness and inclusiveness have been revealed, challenged, and changed. Thus, it is possible that baseball will continue to be a means of recognizing cultural diversity among Americans and celebrating the collaboration that can be achieved among players from disparate backgrounds.

Basketball and Ethnic Diversity

The game of basketball, which originated at the Young Men's Christian Association (YMCA) Training School in Springfield, Massachusetts, in 1891, is arguably the most widely exported American sport form. Its national and international appeal has garnered global attention from athletes and spectators inhabiting six continents.

The global popularity of basketball is evident at the amateur and professional levels. It is estimated that well over 250 million people worldwide participate in organized competition, and countless others engage in pick-up games on a daily basis. Global network and media coverage has made it among the more marketable sports in the world. The etiology and evolution of basketball throughout the 20th century yields a unique sociocultural and historical perspective of American sport, as well as racial and ethnic relations.

Historical circumstance has played a major role in the development of American sport forms. Basketball, invented during the height of the Industrial Revolution and the Gilded Age (1880–1920), was no exception. The industrial workplace was the catalyst of America's growth and expanding economy during this period. Organized professional team sports and recreational pastimes grew out of this environment partly because of the diverse workforce. Because of the massive immigration from Europe, industrialists and capitalists believed that sports participation could be used to train immigrant workers to become loyal, efficient, and patriotic citizens. Therefore, team sports were employed as an assimilatory agent

and value purveyor in hope that ethnic and cultural ties would be abandoned.

The systematic utilization of sport was basically for capitalist expansion and the status of the United States as a world power. "Americanized" sports such as football, baseball, and basketball were endorsed and sponsored. Jay Coakley's assessment of the Industrial Revolution and the development of organized American sports, particularly as an acculturation process, helps explain the playground movement in densely populated urban cities in the late 19th century. Advocates of the corporate-bureaucratic-meritocratic society promoted organized playground programs that used team sports because they could suppress the traditional values of white ethnic groups (i.e., Italians, Irish, Germans, Jews, and others) and replace them with those deemed American. The inculcated values were reinforced in public schools, adult-sponsored sport programs, and ultimately the industrial workplace. These groups were the first to play organized basketball.

The Origin of Basketball

Basketball is an American sport invented by James Naismith, the Canadian-born physical educator and coach at Springfield College (Massachusetts). Naismith was commissioned by Dr. Luther Gulick, director of the gymnasium department of the International YMCA Training School at Springfield College, to develop an indoor winter sport for students between football and baseball seasons. Given two weeks to create the activity, Naismith assessed the strengths and weaknesses of the existing sports and conceived a game where body contact would be minimized. The big soft soccer ball of the times was chosen because it was safest, while two peach baskets suspended 10 feet in the air at opposite ends of the gymnasium were erected to further reduce collisions. Because of the physicality of other sports where athletes ran, kicked, or hit the ball, Naismith's 13 original rules only permitted passing the ball to advance it. To score a goal, players had to toss a soft, lobbing shot into the suspended basket. Dubbed "basket ball" by its inventor, the first game was played with two nine-man teams on December 21, 1891.

The sport became an instant success at the YMCA Training School, so much so that

individuals wanted to rename it Naismith Ball, in deference to its inventor. However, Naismith objected and required that it be called "basket ball." By 1893, basketball had been introduced internationally by the YMCA movement and the many students who learned the game under James Naismith.

Growth of Basketball

Basketball was introduced far and wide by college YMCA players and Naismith himself, who traveled with a touring team along the East Coast. His barnstorming eventually sowed the seeds of a vibrant new sport in several major metropolitan areas.

Naismith took the game west when he relocated to the YMCA in Denver, Colorado, in a similar position (1894). He concurrently acquired a medical degree from the Gross Medical School at the University of Colorado and eventually took up permanent residence at the University of Kansas in 1898. Ironically, Dr. Naismith was not hired to develop and coach basketball, although once there he did for 39 years. He was hired to lead chapel prayer. His previous training at McGill University in Montreal, Canada, prepared him to undertake the position, and serendipitously enabled him to spread the game of basketball in the military. As chaplain in the Kansas National Guard, he taught the sport to his soldiers.

By mid-1890 basketball was played extensively at YMCAs, settlement houses, church facilities, and schools. The game was also picked up and revised by Senda Berenson at nearby Smith College, and taught to her female students. In 1898 the first professional basketball league was established in Philadelphia. Eventually, traveling ethnic basketball teams like the Buffalo Germans toured the country. The inclusion of basketball as a demonstration sport in the 1904 Summer Olympic Games at St. Louis also promoted the game to the world, even though it was not sanctioned as a medal sport until 1936.

The City Game and Ethnicity

Basketball grew extensively in the eastern metropolises: New York, Philadelphia, Baltimore, and Washington, D.C. Because of spatial constraints in these densely populated urban cities, basketball became a viable sport of choice. The nominal

start-up costs and access to municipally funded recreation centers, playgrounds, and parks also aided its community acceptance. Inner-city settlement houses, schoolyards, and YMCAs became the major purveyors of the sport's talent pool, who were drawn mainly from the poorer ethnic groups. By the start of World War I, basketball was second only to football in popularity in high schools and colleges nationally.

The sport of basketball was indigenous to the city and the style of those who played the game for the first two decades. Early athletes were German, Irish, and Jewish. Eventually, African Americans were introduced to the game through segregated YMCAs. The Celtics, established in 1912 from a New York settlement house known as the Hudson Guild, were located in a predominantly Irish neighborhood. They became the leading professional team of the 1920s. However, other notable semiprofessional, ethnically oriented teams of the 1920s included the South Philadelphia Hebrew Association (SPHA), the Harlem Renaissance (Rens), and the Harlem Globetrotters, the only franchise still in existence.

Weekend leagues in the 1930s (American Basketball League and National Basketball League) provided a modicum of income for barnstorming teams and itinerant players. Occasionally, integrated invitational tournaments were held throughout the country. In 1939 the Harlem Renaissance won an eight-team World Championship title against the all-white Oshkosh All-Stars. A year later the Harlem Globetrotters defeated the Rens to become world champions.

The Globetrotters, formed in Chicago and allegedly a spin-off team of the Savoy Big Five, became a dominant team in the mid-1920s and until the National Basketball Association integrated in 1950. Ironically, they had a monopoly on the black basketball talent pool because teams and leagues were segregated. Partially because of league integration and the impending loss of star black players, the Globetrotters eventually changed their style of play to strictly comedic entertainment. They eventually became the most iconic and celebrated international basketball ambassadors in sport history. For example, in 1950 and 1951, they were the first American professional basketball team to tour Europe, north Africa, and South America.

The College Game

Basketball found a niche at many colleges and universities, where scholastic programs and annual tournaments were held. This was particularly true in eastern and mid-Atlantic urban areas, as well as certain midwestern and West Coast cities. Intracity collegiate basketball rivalries with scheduled doubleheaders were common in large cities like New York, Philadelphia, Pennsylvania, and Washington, D.C. The burgeoning interest and potential revenues facilitated the establishment of several national championship tournaments in the 1930s: National Association of Intercollegiate Athletics (NAIA), National Invitational Tournament (NIT), and the National Collegiate Athletic Association (NCAA).

Like other collegiate sports, basketball was devoid of black players in most of the major conferences, yet they were afforded opportunities at select northern white institutions. The exception was the Big Ten, which excluded black basketball players until after World War II. As a result, blacks were recruited to play at various midwestern and West Coast universities. Jackie Robinson, the two-time Pacific Coast Conference scoring champion and arguably the best all-around player of his time, excelled at the University of California, Los Angeles (UCLA) before joining the military in 1941. Unbeknownst to most, Robinson played professional basketball with the Los Angeles Red Devils, an integrated team in 1946, after playing summer baseball on the Dodgers minor league club in Montreal, Canada. Later, fellow Bruin Don Barksdale would be named a college All-American in 1947 and the first black player on the United States Olympic basketball team in 1948. However, the vast majority of black basketball players were relegated to historically black colleges and universities (HBCUs) located primarily in the south.

Since basketball was not played extensively in the southern states before and immediately after World War II, many players at HBCUs were from northern and midwestern inner cities. Because of sanctioned segregation in the south, HBCUs were forced to organize their own athletic conferences and tournament affiliations. The Colored Intercollegiate Athletic Association (now Central Intercollegiate Athletic Association or CIAA) was the first black athletic conference, established in 1912. It was followed by several other HBCU conferences.

Before integration, these conferences produced most of the black basketball stars but were excluded from national tournament championships.

Changing the Game and Tournament Exposure

Interest in basketball grew dramatically among blacks during the post–World War II period partly because of professional basketball integration in 1950, as well as the federally mandated desegregation of the armed forces and the public schools. However, national basketball tournament champion organizers were still not amenable to the inclusion of HBCUs, even though John McLendon, the “Father of Black Basketball” and student of Dr. Naismith, lobbied extensively for the chance to compete. Eventually the NAIA relented in 1952 and created Division 29. The outcome was a black college tournament that sent the winning team to the NAIA National Tournament. HBCU basketball prowess was forthcoming.

The national exposure of HBCU basketball soared exponentially when John McLendon’s Tennessee A&I team won the NAIA National Tournament three consecutive years (1957–59). It was the first time an African American college team won a national title against a white opponent in any team sport. McLendon’s up-tempo offense introduced a new style of play that would be emulated by college and professional teams. Subsequently, other HBCU representatives would win the NAIA championship.

The larger and more celebrated NCAA Basketball Tournament experienced a major change as well when unheralded Texas Western University (now the University of Texas at El Paso, or UTEP) defeated the University of Kentucky, known as Rupp’s Runts, in the 1966 championship game. It was the first time that a major college team started five black players in a championship game and defeated an all-white team. As a matter of fact, all seven of Don Haskins’s Texas Western University players who played were black. Some referred to this sociocultural and historic sport event as the “Emancipation Proclamation of 1966.” The game’s outcome, along with sundry civil rights legislation passed during the decade, spiked the recruitment of black athletes in basketball and football nationally. However, college basketball programs became the primary beneficiary. Within

a 20-year period, collegiate sport programs experienced the most dramatic increase in integration than ever before. For example, the percentage of black players on college basketball teams increased from 10 percent (1962) to 34 percent (1975), and the average number of black players on college teams increased from 2.9 to 5.7 between 1966 and 1985.

The aggressive recruitment of black basketball talent at non-HBCUs has continued into the 21st century, as athletic programs have found the sport to be a major revenue generator. Richard Lapchick’s annual Racial and Gender Report Card for 2010 indicated that black males and females comprised 61 percent and 51 percent of college basketball teams, respectively. The percentage of black head coaches of collegiate basketball programs has also increased over the years, and stands at approximately 25 percent for males and 11 percent for females. The combination of black male and female head coaches of women’s programs is approximately 15 percent. Ethnic diversity in collegiate basketball has increased for other nonwhite racial groups similar to professional basketball.

Professional Ball and Integration

The commercial success and complexion of professional basketball has changed dramatically since the inclusion of its first three black rookies in 1950: Nate “Sweetwater” Clifton, Earl Lloyd, and Chuck Cooper. The latter broke the color barrier in the newly formed National Basketball Association (NBA) when he was drafted in the second round by the Boston Celtics, the same franchise that hired Bill Russell as player-coach in 1966. He became the first African American coach in the NBA. Unfortunately, league integration was a slow process because of the stereotypical views held by league officials, team management, players, and fans. At the time, NBA players were mainly from second-generation German, Jewish, and Irish families and had been raised in metropolitan New York. In the early 1960s approximately 84 percent of the players were white and from urban areas.

The ethnic makeup of the NBA began to change mid-decade when highly touted black collegians, several from HBCUs, joined veteran all-stars like Bill Russell, Elgin Baylor, Wilt Chamberlain, and Oscar Robertson to raise the level of play and lead

their respective teams to championships. Kareem Abdul Jabbar (aka Lew Alcindor), Elvin Hayes, Earl Monroe, Walt Frazier, Willis Reed, and others from the rival American Basketball Association helped solidify the game during the 1970s.

With the merger of the NBA and ABA in 1976, the league and talent pool expanded. The ABA added a more up-tempo, high-flying, spectator-driven game that was missing in the elder league. The most celebrated player was Julius “Dr. J” Erving and his patented slam dunks. Fans and players alike emulated his style of play and dress. He, along with the rivalries between Larry Bird (Boston Celtics) and Ervin “Magic” Johnson (Los Angeles Lakers), rejuvenated spectator interest and rekindled memories of the Chamberlin-Russell duels of decades earlier.

International Exposure and the Dream Team

Basketball is played throughout the world, and many have contributed to its global exposure. Touring college, professional, and armed forces teams have played a major role in disseminating the game. Also, the International Basketball Federation–sanctioned leagues and tournaments have drawn players from all over the world. This international exchange of basketball skills and techniques has enabled foreign players to equip themselves so well that they have begun to rival American players.

Because of the recent success of international teams and players, the United States permitted its NBA players to compete in the 1992 Olympic Games. The celebrity status and notoriety of these all-star players commanded a media following unlike any other team. Dubbed the “Dream Team” by the media, many of the players were known throughout the world by merely their first name or moniker (e.g., Magic, Air Jordan, Clyde the Glide, and Larry). Needless to say, the team’s arrival and decimation of their Olympic opponents in Barcelona reestablished America’s dominance in basketball, but more importantly, it fueled the dreams and aspirations of athletes worldwide.

As a result, both the NBA and its female counterpart, the Women’s National Basketball Association (WNBA), have grown internationally in stature and ethnic diversity. Recent NBA data (2011) indicate that 17 percent of its players are foreign born. Racially, 82 percent of the league is comprised of

players of color, with 78 percent black. Similar statistics for the WNBA have been documented: blacks (69 percent), whites (21 percent), Latinas (3 percent), and foreign players (6 percent). Thus, the face of professional basketball has undergone an astounding metamorphosis since its first black player entered the NBA in 1950, while the African American population remains at 13 percent.

Basque Americans

According to the 2008–10 American Community Survey (ACS) estimate, there are approximately 55,822 Basque Americans of full or partial Basque descent living in the United States. The Basque people are indigenous to the Pyrenees mountain

region in Europe where some originated in southwestern France and others in northeastern Spain. The earliest Basques in America may have arrived with Christopher Columbus. The largest contemporary populations of Basques in the United States reside in California, Idaho, Nevada, Washington, and Oregon, and they have been present there since the mid-1800s. Many migrated to the United States at that time seeking economic stability because of poverty in the Basque region.

Though the first Basque men in the western United States became sheepherders and ranchers, they were not predominantly herders in the old country. They came mainly from varied rural occupations. Pictured in the homes of many Basque Americans today are paintings or photographs of their traditional family homesteads. Bright white stucco with red tile roofs, the farmsteads (*baserri*) dot the rolling hills in the old country. Though a small percentage of Basques in the United States are still running sheep operations, increasing numbers have attended universities and have entered varied other professions.

Roman Catholic is the dominant faith of Basque Americans, and the people strongly support education. Though the Basques participate fully in American culture, they treasure their ancient and unique heritage. They keep many ethnic markers alive, and most important to many Basques is their unique language. It is of non-Indo-European origin, and it remains somewhat of a mystery to scholars. To speak it is a point of pride for the Basques, though the use of the language has faded with passing generations. Both the University of Nevada at Reno and Boise State University in Idaho sponsor Basque language classes using *Batua*, a unified consensus dialect created by scholars because of variants in the original spoken and written Basque. In some cities where the Basque American population is sizable there are Basque-language choirs and dancing clubs for adults and teenagers. A few cities in the United States have language immersion primary schools for children.

The North American Basque Organization (NABO), various Basque Cultural Centers, the Society for Basque Studies in the United States, and a Basque Museum on Grove Street in Boise, Idaho, are only a few of the formal efforts the Basque Americans have created to preserve their

The photo shows a Basque American hotel and restaurant in Winnemucca, Nevada, in 1981. About 55,822 people of full or partial Basque descent lived in the United States in 2010.

heritage for future generations. There are Basque restaurants in several of the western states that offer authentic Basque cooking served family style. The menus are varied, but thick and savory bean soup, codfish served with tomato sauce, lamb, fresh green salad with a light vinegar-oil dressing, freshly steamed vegetables, long loaves of bread, and a variety of desserts are almost always available. The Basques were cod fishermen for generations that stretch back into antiquity, and long ago they fished the northeastern shores of America. Cod is a staple in the diet of the Basque country, and the tradition has continued here.

Every five years an International Basque Cultural Festival called the *Jaialdi* (festival) is held in Boise, Idaho; the public is invited. Activities during the four-day celebration include a scholarly symposium, dance performances, choirs, music

performed throughout the days, booths, weightlifting and wood-chopping competitions, tables of *muz* (a card game), singing storytellers, and an outdoor dance on Saturday night. Sometimes heard at the festival are voices trying their skill at the *irrintzi*, once a war cry and a way for people in the Pyrenees to locate one another in times past. The cry is now a subject of competitions at festivals in the old country and here, and it sounds like a cruel laugh that then changes to a horse's neigh followed by a wolf's howl. The end sounds like the fading notes of a jackass's bray. A beautiful Basque Mass is held on Saturday evening at Boise's St. John's Cathedral. A Basque choir sings, and the Boise *Oinkari* (walker/infantry) dancers perform a colorful traditional dance at the altar.

planned by the U.S. Central Intelligence Agency (CIA) and funded by the U.S. government, trained about 1,500 Cuban exiles to overthrow the newly established Cuban government. The invasion was launched on the night of April 16, 1961, and was defeated within three days by the Cuban army, led by Fidel Castro. By April 19, 1961, most of the members of the invading force, organized in the paramilitary group Brigade 2506, had been captured. This unsuccessful invasion challenged U.S. hegemony in the region and strengthened Castro's hold on power. It took place amid an already strained relationship between the two countries, which would later culminate in the Cuban Missile Crisis of October 1962. The aftermath of the Bay of Pigs invasion greatly affected the development of the Cuban-American community in the United States.

Historical Context, Invasion, and Failure

The Bay of Pigs invasion was motivated by the Cuban Revolution, which resulted in Fidel Castro's ousting of U.S. ally Fulgencio Batista on January 1, 1959. Cuba's relationship with the United States began to deteriorate soon afterward. The Cuban government initiated a wave of nationalization of private land, including U.S.-owned properties and assets on the island, and the United States responded by placing an economic embargo on Cuba in October 1960. In the meantime, President Dwight D. Eisenhower tasked the CIA with preparing the overthrow of the Castro government.

After President John F. Kennedy took office on January 20, 1961, he approved the operation initiated by his predecessor. In an attempt to keep U.S. involvement secret, preparations were conducted abroad and the Cuban exiles who had been recruited by the CIA were trained in Guatemala and Nicaragua. The first attack was launched on April 15, 1961, when eight B-26 bombers left Nicaragua to bomb Cuban airfields. The U.S. planes used for the attack had been repainted as Cuban Air Force planes to simulate a defection from the Cuban military. During the night of April 16, a diversionary force approached the northeastern shore of Cuba, while the members of the brigade, escorted by CIA agents and U.S. ships, landed on the Bay of Pigs. Within two days, most of the members of the brigade had been captured and about 100 had been killed. Those

Bay of Pigs Invasion

The Bay of Pigs invasion was a failed military invasion of Cuba at the Bahía de Cochinos (Bay of Pigs) in April 1961 carried out by a group of counterrevolutionary Cubans. The invasion,

captured were imprisoned, but they were released in December 1962 in exchange for \$53 million in food and medicine, raised by private donations in the United States.

Many explanations have been proposed to explain the great failure of the invasion. First, plans for the attack were poorly hidden from the Cuban government which, once aware of an imminent invasion, trained and armed soldiers. Second, because President Kennedy wanted to conceal plans for the invasion from the public, he was not able to provide adequate air, naval, or land support. Finally, and most importantly, the plan relied on the false assumption that the invasion would be popularly supported in Cuba. Contrary to U.S. expectations, however, there was no uprising, mass defection, or insurrection against Castro in Cuba.

Consequences of the Invasion

The failed invasion had a significant impact on American foreign policy internationally, but also domestically, as it changed the trajectory of

multicultural America. Over 50 years after the Cuban Revolution and the subsequent Bay of Pigs invasion, consequences of U.S. action in the region can still be perceived in the United States.

Most evidently, the events led to an exodus of Cubans to the United States, particularly in south Florida. The large influx of Cubans prompted the U.S. government to initiate a public relations campaign aimed at portraying Cuban refugees as valuable immigrants, both ideologically and socially, as these first waves of migration were largely composed of educated, upper-class, white Cubans who had lost their possessions during the revolution. These immigrants were presented by the media as being universally anticommunist and therefore compatible with American principles, thus illustrating the case of the Cubans as a vindication of American identity and values.

However, because of the revolution and U.S. policy toward Cuba during the Bay of Pigs, successive waves of immigration crafted distinctions within the Cuban-American population. The

A Cuban propaganda poster proclaims a quote from Castro: "Luchar contra lo imposible y vencer," which means "Fight against the impossible and win." Peter Bourne, a Castro biographer, wrote of Castro and the Bay of Pigs invasion, "Cuba's stature in the world soared to new heights, and Fidel's role as the adored and revered leader among ordinary Cuban people received a renewed boost. . . . In his own mind he had done what generations of Cubans had only fantasized about: he had taken on the United States and won."

continued embargo on Cuba and the subsequent deterioration of living conditions on the island led to several successive waves of a very different type of Cuban immigrant to Miami: economic migrants of darker skin who had, on average, a lower level of education. The distinction within the Cuban community, based on skin color and wealth, still persists.

Although the economic assimilation of Cubans into the United States—facilitated by the U.S. government—led them to successfully form a powerful exile community in Miami, they largely resisted cultural assimilation. These exiles hoped to return to Cuba and so maintained a strong sense of identity. The Cuban community acquired tremendous political power through campaign donations and lobbying by groups such as the Cuban American National Foundation in the key electoral state of Florida.

The trauma of the revolution and the failed Bay of Pigs invasion led to the creation of a strong Cuban exile community in South Florida and contributed to their identity and political cohesion. First formed for temporary exile, this community strengthened because of U.S. domestic policy, the role of the media during the Bay of Pigs, a shared anti-Castro sentiment, and a U.S. reluctance to endure criticisms of hegemony. A distinct Cuban American culture emerged, and the Cuban experience in America differentiates this group from other Hispanics and contributes to the multicultural character and heritage of the United States.

Bear Flag Revolt

The Bear Flag Revolt of 1846 was one of many significant battles during the Mexican-American War (1846–48) and reflected attitudes and hostilities manifested both before and after 1846. It set a pattern for filibustering and independent armed uprisings in the southwestern United States for the next decade. California's eventual adoption of the Bear Flag as the state flag has also been controversial and interpretations over what it means have been important in an increasingly diverse state. The representations and interpretations of the Bear Flag Revolt and the involvement of Mexican Americans can vary widely, as they do with the Battle of the Alamo. Thus one brief isolated battle between the United States and Mexico has come to represent more than the sum of its events.

Raising the Flag

At the request of U.S. President James K. Polk, John C. Fremont led a group of Anglo American settlers in 1845 into Alta California, then a province of Mexico and presently near San Francisco. On the morning of June 10, 1846, a small band of white settlers, encouraged by Fremont but not officially sanctioned by the U.S. government, rebelled against Mexican rule and began what would become several days of skirmishes. The short-lived battle culminated in the June 14 arrest of Californio Mariano Vallejo, the Mexican *comandante* of Alta California, at his ranch in Sonoma. Mariano and his brother Salvador were taken to Sutter's Fort in Sacramento where they later reportedly recounted to historian Hubert Howe Bancroft how they had been humiliated and abused in a manner unbecoming their socioeconomic and political importance. On June 15, a day after the brothers' arrest, William B. Ide, who would lead the short-lived California Republic, read a proclamation of independence from Mexico. In celebration, settlers raised a flag in the plaza decorated with a crude rendition of a grizzly bear. Thus, the rebellion became known as the Bear Flag Revolt.

Perhaps unknown to Fremont and other Anglo American settlers until the July arrival of the U.S. Navy was that the United States had declared war on Mexico on May 13, 1846. Thus, the Bear Flag Revolt ran parallel to the Mexican-American War, and its victory was capitalized on by the U.S.

military. Whether the revolt was sanctioned by the government or led by the military in a more clandestine operation, similar to that of Texas in the 1830s, continues to be of historical debate. Given the United States' offer to purchase parts of Alta California in 1835, much as it had done previously with Texas, speculation continues on Fremont's role in the revolt.

Choosing Sides

Some wealthy Californios fought on the side of Anglo American settlers, because, much like their Tejano counterparts at the Battle of the Alamo, they supported their own personal status and property against a government in Mexico City and in a new emerging U.S. social order. Prior to the Bear Flag Revolt, some Californios even supported their own independence movement under the leadership of Mexican Brigadier General Jose Marie Castro, who was stationed in the Monterey Bay area. Many poor Mexicans and Indians fought against Anglo American settlers and their wealthy Californio counterparts, who understood that, with the Bear Flag Revolt, U.S. occupation and annexation were imminent.

Although upon occupation of California in July 1846 the U.S. government promised safe and fair treatment for all residents of the territory, for the majority of Mexican and Indian residents the result was anything but fair. Mexicans, poor and wealthy alike, were forced to give land, money, and supplies to both Bear Flaggers and the U.S. military; poorer Mexicans were often subject to theft, assault, and death. While the signing of the Treaty of Guadalupe Hidalgo in 1848 was meant to end hostilities between Anglos and Mexicans in this new U.S. territory, relations remained strained and violent, particularly in the mining districts after the discovery of gold and silver brought a massive influx of settlers.

The original Bear Flag was raised in Sonoma, and several historic replicas were displayed in San Francisco but were destroyed in the city's 1906 earthquake and fire. Still, the flag's image was promoted consistently throughout the 19th and early 20th centuries by patriotic organizations such as the Native Sons and Daughters of the Golden West. California Governor Hiram Johnson signed state Senate Bill 291 in 1911, making the Bear Flag the state's official flag. In 1953 and

1954 specifications were established for the design and manufacture of the California state flag, and beginning in 1961, state code mandated the regular compiling and dissemination about the laws and regulations regarding the state flag.

Strained Relations

In 1996, on the 150th anniversary of the Bear Flag Revolt, Mexican, Anglo, African, and Native Americans protested the celebration in Sonoma, led by then governor Pete Wilson, as causing a division and promotion of ongoing ill will between the state and various ethnic groups, particularly those targeted by Wilson's immigration policies.

The Bear Flag Revolt continues to shape U.S. and Mexican relations in California, and the state flag is a continual reminder of how California and its peoples entered into the union and the ongoing adjudication of the Treaty of Guadalupe Hidalgo's protections for its descendants.

Belarusian Americans

The first massive immigration wave of Belarusians started at the end of the 19th century and lasted until World War I. Political emigrants and

Belarusian Jews were the dominant immigrants to the United States. This initial immigration was the result of several factors, including the difficult economic situation for Belarusians in their home countries; limitations on the Belarusian language (many Belarusian schools in Poland were closed at the beginning of the 20th century, and the newspapers published in the Belarusian language were proclaimed illegal); intolerance toward Orthodox Belarusian Jews; high taxes; and a lack of learning possibilities.

Emigration was not intensive during the period between World War I and World War II. However, a second emigration wave started after World War II, when, according to various calculations, around 50,000 Belarusians arrived in the United States. According to Vitaut Kipel, the newcomers constituted a significant number of Belarusian natives. These Belarusians emigrated because of political reasons, anti-Communism, and the desire to reestablish an independent republic of Belarus. Some of these emigrants were prisoners of the Polish–Soviet War (1919–20); others had left Belarus after World War I and settled in European countries before relocating in America; and still others were Belarusians who were sent to German labor camps during World War II. The emigrants also included refugees, deserters, and dissidents. In later years, the scope of emigration decreased significantly, and the emigrants were primarily Belarusians of Jewish origin.

The Belarusians settled throughout the United States, with the largest number living in the states of Illinois and New York. Such distribution was conditioned by the demand for unqualified workers and the decisions of the people responsible for diverting ships with emigrant passengers to American ports.

Nowadays, there are between 700,000 and 750,000 Americans of Belarusian origin in the United States, although it is difficult to ascertain the exact number. This is partly because the ethnic group of Belarusians is not distinguished in official emigration documents, as it was identified with larger emigrant groups such as Russians or Poles, because the Belarusians held the passports of these countries. In addition, there are conflicting interpretations about the territory from where the Belarusians came. It is essential to know whether this is the territory of the present-day

Belarus or an earlier part of the territories where the Belarusians lived in Poland and Lithuania.

Culture

Red, white, black, and green colors dominate in the Belarusian national costume, depending on the region of Belarus. According to Kipel, Belarusian Americans have preserved the main elements of the traditional costume.

A trace of Belarusian cuisine also remains in the life of Belarusian Americans. One of the culinary remnants is the traditional bagel. Americans also know Belarusian *pirogy*, *kielbasy*, and cabbages. The Belarusian cuisine is dominated by various grains, potatoes, beef, pork, and mushrooms. Many dishes, such as *dranikai* and *babka*, are made with potatoes. There are also dishes similar to the ones of neighboring countries (Lithuania, Latvia, and Poland), such as cabbage rolls, borscht, cold beetroot soup, or meat jelly. Belarusian Americans have preserved the traditional cuisine in their families.

During the period from 1991 to 2007, 227 Belarusian books were published in the United States. The most significant Belarusian publications are *Belarus Digest* and *Belarusian Review*; both magazines are published in English.

Prominent Belarusian Americans

The Belarusians have integrated into the American community, attending U.S. schools, colleges, and universities, and working in business or public service. This integration is exemplified by Rusel (Ruslan) Timoshenko, who in 1993 came to the United States with his parents, finished school, and decided to work for the New York City Police Department. In 2007, as he was patrolling the street and attempting to arrest a criminal, he was shot to death. Timoshenko was honored by the mayor of New York, Michael Bloomberg, and the Association of Russian-Speaking Police Officers. He was also honored with a gold medal for his courage.

The most widely known Belarusian Americans are television personality Larry King, whose mother was an emigrant from Belarus; former U.S. attorney general Michael Mukasey, whose father was born not far from Baranovich; fashion designer Ralph Lauren and economist Simon Kuznets, whose parents were emigrants of Jewish

origin from Pinsk; actor and producer Kirk Douglas, whose parents were emigrants of Jewish origin from Gomel; and his son, Michael Douglas, also an actor and producer.

Organizations

Belarusian Americans have established some national nongovernmental organizations that seek to unify the Belarusians who come to the United States and to preserve national identity and culture. In 1950, the Belarusians established a formal religious organization, the Belarusian Autocephalous Orthodox Church (BAOC). This organization provides teaching services according to the programs of the schools in which they are offered, while providing liturgical services in the Belarusian language.

Another significant organization is the Belarusian American Association (BAZA), which was established in 1949 and registered in New York State. The Belarusian American Community Center "Polacak" demonstrates the will of the Belarusians to integrate into their new homeland while preserving their own identity. The name of the center refers to the city of Polotsk in Belarus, one of the oldest Slavic centers.

In 1990, after the reestablishment of Belarusian independence, the demand for a dialogue between the native country and the Belarusian diaspora emerged. In May 1993, the Council of Ministers of the Republic of Belarus confirmed a state program called Belarusians in the World.

Belgian Americans

Belgium is a small country in the Low Countries (with the Netherlands and Luxembourg), which border France and Germany. The modern state was created in 1830, when France assisted the region (predominantly Catholic, in contrast to the Protestant Dutch king) in gaining its independence from the Netherlands. Belgian is a nationality, not an ethnicity. The major ethnic groups of Belgium are the Flemish people, or Flemings, a Dutch-speaking people who make up about 60 percent of the country and are centered in Flanders, and the French-speaking Walloons, principally in Wallonia.

Belgium had been controlled by both France and the Netherlands in rapid succession; each side to some extent feared being replaced by a future bilingual people, so the new state adopted both French and Dutch, preserving the use of both. The term *Walloon* is sometimes used, especially by non-French speakers, to refer to all French-speaking Belgians, but this is a misusage; the Flemish and Walloons are the largest groups in Belgium, not the only groups, and Brussels, in Dutch-dominated Flanders, is overwhelmingly French-speaking. Because of the country's dual language groups and long cultural ties to its neighbors, both Flemish and Walloon identity are complicated matters not limited to language.

There are about 389,171 Flemish Americans and 400,000 Walloon Americans as of recent estimates.

Colonists from the region of present-day Belgium preceded the British in parts of North America, notably Dutch settlements on Long Island and Staten Island in what is now New York, and Hoboken, Jersey City, Pavonia, Communipaw, and Wallkill in what is now New Jersey. Peter Minuit, the director-general of the Dutch colony of New Netherlands from 1626 to 1633, was Walloon, and negotiated the purchase of Manhattan from the Algonquin tribe in 1626. Lord Baltimore, the English peer who was the first governor of the colony of Maryland (and governed for a lengthy 42 years, contributing significantly to the character of the early American civilization), was descended from Flemish aristocracy. Belgian Americans have fought in all major wars in which the United States was involved.

The first major wave of Belgian immigrants after the founding of the United States came in the 19th century as part of the larger wave of European immigration. From 1820, when the first Belgian immigrants arrived, until 1910, 104,000 Belgian immigrants arrived. By 1900, Belgian religious orders had been established in 16 states, and 14 of those states had bilingual schools. The number of immigrants roughly doubled between 1910 and 1970. During the 19th century, immigrants were often skilled tradespeople and settled in the places where there was a demand for their skills, especially what was then the frontier or proximate to it: Wisconsin, Indiana, Michigan, and West Virginia. During the 20th century, Belgian immigrants frequently came seeking an American university education, or work in the country's scientific, technical, and academic communities. Large Belgian American communities have developed in Washington, Oregon, Ohio, Kentucky, Illinois, Florida, North Dakota, and Minnesota.

The largest Belgian American community is that of Wisconsin, spread across Brown, Door, and Kewaunee counties, in the Green Bay area. The region was originally settled by Walloons in the 1850s, and a large percentage of the population is descended from Walloons today. Though Belgian Americans assimilated in most parts of the country, their influence remains in a number of ways. Belgian place names like Brussels, Antwerp, Rosiere, and Liege are used by many towns throughout the United States. A dialect of

Walloon French may still be spoken in some Belgian American communities.

Though a number of Belgian churches were established, today most Catholic Belgian Americans do not belong to specifically Belgian parishes; the dispersion of the Belgian American population is one factor (Wisconsin and Detroit Belgian Americans, where they are the most concentrated, are more likely to belong to Belgian parishes), and the overall shortage of Catholic priests, and resulting contraction of parish churches, is another.

Cuisine

Booyah, sometimes today called chicken booyah, is a traditional dish in parts of the midwest, dating from the 19th or early 20th century. It can be found in Belgian American regions of Wisconsin as well as parts of Minnesota. Typically a dish prepared at fairs, church picnics, and other large gatherings, booyah may be cooked in a kettle holding more than 50 gallons, and the name is believed to derive from the French word *bouillir*, meaning to boil. Over the course of two days, a stock is prepared from bones and vegetables, in which meat and root vegetables are then cooked. Chicken is common, and beef and pork are popular; it is not uncommon to see two or three meats used in the same booyah.

Booyah may be related to burgoo, a stew endemic to Kentucky, home to a significant number of Belgian Americans. A game-rich state, in Kentucky burgoo was traditionally made with squirrel, raccoon, venison, game birds, or whatever else the hunters had brought home; the meats might be smoked, and unlike booyah, a thickening ingredient like cornmeal, wheat, or mashed beans is added. The thickness has become the defining characteristic of burgoo, in which a spoon should be able to stand up, and it lends itself well to a number of condiments, from cider vinegar to Worcestershire sauce; in other respects it is prepared much like booyah, and is associated with large gatherings.

Door County continues to celebrate the Kermis Harvest Festival, an originally Dutch tradition held throughout the Low Countries and passed on to Belgian Americans. Originally, a Kermis was a celebration of the anniversary of a church's founding; in the United States it has become a harvest festival, celebrating Belgian

cuisine and culture. A mainstay at Kermiss is Belgian pie, made with a yeast-raised crust (most American pies use unleavened crusts), a filling of fruit or rice pudding, and a topping of sweetened cottage cheese mixed with cream.

Prominent Belgian Americans

Famous Belgian Americans include Henry Ford, whose mother was the daughter of Belgian immigrants; movie star Audrey Hepburn; jazz musician Toots Thielemans, who immigrated to the United States in 1952; Leo Hendrik Baekeland, the chemist who invented Bakelite in 1907; political scientist Anne-Marie Slaughter, who became famous to the general public in 2012 for her *Atlantic* article “Why Women Still Can’t Have It All”; and Green Bay Packers player and coach Curly Lambeau, for whom Lambeau Field is named.

Beloved

Beloved is a novel written by Toni Morrison in 1987. It was awarded the Pulitzer Prize for fiction in 1988 and led to Morrison’s receiving the Nobel Prize for Literature in 1993, the first African American woman to be so recognized. A film adaptation was made in 1998, directed by Jonathan Demme, and starring Oprah Winfrey (who also produced it), Danny Glover, and Thandie Newton.

The novel begins in 1873 and ends in 1875, with flashbacks to 1795. Time and locations

(the slavery plantation ironically named “Sweet Home” in Kentucky and the mysterious house 124 in Ohio) reflect the arduous journey of enslaved people from the south to the north in search of freedom before and after the Civil War. The numbers of the house metaphorically represent the absence of the third child, Beloved, who was killed by her mother Sethe when a posse arrives to take her daughter back into slavery. For Sethe, it is an ultimate act of love of a mother who can only protect her children by putting them out of the reach of the slave owners.

Beloved first appears as a ghost who haunts house 124 and symbolizes the repressed memory of Sethe, but also epitomizes the whole African American community. However, when Paul D, who worked on the same plantation as Sethe, comes to visit and triggers memories of the painful past, Beloved appears as a grown woman but who is on an emotional level of a 2-year-old child, the age she was when she died. Her memories recall the experience on a rat-infested slave ship with tightly packed bodies.

Recovered Memory

The novel is dedicated to the more than 60 million people who perished in slavery, and Beloved embodies their voices. By making the untold history, which has been buried like the dead child, come to life, Morrison makes it the focal point of the novel. The novel rests upon the notion of recovered memory that can be entered even outside the mind of the individual. It makes the memory of slavery simultaneously individual and communal and allows it to be accessed and examined. Morrison wanted to draw attention to the period of American history that is often glossed over without profound examination of the toll it took on the entire society, and to pay tribute to its victims.

At the end of the novel, women from the community perform a ritual to exorcise Beloved and stop her from tormenting Sethe, who desperately tries to give Beloved all the love she was not able to give her in life and to justify her actions. Beloved’s disappearance symbolizes the disappearance of memory of all the enslaved people who perished, but also of their continuing, even if unacknowledged presence. Her very name honors the love of all mothers in slavery for their children. It also illustrates the dualism of life

and death, as it refers to the people gathered at Beloved's funeral and all who read the novel and thus participate in the transmission of the story. Beloved stops haunting the community once they face her and the guilt they feel over her death, the burden of their collective past, but the sad remnants linger even after she disappears.

Psychological Repercussions

The novel is primarily concerned with the psychological repercussions of slavery. Scarred bodies of the enslaved testify to their broken psyches. Their physical survival depended on their (un)willingness to allow themselves to love themselves and their fellow slaves, to lay claim to their bodies and the bodies of the ones they love. Morrison questions on what the ability of love depends in circumstances when people are not allowed to feel human and are treated only as somebody's property. More than rape and the taking of her milk, Sethe is destroyed by the fact that her owner—whom Morrison names Schoolteacher, parodying scientific discourse used at the time to justify slavery—categorizes her characteristics in two columns: human and inhuman, objectifying her and rationalizing her mistreatment at the hands of his nephews.

Negation of the identity of the enslaved people is prefigured in their inability to choose their names, to occupy the position of subject, and use their voice. Their empty identities are reflected in the arbitrariness of their names, such as Sixo, Paul D, A, and F. The characters who give themselves new names after obtaining their freedom, such as Baby Shugs and Stamp Paid, achieve a level of mental independence, and renegotiate their Otherness. Baby Shugs becomes a preacher in the community, teaching former enslaved people to love themselves and to love their bodies as the only way to deal with the hate heaped on their selves. They claim themselves and their subjectivity in different ways and are able to envision a future together. Sethe's daughter Denver, as the third generation born into slavery but brought to a free territory, represents hope at the end of the novel, since she manages to unite the African American community.

Neoslavery Narrative

The novel contains elements of historiographic metafiction, magic realism, utopianism, and Gothicism. Its cyclic structure, multiple points of view

and streams of consciousness, and intertextuality with references to Greek myths, the Bible, and apocalyptic literature situate it in the postmodern tradition of American literature. Morrison developed a genre of neoslavery narrative, which reenvisions the history of African Americans who, during 300 years of slavery, were dispossessed of history and identity. Unlike slave narratives, however, the novel focuses predominantly on the inner lives of enslaved people's familial and communal history and oral tradition in recreation of their stories. Similar novels include Octavia Butler's *Kindred*, Edward Jones's *The Known World*, and Margaret Walker's *Jubilee*.

Beth Din

Beth Din (also *beit din* or *bet din*), from the Hebrew, meaning literally house of judgment, is the term applied to a rabbinical court that consists of at least three *dayanim*, or judges. Judaism traces the origin of *battei din* (the plural form) to the biblical account of Moses appointing elders to help judge and govern the people. A hierarchy of courts arose during the rabbinic period to deal with both civil and religious law. The *beth din* never again possessed the importance it held during the Second Temple period, but throughout the

Diaspora, battei din were established. In the 21st century, Jews use these religious courts voluntarily to arbitrate disagreements within the community, to oversee conversions, and to validate or nullify marriage and divorce. During the Temple and Mishnaic period, a three-court system was in place. At the local level, the beth din consisted of three judges who received their authority from the heads of the academies or from the patriarch. These judges had authority over civil and religious matters. A beth din ruling was required for the conversion of non-Jews, for the release from vows, for exemption from the law annulling debts in the sabbatical year, for exception to the law requiring the release of slaves after six years, and similar issues, including all matters that required the payment of fines.

While almost all towns had a beth din of the lowest level, only towns with a population greater than 120 had a higher court, sometimes called the small Sanhedrin, comprised of 23 judges who were authorized to hear criminal cases. Their jurisdiction ranged from cases that might appear to belong to the lower beth din, such as slander, but that might result in criminal sanctions (as with slander of unchasteness) to capital cases.

The highest court was the Great Beth Din, called the Sanhedrin. Comprised of 70 judges, the Sanhedrin was the supreme court, the source of final authority for the making and interpretation of law. Some crimes such as the uttering of false property or the corruption of an entire town could be heard only by this highest court. Some death penalty cases such as against the rebellious son, the enticer of idolatry, and false witnesses required confirmation by the Sanhedrin before the sentence could be imposed. The Sanhedrin also appointed the judges of the lower courts.

The beth din reached the height of importance during the Second Temple period (530 B.C.E.–70 C.E.). The prophet Ezra, who is connected closely with the restoration of Mosaic Law and the study of the Torah, is credited with its establishment. It was he who decreed that a beth din be set up in all populated centers. After the destruction of the temple in 70 C.E., the beth din at Yavneh, established by Yochanan ben Zakkai, became the national and religious center of Judaism. References in the Talmud indicate that local battei din continued to be active in this period.

Even as the hierarchical court structure disintegrated, the need for the beth din continued. The Jewish community continued to avoid secular courts to settle disputes. The autonomy of the beth din varied according to location. In Spain, Jewish courts were authorized by the king, and, in some cases, given criminal jurisdiction. The Council of the Four Lands, similar to the Sanhedrin of earlier times, was granted authority over Poland's large Jewish population. From 1580, perhaps earlier, until 1765, the council regulated Jewish social, economic, and religious life. Emancipation in the 18th century granted greater civil rights to Jews, but the authority of Jewish courts was largely limited to ecclesiastical matters such as synagogue procedures, life events, and kosher food.

In 21st-century America, Jews voluntarily choose to use a beth din. Battei din are asked to rule on issues connected to synagogues, clergy, and lay leaders. They also rule on larger social and ethical issues and on more specific issues concerning taxation, inheritance, and intellectual property. Many Jews still feel the obligation to use a Jewish forum to adjudicate disputes that involve a fellow Jew. The beth din, like secular alternative dispute resolution methods, is usually quicker and less expensive than litigation. According to Jewish law, Jewish courts have exclusive jurisdiction over the termination of marriage. A civil divorce alone is not sufficient to end a Jewish marriage. A religious divorce properly executed with the aid of a rabbinical court is required.

Founded in 1960, the Beth Din of America is sponsored by the Union of Orthodox Jewish Congregations of America. For more than half a century, it has ruled on areas of family law, Jewish divorce, and personal status. Since its reconstitution in 1994, it has also adjudicated financial disputes. Some congregations establish their own beth din. These battei din claim no jurisdiction outside their own group. All battei din follow the procedures laid down by the Shulhan Arukh (Code of Jewish Law) known as Hoshen Mishpat (the Breastplate of Justice). Diaspora battei din lack the power of compulsion, but generally those who submit an issue to a beth din will abide by the decision rendered.

Beulah Show, The

The Beulah Show is a radio and television situation comedy series that revolves around an African American maid in the Henderson household, a suburban white middle-class family. The program aired on the ABC radio network from 1945 to 1947, the CBS radio network from 1947 to 1954, and the ABC television network from 1950 to 1953. The direction, writing, and production of *The Beulah Show* were handled by white men.

The character of Beulah originated with Marlin Hurt, a white man. He introduced and played the maid, Beulah Brown, in 1939 in a program called *Hometown, Unincorporated*, and in 1940 on NBC radio's *Show Boat* series. In 1943, Beulah became a major part of another series titled *That's Life*. In late 1944, the character gained popularity in the radio comedy *Fibber McGee and Molly*.

Hurt's character Beulah spun off to a separate radio series, *The Marlin Hurt and Beulah Show* (later *The Beulah Show*), airing on CBS in 1945. The series was well received but was taken off the air temporarily following Hurt's sudden death from a heart attack in 1946. Twelve months after Hurt's death, a nationwide search for a new Beulah occurred, and in February 1947, another white man, Bob Corley, was enlisted to play the role on ABC radio.

The series and character outgrew their novelty act status in October 1947, when Hattie McDaniel

Amanda Randolph played the role of Beulah from 1953 to 1954. She is shown here with Ernest Whitman, who played Beulah's boyfriend. The National Association for the Advancement of Colored People, among others, accused the show of stereotyping.

signed on to play the role for CBS. McDaniel was a successful black film actress, having performed as a domestic in over 300 films for 15 years before appearing as *Beulah*.

In the television version of *The Beulah Show*, Beulah Brown was played by Ethel Waters from 1950 to 1951, Hattie McDaniel from 1951 to 1952, and Louise Beavers from 1952 to 1953. The Henderson family included father and businessman Harry (portrayed by William Post, Jr., 1950–52; and David Bruce, 1952–53), mother and homemaker Alice (Ginger Jones, 1950–52; and Jane Frazee, 1952–53), and their 10-year-old son Donnie (Clifford Sales, 1950–52; and Stuffie Singer, 1952–53).

Beulah could manage and solve all of the family's problems but could not solve her own, which was convincing her boyfriend and fix-it shop owner Bill Jackson (portrayed by Percy "Bud" Harris, 1950–51; Arthur "Dooley" Wilson, 1951–52; and Ernest Whitman, 1952–53) to marry her. Bill and

Beulah's girlfriend Oriole Winston (Thelma "Butterfly" McQueen, 1950–51; and Ruby Dandridge, 1951–53), a maid of the Hendersons' next-door neighbors, were always present to assist Beulah in resolving her weekly situations.

Beulah and the Image of Mammy

Historically, Beulah's role is closely patterned after the Mammy, the primary image construction of black females in American popular culture prior to *Beulah*. Mammies were faithful, obedient domestics who could also be domineering, strong-willed, and bossy. They were a "blend of quick temper, earthy wisdom" and typified the "good" black mother figure in white homes. Beulah is a domestic and, as star of the series, is the savior of the Henderson household.

However, Beulah's portrayal of a domestic does not succumb to the simplistic functions often ascribed to the Mammy stereotype because of the intricacies of television production. As the central character of a television show, Beulah is actually afforded the same privileges as white television sitcom fathers. That is, the central character of any television show has a certain amount of narrative power simply because the episodes are written from his or her point of view, are based on their values, and literally revolve around them. The narrative importance of the white father in 1950s sitcoms, in particular, is evident through familial conversations, praise-giving occasions, the narrative itself, and visual and aural dominance.

The interesting factor concerning Beulah is that she has an unusual amount of power. Even though she is a middle-aged, heavy-set, black working-class domestic (at the bottom of the American social hierarchy with the exception of black children), Beulah has more access to and more influence in the Henderson household than the other family members. Furthermore, the execution of this power causes Beulah to be constructed as a white father and white mother conflated into one character. Beulah is neither black nor white. Therefore, Beulah is afforded this narrative importance, not because she is black, female, and working class, but because she is the star of the show.

Beulah Brown was a victim of the time in which her character appeared on radio and television. Even though her race and class indicated on one

level that she was separate and unequal from the Henderson family, on another level she was constructed simply as another typical sitcom star that enjoyed the same rights and privileges as white fathers in other sitcoms.

The Beulah Show should be remembered as one of the pioneers of the American television situation comedy genre because it helped shape the sitcom form, it was the first significant TV sitcom to focus on blacks, and it permitted talented African Americans a way to make a living. Unfortunately, however, it also pioneered and televisually began the construction of an image of black women that has been very difficult to dismantle.

BiDil Controversy

BiDil, a drug used to treat congestive heart failure, made history on June 23, 2005, when it became the first drug approved by the U.S. Food and Drug Administration (FDA) for use by one

specific racial group. BiDil was approved specifically for use by self-identified black patients after it was shown to substantially reduce deaths in comparison with a placebo in a trial involving only blacks. Some hailed BiDil's race-specific approval as beginning of a new era of personalized medicine in which pharmaceuticals would be prescribed based on an individual's genetic makeup; others found the claims for BiDil to be suspect and also questioned the wisdom of treating self-declared race as a classification based in genetics rather than as a social construct.

The history of BiDil dates back to the 1980s, when a cardiologist, Dr. Jay Cohn, studied the effectiveness of the vasodilators hydralazine and isosorbide dinitrate to treat patients with heart failure. At the time, Cohn was not considering the effects of these drugs on any specific racial group, and the trial subjects consisted of both black and white men. Two trials were organized in conjunction with the U.S. Veterans Administration; the first (Vasodilator Heart Failure Trial I, or V-HeFT I) ran from 1980 to 1985, while the second (V-HeFT II) ran from 1986 to 1991. These trials found that vasodilators could help patients with heart failure, but that another type of drug, the angiotensin-converting enzyme (ACE) inhibitor, was even more effective for most patients. As a result, ACE inhibitors became the treatment of first choice for patients with heart failure, while hydralazine and isosorbide dinitrate, both of which were already available as generic drugs, became an alternative treatment for patients who did not do well with ACE inhibitors.

Cohn continued to study the effectiveness of hydralazine and isosorbide dinitrate (H/I) in combination, and in 1996 presented BiDil, the first H/I drug, for FDA approval. When approval was denied, Cohn reanalyzed the data from the 1980s trials and found that African Americans in those trials had done particularly well when treated with H/I. A new trial testing the effectiveness of BiDil on African Americans proved successful—deaths were reduced by 43 percent in a trial of 1,050 African American patients with heart failure. In fact, the drug was found so superior in comparison to a placebo that the trial was halted early so BiDil could also be offered to the placebo group. Note that in this trial, both groups took their prescribed medications during

the trial, so BiDil or the placebo was tested for effectiveness in combination with the patients' usual drugs. This trial led to BiDil becoming the first drug to receive FDA approval for use with a specific racial group.

A legitimate question has been raised as to why, during Cohn's second attempt to receive FDA approval for BiDil, he did not arrange for trials with a racially mixed group. One possible answer may be economic rather than scientific: the original patent for BiDil (as a treatment for individuals of all races) would have expired in 2007; the new application, based on using BiDil as a treatment for African Americans only, would not expire until 2020. What is certain is that no statement can be made about the effectiveness of BiDil for blacks versus individuals from other races because the study that led to FDA approval included only blacks, and the original studies from the 1980s were not designed to answer the questions necessary to receive FDA approval.

Because BiDil was approved for a particular population group, some people believe it is a pharmacogenomic drug, but this is not correct. There is no claim that the effectiveness of BiDil is based on the differing response of individual patients to the drug, based on variations in their genetic makeup, nor is there any evidence linking the effectiveness of BiDil to any particular genes. In addition, conflating self-identified race with genetic factors is problematic; thus, any supposition that the drug exerts some particular effect because of the genetic makeup of black Americans is inherently suspect.

The practice of retrospective subgroup analysis is also questionable—statisticians refer to such analyses as “data fishing” because they are not based on hypotheses but may instead capitalize on chance factors in the data. Finally, the number of black patients in the 1980s trial that offered the strongest argument for BiDil as a drug uniquely effective for blacks was much smaller (45) than is the norm in FDA trials to seek approval of new drugs.

Marketing aside, the existence of a drug particularly effective with black heart failure patients would be welcome in the medical community because blacks in the United States suffer from higher rates of death from heart failure than whites. For instance, the age-adjusted death rate

from heart failure in 2004 for white Americans was 213.3 per 100,000, while for black Americans it was 280.6 per 100,000. However, this differing rate of death could be caused by a combination of factors, including poverty, health behaviors, and access to health care, and does not demonstrate any genetic difference causing the discrepancy, nor any need for specific treatments for black heart failure patients only.

BiDil has not been a great success commercially, in part because many insurers have refused to cover it or have required high co-payments on the grounds that its active ingredients are already available generically (at about one-sixth the cost of BiDil). In addition, the specification of BiDil as a drug only for African Americans greatly reduces the pool of patients who might be prescribed it. At the time of the drug's approval, some predicted sales as high as \$825 million, but in the first year after approval, national sales amounted to only \$4.5 million. In 1986 two high-ranking executives, Chief Executive Michael D. Loberg and Chief Business Officer Lawrence E. Bloch, resigned without explanation from NitroMed, the company that brought BiDil to market.

Bilingual Ballots

In the United States, federal provisions for bilingual ballots are linked to a longer history of voting rights and citizenship. The Fifteenth Amendment, ratified in 1870, states that the right to vote shall not be denied or abridged on account of race, color, or previous condition of servitude. However, through the establishment of poll taxes, literacy tests, grandfather clauses, and the delayed suffrage of women, many states and local jurisdictions routinely disenfranchised minority voters.

The Civil Rights Act of 1964 (CRA) banned many forms of racial discrimination and Title I prohibited the unequal application of voter registration requirements, but it did not address the literacy tests that prevented many people from voting. The Voting Rights Act of 1965 (VRA), and its subsequent revision in 1975, became the central piece of legislation to protect the voting rights of language-minority citizens.

Title VI of the CRA states that the federal government or federal programs cannot discriminate or deny benefits to people on the basis of race, color, or national origin. While language is not specifically listed in Title VI, most applications of this statute rely on the connection between language and national origin. The VRA banned English literacy tests because they were designed to disenfranchise African Americans, who had higher rates of illiteracy because of educational barriers and discrimination. By 1975, widespread voting discrimination was still occurring, particularly among minority groups whose primary language was not English.

Enfranchisement of Language Minorities

During the 1975 reauthorization of the VRA, Congress turned its attention to the enfranchisement of language minorities, in part because of Title VI's entailment of national origin and language. Congress added minority-language assistance provisions, which were designed to provide meaningful access to voting by eliminating language barriers for citizens with limited English proficiency (LEP).

These provisions were designed as a partial remedy for the effects of past discrimination against language minorities. The provisions established

triggers based on the concentration of language minorities and the rate of voting registration of these minorities. These triggers included bilingual ballots, the prohibition of English-only elections materials, bilingual voting assistance, and the establishment of preclearance requirements. Currently, these minority language provisions cover 31 states, either in whole (Texas, Alaska, Arizona, California, New Mexico) or in part.

Spanish language assistance is the most common, but a growing number of jurisdictions are required to provide bilingual voting assistance in Chinese, Vietnamese, Tagalog, Korean, and Japanese. After Spanish, voting assistance in Native American languages is the most prevalent, especially in Alaska. The bilingual ballot and voting assistance provisions have had a significant impact on voter registration and turnouts of language minorities, particularly for Native Americans and Hispanics. Since the 1992 amendments to the VRA, which increased provision coverage, Asian Americans have also seen much higher levels of registration and turnout. In addition, the number of minority elected officials has dramatically increased, due in part to the growing enfranchisement of LEP citizens.

Resistance and Arguments

Unfortunately, there has been substantial resistance to the bilingual ballot provisions, both at the state and federal levels, even though evidence strongly indicates that the VRA language provisions are necessary to prevent current and future patterns of voting discrimination. During the 2006 reauthorization of the VRA, some members of Congress unsuccessfully attempted to repeal or limit these provisions, arguing that they were a costly unfunded mandate and that LEP voters should accept English as the “language glue” of the American multiethnic immigrant melting pot.

However, it is important to note that the United States does not have an official language, even though English is unquestionably the dominant language of the nation. All attempts to make English the official language have failed in part because English fluency is not a prerequisite for American citizenship. Even though naturalized citizens must demonstrate a limited proficiency in English, the standard is not fluency or high literacy.

Proficiency Versus Literacy

Additionally, it is important to recognize the distinction between speaking proficiency and literacy. Literacy tests were so effective for disenfranchising emancipated African Americans (for whom it was illegal to learn to read and write) precisely because of this distinction. A bilingual speaker who knows enough English to function daily in American society may have a very limited literacy level that would not be adequate for voting purposes. Indeed, many monolingual English speakers have difficulty in understanding the convoluted legal language and syntax that characterizes ballot questions.

Additionally, English-only elections have a disproportional impact on first-generation or older immigrants, who were educated in non-English educational systems. Because the second generation is incorporated into the American educational system, they will have much higher English literacy rates than their parents.

Conclusion

According to figures compiled from the 2008 presidential election, while the number of people who did not vote because of problems with English was small, the data indicate that a significant proportion of eligible Asian and Hispanic voters did not vote because of their limited English proficiency. Whereas only 1.4 percent of nonvoters stated that difficulty with English was a barrier to voting, that rate climbed to 9.3 percent for Asian American voters and 3 percent for Hispanic voters.

This high rate of nonvoting tends to occur in places where the VRA triggers have not yet been activated through population density, indicating that the bilingual ballot provisions of the VRA are effective and remain important for voter enfranchisement. The VRA and its subsequent revisions are a critical part of the United States’ immigrant history and its multicultural national future.

immersion, a model of bilingual education, native English-speaking students participate, as well. Bilingual education programs use ELLs’ native language and English as a second language for instruction of literacy and the content areas.

According to the National Association for Bilingual Education Web site, bilingual education “refers to approaches in the classroom that use the native languages of English language learners (ELLs) for instruction. Goals include: teaching English; fostering academic achievement; acculturating immigrants to a new society; preserving a minority group’s linguistic and cultural heritage; enabling English speakers to learn a second language; developing national language resources; or any combination of the above.”

Bilingual education has been implemented across the world for centuries. Because linguistic diversity is the norm in many societies, the use of multiple languages for instruction is a common practice. Bilingualism and multilingualism has been created out of trade, migration, politics, natural disasters, war, and colonialism. Technological advances and widespread use of virtual communication tools, increasing international travel, and growing migration have raised the bilingual population throughout the world. Most of the world’s population is bilingual: 56percent of Europeans are bilingual, while 38 percent of the population in Great Britain, 35 percent in Canada, and 17 percent in the United States are bilingual. A study conducted by the United Nations found that 66 percent of the world’s children are bilingual or multilingual. The current increase in multilingualism is partly because more people around the world are educating their children in a second language, especially in English, but also in Arabic, Chinese, and Spanish.

History

Bilingual education in the United States is not a new concept. North American communities began implementing bilingual schooling as early as the 1600s. In 1839, Ohio became the first state to adopt a bilingual education law permitting German-English instruction, and in 1847 Louisiana approved a similar provision for French-English education. The New Mexico Territory adopted a law to authorize Spanish-English schooling in 1850. The school superintendent of St. Louis, William

Bilingual Education

Broadly defined, bilingual education is the use of two languages for instruction and learning of academic content in schools, usually in PK-12, but can also include higher education. While this definition is the common thread that categorizes education in two languages, there are wide differences in models, linguistic goals, distribution of each language, targeted population, and more. In the United States, bilingual education is typically offered to students who are not proficient in English, commonly known as English-language learners (ELL). In dual language or two-way

Harris, who later became U.S. commissioner of education, argued in favor of bilingual education in the 1870s, stating that “national memories and aspirations, family traditions, customs and habits, moral and religious observances cannot be suddenly removed or changed without disastrously weakening the personality.” In many states, such as Colorado and Iowa, bilingual instruction was offered in as many diverse languages as Polish, Chinese, Norwegian, and Cherokee. In San Francisco, Chinese-language schools were established beginning in the mid-1880s, while in Texas, state education funds helped establish Czech-language schools in the late 19th century.

By the early 20th century at least 600,000 students in public and parochial schools received instruction in German. However, anti-German sentiments after World War I drove states to abolish all bilingual education in most schools and enact English-only instruction laws. The ban against bilingual schooling lasted until the early 1960s. The revival of bilingual education was driven by Cuban exiles in Dade County, Florida, after the Cuban Revolution, who recognized the importance of educating their children in Spanish and English.

Policy and Legislation

The U.S. Supreme Court ruling in *Brown v. Board of Education* (1954), abolishing school segregation, and the Civil Rights Act of 1964, prohibiting discrimination on the basis of race, color, or national origin, provided the basis for the passage of the federal Bilingual Education Act of 1968. This legislation provided federal funding to encourage school districts to implement native-language instruction and other types of support services for English language learners. The Bilingual Education Act was enacted as Title VII of the Elementary and Secondary Education Act; it was replaced in 2002 by the English Language Acquisition Act under the No Child Left Behind Act. Title VII became Title III of the Elementary and Secondary Education Act, which no longer gave funding priority for native-language instruction and instead gave each state discretion on how to spend federal funds for English language learners.

In the 1974 landmark decision in *Lau v. Nichols*, the U.S. Supreme Court ruled there is no equality of treatment merely by providing students with

the same facilities, textbooks, teachers, and curriculum because students who do not understand English are effectively foreclosed from any meaningful education. The court’s decision required schools to take steps to overcome language barriers impeding ELLs’ access to the curriculum.

Neither the Bilingual Education Act nor the *Lau* decision requires any particular methodology for teaching ELLs. In other words, there is no federal mandate for bilingual education, although a few states mandate it under certain circumstances. What civil rights laws do require are educational programs that offer equal opportunities for ELLs through specialized instruction, such as the use of the native language and/or ESL instruction.

Politics of Language Education

While the education of ELLs may appear to be simply a matter of choosing whether to use the students’ native language, ideologies and beliefs about linguistic diversity, immigration, and immigrant rights permeate pedagogical and linguistic decisions. Educator and author Richard Ruiz delineates three orientations that drive the policies and politics of language and ELL education: (1) language as a problem orientation—the belief that language diversity results in social conflict, divisiveness, and ethnic strife; (2) language as a right orientation—the view that language is a basic human right and that language prejudice and discrimination must be challenged; and (3) language as a resource orientation—considers language diversity as a cultural, social, personal, and national resource, both as an economic advantage and a vehicle for social unity.

In the last two decades, the “language as a problem” orientation has paved the way for the “official English” movement that aims to legislate English as the official language of the United States. To date, bills introduced in Congress to make English the official language have failed. Nonetheless, 28 states have passed official English laws. Hawai‘i is the only state that has two official languages, English and Hawai‘ian. Language restrictionism policies are closely tied to language minority education. States have been successful in passing legislation banning bilingual education and instituting compulsory English immersion programs. In 1998, California passed Proposition 227, the English Language Education

for Children in Public Schools initiative; Arizona passed Proposition 223 in 2000; and Massachusetts discontinued bilingual education in 2002.

ELLs are one of the groups most at risk for academic failure and arguably the most vulnerable. Immigration status and language barriers present significant challenges for most ELLs and their families, often restricting their potential for success and future opportunities. The intense and often extreme anti-immigration sentiment reappearing across the country cause many ELLs and their families to live in daily fear associated with society's language and ethnic prejudices. ELLs have to cope with considerable linguistic, socio-cultural, and legal challenges that other disadvantaged groups do not experience. Even ELLs who are U.S. citizens, but whose parents are undocumented, face the frightening prospect of having their parents deported. Out of fear of deportation or imprisonment, parents of ELLs sometimes

keep their children home from school. This takes a heavy psychological toll on students and often interferes with their learning.

Children of undocumented immigrants find themselves caught between two broken systems: public education and immigration law. Through no fault of their own, they find themselves in the cross fire of tough laws, policies, and social stigma. Anti-immigrant patterns, often targeted at Latinos, and particularly Mexicans, resurface often and in many different forms. Arizona and Alabama, among other states, have enacted restrictive and harmful policies that have long-lasting, negative effects on the education of ELLs. For example, Arizona has endorsed a number of statewide policies that directly target Latino immigrants, including banning bilingual education, eliminating the Ethnic Studies Program, and barring teachers who have foreign accents from teaching ELLs. The state also enacted S.B. 1070,

There are many points of view on the topic of bilingual education in the United States. Opponents argue that it delays a student's ability to master English, thereby setting them back and retarding their learning of other subjects as well. Proponents of the practice argue that it keeps non-English-speaking children from falling behind their peers in math, social studies, and science while studying English. They also argue that such programs actually teach English better than English-only programs.

a law that allows police to check a person's immigration status while in the process of enforcing other laws. Alabama's H.B. 56 requires public schools to collect information on the residency status of children and their parents. The state law contradicts a 1982 U.S. Supreme Court ruling in *Plyler v. Doe* that gives undocumented students the right to a free K–12 public education and prohibits schools from requesting residency status documentation.

Claims about the ineffectiveness of bilingual education combined with the media's predisposition against it, misinformation, and incorrect assumptions have been widespread. The inadequate implementation of some bilingual programs further fuels the notion that bilingual education is a failure. The real culprits of low performance in bilingual education programs can be better explained by lack of adequate funds, scarcity of qualified educators, overcrowded classes, and the absence of proven teaching methodology. Well-designed bilingual programs that address these fundamental factors have proven to be highly effective for linguistically diverse students. Numerous studies have demonstrated that students who participate in programs that use the native language for instruction for more than three years show better academic performance, mastery of English, and are less likely to drop out of school.

Second Language Acquisition

One of many false claims about bilingual education is that ELLs can acquire English in one year. Decades of research, both in the United States and abroad, have demonstrated that the acquisition of academic language for a second-language learner takes between five to seven years, in comparison to the one to two years it takes to learn conversational language. In the United States, ELLs' loss of their home language and culture is often seen as necessary for their English development. However, research shows that cognitive skills are best acquired through the primary language and then more easily transferred to the second language.

Developing additive bilingual and biliteracy skills has no negative consequences for students' academic, linguistic, or intellectual development. To the contrary, research findings point to linguistic and academic benefits for bilingual children

who demonstrate a greater awareness of linguistic meanings and seem to be more flexible in their thinking than monolingual children. The use of the home language helps children develop critical thinking abilities and cognitive skills. This cognitive structuring is not only shaped by linguistic knowledge but also by cultural knowledge and the context in which that knowledge is obtained.

Bilingual Education Program Models

Offering bilingual education programs for ELLs depends on several factors: sufficient numbers of students from the same language group, availability of certified bilingual teachers, and state and local policies that allow or require bilingual education.

The different models of bilingual education have distinctive characteristics: linguistic goals (bilingualism or monolingualism in English), differences in length of implementation (short term or long term), variations in amount of use of each language, and distinctions in student composition. Models fall under one of two paradigms: additive programs—whose goal is to develop full bilingualism, biliteracy, and biculturalism by adding the second language and maintaining and developing the first language; and subtractive programs—whose goal is to become monolingual in the majority language by abandoning the native language. Additive program models include maintenance, developmental bilingual, heritage language, and dual language or two-way immersion; while subtractive models include transitional bilingual education. Programs that do not use the native language and are therefore not considered bilingual models are structured English immersion, and English as a second language. The various models are:

- *Transitional bilingual education, early-exit and late-exit*: temporarily supports ELLs' academic development by providing native language instruction as students acquire English through ESL and consists of two program types: (1) early-exit, the model most widely implemented in the United States, in which ELLs are moved into the general English education program after one to four years, once they have achieved proficiency in English;

and (2) late-exit, in which students continue to receive instruction in their native language for a few more years after having achieved proficiency in English.

- *Maintenance bilingual education*: also known as developmental or enrichment bilingual education. This program allows ELLs to maintain and develop their native languages after they have acquired English, usually through eighth grade or beyond. The aim of maintenance bilingual education is for students to develop bilingual and biliterate proficiencies and to achieve academically at grade level.
- *Heritage language*: designed for students who are not proficient in the heritage language of their family and who have varying degrees of skills. The aim of these programs is to revitalize the native language and culture, which is no longer used fluently by the younger generation of its speakers.
- *Dual-language education*: also known as two-way bilingual immersion, is the only bilingual model that integrates English native speakers with ELLs. All students develop their native language and culture while acquiring a second language and culture. The goals are to develop biliteracy and bilingualism, high academic achievement, and multicultural competencies.

Because educational program evaluation studies are difficult to design, research on the effectiveness of bilingual education remains in dispute. The vast variations in program implementation, pedagogical approaches used, types of schools, differences in student populations, and communities being compared add to the difficult task of determining the programs' effectiveness. Nevertheless, researchers, educators, and applied linguists recognize that the following premises have strong empirical support: (1) native-language instruction does not retard the acquisition of English, (2) well-developed skills in the native language are associated with high levels of academic achievement, and (3) bilingualism is a valuable skill for individuals and for the country.

Bilingualism

Bilingualism is defined in multiple ways. Some describe it as an equal capacity to fully communicate in two languages—written and spoken—whereas others describe bilingualism as the ability to understand and communicate in two languages with greater skills in the use of one of them.

In general, researchers identify three types of bilingualism: (1) simultaneous bilingualism refers to a person who learns to speak two languages at the same time (e.g., infants who are exposed to two languages at the same time); (2) receptive bilingualism refers to a person's ability to fully understand two languages but use only one language to communicate (e.g., children whose parents speak different languages at home, but they use only one of those languages to communicate); and (3) sequential bilingualism refers to individuals who learn a new language after they have already learned and mastered a first language.

Myths and Facts

While results of some studies have provided evidence of the advantages of bilingualism, other studies have highlighted the challenges that bilingual individuals face.

One of the most popular myths is the idea that bilingual children present developmental delays. Strong evidence supports the assumption that the capacity to learn multiple languages is natural to all human beings. Studies show that all infants have the capacity to discriminate sounds from different languages and are able to reproduce the sounds and recognize their meanings. For instance, babbling among babies is a natural way to try to reproduce sounds the baby hears. Thus, a baby with a monolingual parent(s) will reproduce the sounds of only one language, whereas babies with a bilingual parent(s) would be stimulated to reproduce sounds for both languages and would be able to differentiate those sounds.

Based on those findings, researchers have suggested that infants who are stimulated to develop bilingual skills at an early age show better attention skills and memory over time. That is, older bilingual infants and children have been reported to have a greater ability to analyze words, meanings and use those words in particular situations. Greater thinking and analyzing skills also allow bilingual children to develop advanced problem-solving and attention skills and the capacity to filter important information, compared to those with monolingual skills.

Another myth relates to the assumption that exposing children to two languages will confuse them, and they won't be able to master either. Though the process might be challenging for the

children exposed to two languages, there are multiple strategies that researchers and practitioners have recommended to follow to support the positive development of bilingualism. One suggestion is to use a one-parent one-language approach, so that the child will identify the language as part of the relationship with that particular parent, thus facilitating the differentiation of the two languages. Other researchers argue about the advantages of having both parents using both languages at the same time, called "code switching," so that children would be able to acquire social cues and learn when to use one or the other language based on the social context. Evidence suggests that bilingual individuals often mix languages based on the situation, and that allows them to engage at different levels with family members, relatives, peers, and their community members.

Another assumption is that bilingualism is directly related to intelligence and, thus, sometimes children are exposed to a bilingual context for the greater benefit of having smarter children. Studies have provided evidence that bilingual children do present advantages over other children in language awareness and some cognitive processes (e.g., memory, learning words' meanings), but only in some areas, and that does not translate to bilingual children being more intelligent overall than monolingual children. In addition, bilingualism does not represent an indicator of greater or lower educational achievement or professional career paths.

Other myths about raising bilingual children include beliefs that such children will struggle communicating in either one or both languages; that they will develop learning disabilities, particularly in mastering math and science; and that bilinguals have "split" personalities because they express ideas and emotions in either their first or second language. Empirical evidence shows that there are not significant differences in mastery of language skills between monolingual and bilingual children.

Indeed, researchers have argued that the so-called language delay is based on the misunderstanding that variations in language acquisition among children are "abnormal." In fact, variations occur from child to child within a normal range of language mastery, despite being monolingual or bilingual. Researchers have also documented

multiple cognitive advantages associated with bilingualism that include linguistic awareness, communication and thinking skills, intellectual growth, and greater cultural sensitivity.

Bilingual Schooling

Bilingual schooling generally refers to the existence of two languages in the school setting. The implementation of bilingualism in the school system and educational curricula is not always a simple process. Many important issues need to be taken into account, such as the students' native language, the depth and breadth of the bilingual curriculum, the instructional goals, and teachers' bilingual skills. Strong evidence suggests that "dual immersion" bilingual programs (speakers from both languages) equally support the acquisition and proficiency of both languages for all students involved, both native and foreign speakers.

Bilingualism, Labor Force, and Labor Market

Though much has been speculated about the benefits and disadvantages of bilingualism for immigrants and their children's academic achievement and professional future, little is known about the language characteristics of U.S. labor force and labor market demands. Traditionally, information about individuals' language abilities has been widely documented in the U.S. census; however, that data does not necessarily document a person's ability to speak a second language or a person's level of written or spoken proficiency in two or more languages. Yet, bilingual ability is a key element in the labor market because it facilitates competition for jobs in the United States and around the world.

Social scientists across multiple disciplines (e.g., sociology, political science, economics, education, international relations, and psychology) have broadly documented how language deficiencies directly affect the educational attainment of students, translating into negative labor market outcomes. Among immigrant populations, language skills play an important role in supporting learning abilities, the acquisition of new skills, and a worker's assimilation or integration into the national labor force. Thus, bilingualism could have significant consequences for the national economy because it impacts the accumulation of

knowledge and skills necessary to support personal, economic, and social well-being—known as human capital—as well as influence earnings and occupational distribution.

For example, employment opportunities that require a certain level of language proficiency might not represent a realistic opportunity for an immigrant who has low language proficiency. Even though the individual possibly has the required skills for the job, he or she will be forced to take on low-skill jobs that do not require those language skills. Research has shown that first-generation immigrants (foreign-born) are more likely to take lower-skilled jobs than their second-generation counterparts (native-born), mostly because of the native-born workers' capacity to write, read, and speak the host country language and, thus, exhibit greater bilingual abilities. Furthermore, native-born children of immigrants often become translators for their parents, relatives, and community members who lack bilingual skills.

U.S. statistics show that in addition to education and work experience, language skills represent an important factor for job opportunities. Recent studies have documented that the demand for bilingual workers, native and foreign-born, will continue to rise during the next decade because there is a high demand for bilinguals in the labor market—particularly in education, economics, and service-related jobs. Foreign language associations and schools throughout the nation have reported a remarkable increase in student registration, mainly for Chinese and Spanish languages, during the last eight to 10 years. There has also been an increase in the need for interpreters and written materials translators, mostly in the health care industry, international trade, and business areas. In 2011, the Bureau of Labor Statistics reported that employment opportunities for interpreters/translators would increase by 22 percent between 2008 and 2018 and that fully bilingual workers would be highly marketable across multiple careers. A similar demand for bilingual workers is occurring around the world, with a demand growth of approximately 150 percent in 2011 alone.

Despite bilingualism being generally perceived as a valuable skill in the labor market around the world, the patterns of associations between income and language skills vary greatly from country to country. For example, in the United

States, some evidence shows that bilingual workers at nonsupervisory jobs, such as manufacturing, earn more than their monolingual coworkers. But at the managerial and supervisory levels, bilingual workers report earning less than their monolingual counterparts. In Canada, a 2010 study found that bilingual men and women—approximately 3.6 percent and 6.6 percent, respectively—earn a greater income than English-only speakers. Though earnings differences across countries for bilingual versus monolingual workers might be perceived as labor discrimination, it is important to note that these differences might also be based on the labor market's definition of greater/lower marketable characteristics of workers.

Debate Over Bilingualism

Bilingualism in the 21st century cannot be understood without taking into account globalization, technological and communication innovations, and scientific advances, as well as political and demographic changes, notably increased immigration across nations. As a result of these transformations, people around the world are becoming more exposed to multiple cultures and languages and expressing an elevated interest in belonging to global, sociocultural networks that impact their ideologies and lifestyles. Worldwide, it has been estimated that 65 percent to 75 percent of the population is bilingual and has been exposed to some type of bilingual education, either formal or informal instruction.

How much or how little some populations are exposed to bilingual schooling seems to be closely related to national interests in fostering bilingualism and the resources used to support development of bilingual programs and services. For example, immersion education programs are offered for English native speakers in Canada to learn French, while at the same time similar programs are offered to indigenous and immigrant populations to learn English. Across Latin America (with certain variations in individual countries), English is included in the academic curriculum to support the development of bilingual skills and foster better employment opportunities. In addition, among countries with a high percentage of indigenous populations, such as in Europe, Latin America, Asia, and Africa, bilingual education programs are used to teach those populations

the national language and to integrate them into the local society. Given the increasing rate of immigration, emigration, and population growth around the world, bilingual education programs represent a great resource to support individual development and well-being.

Unfortunately, bilingualism is not exempt from controversy. Interesting examples of procedures and laws developed and imposed by countries to deal with bilingualism and the adoption of foreign languages into national territories abound. The French government passed a law (Toubon law) in 1994 requiring citizens to use the French language when providing services and warning businesses that they would face large fines for using English in their advertisement campaigns. Throughout the world, the adoption of words or terms from other languages continues to proliferate, mostly due to the globalization, technological innovations, and open access communication. As a result, new words are created or old ones are transformed into new terms that have become universal as they enter the languages of different populations around the world, such as *laissez-faire* (French), *per capita* (Latin), OK (English), *salsa* (Spanish), and *kindergarten* (German).

A salient controversy regarding bilingualism relates to the subject of bilingual learners' formal and informal instruction. In the United States, for example, some high schools, universities, and colleges require students to take foreign language courses as a prerequisite for graduation; in other states, laws have been passed to enforce the use of English language only. States with a great influx of immigrants have published bilingual information in written documents and Web sites, and in some areas the media presents information on radio and television in two languages, such as, Spanish/English, Japanese/English, and Polish/English. Many organizations have joined the campaign, including public utilities, government agencies, nongovernmental agencies, elected and/or campaigning officials, schools, and restaurants.

Conclusion

In summary, the U.S. Census Bureau reports that in 2000, almost 10 million children between ages 5 and 17 spoke another language besides English at home. Based on those statistics and given the continuously changing demographics and fast

growth rate of first- and second-generation immigrants, bilingualism will continue to be a pressing issue in U.S. education, economics, and politics.

implicitly protected only white men, excluding Native Americans, African Americans, and women. These exclusions were not explicit in the text, but were well understood and applied. It took additional constitutional amendments and several Supreme Court cases to extend full citizenship and the same rights to all minorities. The First Amendment prohibits the making of any law respecting an establishment of religion and impeding the free exercise of religion. Additionally, neither the Constitution nor any of its amendments mention or contemplate an official national language.

The First 10 Amendments

The Constitution was remarkable but incomplete because it did not include a declaration of individual rights. It stated what the government could do but did not say what it could not do. In 1791, this gap was filled. Inspired by Thomas Jefferson and drafted by James Madison, the first 10 amendments were added to the Constitution.

The first eight amendments establish specific guarantees. These are the freedoms of religion, speech, press, and the right of the people to assemble and to petition the government. Other provisions contained in the first eight amendments also deal with the rights of individuals. The Fourth Amendment protects individuals from excessive searches and seizures by law enforcement officials. The Fifth Amendment prohibits double jeopardy, and it states that people cannot be forced to testify against themselves and guarantees due process. The Sixth Amendment establishes the right of an accused person to a public trial by jury. The defendant also has the right to a lawyer, and to confront witnesses. The Eighth Amendment prohibits the infliction of cruel and unusual punishment on those convicted of a crime. The Ninth Amendment states that the American people have rights that are not specified in the Constitution or the Bill of Rights. The Tenth Amendment stresses the national character of the U.S. constitutional system. The remaining amendments address other specific issues. The Second Amendment acknowledges that the people's right "to keep and bear Arms, shall not be infringed." The Third Amendment prevents the government from making citizens shelter soldiers in their homes.

The Seventh Amendment assures a trial by jury in civil cases. Originally, the Bill of Rights

Bill of Rights

The Bill of Rights is the collective name for the first 10 amendments to the U.S. Constitution. Since its adoption in 1791, it has served as the founding element of basic American freedoms. It specifies the guarantees and liberties of the American people and protects them from the beliefs of popular majority opinions and transitional government officials. Originally, the Bill of Rights

applied only to the laws and activities of the federal government. It was not until after the Civil War that the Bill of Rights' provisions were applied to the individual states.

Equality for Women and Minorities

The Bill of Rights seemed to be written in wide-ranging language that excluded no one, but, in fact, it was not intended to protect all the people. Whole groups were left out. Women were second-class citizens, essentially the property of their men and unable even to vote until 1920, when the Nineteenth Amendment was ratified. Native Americans were completely left outside the constitutional system. They were governed not by ordinary American laws but by federal treaties and statutes that deprived tribes of most of their land and much of their political autonomy. The Bill of Rights ruled for nearly 135 years before Congress granted Native Americans U.S. citizenship. And it was well sensed that there was a “race exception” to the Constitution.

For 78 years the Constitution enforced slavery and protected racial subordination. Instead of constitutional rights, enslaved people had no access to the rule of law; they could not go to court, make contracts, or own any property. They could be beaten, imprisoned without trial, and hanged. In short, as one infamous Supreme Court opinion stated: “Blacks had no rights which the white man was bound to respect.” The American ideal of equal rights under law was not explicitly included in the Constitution until after the Civil War, with passage of the three Reconstruction-era amendments. The Thirteenth Amendment (1865) banned slavery. The Fourteenth Amendment (1868) established equal rights of citizenship to all Americans, with the special purpose of recognizing the rights of former enslaved people. The Fifteenth Amendment (1870) provided that voting rights of citizens “shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.”

Freedom of Religion

The right to freedom of religion is so central to American democracy that it was enshrined in the First Amendment, along with other fundamental rights, such as freedom of speech and freedom of the press. The Bill of Rights guarantees

an atmosphere of absolute religious liberty and diverse faiths have flourished in America since the founding of the republic. The Constitution does not mandate the separation of church and state, although some of the Founders voiced their support for this idea. Indeed, James Madison once observed that “the [religious] devotion of the people has been manifestly increased by the total separation of the church from the state.”

The establishment clause and the free exercise clause together read: “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof . . .” Originally, the First Amendment applied only to the federal government. A number of the states effectively had established churches before the First Amendment was ratified, with some remaining into the early 19th century. Subsequently, *Everson v. Board of Education* (1947)—a decision that denied tax reimbursement to parents of children attending private religious schools—incorporated the establishment clause and applied it against state law.

The first case to examine the scope of the free exercise clause was *Reynolds v. United States* in 1879. The case dealt with the prosecution of a polygamist under federal law, and the defendant’s claim of protection under the free exercise clause. The Supreme Court upheld the law and the government’s prosecution. This case, which also revived Thomas Jefferson’s statement regarding the “wall of separation” between church and state, introduced the idea that although religious exercise is generally protected under the First Amendment, this does not prevent the government from passing neutral laws that could impact religious practices.

This interpretation of the free exercise clause continued into the 1960s. Applying a new standard of “strict scrutiny” in several areas of civil rights law, the Supreme Court started to apply this rule to First Amendment religion clauses, as well, interpreting the free exercise clause to require accommodation of religious conduct except where a state could show a compelling interest. One example was *Sherbert v. Verner*, in which the court overturned the state Employment Security Commission’s decision denying unemployment benefits to a member of the Seventh-day Adventist Church who was fired after her employer adopted a six-day work week, which would have required her to

work on Saturdays against the dictates of her faith. As Justice William Brennan stated for the majority, “to condition the availability of benefits upon this appellant’s willingness to violate a cardinal principle of her religious faith effectively penalizes the free exercise of her constitutional liberties.” This view of the free exercise clause would begin to narrow again in the 1980s and 1990s. Examining a state prohibition on the use of peyote, the Supreme Court upheld the law, despite the drug’s use as part of a religious ritual, and without employing the strict scrutiny test. Instead, the court reaffirmed that a “neutral law of general applicability” does not implicate the free exercise clause. This was followed by intense opposition from Congress and the passage of the Religious Freedom Restoration Act in 1993 in an attempt to re-establish the prior test. However, in *City of Boerne v. Flores*, the Supreme Court struck down the act, holding that it unconstitutionally tried to usurp the Supreme Court’s role in interpreting the Constitution.

No Official National Language

Many people are surprised to learn that the United States promulgates no official language. As one of the major English-speaking nations, many assume that English is the country’s official language. Despite efforts over the years, the United States has not adopted an official language. English-only laws can violate the Constitution’s protection of due process, especially in courts where no translation service is offered, and in instances where English-only ballots are used and bilingual ones were available in the past. According to the 2010 census, 55.4 million people aged 5 and older speak a language other than English at home, more than double that of the last three decades and at a pace four times greater than the nation’s population growth.

Birth of a Nation, The

D. W. Griffith’s *The Birth of a Nation* (1915) was a cinematic masterpiece for its day, a three-hour feature film with battle sequences and wide-angle shots. More significant than its cinematography, however, was its inaccurate depiction of the post–Civil War era, namely its portrayal of the Ku Klux Klan as a much-needed white vigilante organization that saves the white south from evil black-led reconstructionists.

Birth of a Nation is largely based on writer Thomas Dixon’s fictional antiblack works, *The Leopard’s Spots* (1902) and *The Clansman* (1905). The first half of *Birth of a Nation* deals with the Civil War, including various battle scenes, and culminates with the south’s surrender at the Appomattox Court House. The second half of the film focuses on the Reconstruction era, particularly in South Carolina. The film also features a love story between Ben Cameron, a white southerner, and Elsie Stoneman, a white northerner. One of the most fascinating and controversial features of the film, however, is the portrayal of African Americans.

Portrayal of American Blacks

For instance, there are scenes that focus on Reconstruction-era legislative sessions in South Carolina, in which Griffith depicts the legislature as dominated by a barbaric black majority, while the white minority watches helplessly. In the legislature, some African Americans are barefoot, while others are eating chicken or secretly drinking from flasks of liquor. According to Griffith, the first piece of legislation passed by this black-dominated legislative body provided for the intermarriage of blacks and whites. Shortly after this legislation is passed,

Griffith focuses the camera on the African American legislators who stare longingly at the few white women spectators in the gallery, and then the African Americans erupt into paroxysms of joy.

Moreover, all the major “black” characters, such as Silas Lynch and Gus, are actually whites in blackface, and these characters chronically leer and stalk white women throughout the film. For example, even though Lynch is lieutenant governor of South Carolina, his main ambition, according to Griffith, is to marry Elsie. After she rebuffs him, Lynch decides to kidnap her. Like Lynch, Gus is also consumed with desire for white women. Gus, a corrupt Union soldier, constantly follows and stares at Ben Cameron’s younger sister, until he finally catches her alone at a spring and asks the young white woman to marry him. She flees from Gus, and in a memorable scene, throws herself over a cliff rather than be ravaged by Gus.

Whereas African Americans are vilified throughout the film, Griffith’s white characters, especially southerners, are depicted as physically strong and noble. In one scene, a white man fights and defeats an entire tavern full of African Americans, until he is finally shot in the back by the nefarious Gus. In another scene, a handful of whites, including two former Union soldiers, admirably defend their position against an entire black regiment.

The film ends with a celebratory defeat of Reconstruction-era South Carolina by the Klan and their allies. Gus is captured and killed after a “trial” by the Klan, and Lynch and his supporters are routed in a skirmish with Klansmen. Finally, Ben and Elsie are married, thus showing a unification of the white south and the white north in a post-Civil War society.

The NAACP and the Rise of the KKK

The Birth of a Nation was immensely successful, as throngs of whites flocked to see the film. President Woodrow Wilson even screened it at the White House. The National Association for the Advancement of Colored People (NAACP), a national civil rights organization formed just six years before the film’s debut, picketed the film nationwide and demanded that it be censored. The NAACP was somewhat successful in its efforts, as the film was ultimately banned in Boston and Wilmington, Delaware. Nevertheless, *The Birth of*

A poster of the movie The Birth of a Nation that refers to the original title of the book, The Clansman. The film was highly controversial and caused widespread protests.

a Nation grossed \$18 million and contributed to the reemergence of the Ku Klux Klan.

The Klan had been lying dormant for several decades but made a comeback several months after the film’s release. By 1925, the Klan would march 40,000 members strong on the nation’s capital in a peaceful demonstration, and also claim a nationwide membership of 5 million. *The Birth of a Nation* is not solely responsible for the reemergence of the Klan, as xenophobia surrounding World War I was a huge factor, as well, but it definitely was a factor in the Klan’s reappearance.

Black Codes

Black codes were laws passed by former confederate states after the Civil War and during Reconstruction that curbed the freedom and civil liberties of newly freed slaves. They lasted until the passage of the Fourteenth Amendment in 1868; similarly restrictive laws called Jim Crow laws were passed at the end of Reconstruction in 1876. With slavery outlawed, states enacted black codes in an effort to transfer to blacks many of the restrictions previously held by slaves, in order to maintain legal and social distinctions between the black and white populations. The laws varied in their degree of strictness and limitations from state to state. Black codes were a perpetuation of antebellum slave codes but differed in that they granted freedmen limited civil rights such as the ability to marry, own personal property, and sue in court.

Discriminatory Laws During Slavery

Slavery was adopted because of the shortage of workers in the new North American colonies. The expansion of industry drove colonists to seek ways to maintain production without driving up the cost of labor. Chattel slavery was born in this economic environment, which would ultimately give slave-masters complete control of the enslaved workers.

Laws called “slave codes” were laws passed in the antebellum south that were designed to perpetuate the system of chattel slavery, permanently locking African Americans into a lifetime

of bondage. These were the antecedents to the post-emancipation black codes, embedding in law a system of black inferiority and restricting slaves’ ability to marry, travel, or become free.

In the early part of the 17th century, blacks worked alongside white indentured servants and were of the same social status. By the late 1600s, laws were systematically implemented in the English colonies that began to greatly restrict the actions and behavior of blacks, which led to the racialization of slavery in the United States. There were significant differences in each colony’s slave laws. Virginia, for example, was noted for having particularly harsh laws against African Americans. A 1669 law stated that if an enslaved person resisted his or her master and was killed while being punished, the master would not be charged for the crime. The assumption was that the slave-master did not have malicious intentions because no one would willfully destroy their own property.

But laws restricting black freedom were not limited to slaveholding states nor dependent on the institution of slavery. Northern states in the mid-19th century implemented laws restricting blacks, either prohibiting them from migrating to the state at all (as in Illinois in 1853) or prohibiting marriage between blacks and whites, as in Illinois, Indiana, and Michigan. Such anti-miscegenation laws were standard in the south, and these border states were influenced by their neighbors.

Restriction on Free Blacks

Black codes had a negative impact on everything from the daily life of African Americans to legal proceedings. African Americans could not testify in court in cases that involved those of their own race. In addition, they could not vote or participate in any legal proceedings. Further, they could not own a home or property or even rent a place of residency. Beyond that, any type of speech or conversation by blacks that was deemed a threat to white society or individuals was considered criminal behavior. Anyone found guilty of actions considered to be seditious had to pay a hefty fine. In addition, blacks could not buy firearms and they were penalized if they violated curfew. The black codes became more and more restrictive for African Americans in an effort to perpetuate a white supremacist society. The primary effect this had on blacks during Reconstruction was to

infringe their ability to be full American citizens; the black codes were dehumanizing. The laws enacted represented a continuation of the slave codes that had relegated blacks to nonhuman status during antebellum times.

The degree of harshness of the codes was contingent on the state in which one lived. Mississippi was notorious for its harsh treatment of African Americans. Annually blacks had to sign a legally binding labor contract. The contract stated that if they were ever to run away and not complete their assignment, they were forced to forgo their pay for the entire year. At any time, the servants—as they were sometime referred to—were expected to be prepared to show identification that displayed their place of residence and authorization to work. If they were caught trying to escape labor and flee the region, they could be promptly arrested and returned to their master, as employers were often called. People were employed to be on the lookout for fugitive laborers. These so-called Negro catchers were paid handsomely for their important responsibility of keeping blacks in their place. In addition, anyone caught trying to convince a black servant to flee employment or trying to assist a runaway with food or drink could be imprisoned or assessed a fine.

Black male children in Mississippi were required to be apprentices until they were 21 years old. African American girls were apprenticed until they were 18. The master could punish enslaved children in the same way their parents could, including the administration of corporal punishment. Due to southern white fear of black deviance, great pains were taken in Mississippi to keep African Americans from loitering or aimlessly wandering about towns and cities. Therefore, any vagrant free black person would be charged a heavy fine, which they generally could not pay, so they were forced to work until the debt was settled.

South Carolina had equally cruel black codes. For example, slaves who missed work because of illness were charged for the food, medical care, and other resources consumed during the hiatus. The cost was deducted from their wages. Black South Carolinians had to work from sunup to sundown and domestic servants had to be on call 24 hours a day. The code in South Carolina even mandated that African Americans display a kind disposition and exert gentle speech toward their masters.

Many of the activities blacks were permitted to do benefited white society and disadvantaged African Americans. For example, blacks were allowed to enter into contracts but this was primarily done to lock them into labor contracts that were unfair and paid low wages. Like Mississippi, the codes existed throughout the south that penalized blacks for trying to terminate their employment. In some states African Americans could face imprisonment if they fled their job. In a system that seemed to perpetuate slavery even after emancipation, it seemed that black codes were designed to mimic the social relations between blacks and whites of antebellum times, re-creating the slave/slave master relationship.

The northern public was largely critical of black codes, as they recognized the laws as an attempt by the south to maintain the southern status quo. The 1866 elections proved a major blow for black codes. The Republicans gained large majorities in the election. As a result, they implemented martial law in the south.

New elections were held and free blacks were allowed to vote along with poor whites, and the new government repealed all black codes. In 1868 The Fourteenth Amendment was adopted, which granted blacks equal protection and ensured that southerners could not resurrect black codes. However, similar laws would be implemented in the south during the 20th century known as Jim Crow laws, a manifestation of earlier black codes. The Civil Rights Act of 1964 finally brought an end to over 200 years of laws that denied equal citizenship to African Americans.

Black Entertainment Television

Black Entertainment Television (BET) is an American cable network primarily targeting a young African American audience. Established by Robert L. Johnson on January 25, 1980, and currently owned by Viacom, BET offers music, entertainment, comedy, movies, and other programs. Much of its programming reflects hip-hop and urban cultures of contemporary American society. Although BET offered current affairs programs, such as Ed Gordon's *BET News* and Tavis Smiley's *BET Tonight*, the network's major overhauls in the early 2000s resulted in its increasing investment in music and the dismantling of BET's news division. Its sister channels include BET Gospel, BET Hip-Hop, and Centric, formerly known as BETJ or BET Jazz.

Before starting BET, Johnson worked in Washington, D.C., as press secretary to Walter E. Fauntroy, a congressional delegate, and as vice president of government relations for the National Cable Television Association. When Johnson learned about a plan to launch a cable channel targeting an elderly audience, he realized that the same principle could apply to African American viewers, which was estimated to have a \$75 billion purchasing power. Initially, BET offered gospel music and reruns of low-budget films. Johnson planned to generate profit from advertising by leveraging the fact that blacks watched more television than whites and tended to be more brand loyal.

Initially, BET broadcast two to four hours a week, without original content, as a block of programming on Nickelodeon. Johnson admitted that BET showed movies considered to be

Blaxploitation films because that was all it could afford. It wasn't until the summer of 1983, when Taft Broadcasting Company made a \$360,000 investment, that its programming expanded to six hours a day, seven days a week. BET started showing music videos provided by record companies for free, and its own content, including *Bobby Jones Gospel Hour* and *Video Soul*.

Growth and Expansion

Although BET began turning a profit in 1986, when its subscriber base exceeded 12 million, it still struggled to find channels through which its programs could be aired. During this period, many urban areas, including New York, Chicago, Washington, D.C., Boston, and Detroit, did not have cable services or were just beginning to be wired with cable. Most services existed in suburban and rural areas, where white audiences were reluctant to have BET added to their channel lineup, especially because cable channels were still limited in numbers.

Nonetheless, BET's programming grew, and since the late 1980s, it has served as a portal of current affairs for African Americans. Journalist Ed Gordon appeared on *BET News*, *Black Men Speak Out*, *Conversation With Ed Gordon*, and other programs. Tavis Smiley was the host for his talk show, *BET Tonight*, until Gordon took over his position in 2001. *Lead Story*, *BET Nightly News*, and other news programs were some of BET's news programs that became available to its audience.

In 1991, BET became the first African American-controlled company to be traded on the New York Stock Exchange, raising \$72 million. After aggressive expansion efforts during the decade, BET Holdings owned four cable television channels, four magazines, and an online service. It also established BET SoundStage Restaurant in Maryland. In 1999, BET announced a \$35 million venture project with News Corporation, USA Networks, and Liberty Media to launch its Web site, www.bet.com.

Selling Out and Critiques

In 2001, Johnson sold BET to Viacom for approximately \$3 billion, making him the first African American billionaire. By then, the network reached over 60 billion viewers domestically. Although the

payoff for Johnson was \$1.5 billion, many African Americans viewed his decision as a betrayal to black communities. Critics claimed that Johnson was solely interested in financial gain and not the advancement of African American culture and the preservation of its heritage. Journalist George Curry said this was a part of a larger issue facing African Americans who witnessed AOL Time Warner's purchase of 49 percent of *Essence* magazine (currently owned by Time Inc.) and 100 percent of www.Africanna.com. Similarly, the *Chicago Tribune* held the ownership of Blackvoices.com (currently a part of the *Huffington Post*).

Since the early 2000s, BET has struggled to strike a balance between entertainment and news. For example, following the death of Coretta Scott King on January 30, 2006, BET maintained its regular music video programming while its cable competitors covered King's funeral live. Although BET broadcast a special program titled *Coretta Scott King: Married to the Mission* on the evening of the funeral, it did not escape severe criticism by the National Association of Black Journalists, among others.

BET's entertainment programming has not escaped criticism either. Curry commented that BET had become ET, or empty television, saying the network has lost its unique programming that offered serious perspectives on issues concerning black America. Activist and author Keith Boykin and filmmaker Spike Lee agreed with Curry. Boyce Watkins, a professor at Syracuse University and frequent commentator on many networks, asserted that the growth of BET was one of the black disasters of the 20th century.

The Hunger Strike and Beyond Television

In November 2007, E. Faye Williams of the National Congress of Black Women, and members of other civil rights groups joined the Reverend Delman L. Coates in his protest called "Enough is Enough." The group demonstrated in front of the homes of Viacom executives in Washington, D.C., and New York, claiming that BET and other channels under the umbrella of Viacom degraded African Americans and women.

On March 16, 2008, "The Hunger Strike," an episode on *The Boondocks* widely speculated to be a portrayal of Viacom's pressure on the Cartoon Network, was aired only outside the United

States. The episode, which criticized BET, only became available to the general public after its DVD release. Rapper Percy Miller's launching of Better Black Television (BBT) has been one of the responses to such criticism against BET.

BET's presence has gone beyond television programming. Since 2001, it has hosted the BET Awards. The event showcases the works, contributions, and performances of African American and other minority singers, actors, athletes, and other personalities in entertainment. In 2006, BET launched the BET Hip-Hop Awards, specifically to celebrate hip-hop performers, producers, and artists. Since 2008, the BET Honors has awarded African American achievements.

BET has also increased its presence globally since the establishment of BET International in February 2008. The network caters to the British, Irish, African, and Middle Eastern markets, with both U.S.-produced and locally produced programs, including *106 & Park*, *American Gangster*, and *College Hill*.

Black Hills Dispute and War

The Black Hills are a geological anomaly created from volcanic eruptions that formed concentric rings approximately 1.8 billion years ago. The

tallest peaks east of the Rocky Mountains, the hills suddenly emerge from the surrounding grasslands and are home to one of the most complex and diverse biological ecosystems. They are considered a sacred site by several Native American tribes of the northern plains such as the Kiowa, Cheyenne, and Lakota. Scholars currently date the earliest indigenous habitation in the area to 7,000 B.C.E. The so-called Black Hills Dispute and Black Hills War refer to a struggle of more than 150 years between the Lakota people (also known as the Sioux) and the United States government over ownership of this area, which continues today. Numerous natural sites within the Black Hills, such as Bear Butte, Harney Peak, Wind Cave, and Reynolds Prairie, are deeply connected with the oral and ceremonial traditions of the Lakota.

Lakota Oral and Ceremonial Traditions

While historical accounts note the Lakota's arrival in the Black Hills area circa the 1770s, Lakota oral tradition identifies the Black Hills as the site of their origin and posits the 1770s migration as a return to their homeland. For the Lakota, the sacred enclosed landscape of the Black Hills, which they refer to as the heart, is a physical location where the celestial movements in the sky are mirrored and associated with specific sites. Careful observers of the sun and the night sky, the Lakota were quite knowledgeable about the cyclic pattern of celestial movement and changing seasonal patterns. The interrelationship between celestial movements, particular stories, specific sites, and ritual served to provide sacred order to the life of the Lakota, gave meaning to their understanding of their place in the universe, and was believed to be necessary to the continuation of all life.

Broadly, the Black Hills mirror the movement of the sun through a great circle of stars that marks the perimeter and is remembered through two oral traditions: the sacred hoop and the race track. Movement of the sun through specific constellations of the night sky from spring to fall required the Lakota to move to particular sites along the racetrack and conduct specific rituals. For example, when the sun was in the constellation of the Bear's Lodge (at the summer solstice), memorialized through the story of a hill created by Fallen Star to save children threatened by

bears, the people moved to what is known today as Devil's Tower to perform the Sun Dance ritual. Understanding the interconnections of the quartet aids in understanding the critical importance of the Black Hills to the Lakota.

Contact

Early contact between the Lakota and colonial powers began at the turn of the 19th century. They were one of the tribes encountered by the Lewis and Clark expedition. In the early years of contact there was trade between the tribe and French traders and Americans, but by 1851, white encroachment was quickening and the first major treaty was signed between the United States and the Lakota at Fort Laramie. In spite of land cessions, the original Ft. Laramie Treaty reserved a significant portion of land that included most of present-day Nebraska, the western halves of South and North Dakota, and portions of northeastern Wyoming and southeastern Montana for the Lakota. However, the United States retained the right to establish roads, military, and other posts in the Lakota territory. The treaty also served to establish boundaries between different Native nations.

The Black Hills War

Seven years after the Ft. Laramie Treaty, gold was found at Pike's Peak, west of the western-most border of the newly formed Lakota Territory. This triggered a wave of gold seekers through Lakota Territory, nearly 100,000 people in 18 months' time. It also created an American desire for faster transportation into the area and sights were set for a transcontinental railroad. The influx of Americans through Lakota Territory triggered enough tension and skirmishes for the Americans to call for a new treaty at Ft. Laramie in 1868, which reduced the Lakota land base, but it still included the Black Hills. The treaty also called for the establishment of government agencies on the reserved lands.

In 1874, General George Custer entered the Black Hills on an expedition to find a location for the construction of a government agency. The expedition also included a large company of soldiers, geologists, and miners. On June 30 they struck gold, starting a new wave of gold fever. Skirmishes between the Americans and the Lakota and Cheyenne intensified as the Natives

continued to defiantly leave their reservations in protest over the intrusion of whites into the Black Hills, their sacred lands.

Many met for a Sun Dance led by Sitting Bull, the important Hunkpapa Lakota chief, in June 1876. Native accounts of the ritual claimed that Sitting Bull received a vision that prophesied an important Native victory against the American soldiers. Eleven days later Lakota and Cheyenne forces engaged Custer and his troops at the Greasy Creek. The Battle at Little Bighorn and the defeat of Lt. Col. George Armstrong Custer and the Seventh Cavalry on June 25, 1876, is arguably the most widely circulated story of the Indian American archives—for both Natives and non-Natives. From a Native perspective, the victory was foretold through vision and therefore supernaturally sanctioned.

The great victory, however, signaled coming defeat as huge numbers of soldiers hounded the Lakota, driving them to their reservations. Some, such as Sitting Bull, fled to Canada for a time. Another great leader, Crazy Horse, managed to elude the forces for nearly a year before eventually turning in himself and his band at Camp Robinson in May 1877, and within months he was killed during a scuffle as he was arrested and taken into custody.

In 1877, the U.S. government repealed the 1868 Ft. Laramie Treaty and reduced Lakota lands significantly, placing specific bands in separate locations. Most importantly, the Black Hills were no longer part of the Lakota lands. A new threat to the Oglala came later that year with the passage of the Dawes Allotment Act, which sought to reduce the holding of the Sioux and divided the great reservation into six separate reservations. The Dawes Act planned to “civilize” the Indian through the cultivation of farming.

It provided for allotments of 160-acre plots, which would be given to each adult male member of the tribe. Through ownership of private property, the reformers supporting the act argued that the Indian would acquire the skills necessary to enter their place within the American system. The act meant that the tribal tradition of jointly owned lands would be broken, the larger Lakota Nation would be broken into smaller, more manageable groups, and, perhaps most importantly, the plan would free 9 million acres of land for

further settlement, meaning a large profit for the U.S. government.

Twenty years of tension and deep divide provided fertile ground for the Ghost Dance, a millennial movement that swept through many Native tribes, in particular the Lakota. Not only was there considerable stress between the tribes and the U.S. government, there were profound splits internal to each group. The Lakota first heard about Wovoka, the visionary founder of the movement, from the Shoshone and Arapaho. Wovoka was considered the Son of God on earth, who had come first to the whites who had rejected and killed him. Five Lakota left their agency without permission to visit the new Messiah. Upon their return, they called a council and Indian police promptly confined the travelers to the prison.

After their two-day confinement, the prisoners were released after promising not to hold councils to share what they learned during their visit. The matter, however, was not laid to rest. The next spring, Kicking Bear, from the Lakota Cheyenne River agency, went to visit the Arapaho; his stories about the Ghost Dance and instruction about how to perform the ritual circulated throughout the reservation. The Ghost Dance movement took hold among the Lakota people and gained momentum.

In mid-December 1890 the situation was ready to explode. Sitting Bull had been killed at the Standing Rock agency, and many members of his band fled to meet up with Big Foot’s band from the Cheyenne River agency. They were returning from a Ghost Dance ritual but were heading toward the Pine Ridge agency to surrender. On December 28, the U.S. military intercepted the group and forced them to set camp even though they were only 16 miles away from the agency seat. The following afternoon a melee broke out as soldiers worked to disarm the bands. There are numerous, conflicting reports about what transpired next, but in the end the majority of Lakota—more than 150 men, women, and children—were killed in the Massacre at Wounded Knee, effectively ending the Black Hills War.

The Black Hills Dispute

With the closing of the frontier and the move to the 20th century, the Lakota never forgot the

Harney Peak is the highest natural point in South Dakota. A Sioux Native American named Black Elk claimed to have had his Great Vision on the site of Harney Peak when he was 9 years old. In a book about Black Elk by writer John Neihardt, Black Elk recorded his vision as "While I stood there I saw more than I can tell and I understood more than I saw; for I was seeing in a sacred manner the shapes of all things in the spirit, and the shape of all shapes as they must live together like one being."

Black Hills. In the early 1920s their efforts shifted to legal resistance. They filed a land claim for the Black Hills, arguing the 1877 legislation was illegal because the United States never legitimately purchased the land. They won a major victory in 1956, which was appealed. Eventually the case was heard by the U.S. Supreme Court on June 30, 1980. In *United States v. Sioux Nation of Indians* the court ruled 8–1 to uphold the original Lakota victory, which found the United States illegally seized the Black Hills. The court awarded the Lakota nations \$106 million, the largest award to Native tribes for illegal land seizures. However, the Lakota never sought monetary award; they wanted the return of their sacred lands. In spite of exceptional poverty in contemporary times, the Lakota nations continue to reject the award, which with accrued interest is now in excess of \$350 million.

The gold boon dwindled quickly and today the economic mainstay of the Black Hills is tourism.

Mining is a historical object rather than an income producer. Propelling the tourism industry are two important attractions. First, the Black Hills are home to Mount Rushmore, one of the most important icons of American ideals meant to evoke a strong sense of nationalism. More than two million tourists visit it every year. For Native peoples, the site is a symbol of American imperialism. It was occupied during the late 1960s and early 1970s by the American Indian Movement, demonstrating Native resistance that continues to contest ownership of the Black Hills. Mount Rushmore has also entered popular culture and is mobilized in many ways from political cartoons to T-shirts, movies, and posters. It is a frequently used icon that both exalts and critiques political and/or social power. It is also symbolic of Native presence, resistance, and persistence.

The second draw of tourism to the Black Hills is its natural scenic landscape, much of which is managed by national and state park services that

control access to the lands—another site of contention for the Lakota. In an interview for the film *A Seat at the Table*, Lakota activist Charlotte Black Elk relates the denial of her application for an access permit to the Black Elk National Forest, which is named for her grandfather, while applications from others such as the motorcycle group Hell's Angels were approved.

Update

In 2012, an announcement was made that a large parcel of privately owned land in the Black Hills was going to be auctioned publicly. Known today as Reynolds Prairie, the land was one of the more significant sites in the racetrack oral tradition and is known to the Lakota as *Pe' Sla*, Lakota for bald head. It was and is considered by the Lakota to be the center of the Black Hills. According to oral tradition Lakota traveled there in May after spring had fully arrived and conducted rituals in which offerings were given in gratitude for their many blessings; these rituals are considered necessary for the continuity of the life cycle.

Lakota and other Natives were outraged that the auction was to be public and that the land was in danger of development. Facebook and the Internet were used extensively, shaping the outcome. First the public auction was canceled, and the owner decided to hold a private auction instead. Second, a fund was set up to accept donations in an effort to help the Rosebud Sioux raise the earnest money and on September 10, 2012, the Associated Press reported that the Rosebud Sioux Tribe's bid of \$9 million for 2,000 acres of land was accepted by the land's owners.

The tribe's confidence that it could raise the funds to purchase the land before the November 30, 2012 deadline, wasn't misplaced. Through the combined efforts of the *Oceti Sakowin* [Great Sioux Nation], the \$9 million was raised, and the land purchased. Rosebud Sioux Tribe Chairman Cyril "Whitey" Scott announced on November 30, 2012, that the purchase had been made. "I can tell you that *Pe' Sla*, the sacred land on behalf of the *Oceti Sakowin*, is secured. The \$9 million was secured, *Pe' Sla* has been purchased."

Black Muslims

The label "Black Muslims" refers to African American adherents to religious groups that share a tenuous relationship to orthodox Sunni Islam. These groups emphasize black nationalism and separatism, as opposed to the Islamic belief of the *umma* or a unified Muslim community that does not make doctrinal differences in race or ethnicity. Black Muslims are usually identified as belonging to the Moorish Science Temple of America, Nation of Islam (NOI) or one of its splinter groups, or the 5 Percent Nation of Gods and Earths.

Moorish Science Temple of America

Founded in 1913 in New Jersey, the Moorish Science Temple of America is the Nation of Islam's predecessor. Its original leader, Noble Drew Ali, was believed to be a reincarnation of three of the world's greatest religious leaders: Jesus, Buddha, and Muhammad. Followers of Drew Ali were

taught some of the orthodox precepts of Islam, including facing east during prayer, observing Friday as the Sabbath, and calling their God “Allah.” Also included in worship are some traditional Christian hymns, most likely appropriated from Drew Ali’s Baptist upbringing in North Carolina. Members also adopted the suffixes “Bey” or “El” to their surnames as a means of distinguishing themselves from other blacks and of creating an identity not inherited from their ancestors’ slaveholders.

The mission of the Moorish Science Temple of America was to promote racial uplift and, in contrast to NOI, its members were encouraged to become good and upstanding citizens, rather than confrontational. Ideologically, the group aligned itself with Marcus Garvey’s Universal Negro Improvement Association, and by the 1930s, the group numbered well over 30,000 members. Membership in the Moorish Science Temple declined with the founding of NOI and the introduction of Sunni Islam to the Black Muslim fringe. In the 2000s, only about 200 members attended annual meetings on the East Coast.

Nation of Islam

W. D. Fard founded the Nation of Islam in Detroit in 1931. Fard was a peddler of undetermined ethnic origins who introduced Islam to urban blacks in the northern United States. The NOI actively promotes the idea that blacks are superior to whites, and that black subjugation by whites was the result of efforts of a mad scientist called Yakub, who created the white or, as the NOI refers to them, “Caucasian” race. As such, the NOI is focused on restoring blacks to their original elevation in the social and evolutionary scale.

The organization loosely incorporates elements of Sunni Islam into its teachings, including fasting, modest dress (e.g., head coverings for women), and specific gender roles. Congregations meet in temples identified by cosmic numbers, like Harlem’s famous Temple No. 7.

The 5 Percent Nation of Gods and Earths

The 5 Percent Nation of Gods and Earths is a splinter group of Nation of Islam. It was founded on October 10, 1964, by former NOI member Clarence 13X. In contrast to NOI, which

preaches its own formulation of Islam, Clarence 13X taught his followers that they are gods. The 5 Percent Nation of Gods and Earths, more commonly known as the “Five Percenters,” believe that the world’s black population is divided into three groups: 85 percent are unaware of divine knowledge or of God; 10 percent are people who know the truth, but rather than embrace it, they deceive others for personal gain. Among this group are religious leaders within the black community who profit from religious leadership. The last 5 percent, the Five Percenters, are known as the “Poor Righteous Teachers,” who strive to bring the truth to blacks.

The group is guided by the tenets of what is referred to as “Universal Knowledge.” A sun, moon, star, and the number seven represent this knowledge, as well as the group itself. Each item has its own significance related to gender and the dissemination of knowledge: the sun represents the male body, knowledge, truth, and light. The moon represents the female body and wisdom. The star represents understanding and children. Finally, the number seven represents God as the Five Percenters understand him: as a man, not a mysterious, omniscient force as perceived in other religious groups. The group relies on the “Supreme Alphabet” and “Supreme Mathematics” for understanding scripture and lessons borrowed from NOI.

Every year, the group holds a series of annual events known as universal parliaments. These are gatherings to encourage members to expand their understanding of universal knowledge and to discuss issues affecting the Five Percenters as a group.

From the 1980s and into the 2000s, much of the proselytizing done by Five Percenters was done through the medium of hip-hop music. Among the more notable members of the Five Percenters are Eve, Erykah Badu, Public Enemy, and Wu-Tang Clan.

Black Panther Party

Founded by Huey Newton and Bobby Seale in Oakland, California, on October 15, 1966, the Black Panther Party (originally known as the Black Panther Party for Self-Defense) was a radical African American organization that promoted black nationalism and resistance to the integrationist ideals of the civil rights movement. Newton and Seale had been heavily influenced by Malcolm X's black nationalism, Mao Zedong's "picking up the gun" ideology, and philosophies of other thinkers including Franz Fanon and Che Guevara. Until its demise in 1982, the Panthers worked closely with the urban black population that was experiencing segregation, racism, poverty, and other social, economic, and political difficulties. Partially because of its publication, *The Black Panther*, the party expanded nationally during the late 1960s, with its peak membership nearing 10,000 in 1969. Although its fundamental philosophy subscribed to socialist and communist ideas, the party attracted diverse membership.

The Black Panther Party for Self-Defense initially captured national attention in 1967 when its rifle-bearing members dressed themselves in leather jackets and black berets and marched into the California state Capitol building. This demonstration was a response to what the party maintained was the brutality against blacks committed by the white-dominated police forces. In addition, the party's volunteers patrolled the streets in Oakland to educate African Americans

about their rights. This was the beginning of the organization's role of infusing black pride and engagement into political militancy.

Programs

The Black Panther Party had a set of strict rules for its members. One of the key regulatory programs was the Ten Point Program, which called for freedom, employment, housing, education, and other fundamental rights. Notably, the program sought exemption from military conscription as a manifestation of the party's resistance to a racist government, as well as "land, bread, housing, education, clothing, justice, and peace." These ideas stemmed from Newton's fundamental theory of "what we want" and "what we believe" that emphasized African American self-determination.

Although the party was originally launched to protect African Americans from police brutality, it expanded its scope to include various community programs. Modeling after Head Start, the Panthers started the Free Breakfast for Children program. Additionally, they hosted free sickle-cell anemia testing, offered grocery donations to the poor, encouraged drug and alcohol rehabilitation, organized free ambulance services, and engaged themselves in many other social outreach activities called Survival Programs. Party leaders believed that these programs were consequential in altering African American consciousness. Simultaneously, the presence of the party in local communities resulted in an increasing participation by women and urban residents, in general.

Political Activity

The Black Panther Party influenced the development of African American political radicalism. The party emphasized antiracist and anticapitalist perspectives. Newton's assessment on American racial politics frequently compared itself to the racial and ethnic subjugations of Africans, Asians, and Latin Americans. Such anticolonialist theories led to the party's denouncement of the United States as an empire. In the context of the Vietnam War and the geopolitical environment of 1970, the Black Panther Party called for global cooperation among oppressed people around the world in order to attain revolutionary intercommunalism.

Between 1973 and 1975, the Black Panther Party heavily exercised its political agency. Seale ran in the Oakland mayoral race in 1973 and received the second-highest number of votes among the nine candidates. Elaine Brown ran for Oakland City Council in 1973 and 1975, gaining 30 percent and 44 percent of the vote, respectively. Seale and Brown led massive voter registration campaigns. Despite their electoral losses, the candidates showed the power of African American political mobilization by winning many votes. Eventually, in 1977, Brown helped Lionel Wilson become Oakland's first African American mayor.

Controversy and Harassment

The party remained controversial. Its leaders, including Eldridge Cleaver, often encouraged armed resistance. Their display of weapons, demonstrations, use of revolutionary language, and other actions led to violent confrontations with authorities. Locally, the Panthers experienced violence and intimidation by the Oakland Police Department. In April 1968, Bobby Hutton was killed by an Oakland police officer during a gun fight. Nationally, in the following year, two members were killed by the Chicago Police Department. Dozens more were also shot or imprisoned.

Furthermore, the Federal Bureau of Investigation (FBI) in 1967 had its counterintelligence program (COINTELPRO) infiltrate and attempt to neutralize the party. FBI Director J. Edgar Hoover commented in 1968 that the Black Panther Party was the greatest threat to domestic security. Along with leaders and members of other civil rights organizations, including the Southern Christian Leadership Conference, the Student Nonviolent Coordinating Committee, and the Nation of Islam, the Panthers' members were targeted by COINTELPRO.

Although the party's diverse membership helped the organization grow rapidly during its early period, it caused dissonance within the party as the 1970s progressed. Newton and David Hilliard preferred to maintain the combination of community service and self-defense as its main objective. Cleaver and others were inclined toward a more aggressive approach. The disagreement between Newton and Cleaver resulted in Cleaver's removal from the Central Committee. In the meantime, Brown increased the party's

involvement in electoral politics and women's roles within the organization that had long been predominantly male. In 1977, however, Brown left the party after Newton ordered the beating of a female member upon Newton's return from Cuba. Although the party existed until 1982, its membership was less than 30 by 1980. The dissolution of the party was inevitable when Newton was found to have embezzled funds from a Panther-sponsored school in order to buy drugs.

Legacy

The legacy of the party remains to this day. In 1989, the New Black Panther Party was established in Dallas, Texas. It later welcomed many of the former Nation of Islam members. In 2004, the National Alliance of Black Panthers was established. Although many of these organizations are unrelated to the party, its emphasis on grassroots activism and self-determination continues to appeal to many African Americans.

Black Power Movement

The Black Power movement consisted of various political movements based on black autonomy, self-sufficiency, and nationalism. The term *black power* was first used by Congressman Adam Clayton Powell, Jr., in the 1950s. Growing out of the civil rights movement of the 1950s and 1960s, the Black Power movement aimed to achieve full racial equality. While these two movements share much in common, there exist many differences.

Furthermore, since the Black Power movement included black separatist factions that emphasized self-defense, which was frequently associated with violence, it was stereotyped as a militant movement in the late 1960s and the early 1970s. In reality, however, it was a complex movement with differing ideologies and impacts upon American society and culture.

Despite the achievements of the civil rights movement, most notably showcased by the Civil Rights Act and the Voting Rights Act, many African Americans continued to believe that racial discrimination persisted and the idea of self-determination was ignored in the movement. They claimed there was a need for more emphasis on black autonomy. The base of the Black Power movement exists in this sentiment of the mid-1960s. Many large cities were beginning to have black majorities. Malcolm X argued that even though he shared the concerns of the civil rights movement, African Americans should pursue their equal rights by any means necessary. He considered integration a surrender to white supremacy.

This call for immediate action and solidarity resonated with other leaders and activists. In 1966, Huey Newton and Bobby Seale established the Black Panther Party for Self-Defense. The

The Black Power movement encouraged African Americans to embrace their heritage by adopting hairstyles that highlighted their natural hair texture, such as cornrows. The braids regained popularity in the United States in the late 1960s and 1970s.

assassination of Malcolm X, urban uprisings in the mid-1960s, and continuing social instability set the stage for the Black Power movement to start. Leading the Student Non-Violent Coordinating Committee (SNCC), Stokely Carmichael used the expression “Black power” to attain racial solidarity and to shift SNCC’s focus on African American–centered social change. By the end of the decade, the Black Power movement had spread both domestically and internationally.

The movement’s fundamental belief in black autonomy was not new in American history. The Harlem Renaissance, Pan-Africanism, and other cultural and political movements had existed since the early 20th century. In many ways, the Black Power movement would not have existed without the achievements of the 1950s and 1960s. Although these earlier movements encouraged racial pride and self-esteem, as did the Black Power movement, mid-century activism was more dynamic and expansive. Additionally, unlike the civil rights movement, which took place primarily in the southern states, the Black Power movement had wider manifestations.

The Black Power movement existed in numerous areas. Many of these examples emphasized the link between Africa and the United States. One of the most prominent examples that remains highly current to this date is the holiday of Kwanzaa, established by Maulana Karenga in 1966. Kwanzaa is based on seven principles: *umoja* (unity), *kujichagulia* (self-determination), *ujima* (collective work and responsibility), *ujamaa* (cooperative economics), *nia* (purpose), *kuumba* (creativity), and *imani* (faith). Stemming from African religions, these ideas helped many African Americans reconnect to African cultural heritage. In sports, at the Olympic Games in Mexico in 1968, the gold medalist Tommie Smith and the bronze medalist John Carlos raised their fists on the podium after the 200-meter race. In 1968, San Francisco State University launched the nation’s first Black Studies Department. Many colleges and universities followed. These intellectual developments encouraged the word “black” to replace “Negro” during this period.

In addition, African Americans began to adopt more African-style hairdos and clothing. “Black is beautiful” as a cultural movement phrase was widely shared to dismiss the idea that African

Americans' natural skin color, hair, and facial features were ugly. In the arts, Amiri Baraka, Nikki Giovanni, Sonia Sanchez, Maya Angelou, and others produced various artistic works that reflected the concerns of the movement and underscored the culture and tradition of Africa. Even artists who were not involved in the movement such as Toni Morrison, the Temptations, and others expressed their political awareness. The Black Power movement's impact existed in other parts of African diaspora. In the Caribbean, for example, the idea of autonomy, solidarity, and equality led to the Afro-Caribbean movements, the People's Progressive movement in Barbados, and the Black Beret Group in Bermuda.

The end of the Black Power movement had two significant causes. The first was its tie to violence. Even though the Black Power movement brought about numerous changes and improvements, a common association to violence inaccurately characterizes the movement. On the one hand, even after the civil rights era, African Americans faced unequal job opportunities, wage gaps, segregation, and other forms of racism. On the other hand, both whites and blacks believed that the solutions to these problems that the movement promoted were extremely separatist and could possibly undermine the progress made during the civil rights era.

The second cause of the movement's demise was its lack of organization. Without a single figure who led the movement, there was no consensus on its ultimate goals or means to achieve them. The mainstream Black Power followers considered the radical members to be too willing to resort to violent measures. On the other hand, the radicals argued that the mainstream participants were too accommodating. With the assassinations of Mark Clark and Fred Hampton in 1969, raids and arrests led by the U.S. government and other events resulted in the quick decline of the Black Panther Party. Simultaneously, in the early 1970s, there was an increase in the number of blacks who considered supporting progressive white officials more viable. For these reasons, the Black Power movement terminated by the mid-1970s.

Blackface

Theatrical “blackface” makeup used in vaudeville and minstrel shows assisted in the depiction of black characters in stereotypical ways. This tradition became popular in the mid-19th century in the United States. Arising from the tradition were popular stereotyped subcharacters that grew very popular; some examples are the darky, the coon, the mammy, the Uncle Tom, the buck, the Jezebel, and the pickaninny.

These stereotypical characters were exaggerated and two-dimensional. The darky, a simpleton and buffoon, was lazy and cowardly. The coon butchered the English language and put on airs trying to seem distinguished despite his obvious crude nature. The mammy, often played by men, was a sexually unappealing, stubborn, and bossy source of homespun “wisdom,” which was more likely to be more simple buffoonery and superstition. The Uncle Tom was a gentle, religious old man, sitting ineffectually on a porch, typically. Both the mammy and the Uncle Tom persist even in 2013 as logos for food products. The buck and the Jezebel were the threatening, hypersexualized male and female counterparts to the mammy and Uncle Tom or darky. Both the buck and the Jezebel were predatory and threatening to white culture. Finally, the pickaninny was the barefoot, ignorant black child.

From 1830 to 1930 the blackface performance was a key component of American theater. In the early 1900s blackface began to be performed apart from minstrel shows as its own independent

kind of show. This phenomenon also thrived in the United Kingdom.

Blackface performers used burnt cork and later greasepaint and even shoe polish to achieve their exaggerated black skin. They used other makeup to accentuate their lips, and “nappy” wigs. The clothes of the blackface performer were generally shabby, ratty formal wear to further a ridiculous feel to the characters.

Al Jolson was a Jewish American actor, comedian, and singer. At the peak of his stardom he was known as the “World’s Greatest Entertainer.” In the 1930s, he was America’s most famous and highest-paid entertainer. Between 1911 and the end of the 1930s, Jolson performed in nine sold-out Winter Garden shows, made a series of successful musical films, traveled for 16 national and international tours, pressed in excess of 80 hit records, and in 1927 starred in the groundbreaking, first full-length movie with dialogue, *The Jazz Singer*.

Jolson’s blackface and singing style are seen by experts as metaphors for the suffering of both Jews and blacks throughout history. Historian Michael Alexanderas calls *The Jazz Singer* a fictional blend of Jewish liturgical music and African American music in the form of jazz. The film, and Jolson specifically, were well received by Harlem audiences and critics alike.

The mid-20th century in the United States brought with it the civil rights movement and the end of blackface as a common theatrical form. The technique persists as of early 2013, typically as critical or satirical commentary, but also as political speech from across the spectrum. For example, some instances of blackface have been seen on the campuses of major southern universities such as the University of Alabama as recently as the early 1990s during Old South Week. One of the most enduring impacts of the blackface tradition was the ongoing co-opting of African American culture in the United States.

Notably, black performers were also using blackface onstage by the mid-19th century; in fact, until the 20th century, black actors were generally not permitted to perform out of blackface, regardless of their complexion. Activist and philosopher Frederick Douglass spoke out against blackface in general, although he acknowledged the presence of blacks on stage in any form to be a positive development. Even so, these shows

with black performers, billed as authentic cultural “insider” experience, typically found white audiences viewing the performers as if attending a circus or visiting a zoo more than patronizing the arts. These all-black minstrel shows tended to depict a fictionalized and romanticized view of life on American slave plantations.

Although, of course, performing in blackface subjected the black community to stereotypes and forced black performers to be complicit in this process, compared to other work available, performing in blackface provided black actors with a fairly good income. It also allowed black performers, albeit in a limited way, to develop their craft. Furthermore, this kind of performance brought African American culture to the forefront of American culture and show business. An all-black vaudeville organization, the Theater Owners Booking Association (TOBA), was founded by performers in 1909. Although TOBA members tended to make very little from their performing, their organization did support the further growth of the black entertainment industry. In 1914, for example, the Harriet Beecher Stowe classic *Uncle Tom’s Cabin* was brought to the stage by TOBA performers.

Yellowface

Yellowface refers to the practice of white performers wearing makeup and costumes to portray Asian characters. However, the term also refers to the institutional practice of refusing to hire Asian performers to portray Asian characters and the promulgation of racist, stereotypical caricatures of Asians in the performing arts industry.

During the mid-19th century, following the building of the railways and the California Gold Rush, Asian stereotypes and negative ideas about Asian immigrants had become commonplace. Between 1850 and 1930 more than one million Asian immigrants entered the United States. The coolie was the Asian equivalent of the darky, a basic unskilled, uncivilized laborer identifiable by his “coolie hat.” The Yellow Peril was a less comedic and more threatening stereotype that exploded in popularity in the late 19th century as the racial purity movement grew in California. The idea of the Yellow Peril was that the Asian was a polluting influence in otherwise pure white society.

Other 19th-century Asian stereotypes included the deviant, the dragon lady, and the nonthreatening sex objects (the lotus blossom, the China doll, and the geisha girl). The deviant depicted household servants and laundry workers by day who haunted opium dens and ran female prostitutes as slaves by night. The dragon lady is the Asian Jezebel, hypersexualized and economically opportunistic. The nonthreatening sex object stereotypes were all servile and obedient in their hypersexuality.

The 20th century gave rise to two more notable Asian stereotypes: the gook and the model minority. The gook was a product of the Korean War and became much more popular during the Vietnam War. This stereotype portrayed the Asian as a supernaturally powerful enemy, stealthy and sneaky, and above all, dangerous. The model minority was the well-assimilated and successful Asian juxtaposed against the less-assimilated Latino immigrant and the black.

Yellowface performances on the movie screen began with the famous *Madame Butterfly* starring Mary Pickford in Asian makeup (1915). This trend dovetailed with the “whitewashing” practice in which Asian characters were transformed into white characters so that yellowface makeup was unnecessary. In 1935 Anna May Wong, the first Chinese American movie star, was considered for the Asian lead character O-Lan in *The Good Earth*. The role went to Luise Rainer, a white actress, and Wong was cast as the dragon lady villainess—a role she turned down.

Other well-known yellowface characters include Charlie Chan and Fu Manchu, both played by the same white actor, Warner Oland. Charlie Chan appeared as a wise and benevolent (albeit at times comedic) detective. Based on an actual person in Honolulu, Chang Apana, Charlie Chan was the “positive” antidote to Yellow Peril. Fu Manchu and characters like him were more traditional Yellow Peril characters; Dr. Fu Manchu was terrifying, completely evil, and almost unstoppable.

The yellowface tradition continued well into the 1970s in the United States. White actor David Carradine played Kwai Chang Caine in the popular television series *Kung Fu*. Carradine returned to the role—in yellowface—in the 1990s. Max Von Sydow provided a science

fiction reprise of the Fu Manchu character in 1980’s *Flash Gordon*.

Brownface

Brownface refers to the racist, stereotypical caricatures of Latinos in American culture, particularly in the media. “Latino” includes anyone from Central or South America living in the United States. Like other ethnic groups in the United States, Latinos have traditionally been pigeonholed into several long-standing stereotypes.

The Latin Lover was popularized by Italian actor Rudolph Valentino in the 1920s, but this stereotype was based on long-held ideas about Latino sexuality and the “dark, mysterious stranger.” The female version of this caricature—the harlot, spitfire, exotica, or mamacita—has persisted throughout different generations with remarkably few changes, hypersexualized and animalistic.

The bandito was a dirty, unkempt, violent criminal depicted most often in the old westerns. This stereotype of the lawless Latino gave rise to other, more modern incarnations: the greaser, the zoot suiter, and the gang-banger, to name a few.

The greaser actually originated in 19th-century California as Mexican miners who successfully found gold were harassed and intimidated. Later, the greaser was the hooligan outsider heralding the loss of the “good” urban neighborhood typified by the Sharks in *West Side Story*, for example. The Mexican American zoot suiter in the 1940s was also thought to be a criminal and pronounced as such by mainstream media; this hysteria culminated in violent attacks on zoot suiters and other Latinos in Los Angeles. Finally, the gang-banger is the more modern Latino criminal, vicious, pointlessly violent, and cruel.

The domestic, maid, day laborer, wetback, peon, and beaner are all part of the Latino worker stereotype, typically in service to white families and speaking in broken English with exaggerated accents. The undercurrent of anti-immigration sentiment in these roles is generally very obvious.

The male buffoon or comedic relief is the classic fool with a Latino twist. He is simple, childlike, and clumsy. He is often the comedic sidekick to a more heroic character, such as Pancho in *The Cisco Kid* and Chico in *Chico and the Man*. His female counterpart is also a source of comedic

relief, and typically her accented antics are used to negate her sexuality.

Finally, the lazy Mexican stereotype and its various incarnations such as the drug addict and the slum dweller depict the Latino as foolish, lazy, and a drain on society.

The children's character Speedy Gonzales, along with his Mexican peer mice, provides an interesting example of brownface stereotypes. Speedy, although he is the hero, is a comedic figure, complete with notable accent and gigantic sombrero. His cousin Slowpoke Rodriguez is the typical drunken, lazy Mexican, and the bystanders in any situation are the peons, cowardly and weak, and in need of guidance and intervention.

Historically, these stereotypes were an important outcropping of Manifest Destiny and the conquering of the American southwest. The displacement of Mexicans and subsequent exploitation of immigrants for labor birthed not only stereotypes such as those discussed above but also a general failure to acknowledge Latino contributions to the American economy and culture.

Brownface also refers to the difficulties experienced by Latino actors attaining roles and the tendency to cast non-Latinos in Latino roles. Some examples of this include Telly Savalas's portrayal of Pancho Villa, Charlton Heston as a Mexican in *Touch of Evil*, and Marlon Brando as Emiliano Zapata.

As of early 2013, brownface issues persist in American culture. At least 18 percent of Latin Americans also have African heritage, yet the appearance of black Latino characters is extremely rare. Whites also continue to be cast as Latino characters in television and film. Finally, there is a strong tendency to depict upper-class Latinos as white Hispanics. In contrast, thuggy supporting roles tend to fall to nonwhite Latinos.

Redface

Redface refers to the racist, stereotypical caricatures of American Indians in American culture, particularly in the media. It also refers to the institutional practice of refusing to hire Native American performers to portray American Indian characters and the promulgation of racist, stereotypical caricatures of Native Americans in the performing arts industry. Like other ethnic groups in the United States, American Indians

have traditionally been pigeonholed into several long-standing stereotypes. The chief was the head of an Indian tribe. Most Native American "chiefs" were not actually chiefs, and were simply Native American leaders. The brave, or buck, was an American Indian man who had evidenced his courage or value as a soldier or hunter.

The Indian Princess was supposedly the Native American equivalent of royalty, the daughter of a chief. In reality, there was never an American Indian royalty class. The princess stereotype created attractive, "believable" American Indian mates for whites in various stories. The squaw was any Native American woman who was not a princess. She was asexual despite her status as mother and silently served her family and tribe. Along with the squaw was the papoose, the Native American baby.

While many American Indians are depicted as savages, two subcaricatures are central to the idea of the savage. One is the renegade, the "injun" or warrior who is violent and animalistic and opposes whites at every turn. The injun made numerous appearances in the traditional western movie. The other is the noble savage, a simple, peaceful figure living in harmony with nature. The crying "Indian" of the Keep America Beautiful campaign is the noble savage. (Ironically, Iron Eyes Cody, the man who played the crying Indian, was Italian.)

When Europeans first came to North America there were many distinct cultures and languages living in the area. It was only after the oppression and stereotypical treatment they experienced within mainstream American culture that Native Americans conceived themselves as a people. Depending on their role in the lives of white settlers, American Indians were either noble savages (as when they served as guides or helped fight the French) or violent, renegade savages (as when they interfered with westward expansion).

As recently as 2013, Native Americans were still fighting redface depictions in American sports. The co-opting of American Indian images and names by sports teams such as the Washington Redskins and the Atlanta Braves has received considerable attention but had not been resolved at the time of this writing.

In the earliest western movies many Native American extra roles were filled by Navajos who

were close by, although speaking roles went to white actors. Six Nations actor Jay Silverheels played the role of Tonto in *The Lone Ranger*; he also founded the American Indian Actors Workshop. Chief Dan George was nominated for the Academy Award for Best Supporting Actor in the 1970s and was the first American Indian to receive a nomination from the Academy of Motion Picture Arts and Sciences. Will Sampson, who played a memorable role in *One Flew Over the Cuckoo's Nest* in 1975, also founded the American Indian Film Institute in 1979. Finally, Russell Means is a Native American activist and noted actor who played in *The Last of the Mohicans* and *Natural Born Killers*.

Blackfoot

The Blackfoot confederacy consisted of several individual Native American tribes: the Piikana, or Peigan; the Siksika; and the Kainai. Blackfoot tribal territory traditionally spanned from the north between Edmonton and Calgary, Canada, south to Wyoming, west to the Rocky Mountains, and east to the Cypress Hills region in Canada. Originally, the tribes spoke a common language, *Niitsi'powahsin* (Blackfoot), which was part of an extensive Algonquian language family.

Until the late 1800s the Blackfoot was a High Plains, nomadic culture that relied primarily on native plants and American bison (buffalo) for food, shelter materials, and clothing. Each of the three tribes divided into smaller bands containing around 20 family units of about 250 people and had from 20 to 25 tepees.

In winter, each band stayed in a relatively sheltered area near a river to wait out the long, harsh months associated with this geographical climate. With warmer spring temperatures, the Blackfoot bands dispersed, meeting and moving with the migration patterns of the buffalo. Near the summer solstice the three groups convened at an agreed-upon spot for a large summer gathering known as the Sun Dance. The near-extinction of the buffalo by the late 1870s at the hands of U.S. soldiers and settlers forced the Blackfoot to change their lifestyle and to adapt to the new reality imposed on them.

Today, the U.S. population of Blackfoot, who self-identify as Blackfeet in the contiguous 48 states, is distributed across a wide geographic area, but there is a large reservation located near Glacier National Park in Browning, Montana. According to the U.S. 2010 census, about 10,405

Blackfeet reside within the 3,000-square-mile reservation. Approximately 74 percent of the total Blackfoot populace considers itself to be multi-racial. This may be due to multiple tribal affiliations, as well as nonnative influences.

Historical Development

In the middle 1600s, French traders and trappers in central Canada began to meet indigenous Blackfoot peoples. Near the end of that century, Hudson Bay Company officials wrote about their contact with the Blackfoot in Alberta, Canada, and referred to traditional Blackfoot maps to indicate what might be on the other side of the Rocky Mountains. French trappers and traders arrived in larger numbers and brought with them Jesuit priests, and nuns—and European diseases.

In 1803, the United States purchased most of Montana from France via the Louisiana Purchase. While exploring the region, members of the Lewis and Clark expedition met and clashed with Blackfoot (Peigan). Meriwether Lewis killed a Peigan in the exchange, thus setting the tone for future encounters between the Blackfeet and U.S. government officials. The Peigan group was arbitrarily split into two groups, the North Peigan and the South Peigan, by the imposition of an international border between the United States and Canada in 1818. This political boundary disrupted the original seasonal migration of the Blackfoot peoples, as European settlers encroached into the region from the east.

The U.S. and Canadian border—referred to colloquially by the Blackfeet as the “Medicine Line”—impacted Blackfeet mobility and treaty negotiations. Guns were actively traded in the region, which escalated conflicts between white settlers moving west and native populations under duress. Smallpox and other diseases new to indigenous populations had devastating effects throughout the 18th and 19th centuries, killing approximately 90 percent of the Blackfoot population. A series of treaties limited the migration patterns and land use of the Blackfeet in both Canada and the United States.

Military, Missionaries, and Reservations

The U.S. army began building forts in Blackfoot territories in the 1830s. The 1860s brought more white settlers, the whiskey trade, and the first

steamboat via the Missouri River. The U.S. Army killed about 217 Blackfeet, primarily women and children, at the Marias Massacre in 1870. The first missionary school for Blackfeet children was built in 1872 in Montana. Missionary schools separated Blackfeet children from their families, their native language, and their cultural traditions.

President Grant established the Blackfeet Reservation near Browning, Montana, in 1873. Ten years later the Canadian Pacific Railroad reached the traditional Blackfoot homeland, making it easier for white settlers to move into the area. The last major buffalo hunt for the Blackfoot was in 1884.

Into the Present Day

The 1910 U.S. census reported 2,268 “Indians” living on the Blackfeet Reserve; Glacier National Park was established from ceded Blackfeet land that same year. Oil was discovered in Blackfoot territory in 1931. Three years later, Congress passed the Indian Reorganization Act, taking much of the remaining Blackfeet land and placing it under government control. Large-scale logging began on the Blackfeet Reserve in 1945. Today, oil and gas reserves, as well as tourism and ranching, provide a majority of Blackfeet household income and local jobs.

Blaxploitation Films

Blaxploitation films are low-budget movies that appeared in the 1970s, originally targeting an urban African American audience, and made some financial success. Many blaxploitation films featured funk and soul music and included African American actors.

With some exceptions, these films were a few of the limited venues where black actors could play central roles on the movie screen during the 1970s. Later, non-African Americans began to watch this genre of films. Blaxploitation films' stereotypical portrayals of African Americans eventually led to controversies about black representation and caused the gradual end of the genre. Although the blaxploitation film boom did not last more than 10 years, close to 100 of these films were produced during this period.

The term *blaxploitation* was coined by Junius Griffin, a former film publicist who at the time these films first appeared headed the Los Angeles branch of the National Association for the Advancement of Colored People (NAACP). Griffin used his close affiliation to Johnson Publications, through its magazines *Jet* and *Ebony* to popularize the term and the genre.

The Birth of Blacks in Film

Blaxploitation films exist as a part of the long history of African Americans in the film industry. The first half the 20th century witnessed the rise of hundreds of African American-only theaters where low-budget black musicals, westerns, comedies, and other films were available. While some African American actors appeared in non-black-only films earlier in the century, their numbers were limited. Furthermore, their roles were extremely limited to stereotypical black characters, such as a maid or ignorant slaves as seen notably in *Gone With the Wind* (1939). In the

meantime, between the 1920s and 1940s, Oscar Micheaux, the first African American to produce a feature-length film, paved the way for African American film production. By the end of the 1960s, Sidney Poitier had become the first black actor to win an Academy Award for Best Actor in the 1963 film *Lilies of the Field*, and *In the Heat of the Night*, produced four years later about a black detective (also played by Poitier) investigating a murder in a racist small town, had won five Oscars, including best picture.

It was during this period when many films came out with African American casts, featuring crime, drugs, prostitution, and other socially controversial topics. Many of these films reflected race-based resistance against whites and included white authority figures, such as police and politicians, who antagonized blacks. For example, one of the most successful blaxploitation films, *Sweet Sweetback's Baaadasssss Song* (1971), about saving a Black Panther from some racist cops, written by, directed by, and starring Melvin Van Peebles, depicted sex, violence, and resistance to a white-dominated society. Another successful film, *Shaft* (1971), directed by Gordon Parks, featured a private detective in New York who worked to find a kidnapped daughter of a mobster. Other known blaxploitation films include *Variety* (1972), *Slaughter* (1972), *Detroit 9000* (1973), *Black Caesar* (1973), and *Willie Dynamite* (1974).

Peebles's and Parks's films were so popular that they set the standard for other blaxploitation films. Most films in the same genre that followed depicted an aloof African American protagonist, white villains, sex, violence, action, and struggles of economically dispossessed African American urban residents. The more prevalent this plotline became, the more criticism the genre experienced. Critics argued that the movie industry was producing these films for blacks with black actors in a token manner, instead of offering them larger production budgets and socially uplifting content. When *Superfly* came out in 1973, many protested its portrayal of a cocaine dealer who was making a last large deal before his retirement.

Stereotypes, Prejudice Mark Genre's Decline

Several factors caused the genre's decline. Most significantly, promulgation of white stereotypes

against African Americans and depictions of blacks as socially unacceptable prompted the NAACP, the Southern Christian Leadership Conference, and the Urban League to join with black film professionals to form the Coalition Against Blaxploitation. It was clear that even though the films offered entertainment to many urban blacks, they did not correct prejudices against African Americans. Although others argued that these films showed black power and pride, such optimism was limited.

Protests and activism against the genre soon led the industry to seek other types of films that would still generate profit from the same, namely urban, African American audience. Additionally, while *Jet* magazine once characterized blaxploitation as just another clichéd work, along with blackface, critics saw the films as noninnovative. As a result, filmmakers slowly expanded the genre from the controversial crime and violence movies into other categories. Horror films, such as *Scream*, *Blacula*, *Scream* (1973), *Abby* (1974), as well as black westerns and martial arts films gained popularity. Filmmakers also began to produce remakes of earlier films for a black audience. *The Black Godfather* (1974), *Black Shampoo* (1975), and *Black Samurai* (1977) were some examples.

Although the blaxploitation genre dwindled by the end of the 1970s, its influence is still felt. Recent movies such as *Austin Powers in International Man of Mystery* (2002), *Kill Bill, Vol. 1* (2003), *Inglorious Basterds* (2009), and other films follow familiar plotlines and characters of the blaxploitation models to different degrees. Similarly, Spike Lee and John Singleton have produced films that use blaxploitation elements, frequently causing criticism for glorifying criminal or violent acts as heroic.

B'nai B'rith

B'nai B'rith, Hebrew for “Sons of the Covenant,” was founded in New York by 12 German-born Jewish immigrants for the purpose of providing unity and dispelling disorder in the Jewish community. The 12 men met regularly to discuss the status of Jewish immigrants in the United States, and in the early fall of 1843 they created an organization whose design was to unite Jewish people from a variety of backgrounds toward the common cause of asserting an American Jewish identity. By 1850, the Independent Order of B'nai B'rith dedicated itself to developing a Jewish identity within the confines of American culture.

Early Development and Growth

Initially, its goals were two pronged: assimilate Jewish men, women, and children into mainstream American culture; and establish a strong American Jewish community. Founded originally as a brotherhood, B'nai B'rith emphasized culture based on ethnicity over religion in an attempt to bridge the religious differences that spanned the various denominations of Judaism, including Orthodox, Conservative, and Reform movements, each espousing patently different doctrine and dogma.

Akin to many immigrants during this time period, Jewish immigrants sought ways to assimilate American ways of life into their daily routines so that they and their children would blend seamlessly into U.S. culture. In the specific case of Jewish immigrants, this adaptation sometimes inspired a secular approach to Judaism. Therefore, members often made their sole connection to Jewish heritage through the primarily social, rather than religion-based, vehicle of B'nai B'rith.

The organization established itself first in New York and Baltimore but quickly grew across the East Coast and expanded into the western and southern regions of the United States. B'nai B'rith members initially established smaller groups or

“lodges” in larger metropolitan areas and then cultivated supplementary lodges in smaller communities. The growth in number of lodges naturally led to an increase in new members. The lodges sustained themselves financially by charging induction and membership fees. They also served a philanthropic function by requiring additional payments from members that were directed to an insurance fund for Jewish widows and orphans. In its contemporary form, B'nai B'rith has grown into a global Jewish organization with a presence in over 50 countries, where it is known as B'nai B'rith International (BBI).

Philanthropic Affiliations

In addition to establishing lodges, the organization has focused its efforts on philanthropy and social services. As early as 1897, a women's auxiliary group enjoyed a brief existence, and then, in 1909, the first official B'nai B'rith Women was formed in San Francisco. In 1927, B'nai B'rith Girls groups emerged, sometimes called Junior Auxiliaries or Girls' Auxiliaries. Until 1990, however, only men were allowed full membership, and B'nai B'rith maintained a somewhat complementary relationship with the National Council of Jewish Women (NCJW). Since that time, women have been allowed full membership in B'nai B'rith.

B'nai B'rith serves as an affiliate of the Anti-Defamation League, the B'nai B'rith Youth Organization (BBYO), and the college campus organization, Hillel. The Anti-Defamation League works to end denigration of the Jewish people and to “secure justice and fair treatment for all.” Both the BBYO and Hillel focus their endeavors on young people. The BBYO especially works to unite Jewish teenagers from disparate backgrounds and to encourage them to “live Jewish lives while making a difference in the world,” while Hillel, created by Rabbi Benjamin Frankel at the University of Illinois in 1923, provides a Jewish presence on university campuses.

Community Services

Currently, B'nai B'rith International lists a number of social services provided for children. For example, BBI Cares for Kids is a community service project that sends teddy bears and other stuffed animals to children with health problems.

Perlman Camp is an organization that sponsors a youth summer camp to teach young adults religious tolerance and to foster the next generation of Jewish leaders. Diverse Minds Youth Writing Challenge provides a scholarship competition for high school students promoting messages of tolerance and equality. Winners receive a \$5,000 college scholarship, along with the publication of their work. Finally, Smarter Kids-Safer Kids is a guidebook published by B'nai B'rith for children and parents that discusses issues such as sexual abuse, Internet safety, and public safety.

According to the B'nai B'rith International Web site, the organization also provides a variety of community services. For example, B'nai B'rith sponsors *Project H.O.P.E.* (Help Our People Everywhere), which collects and distributes food to poor and elderly Jews during Passover when expensive and difficult to find foods are required to celebrate the holiday according to Jewish dietary laws. Seder Kits for Soldiers and Buddy Bears for Military Families send kosher food care packages to military personnel serving overseas and stuffed bears to children with a parent serving overseas. B'nai B'rith supports stem cell research by partnering with American Technion Society and the Stem Cell Foundation International to raise money for research and public awareness of the benefits of stem cell research. Finally, Unto Every Person, There is a Name sponsors ceremonies, such as the annual Holocaust Remembrance Day. Ceremonies are held nationwide, usually in public parks or government buildings, where names of those who perished during the Holocaust are read to keep their memories alive and to reassert a commitment to prevent genocide.

Significance and Impact

Today, B'nai B'rith International proclaims that the organization exists as the “Global Voice of the Jewish Community.” Specifically, through Hillel, B'nai B'rith provides leadership on both high school and college campuses, nationally and internationally. Presented publicly as a secular organization, B'nai B'rith emphasizes Jewish unity regardless of religious differences. It is politically active in a variety of contexts, as well. It champions civil rights legislation, as well as international issues. It works with the Leadership Council of Aging Organizations to advocate for seniors and for the preservation of

Social Security. It assists victims of disasters around the world, such as individuals impacted by the Mount Carmel wildfires in Israel, Japanese victims of the earthquake and tsunami that hit Tohoku, flood victims in the United States, and victims of Hurricane Irene. Since its inception in the 19th century, B'nai B'rith International has extended the initial goal of establishing an American Jewish identity to asserting a global Jewish identity; promoting Jewish unity, security, and continuity; and standing up against anti-Semitism and intolerance around the world. B'nai B'rith works for Jewish unity, security, and continuity and fights anti-Semitism and intolerance around the world

mid-to-late 1970s after the fall of South Vietnam in April 1975 and the dislocations in surrounding countries. The United States evacuated 130,000 Vietnamese by air, then by sea, mostly to the United States. Boat people also left by land and by air.

Boats have long been a way for the poor to flee oppression or hardship and seek asylum elsewhere. Boats are often poorly designed for the sea voyage and routinely overcrowded. Boat people run a real risk of being attacked by pirates and an equal risk of being rejected when they attempt to land, perhaps even forced to return. Boat people are small in number compared to illegal border crossers that plague the United States and Europe—with half a million unauthorized immigrants in the United States annually.

Only 20 nations take part in United Nations High Commissioner for Refugees (UNHCR) resettlement programs. Among nations receiving large numbers of refugees, the United States led in 2009 with 60,191 refugees resettled in the country, followed by Canada with 10,804, and Australia with 8,742. Those seeking refuge in the United States include refugees from nearby islands. Cubans have been boat people since the 1950s, and Haitians and Dominicans also undertake the dangerous but relatively short trip. Moroccans, Albanians, and Vietnamese have also become boat people. Contemporary boat people are less likely than that flow to be in small fishing vessels; rather, they purchase passage on large ships, but the boats are still overcrowded, marginally seaworthy, and extremely expensive.

The Vietnam War

South Vietnamese in the unified Vietnam feared government reprisals for their actions in the war. And the Communist rule in Ho Chi Minh City (formerly Saigon) was repressive because Saigon was the center of Americanization. An estimated 65,000 southerners were executed and a million more were sent to reeducation camps and prisons, where 165,000 died. In desperation, southerners chose the illegal act of leaving their country, and the only transportation option was the fishing boat common to Vietnamese coastal waters. Vietnamese seeking to leave often bribed officials and then departed secretly at night in a boat that could have as many as 400 passengers or on smaller homemade rafts or fishing boats.

Boat People

Although it has come to be used more broadly to describe any group of refugees using boats to escape their home countries, more commonly the term *boat people* applies to Vietnamese, Laotians, and Cambodians who fled southeast Asia in the

Families were routinely separated because of the cost, with only some members leaving at a time. Middle-class Saigonites with forged papers traveled to Danang, stayed in a safe house, and then boarded a fishing vessel for international waters. Because it took several false starts before a successful escape, refugees depleted their resources.

As many as 1.5 million fled on coastal vessels. These craft were not designed for open water, and refugees in panic overcrowded them, so the sea voyage was extremely perilous. Estimated deaths range from 50,000 to 200,000, primarily due to drowning, but refugees also faced attacks by pirates, murder, slavery, and prostitution.

Ethnic Chinese

There were also ethnic Chinese, known as Hoa, who left Vietnam for Hong Kong in fear of Communist retribution. Hundreds of thousands of Hoa left Vietnam after 1975. The Chinese ruled Vietnam for a millennium, and in the Christian French era the Chinese Vietnamese came to dominate commerce and industry and immigration increased. Ethnic Vietnamese regarded the Chinese as alien and discouraged assimilation; the Chinese tended to retain Chinese citizenship.

After partition in 1954 the two Vietnams attempted to press assimilation of the Chinese into society. Those in North Vietnam after partition were encouraged to become citizens, while those in South Vietnam were allowed to defer citizenship until unification. The Chinese were less than 1 percent of the northern population and had little influence on the economy. The partition and war enhanced Chinese commercial dominance in the south and encouraged them to move into banking, steel, cement, and construction, particularly of military bases. The Chinese controlled banking, the rice trade, and most manufacturing and became exceedingly wealthy as massive amounts of American capital flooded in.

In 1975 unification came. The new government attempted to stabilize the society, particularly the economy. The Vietnamese began nationalization and confiscation in the late 1970s, attacking Hoa suspected of sympathizing with China, profiting from Vietnamese poverty, and siding with the United States. Southern Hoa were capitalists in a Communist economy, and there was violence as they resisted the government's takeover.

Nationalization and other economic reforms alienated the Hoa. So did forced incorporation and assimilation. By mid-1978 there were 1.3 million Hoa, the largest minority in Vietnam.

The government encouraged Hoa to leave; all they had to do was pay a bribe and a departure fee. The government also charged fees in gold, making by one estimate \$115 million, or 2.5 percent of the Vietnamese gross national product (GNP). The trade flourished between 1977 and 1979.

By April 1978 boat people were leaving at a rate of 5,000 a month. The government supervised the departures, which were up to 85 percent Hoa. They left in large vessels of up to 1,000 passengers. By the end of 1978, 265,000 Hoa were in China, preferring state oppression from their own people rather than from Vietnamese. The total Hoa migration to China was about 450,000, but after 1980, the government of Vietnam eased relations with the remaining Hoa and stopped the departures. As of 2007 there were about 900,000 Hoa still in Vietnam, 1 percent of the population.

Along with the Hoa, the exodus of 1978 included ethnic Vietnamese, the stereotypical boat people in small boats, scantily provisioned. Some of the Hoa from China fled the state farms for open water. Hoa and ethnic Vietnamese refugees totaled more than a million, with the peak departure month June 1979 (55,000).

While that was going on, the newly unified Vietnam attacked Cambodia (Kampuchea) and China in, respectively, December 1978 and February 1979, producing a large number of refugees. The victorious Communists in Vietnam imprisoned a million, and 165,000 died being reeducated. Torture and abuse were widespread. The war's destruction and severe poverty were other stimuli to outmigration. And the Sino-Vietnamese War of 1979 pushed Hoa to become boat people.

1970s and 1980s Refugee Flows

From 1975 to 1985 over 575,000 Vietnamese fled by sea, and even in the latter year, 2,700 a month still sought asylum in other southeast Asian countries. Some were unfortunate enough to remain at sea for months. In open waters, the best hope was that a freighter or other oceangoing vessel would pick up the boat people and take them 2,200 kilometers to Hong Kong. Another option

These Vietnamese refugees were waiting to be taken aboard a command ship in May 1984. The 35 men, women, and children had spent eight days at sea in a 35-foot fishing boat.

was to arrive at one of the southeast Asian countries—boat people went to China, Hong Kong, Malaysia, Indonesia, Singapore, Thailand, and the Philippines.

In 1981, 77 percent of boats that landed in Thailand had been attacked; in 1982, 65 percent; and in 1983, 56 percent. In 1983, half the boats that reached Thailand had been attacked, and a large share of those that landed in Malaysia were victims en route. Thailand had 40,000 to 50,000 fishing boats and abundant hiding places for part-time pirates. Thai government control was weak and police presence was inadequate (pirates were more

heavily armed). Thai fishermen-turned-pirates killed hundreds of thousands of Vietnamese refugees, and the slaughter was often brutal as pirates used hammers, machetes, or guns to kill entire boatloads or tossed refugees overboard to drown.

The Thai government did not help the refugees and sometimes hindered U.S. Navy rescue efforts. Thailand demanded and received several million dollars in financial assistance from the United States and other nations.

Boat people who survived the horrors of life on the South China Sea were processed through UNHCR refugee camps in southeast Asia. In the camps, rapes and beatings continued, and U.S. aid money intended for the camps was mostly diverted. Thai guards bullied and mistreated inmates.

The refugees were unable to find refuge readily. Not all nations welcome boat people. They are a source of controversy in Australia, Canada, the United States, Italy, and Spain, as well as in the small nations of southeast Asia overwhelmed by the massive 1970s–1980s refugee flows. Malaysia was among the countries that refused to allow them to remain if they did land. Desperate refugees sank their boats offshore to keep authorities from towing them back to sea.

In 1979 Hong Kong was the first to establish a “port of first asylum,” and the port received over 100,000. Refugee camps were the scene of violent clashes between security forces and boat people, upsetting the public (the camps were close to heavily populated residential areas).

Between 1979 and 1984 under the Orderly Departure Program refugees settled in the United States and elsewhere in the West. First they had to return to their point of departure, see if they were eligible under set criteria, and then migrate. In 1979 the numbers rose over 100,000, and the Association of Southeast Asian Nations (ASEAN) countries indicated that they could take no more because their camps were already packed. With 10,000 to 15,000 Vietnamese departing each month, 65 nations met at Geneva and increased UNHCR funding. President Jimmy Carter raised the immigration quotas to double the number of southeast Asian refugees accepted each month. The United States and Vietnam established the Orderly Departure Program. In 1980 and 1981 the flow was diminished. By 2000 over 2 million Vietnamese had left their country.

Resettlement and Repatriation

By 1995 nearly half a million Vietnamese were in the United States, another 210,000 were elsewhere in the world, and 46,000 were in ASEAN camps. As the countries phased out the camps, they forced their inmates to repatriate. In 1996 there were still 39,000 in camps. The United Nations ceased funding and closed the camps. The Vietnamese went back to an uncertain fate. Of the 2 million boat people from Vietnam, somewhere between 30,000 and 250,000 died (one estimate says almost half a million).

Countries of first asylum became increasingly reluctant to take additional refugees as the outflow continued. Southeast Asians considered pushbacks of newcomers. In June 1989 the Comprehensive Plan of Action for Indochinese Refugees was adopted. It established that all boat people after March 14, 1989, were not refugees but seekers of asylum who would have to qualify for refugee status. Those screened out were returned to Laos and Vietnam under a monitored, orderly repatriation program. For those classed as economic refugees, the future included years in a camp before repatriation to Vietnam. By the mid-1990s the refugee flow had diminished to the point that many camps were shut down. The receiving countries had already taken about all they were going to take.

Humanitarian Operation (HO) was a program for those who had helped the United States or were in the former regime. If they were persecuted by the current regime after 1975, they were allowed to immigrate, as were Amerasian children and their mothers or foster parents. The program ended in 1994, but in 2005 the United States and Vietnam established a new HO immigration program. Another relocation effort was conducted under the auspices of the Roman Catholic Church.

Western countries preferred married couples, young families, and adult women. Single men and minors tended to remain in the camps for years. UNHCR workers sometimes recommended hard-working and industrious members of this group for resettlement in the West. Some preferred the camps to Hong Kong, Indonesia, the Philippines, and Malaysia. And Vietnam became more capitalist and offered financial incentives to returnees in the 1990s. Voluntary or forced repatriation to Vietnam was the lot of most of the camp dwellers,

but Hong Kong, now Chinese, took 2,500 in 2002. The final 200 in the Philippine camps moved to the West in 2008, and the boat people were history.

The United States and Europe were major recipients of boat people, with the United States taking 823,000, Australia and Canada 137,000 apiece, France 96,000, and Britain 19,000. Refugee loads declined in western Europe, Australia, and the United States in the late 1980s when visa requirements stiffened. Israel accepted several hundred Vietnamese, comparing them to Holocaust refugees. Other nations and their totals were Japan, 11,000, and Germany, 40,000.

Boat People in the United States

The U.S. Refugee Act of 1980 authorized 50,000 refugees a year and established administrative procedures for permanent residency and citizenship. Children and spouses of servicemen and political prisoners were also allowed asylum/refugee status. In all, the United States acquired 531,310 Vietnamese between 1981 and 2000.

In the aftermath of the boat people escapes, the United States had significant populations of southeast Asians—Hmong, Laotian, Cambodian, and, particularly, Vietnamese. Significant Vietnamese migration to the United States took place between 1977 and the mid-1980s. The Hmong and Montagnard were ethnic minorities who backed the United States and South Vietnam in the war and ended up in the refugee camps in the late 1970s to avoid the instability of the new Vietnam. Laotian Hmong ended up in California and Minnesota, from which they funded attempts to overthrow the Communist government. Montagnards remained in resistance in Vietnam until the end of the Cold War, but most were either in Cambodian camps or resettled in the United States.

Boat people in the United States were supported by nine voluntary agencies that worked with local sponsors to settle refugees through the country. Churches and families agreed to provide food and shelter and arrange for school, jobs, and general adjustment. The government sought to spread the refugees widely to prevent them from becoming burdensome to a given community. The Vietnamese preferred not to live in cold climates and wanted to live with family and friends in a familiar setting.

Soon 40 percent of all Vietnamese Americans were in Orange County, California. San Jose, California; Houston, Texas; and Washington, D.C., also held significant numbers. The boat people revitalized their new communities as they became the seventh-largest language group in the United States. Vietnamese remains the language 83 percent of Vietnamese Americans speak at home, but Vietnamese have one of the highest naturalization rates of any immigrant group. In 2000 there were 1.22 million Vietnamese in the United States, the fifth-largest Asian group but projected to be number two in 2010 behind the Chinese.

By the end of the century, as relations between Vietnam and the United States normalized under President Bill Clinton, former boat people became overseas Vietnamese, Viet kieu. And a significant number of the 2.7 million Viet kieu began returning to Vietnam in the late 1990s, bringing their experience, knowledge, and wealth acquired in the receiving states.

The returnees invested \$89 million in 2007, nowhere near the \$5.5 billion or more in remittances by diasporan Vietnamese but a harbinger of investment to come. While not as significant as the overseas Chinese—or as wealthy—the Viet kieu provided a significant stimulus to the modernization and economic growth of Vietnam.

Bolivian Americans

Bolivian Americans are one of the smallest Hispanic groups in the United States: the third-smallest, with a population of 99,210, as of the 2010 census. Nearly half of the 2010 population, 38 percent of the total, live in the Washington, D.C., area. Much of the rest are concentrated in Los Angeles, California; Miami, Florida, and its outskirts, Providence, Rhode Island; and Queens, New York. Texas, New Jersey, Illinois, New York, and Massachusetts all have small Bolivian American populations as well.

The 20 cities and towns with the highest percentage of Bolivian Americans are all located in Virginia, near Washington: West Falls Church (7.62 percent), Annandale (6.68 percent), Seven Corners (6.49 percent), Lake Barcroft (4.94 percent), North Springfield (4.87 percent), Bailey's Crossroads (4.45 percent), Lincolnia (4.29 percent), Kings Park (3.95 percent), Pimmit Hills (3.2 percent), Woodburn (2.71 percent), Burke (2.28 percent), Ravensworth (2.11 percent), Idylwood (2.09 percent), King Park West (2.05 percent), Dulles Town Center (2.04 percent), Merrifield (2.04 percent), Arlington (2.03 percent), and Newington (2.01 percent).

Part of the Inca Empire before European colonization, Bolivia is a landlocked central South American country. Its ethnic diversity leads to many distinct groups of Bolivians, and of Bolivian Americans: those of indigenous descent, those of European descent (including Spanish, German, and Croatian), Afro Bolivians, and Japanese Bolivians. While Spanish is the most common language in Bolivia, about 30 percent of the country speak Quechua and 25 percent speak

Aymara, languages indigenous to the Andes region. (Smaller indigenous groups include the Guarani, Moxos, Tacanas, Panos, Aruacos, and others.)

About 60 percent of the country are indigenous, and there is an additional mestizo population (a mix of indigenous and European descent) that does not self-identify as indigenous. (Most of the population identify as both indigenous and mestizo.) Afro Bolivians are the descendants of African slaves brought to the country by the ruling Spanish conquistadors during the colonial period. The country recognizes 37 official languages. Many of the Japanese Bolivians are descended from Japanese Okinawans who were relocated to Bolivia by the U.S. military during World War II.

Immigration Waves

The first major wave of immigration from Bolivia did not occur until the middle of the 20th century, which partly accounts for Bolivia's underrepresentation in America's Hispanic population. A wealthy country at the dawn of the 20th century, Bolivia lost some of its territory in its defeat by Paraguay in the 1932–35 Chaco War, which contributed to the growing power of the Revolutionary Nationalist Movement (MNR). The MNR fought a revolution against the established government in 1952 after losing the 1951 election.

During the revolution and the ensuing 12 years of chaos before the revolutionary government was overthrown by the military, many Bolivians fled the country to the United States and other destinations. As with the immigration from Cuba in the same era, most of the immigrants were middle to upper class, well educated, highly skilled, a mix of well-off families and young professionals. They were individuals who could afford to leave and prosper elsewhere, in other words. This wave of immigrants were primarily of European or mestizo descent, and consisted overwhelmingly of Spanish speakers.

The second wave of immigration came in the 1980s as Bolivia's economy suffered after a series of successful and failed coups, widespread unrest, and dramatic reforms that transferred control of many public enterprises to foreign investors. Most of the second-wave Bolivian immigrants

were indigenous or mestizo and were more likely to consist of young men, either unmarried or leaving their families at home. Sometimes their families joined them once they had established a residence. Both of these two major waves were likely larger than records show; a common method of bypassing immigration restrictions, especially in times of crisis, is to visit on a tourist visa and simply not return. For this reason, Bolivian American population figures are assumed to be understated. Like many other Central and South American groups, Bolivian Americans have a low rate of naturalization (becoming citizens); many retain ties to Bolivia and intend, or hope, to return some day. Despite this they are generally well assimilated and have a high rate of English fluency.

Certainly some Bolivian immigrants came to the United States before the first wave, but their nationality was rarely correctly noted. Hispanic Americans were not further classified according to nation of origin in the census until 1960, and immigration officials often did not bother being more specific than Central or South America in their records.

Prominent Bolivian Americans

Famous Bolivian Americans include Jaime Escalante, who was born in Bolivia, immigrated to the United States, and as a high school teacher, became famous for his methods teaching AP Calculus to struggling students (he was the subject of the movie *Stand and Deliver*); movie star Raquel Welch, born Jo Raquel Tejada, whose father immigrated from Bolivia when he was 17; country singer-songwriter James T. Slater; White House Domestic Policy Council director Cecilia Muñoz, born in Detroit to Bolivian immigrants; composer and conductor Jaime Mendoza-Nava (1925–2005), whose Hollywood scores included elements inspired by the traditional music of the Andes region; Ben Mikaelson, a Danish Bolivian whose family immigrated to the United States when he was a child and who went on to become a writer of children's literature; Chicago journalist Milenka Peña; and violinist and conductor Jaime Laredo.

Boston Tea Party

The Boston Tea Party, as it came to be known, was a symbolic act in defiance of Britain and a key event in the growth of the American Revolution. It was the culmination of a resistance movement throughout the American colonies against the Tea Act, which had been passed by the British Parliament in 1773. The protests were not only driven by the financial problems related to that imposed taxation but also by an ongoing dispute about the extent, if any, of the British Parliament's authority over the American colonies without the colonies having any elected representation. The event stands as an iconic incident in American history, and other political protests often refer to it.

The roots of the Boston Tea Party are found in the social and political conditions of the North American colonies at the time. Before the outbreak of the Revolution, there were only few links between the 13 British colonies. Neighboring colonies were often hostile to one another, quarrelling over territory and trade. The vote was limited to white, male property owners. The poor, women, and Native and African Americans were excluded.

The 1760s and 1770s were hard times. The economy was depressed, wages were low, and

there was not enough work for everyone. Hardship often made poor people angry and ready to join riots against British soldiers, customs officials, and wealthy pro-British Americans. At the bottom of colonial society were the African Americans. They numbered around half a million, about one in five of the population, and almost all were slaves. They had virtually no rights and could be bought and sold as personal property. There were also about 200,000 Native Americans living in and around the 13 colonies; they had no rights and were often considered enemies.

Relations between Britain and the 13 colonies began to worsen after the end of the French and Indian War in 1763, which drove France out of North America. Until then, Britain had paid little attention to its colonies. But now it decided to keep army personnel permanently stationed in North America and wanted the colonies to pay for it. Most Americans resented the army's presence, and none wished to pay the cost of its upkeep. When the British parliament tried to impose taxes on the colonies, the Americans rejected what they called taxation without representation. The Americans believed that people should only pay taxes approved by an assembly that they had elected. Since American citizens had not elected the British parliament, it could not tax them.

In 1773 the smoldering conflict between Britain and the colonies suddenly flared up into an uncontrollable blaze. The spark was the British decision to allow the East India Company to sell tea directly to the American colonies, instead of auctioning it to the middlemen. The price of the tea in the colonies would fall dramatically. But the three-penny import duty on tea imposed in 1767 by the Townshend Acts (a series of laws passed by the British parliament relating to the colonies in North America) remained. As the first ships carrying East India tea arrived in American ports, they met with resistance everywhere. In Boston, events came to a head. In November, three tea-laden ships arrived in the harbor. Local people, urged by radicals such as Samuel Adams and John Hancock, stopped the tea being unloaded. But the governor of Massachusetts, Thomas Hutchinson, refused to let the ships leave port without unloading their cargo. On December 16 a mass meeting was held at Boston's Old South Meeting

House. Chaired by Samuel Adams, the meeting called for the three tea-laden ships to leave immediately. The commander of the ships asked Governor Hutchinson for permission to do this, but his request was refused.

Shortly after six in the evening, Adams banged his gavel three times and declared, "This meeting can do nothing more to save the country." It was the signal for direct action. With no British soldiers to stop them, about 1,000 people ran down to where the ships were anchored. They were led by a group disguised as Native Americans and armed with axes. Clambering aboard, they split open the tea chests and hurled their contents into the water, cheered on by a large crowd of onlookers. According to historian Philip DeLoria, by wearing Indian dress as an "obvious" disguise, the Boston Tea Party radicals emphasized their difference from real Indians even as they asserted that their adoption of certain Indian ways had made them into a new thing called an American. Representations of the Indian Other were often crucial to the development of a self-conscious American national identity.

Right after that incident, the British Empire began an intense crackdown. In 1774, parliament passed four measures, known as the Intolerable Acts. In September 1774 all the colonies, except Georgia, sent representatives to the First Continental Congress at Philadelphia. The congress agreed to set up a Continental Association to organize a boycott of British imports. It boldly asserted that only the elected colonial assemblies had the right to pass laws for Americans and to tax them. The congress called for resistance to the Intolerable Acts. A few months later, the Revolutionary War began.

The term *Boston Tea Party* did not appear in print until 1834. Before that time, the event was usually referred to as the "destruction of the tea." American writers were for many years apparently reluctant to celebrate the destruction of property, and so the event was usually ignored in histories of the American Revolution. This began to change in the 1830s, however, especially with the publication of biographies of George Robert Twelves Hewes, one of the few still-living participants of the "tea party," as it then became known.

The Boston Tea Party has often been referenced in other political protests. In 1973, a mass

meeting at Faneuil Hall called for the impeachment of President Richard Nixon and protested oil companies in the ongoing oil crisis. Afterward, protesters boarded a replica ship in Boston Harbor, hanged Nixon in effigy, and dumped several empty oil drums into the harbor. In 2006, a libertarian political movement called the Boston Tea Party was founded.

Boxing and Ethnic Diversity

Boxing, as well as sports in general, is a venue through which various ethnic groups have affirmed their identities while claiming a social space for themselves within American life. This process occurs in two ways. The first occurs when members of a respective ethnic group lace up the gloves and directly participate in boxing as athletes. The second process entails the consumption of boxing as fans or spectators, in which fans often identify with fighters who share their neighborhood, hometown, and/or heritage as symbols of pride. This is accomplished by attending matches at local gymnasiums and arenas, watching fights on television, or purchasing world championship title matches on pay-per-view.

The “sweet science” has a long, and somewhat mythical, history of representing a means of social mobility and incorporation for working-class, urbanized immigrant and racial/ethnic minority groups in the United States. It serves as a prominent example of the role that sports play in cultivating a sense of social incorporation and cultural pride. Legendary African American prizefighters who embodied the aspirations of their ethnic compatriots include Jack Johnson, Joe Louis, Sugar Ray Robinson, and Muhammad Ali. Irish American counterparts include John L. Sullivan, James J. Braddock, and Billy Conn, while Italian American fight fans still revere Jake LaMotta and Rocky Marciano. Ring legends José Torres, Wilfredo Gómez, Héctor “Macho” Camacho, Félix “Tito” Trinidad, and Miguel Cotto stand as symbols of Puerto Rican pride among *boricua* (Puerto-born) boxing enthusiasts. Mexican American fans have taken pride in Bobby Chacón, Salvador Sánchez, José “Pipino” Cuevas, Julio César Chávez, Johnny Tapia, Oscar De La Hoya, and Saúl “Canelo” Álvarez.

Early Years

With roots extending to Greco-Roman times, boxing is one of the oldest sports still practiced today. English colonists brought boxing to American shores, although political and religious opposition to pugilism in the early-to-mid 1800s drove the sport underground, causing many bouts to be staged secretly on barges or farms. From the earliest days of the republic, enslaved people and immigrants (particularly the Irish) constituted the majority of boxers. The modern era of boxing dates to 1892, when gloves replaced bare-knuckle fighting. That year, “Gentleman” James Corbett defeated the “Boston Strong Boy,” John L. Sullivan, to capture the heavyweight title. The last of the great bare-knuckle champions, Sullivan was known for entering bars and challenging, “I can lick any son-of-a-bitch in the house.”

Irish, Italian, and Jewish Americans dominated boxing during the first half of the 20th century, as the sport proved extremely popular with European immigrants living in urban communities. Jack Dempsey, of Irish, English, Cherokee, and Jewish descent, was heavyweight champion from 1919 to 1926 and became a cultural icon of the Roaring Twenties. Along with his contemporary

Babe Ruth, Dempsey is credited for pioneering the rise of the modern professional athlete in American society. Dempsey produced the first \$1 million and \$2 million gates in the sport’s history. He ultimately lost the championship to fellow Irish American Gene Tunney in September 1926.

Boxing was one of the few sports in American society that actually flourished during the Great Depression, as working-class youth in cities throughout the nation took up the sport in hope of achieving economic prosperity. James J. Braddock, the son of Irish immigrants, upset Max Baer to win the heavyweight title in June 1935. Laboring as a longshoreman during the Depression in order to support himself and his family, Braddock epitomized the rags-to-riches journey that symbolized hope and inspiration for millions of Americans struggling through the economic crisis, and his life is chronicled in the film *Cinderella Man* (2005).

Despite contemporary popular stereotypes of Jews lacking athletic talent, Jewish fighters played a prominent role in amateur and professional boxing throughout the United States during the early 20th century. Arguably the greatest Jewish pugilist was Benny Leonard, who is regarded by boxing experts as one of the best lightweights in the sport’s history. The son of eastern European immigrants, Leonard grew up in the mean streets of Manhattan’s Lower East Side during the 1900s and 1910s and became known as the “Ghetto Wizard” during his professional career. Leonard possessed lightning-fast hand speed and incredible punching power for a smaller fighter, and thrilled fans with his adaptability in the ring. He could outbox technically sound fighters while also engaging in toe-to-toe slugfests with brawlers. Leonard won 88 straight bouts and held the lightweight championship from May 1917 until January 1925, the longest lightweight title reign in history. After retirement, Leonard returned to the ring as a referee. He died of a massive heart attack while refereeing a match in New York City in April 1947.

One of the few African American fighters to achieve stardom prior to the 1950s was Joe Louis, a ring legend who was the first black athlete to earn national popularity in American society. The son of southern sharecroppers, Louis took up boxing after his family relocated to Detroit in the

"Gentleman" James Corbett is declared "Champion of the World" on a card printed in Chicago in 1893, the year after he defeated "Boston Strong Boy" John L. Sullivan for the heavyweight title.

mid-1920s. Louis's heroic stature emerged in the buildup to his June 1938 bout with former heavyweight champion Max Schmeling of Germany, a match that the American public envisioned as a symbolic showdown between American democracy and German Nazism. Even President Franklin D. Roosevelt praised Louis's patriotism, commenting that the nation needed muscles like Louis's in order to defeat Germany. Adolf Hitler, on the other hand, cited Schmeling as proof of Aryan alleged supremacy. Louis destroyed Schmeling within two minutes of the first round, cementing his status as an American hero. Louis held the world heavyweight title from 1937 through 1949, the longest reign in history. Louis served in the army during World War II. He died in 1981 and was buried at Arlington National Cemetery.

A pair of Italian American pugilists, Jake LaMotta and Rocky Marciano, rose to prominence in the 1940s and 1950s, respectively. Of Italian and Jewish parentage and known as the "Bronx Bull," LaMotta held the middleweight crown from June 1949 to February 1951. LaMotta is most remembered for his five brutal fights with Sugar Ray Robinson, considered by most boxing historians to be the greatest pound-for-pound fighter ever. LaMotta had one of the strongest chins the sport has ever seen, being knocked out only three times in 106 career bouts. Filmmaker Martin Scorsese's 1980 masterpiece *Raging Bull* is a biographical film depicting LaMotta's professional and personal trials and tribulations. Marciano, the only heavyweight champion to remain undefeated throughout his entire career, held the title from 1952 to 1956 and retired with a record of 49 wins, 0 losses, and 43 knockouts. Marciano began his professional career at a time when Italian Americans were still a stigmatized ethnic group, but by the time of his retirement, he had been embraced by the white mainstream as professional sports in the United States was undergoing a profound demographic shift.

Contemporary Times/Muhammad Ali

Since the 1950s, boxing in the United States has become increasingly dominated by African American, Puerto Rican, and Mexican American fighters. Prizefighting's transition from a sport consisting primarily of Irish, Italian, and Jewish American pugilists to black and Latino fighters coincides with the entrance of formerly racialized European immigrant and ethnic groups into the mainstream of American society. As ever-increasing numbers of Catholic and Jewish European ethnicities attained middle-class economic status and relocated to the suburbs in the post-World War II era, the heavily working-class and urbanized sport of boxing saw fewer fighters of these heritages as the years progressed. Nevertheless, boxing still appealed as a means of upward mobility for other working-class populations.

Muhammad Ali, the best-known boxer of all time, achieved global popularity unlike that of any athlete as a result of his accomplishments in and out of the ring. Born Cassius Marcellus Clay in 1942, Clay won the gold medal at the 1960 Rome Olympics and captured the world

heavyweight championship by stopping Sonny Liston in 1964. After winning the title, Clay converted to Islam, changed his name to Muhammad Ali, and aggressively spoke out on civil rights issues. Ali successfully defended his championship nine more times before being stripped of the title and banned from boxing for three and a half years for his refusal to be inducted into the army after being drafted in 1967. Defending his opposition of the Vietnam War, Ali boldly declared, "No Vietcong ever called me 'nigger!'"

This simple statement, uttered as criticism of the nation's legacy of using black soldiers to defend freedom abroad while denying African Americans equality at home, resonated with millions of anti-Vietnam War protesters in the United States and critics of American foreign policy around the world. Ali was finally reinstated in boxing in 1970 and regained the heavyweight championship as a heavy underdog against George Foreman in a 1974 bout in Kinshasa, Zaire, dubbed the "Rumble in the Jungle." Ali finally retired from boxing in 1981 with a record of 56 wins, five losses, and 37 knockouts. ESPN presented Ali with the Arthur Ashe Courage Award in 1997, and President George W. Bush awarded Ali the Presidential Citizens' Medal and the Presidential Medal of Freedom in 2005. In 1999, *Sports Illustrated* named Ali the greatest "Sportsman of the 20th Century."

Ali's 1975 fight with little-known journeyman Chuck Wepner, a white club fighter from New Jersey, inspired Sylvester Stallone to pen the script for *Rocky*. Ali underestimated Wepner and was outboxed by the underdog throughout the early rounds. Wepner knocked Ali down in the ninth round; however, Ali demonstrated his greatness by rallying and knocking out Wepner with 20 seconds remaining in the 15th round. In *Rocky*, Stallone plays Rocky Balboa, a down-on-his-luck and past-his-prime Italian American slugger from Philadelphia nicknamed the "Italian Stallion." Balboa earns a title shot against Apollo Creed, the flamboyant Ali-like world heavyweight champion. Creed fails to take the mismatch seriously, and Balboa knocks him down in the first round. Like Ali, Creed refocuses after rising from the canvas and ultimately escapes with a narrow victory over the sentimental favorite underdog opponent. *Rocky* won three Academy Awards

in 1977, including Best Picture, and spawned five sequels over the next 30 years. In *Rocky II* (1979), written and directed by Stallone, Balboa marries his sweetheart Adrian, starts a family, and ultimately becomes champion by defeating Creed in a rematch. Famous for its excellent Philadelphia cinematography and its gritty depiction of working-class, Italian American ethnic identity, the *Rocky* films remain the most popular boxing movies ever filmed.

African American Domination

African Americans dominated the heavyweight division in professional boxing from the 1960s until the end of the 20th century. Other prominent black heavyweight champions included Joe Frazier, Larry Holmes, Mike Tyson, Evander Holyfield, and George Foreman. Holmes held the title from 1978 to 1985, a duration bested only by Joe Louis's 11-year championship reign. Tyson became the youngest heavyweight champion in boxing history at the age of 20 when he knocked out Trevor Berbick in the second round of their November 1986 bout. At the other end of the age spectrum, the 45-year-old Foreman became the oldest heavyweight champion of all time when he regained the crown by knocking out Michael Moorer in November 1994. With devastating one-punch knockout power in either hand, Tyson and Foreman remain two of the hardest hitters the fight game has ever seen. Holyfield earned a bronze medal at the 1984 Los Angeles Olympics and captured the heavyweight title on four occasions (1990, 1993, 1996, and 2000), eclipsing Ali's previous record as a three-time heavyweight champion.

African American fighters have also made a significant impact on other weight divisions. During the late 1970s and throughout the 1980s, the welterweight and middleweight divisions produced several classic bouts featuring "Marvelous" Marvin Hagler, Sugar Ray Leonard, and Thomas "Hitman" Hearns. Leonard, a gold medallist at the 1976 Montreal Olympics, won professional titles in five weight divisions and was named "Boxer of the Decade" for the 1980s by *Ring* magazine. Meanwhile, the epic 1985 bout between Hagler and Hearns is considered by many boxing journalists to be the most thrilling fight in the sport's history.

Growing Latino/Asian Presence

In recent years, numerous Mexican/Chicano and Puerto Rican boxers have achieved prominence, particularly in the lower weight divisions. The growing Latino presence in amateur and professional boxing occurs at a time in which the Latino population of the United States has increased considerably. The most popular Latino prizefighter is Oscar De La Hoya, a second-generation Mexican American from East Los Angeles who captured Olympic gold in Barcelona after posting a stellar amateur record of 223 wins and 5 losses. Nicknamed the “Golden Boy” for his victory in the 1992 games, De La Hoya won 10 world titles in six weight divisions as a professional fighter. Seeking to tap into the purchasing power of Latinos and capitalizing on Oscar’s popularity and handsome looks, boxing promoter Bob Arum marketed De La Hoya as a crossover star to both Mexican and non-Mexican fans. De La Hoya retired in 2009 after generating more than \$750 million in boxing revenue and fighting more times on HBO than any other boxer.

Héctor “Macho” Camacho and Félix “Tito” Trinidad represented Puerto Rican boxing prominence during the 1980s and 1990s, respectively. Camacho was born in Bayamón, Puerto Rico, but grew up in East Harlem. As an amateur fighter, Camacho won the New York Golden Gloves championship in 1978, 1979, and 1980. He stopped Rafael Limón of Mexico in the fifth round to capture the World Boxing Council’s super featherweight title in August 1983 and won the lightweight championship by defeating another Mexican, José Luis Ramírez, in August 1985. He remained undefeated until 1991. Trinidad, a native of Cupey Alto, Puerto Rico, was one of boxing’s most feared punchers during his heyday. He held the world welterweight title from 1993 to 1999 and captured the light middleweight and middleweight crowns.

The growing presence of Latinos within pugilism in recent decades has generated an intense Mexican–Puerto Rican boxing rivalry, rekindling memories of the Irish-Italian and Italian-Jewish rivalries of the early 20th century. Notable installments of this intra-Latino rivalry include Salvador Sánchez vs. Wilfredo Gómez (1982), Héctor Camacho vs. José Luis Ramírez (1986), Julio

César Chávez vs. Edwin Rosario (1987), Chávez vs. Camacho (1992), De La Hoya vs. Félix Trinidad (1999), and Antonio Margarito vs. Miguel Cotto (2008 and 2011).

Although Asians have not exerted the same degree of influence on boxing as African Americans and Latinos, Manny “Pac-Man” Pacquiao has arguably established himself one of the top fighters of the early 21st century. An elected member of the Filipino Congress, Pacquiao is currently one of the sport’s biggest stars, has captured world titles in a record eight weight divisions, and was named “Fighter of the Decade” for the 2000s. Known for his aggressive pugilistic style, Pacquiao has defeated every top Mexican boxer of his era, garnering the moniker of the “Mexi-cutioner” in the process. Splitting his time between Manila and Los Angeles, Pacquiao is one of the most famous Asian athletes in the world and has emerged as a source of cultural pride for Filipino Americans.

Boyz N the Hood

The year 1991 was a prolific one for African American–made movies, as the new wave of black films gained momentum. John Singleton’s *Boyz N the Hood* was the most popular success of the year’s 19 black-made films. Most of these films were part of the new wave commitment to

take charge of black images in the media; filmmakers sought to explore and expose the depth and complexity of the lives of blacks to a world used to simplistic stereotypes of black characters. Some black characters were even heroes.

The power of John Singleton's film comes from its autobiographical realism, its cinematic and storytelling strength, and the intensity of Singleton's commitment to ending the evils that lead to black-on-black violence and destroy the lives of boys in the black urban underclass.

John Singleton himself emerged from the film's South Central Los Angeles neighborhood, embodying the story of a young black man's escape from the ghetto. He grew up on movies and hip-hop and became a black auteur at age 23, writing and directing this movie that made box office headlines. He wrote the script while studying film at the University of Southern California and shared it with people at Columbia Pictures while interning there. He convinced them to allow him to direct the film although he had only directed student projects. He shot the film in his home neighborhood while subject to gang threats.

Singleton portrays the lack of hope, the unemployment, and the drugs, as well as the pervasive violence of crime and gang wars that frame the everyday lives of three youths growing up there. Tre, Ricky, and Doughboy live on the same street and represent a spectrum of youthful male responses to this environment—all of which are seen to depend largely on parenting. About 11 years old at the beginning of the film, they already show evidence of their differing paths. When we pick them up seven years later, Doughboy (rap artist Ice Cube) has just returned from prison, his half-brother Ricky (Morris Chestnut) is a parent but also a celebrated high school football player with hope for a college scholarship, and Tre (Cuba Gooding, Jr.) is a good student with a girlfriend who is still a virgin and a passionately committed father, Furious Styles (Laurence Fishburne).

Singleton tells a compelling coming-of-age story with these three close friends, each complex and sympathetic. This is a message film, but the message is embodied in the characters and the action, as well as articulated by Furious and the on-screen plea at the end: "Increase the peace." Doughboy

exhibits courage and family commitment, but his mother's preference for Ricky is painfully clear. Without hope, education, or parental support, he slides into the landscape of alcohol and violence. Ricky's hope for escape through education is shattered by his senseless death, which sets in motion the climactic revenge. Tre is pulled by his loyalty and pride to participate in the vengeance and violence that would certainly mean the end of his life. It is his father's continual presence, attention, and teaching that enable him at the last moment to choose against it. He will have a future; the others will not. He had a father, a strong black male, who could teach him how to be a man; the others did not.

Furious Styles's fathering is more than presence; he teaches Tre the fundamental values of responsibility for his actions (including sexual), attention to homework and chores, self-discipline, and respect for elders. Furious also communicates his belief that the plight of the urban poor is caused by white greed and white hope that African Americans will "kill ourselves." White people have little part in the movie; the most villainous character is a black policeman who seems to hate blacks and sadistically enjoys his white-conferred power over them.

Boyz N the Hood initially drew the audiences it portrayed, and although all the characters rang true, Doughboy spoke most deeply to and for them. Singleton's primary purpose was to shake his own people into action to heal their own communities and give their children lives through fathering, tough-love parenting, and education. Yet he hoped and planned that the film would cross color lines to dispel stereotypes about the lives of black youth and generate compassion and awareness of white complicity.

The film uses conventional storytelling techniques and methods of characterization, making it accessible to all audiences. For most whites and many African Americans, the film provided their first exposure to authentic hip-hop culture and the realities of life for many black urban youth. It opened their eyes and generated sympathy. However, various audiences and reviewers have criticized the film's pedantry, antiwhite conspiracy theories, and black separatism. Black women have protested its portrayal of black women and the assumption that only men can make the difference as parents. For the most part, the emotional

power of Singleton's story has affected audiences exactly as he hoped.

Boyz N the Hood launched the acting careers of Cuba Gooding, Jr., and Ice Cube, and made John Singleton both the first African American and the youngest director to receive an Oscar nomination. Its popular and economic success generated a rash of similar films and, while about 75 percent of audiences were black, it crossed color lines, continues to speak to people of all cultures, and proved once again the power and expertise of African American filmmakers.

Bracero Program

The Bracero program was established through executive order in August 1942, and in 1951 it was formalized under Public Law 78. Under the program, over 4 million Mexican workers came to the United States to work in agriculture. Braceros worked in the fields, harvesting beets, tomatoes, cucumbers, and cotton. The Bracero program was the origin of the massive legal and illegal migration of the last two decades of the 20th century.

History of Foreign Manual Labor

The first U.S. use of foreign manual labor in the west was by the cattle industry of the 19th century and the fruit orchards of California between 1850 and 1880. Dry land agriculture in the southwest and California required large acreages for

cultivation of wheat, and large farms continued to grow as farmers shifted to Mediterranean climate crops such as fruits and vegetables. For laborers, conditions and pay were dismal.

The Chinese were the first source of labor. Two hundred thousand Chinese, barred from work in the cities after they built the railroad, contracted to work in California's agriculture fields until 1882, when they were banned from entering the United States by the Chinese Exclusion Act. The Japanese were the next to work in the fields, but the Mexicans were there, too. Between 1850 and 1880, 55,000 immigrant laborers were working in U.S. agriculture, industry, and the railroads.

The development of the railroad that tied central Mexico to the United States brought in an increase of Mexican workers, with upwards of 60 percent of the railway crews coming from that country. Many of these workers were fleeing worsening living conditions in Porfirian Mexico, in the years preceding the 1910 Mexican Revolution. They also found work in the United States as miners, ranch hands, and other labor-intensive jobs. Then came the revolution and constant deterioration of the Mexican agricultural sector. Mexican peasants suffered two million deaths during the revolution and the following decades of government neglect.

In 1917, Congress restricted the flow of migrants across the U.S.-Mexican border but exempted agricultural workers, bringing in over 200,000 laborers between 1917 and 1923. World War I had increased migration, but labor abuses persisted, despite a Mexican model labor contract that delineated the rights and conditions of all migrant workers. In 1924 the United States defined undocumented workers as illegal and established the Border Patrol.

The Great Depression ended the demand for farmworkers. Surplus Mexicans—those with no proof of employment—were deported. Mexican nationals had been recruited for work in mines, railroads, and agriculture during the prosperous years, but the Depression made Mexicans economically superfluous, placing potential burdens on U.S. welfare systems. In California and then in Congress, pressure mounted to deport Mexican nationals, including many who had been recruited in the first place. Some 500,000 Mexicans left the United States during the 1930s, some

by deportation, others by voluntary repatriation under pressure.

By the late 1930s, jobs in Mexico were getting increasingly hard to find so Mexican laborers began to look elsewhere. The obvious place to look was the United States, where a shortage of all labor, particularly manual labor, had resulted from America's entry into World War II.

World War II Labor Shortages

World War II revived demand for workers. Food was a vital war requirement, and the draft had taken away surplus agricultural labor jobs. Domestic workers were moving into war jobs, as well, creating a further labor shortage. When California farm owners asked for seasonal labor, the United States and Mexico agreed to initiate a series of laws and diplomatic agreements to import temporary contract laborers. Called the Bracero program (the Spanish term for strong-arm), the plan went into effect on August 4, 1942, despite complaints from farm labor reformers, who argued there was no labor shortage, only a shortage of decent wages and working conditions.

U.S. farm laborers worried that braceros would undercut their wages and take their jobs, despite provisions that Mexican workers were authorized only where there was a documented labor shortage; they were not strikebreakers. Under the agreement, Mexican workers had to receive the prevailing wage, work for 75 percent of the contract period, and receive decent working conditions, including sanitary and free housing, employer-paid insurance, and free transportation to and from the border.

Farmworkers by the thousands came from Mexico's agricultural regions by train to the northern border. Ciudad Juarez, the entry point into El Paso, Texas, was a vibrant gathering place and recruitment center. El Paso processed 80,000 braceros a year at its peak, nearly a quarter of the 350,000 Braceros recruited each year.

The farm bureaus, and independent associations controlled the contracts. They were written in English and normally were not translated into Spanish. Laborers often signed them without understanding their rights and the conditions. The rules also went unenforced. The U.S. government underfunded inspection programs, allowing abuses to become rampant. Illegal

recruitment and smuggling began from the very onset of the program.

Between the 1940s and mid-1950s, farm wages dropped drastically, as braceros began entering the manufacturing sector, with no protected right. On termination of a contract, the Bracero had to turn in his work permit and return to Mexico. Any other return to Mexico required written permission from the boss.

Post-World War II Labor Abuses

In 1947, with the end of World War II, the Bracero program ended, too. Mexicans started migrating to the United States illegally. Because of the power of agricultural interests, Congress failed to enforce the law and ignored blatant violations of human rights and massive illegal immigration. Farmers faced no penalties, so the number of undocumented Mexicans quickly surpassed the number of legal braceros. Illegal migrants caught in the United States were legalized and allowed to return to work on a farm. The pejorative term *wetback* was given to these illegal migrants stemming from a Border Patrol sweep called Operation Wetback because many of these migrants swam rivers to cross the border into the United States.

In October 1948, in a move called the El Paso Incident, U.S. immigration officials opened the border to migrant workers, despite an agreement with Mexico to restrict immigration and regardless of the fact that the wartime justification was no longer necessary. Farmers demanded cheap labor, Mexico abrogated the agreement. Because of the violation, farmers continued to hire illegal migrants while waiting for the Bracero agreement to be reenacted.

The braceros and illegal migrants offered a guaranteed labor force that allowed agribusinesses to expand to meet the demand for fruit and vegetables. The money the migrants sent home reinforced Mexican dependency on American work, and the back-and-forth movement of workers developed networks between rural Mexico and rural United States that brought increasing traffic beyond the fields to nonfarm work, leaving American farms short of labor and creating more demand for braceros. In the 1950s, braceros comprised over half the labor force in California agriculture and manufacturing sectors, and wages fell as a result.

In 1951, a commission recommended sanctions in the form of fines, and President Harry Truman and the Mexican government agreed, but Congress did not want sanctions. The 1952 Immigration and Nationality Act made harboring illegal aliens a felony, but it included the Texas Proviso that specified that employing undocumented migrants was not considered as harboring them. Owners remained free of penalties.

Between 1942 and 1964, there were 4.6 million braceros in the United States and 4.9 million apprehensions of Mexican nationals. During the Border Patrol's Operation Wetback, 1.1 million Mexicans (including American-born children of braceros) were repatriated. Operation Wetback increased the fear under which agricultural workers lived, giving farmers even more leverage to abuse them. Braceros who protested the treatment, especially illegal migrants, faced certain deportation.

To encourage hiring braceros instead of illegal migrants, the Department of Labor (DOL) eased rules regarding wages and payment for food and housing. Bracero entries peaked at 445,200 in 1956. President John Kennedy reversed the easing of the rules, and the subsequent DOL enforcement led to a decline in bracero numbers.

Ending the Bracero Program

By that time, the Bracero program had outlived its usefulness and was becoming an embarrassment. CBS's *Harvest of Shame* aired in 1960, convincing Kennedy that the braceros were hurting opportunities and conditions for American agricultural workers. Lee G. Williams, who headed the Bracero program for U.S. Department of Agriculture, labeled it legalized slavery.

Churches, civil rights advocates, and labor organizations had long opposed the Bracero program, but the decision to end it came only after the farmworker population diminished and farm owners became dissatisfied with the program. The Bracero program was an indirect subsidy because it guaranteed cheap labor. In 1942, 22 percent of the workforce was in agriculture; by termination of the Bracero program, agriculture employment dropped to under 7 percent (by 2012 it was under 3 percent).

Despite farmers' protests, the Bracero program died on December 31, 1964. By then,

mechanization of cotton fields and other forms of labor meant that braceros were now superfluous. Farmers also created a supply of labor contractors to hire fewer American workers at higher wages, reflecting higher productivity; the farmers mechanized tomato harvesting and eliminated 90 percent of the pickers. And they accepted farm unionization after labor activist César Chávez joined the Filipino grape pickers and won a 15-year "golden age" for agricultural workers, an age that ended with the rise of illegal immigration after 1980.

Massive Mexican migration dates from 1980, with 4 million green cards issued during the last two decades of the 20th century out of an estimated 6 million Mexicans entering the country. The argument that braceros would reduce illegal migration had been wrong. Returned to Mexico, braceros faced the same shortage of work that had brought them to the United States—and they now had experience in the fields of west Texas, southern New Mexico, and elsewhere. Two-thirds of the 40 million arrests of undocumented Mexicans in the United States occurred during the 1980s and 1990s.

Brazilian Americans

Although not a large ethnic group in the United States, the population of Americans with Brazilian ancestry has increased significantly over the past two decades. The U.S. Census Bureau's 2009 American Community Survey estimated that 373,000 Brazilian Americans lived in the United States. This estimate is more than double the size of the Brazilian American population in 2000 (181,000) and more than four times greater than the number of Brazilians living in the United States in 1990 (approximately 66,000). Many claim that the actual number of Brazilian Americans is much higher because of the undocumented status of many recent migrants who remain undercounted by the Census Bureau. Although difficult to enumerate precisely, some experts have suggested that the U.S. Brazilian population may be as high as 1 million. The Portuguese term *brazuca* is often used as an affectionate term for Brazilian immigrants living in the United States.

The vast majority of Brazilian Americans live in urbanized communities along the East Coast, with large communities in New York City; Miami, Florida; and Boston, Massachusetts. In fact, the block of West 46th Street between Fifth Avenue and the Avenue of the Americas in New York City is officially known as Little Brazil because of its large concentration of shops that cater specifically to Brazilian tourists. Los Angeles, California, is home to the largest Brazilian American population on the West Coast. In New England, the presence of Portuguese American and Portuguese immigrant populations facilitated the social transition of Brazilian migrants into local communities to a degree because of a similar linguistic background. However, the Portuguese and Brazilian populations of New England do not necessarily identify closely with one another.

Migration History

Less than 30,000 Brazilian Americans lived in the United States in 1960. Immigration from Brazil substantially increased following the Immigration Act of 1965, which abolished national origins quotas and diversified immigration to the United States by increasing the portion of immigrants from non-European nations. Approximately 2,000 Brazilian immigrants entered the United States each year

from the mid-1960s to the mid-1980s, after which economic crises in Brazil produced a dramatic surge in migration. More than 21,000 Brazilians migrated to the United States during the late 1980s and early 1990s. Whereas Brazilian immigrants before the 1970s tended to be middle class and college educated, more recent migrants have come from a working-class background and have taken up manual labor occupations, particularly in the restaurant and cleaning industries. Many immigrants send portions of their earnings to relatives in their homeland; Brazil ranks second to Mexico in remittances from the United States.

Racial-Ethnic Identity

Academics, pundits, and Brazilian Americans themselves debate whether Brazilians should be considered a Latino population. One side of this debate relies on an inclusive interpretation of *latinidad*, which argues that the designation *Latino* is shorthand for persons with heritage from Latin America; using that definition, Brazilians do constitute a Latino ethnic population like Puerto Ricans or Dominicans.

Others contend that the label *Latino* is virtually synonymous with the term *Hispanic*, thereby implying ancestry from a Spanish-speaking society. Under this more rigid and exclusionary definition, Brazilians (whose heritage derives from a Portuguese-speaking nation) do not count as Latinos. Popular opinions vary considerably on this subject, although the U.S. federal government officially defines the ethnic category Hispanic or Latino as "a person of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish culture or origin, regardless of race." As such, the U.S. government does not consider Brazilian Americans a Latino population.

Quantitative and qualitative research on identity politics among Brazilian Americans has revealed a geographic discrepancy in the manner in which members of this ethnic population self-identify. Based on studies conducted in southern Florida and New England, two areas with sizable Brazilian American communities, researchers noticed a divide in how individuals identified by race and ethnicity. In southern Florida, Brazilian Americans were much more likely to embrace the label Latino and to incorporate it into their own self-identification, while their ethnic counterparts in New

England generally eschewed this term. Instead, Brazilian Americans in New England generally preferred to self-identify as white. Sociologists regard the divergence in self-identification as an outgrowth of local social dynamics in each region.

The large presence of Cubans, Colombians, and other Latin American populations in southern Florida has resulted in a profound Latino cultural influence on the region, which facilitates the maintenance of a Latino identity. This contrasts sharply with New England, where Latinos such as Puerto Ricans and Dominicans represent stigmatized racial minority groups within a majority-white region, thereby compelling a greater inclination to self-identify as white.

Regardless of how they choose to self-identify, Brazilian Americans often find themselves automatically grouped as Latino by many other Americans who may or may not be aware of their Brazilian heritage. The tendency for non-Brazilians to perceive Brazilians as Latinos derives from decades of media depictions of *Carnaval*, as well as samba singer and dancer Carmen Miranda and her signature fruit headpiece, combined with a tendency among the general public to interpret the Portuguese-based accent of Brazilian immigrants as a Spanish-speaking accent.

Notable Brazilian Americans

As their population continues to increase, several Brazilian Americans have achieved notoriety within American society. Perhaps the Brazilian American to have the most profound social impact on American society is Eduardo Saverin, who cofounded Facebook with Mark Zuckerberg and three others in 2004. Saverin is depicted in the 2010 motion picture *The Social Network*, although he renounced his U.S. citizenship in 2011.

Ana Beatriz Barros and Gisele Bündchen are two of the world's leading fashion models, having gained international stardom through their work with Victoria's Secret. Barros has also modeled for GUESS? and Jennifer Lopez's JLO fashion line, while Bündchen has garnered additional fame through her marriage to New England Patriots quarterback Tom Brady. Six-foot, 11-inch basketball star Nenê (born Maybyner Rodney Hilário) has averaged more than 12 points per game throughout his NBA career with the Denver Nuggets and Washington Wizards.

New York City's West 46th Street was officially titled "Little Brazil Street" in 1995 by the city. The area is home to over 76,000 Brazilian Americans. In 1984, the first "Brazilian Day" was held in New York City to celebrate Brazil's Independence.

Natalie Morales has had a respected career as a broadcast journalist and news anchor with MSNBC, NBC News, and the *Today* show. Actress Jordana Brewster rose to fame with her roles as Mia Toretto in the action films *The Fast and the Furious* (2001), *Fast & Furious* (2009) and *Fast Five* (2011).

Brendale v. Confederated Tribes of the Yakima Nation (1989)

Brendale v. Confederated Tribes of the Yakima Nation (1989) complicated the question of whether American Indian tribal nations have the ability to control the land within reservation boundaries, whether those lands are owned by tribal members, and whether Indians who are not members or are non-Indians can control or own the land.

The 2010 census reported that the majority of people (77 percent) living on the reservation or on trust land do not identify themselves as American Indian, but they are still subject to tribal policies. As a result of demographics and federal tribal relationships, non-Indians are subject to tribal regulations if they live within reservation boundaries. Conflict has arisen as a result of the federal Indian policy.

There are several examples established in Indian law that culminated with *Brendale v. Confederated Tribes of the Yakima Nation*. The Yakima nation, just as have state and local governments, established consistency in land use through comprehensive zoning laws. The authority of American Indian tribes to regulate civil and criminal behavior within reservation boundaries is derived from Supreme Court precedent. These cases arose as a result of the historical federal policies that have had a lasting impact on jurisdictional issues within reservation boundaries.

Indian Land and Precedent-Setting Cases

As a result of the Dawes Act (1887), reservation land came into the possession of non-Indians, creating tremendous jurisdictional issues between states and Indian nations. There are many non-Indians who live within reservation boundaries, with non-Indian fee land mixed in with Indian-owned allotments and property that is tribally owned. The result has led to a number of Supreme Court decisions that are complex and seem to swing back and forth between supporting tribal sovereignty and diminishing tribal authority. For example, in *United States v. Mazurie*, the court limited tribal

authority where it found that the tribe had only the authority given to it by the federal government.

The ability to control land within reservation boundaries was further limited in *Oliphant v. Suquamish Indian Tribe*, where the court said that the Suquamish had no criminal jurisdiction over non-Indians who had committed crimes within reservation boundaries or on trust land. The Supreme Court further eroded tribal sovereignty in *United States v. Montana*, where it found that because of the Crow Nation's dependent status, they were stripped of control over non-Indians because the state had jurisdiction. The court did say that the tribe could have jurisdiction if the its health and welfare were threatened.

In another case out of Euclid, Ohio, *Village of Euclid, Ohio v. Ambler Realty*, the village established a comprehensive zoning ordinance to control development. A lawsuit arose challenging the constitutionality of the ordinance. The Supreme Court upheld the ordinance, stating that it regulated land use for the benefit of all members of the village to protect its public safety, morals, and general welfare. This case established that local governments have the right to regulate land established for the benefit of local land use. Thus, grounded in tribal sovereignty, tribal governments enacted zoning laws within reservation boundaries, including trust land, to maintain and regulate land use.

The Brendale Case

Brendale is the combination of two lower court cases, involving two different areas on the Yakima reservation: one in the "closed area" and one in the "open" area. The Yakima reservation is in eastern Washington State. Eighty percent of its 1.3 million acres are held in trust by the United States and 20 percent are held in fee by both Indians and non-Indians. The "closed area" consists of primarily trust land, which is undeveloped and open only to members of the Yakima Nation. Most of the fee land is in the "open area" and open to everyone. The Yakima reservation is "checker-boarded" with non-Indian and Indian-owned land primarily in the "open area" but a small amount is also in the "closed area."

The first case involved a property owner named Brendale who was not a member of the Yakima Nation but was an American Indian who owned

land in the “closed area” and wanted to develop the land to sell it. He obtained a permit from Yakima County but not from the tribe. The second case involved a property owner named Wilkenson, who owned non-fee land within the open area of the Yakima Nation and who was granted a zoning permit from Yakima County. The Supreme Court combined the cases and had a complex finding dependent on whether the area was “closed” or “open.”

The Yakima Nation treaty of 1855 granted the tribe power to exclude non-Indians from tribal lands. Therefore, the Yakima could regulate the land in the “closed area” because it was only for the use of Yakima tribal members. On the flip side, the Yakima could not exclude non-Indians from the “open area” and, therefore, could not regulate that area’s land use.

Current demographics complicate the application of *Brendale*. Depending on the race of the landowner, a conflict arises when 77 percent of those who live within reservation boundaries do not self-identify as American Indian, or are identified as American Indian but are not members of the Yakima Nation. *Brendale v. Confederated Tribes of the Yakima Nation* highlights the impact that historical federal policy has on federal, state, and tribal governments today.

Brooklyn Dodgers

Founded in 1883, the Brooklyn Dodgers (now the Los Angeles Dodgers) are one of the most storied professional sport franchises in American history. Noted for their mid-20th-century exploits both on and off the baseball diamond, the Brooklyn Dodgers were the quintessential sports franchise to epitomize equal rights. No other sports team has been so lauded for its front-office decisions, talent scouting, player selection, frugality, and community support during the postwar years than the Brooklyn Dodgers. They were symbolic of the changing face of American sport and society through their social integration and westward migration.

Much of the Dodgers’ success can be attributed to their administration and the shrewd business acumen of Branch Rickey, the part owner and general manager of the team in 1947. Although the Dodgers were somewhat successful prior to Rickey’s arrival, they became a national phenomenon under his leadership. Rickey’s prescient vision and stealth-like negotiations enabled him to build the organization into a perennial contender, facilitate social change, and create a sustainable national brand that has endured for over a half-century after the team relocated.

Brooklyn, the Borough

Referred to as the “side door” to the Statue of Liberty, Brooklyn was a heterogeneous amalgamation of clans, villages, and enclaves comprised of diverse ethnic groups (i.e., Italians, Irish, Germans, African Americans, and others). Census data indicate that more than a third of the borough’s population was Jewish in the mid-1940s.

The Dodgers’ organization was uniquely “un-Yankee-like” in that they cultivated a working-class fan base. The symbiotic communal relationship

between Brooklynites and the Dodgers was shaped during the 1950s because of the many players who lived among the fans and often used the same public transportation. Consequently, the Dodgers seemed to represent neighborhood- and community-related baseball. Brooklyn's ethnic diversity was instrumental in Rickey's "great experiment" in desegregation. He believed that the borough's diversity would facilitate his integration plan.

Social Integration and Midcentury Changes

The legendary success and seminal moments of the Brooklyn Dodgers franchise occurred after World War II. The team was the catalyst for social change in American sport and society at a time when a midcentury revolution and renaissance of sorts unfolded.

Rickey's successful integration of professional baseball, with the signing of African American Jackie Robinson in 1947, is viewed as his most salient career accomplishment. Often confused and misconstrued as a humanitarian social statement, the signing of Robinson and other elite Negro League baseball players was financially motivated. Rickey saw a reservoir of untapped black talent, and he was willing to negotiate and often exploit the vast resources. His talent scouting and signing of Negro League players enabled him to have four in uniform in 1950, when Major League Baseball had only nine African American players.

The Dodgers eventually signed 16 Negro League players and became black America's team. Due to the controversial social change that took place within the franchise, national tabloids condemned and vilified them for threatening baseball's purity and status quo, while others extolled the courage of the organization and sacrifices made by its players.

Prosperity, Disparity, and Nostalgic Lore

Rickey and Robinson's successful partnership helped galvanize the Dodger fandom, and paid substantial dividends at the gate. Unfortunately, municipal strife and political posturing around the location of a new stadium sent the franchise west.

A decade before the Dodgers' East Coast exodus, they had made more money than any other National League franchise. Their home game attendance reached a league record high of 1.8

million fans in 1947, partly due to Robinson's inaugural season. They even made more money than the Yankees from 1952 to 1956. In spite of the Dodgers' financial windfall and league success, they won but one World Series (1955) out of six attempts. Thus, the rallying cry in Brooklyn became "Wait till next year!" Unfortunately, there was no next year in 1957, as the team relocated to Los Angeles.

More than a half-century since their relocation, the Brooklyn Dodgers are still among the best-known sport franchises of all time, and maintain the most iconic image of any transplanted team in American sports history. Their name is so enduring that it rivals teams that have entered Major League Baseball by expansion over the years.

Brown Berets

The Brown Berets are a youth-led paramilitary organization of the Chicano civil rights movement founded in Los Angeles, California, in 1967,

and which exists in the present. Its goal has been to uphold the objectives of the Chicana/o movement in education, politics, socioeconomics, and self-definition or identity, and to also focus on particular local issues, like criminal justice and police brutality.

The Berets spread throughout the southwestern United States and into large urban areas of the east, Pacific Northwest and midwest. They have supported the work of not only other Chicano movement organizations, like the United Farm Workers (UFW), but also the work of other ethnic organizations, such as the Black Panther Party or the Student Non-Violent Coordinating Committee (SNCC) or the Puerto Rican Young Lords. They have engaged in a number of movement events, but as with other civil rights organizations from the 1950s to the 1970s, were heavily targeted by infiltrators and provocateurs who distorted their image and work, and harmed them internally.

Beginnings

The Brown Berets were formed just prior to the 1968 East Los Angeles student walkouts (blow-outs) led by Carlos Montes and others involved in the Young Citizens for Community Action (YCCA), later changed to Young Chicanos for Community Action. The name of the organization originated from the beret and brown uniforms worn by both men and women soldiers and veterans. The Berets published a newspaper called *La Causa* and started their work supporting the anti-Vietnam War movement, challenging police brutality and educational inequality, and opening a free health clinic and offering free breakfasts. They opened a coffee house, the Piranya, in East Los Angeles, where they met and sponsored cultural programs.

They evolved ideologically from working civically, a strategy used by older-generation Mexican American organizations like the American GI Forum, to focusing on Chicana/o self-determination and nationalism, to international solidarity with global movements based in Asia, Africa, and Latin America. However, unlike other student movements founded at that time, like *Movimiento Estudiantil Chicano de Aztlán* (MEChA), the paramilitary structure of the Berets made it unique. It has an elaborate hierarchy of officers,

code of conduct, and disciplinary procedures. Marching, drills, salutes, and the manifestation of Chicana/o Power are part of the exercise of discipline and earning the trust of the community, as is respecting and caring for the uniform and those who wear it.

1970 Paramilitary Power and Disbandment

Like other Chicano movement organizations that rejected women or limited their participation, the Brown Berets—while rhetorically stressing the importance of gender equity as equally important to that of race or class—failed in practice to live up to its own rhetoric. Women Berets continually challenged their male colleagues, but faced unique challenges due to the structure of the organization and respect for the chain of command and senior officers.

In 1970, they assisted those in the Barrio Logan neighborhood of San Diego in seizing and occupying a piece of land beneath the Coronado Bridge that eventually became Chicano Park. In 1972, they planted a Mexican flag on Santa Catalina, claiming the island for all Chicanos and asserting a violation of the 1848 Treaty of Guadalupe Hidalgo. By 1972, succumbing to heavy infiltration by the Los Angeles Police Department and Federal Bureau of Investigation (FBI), the Brown Berets disbanded.

1990s Resurgence

In 1993, during a resurgence of the Chicano Movement, the Brown Berets were reconstituted under their original charter and they renewed their work in southwestern communities, in particular focusing on those in the criminal justice system. They participated in the 40th anniversary of the Chicano Moratorium and have been active fighting for immigration legislation and enforcement, particularly in Arizona and California.

Internal disputes have emerged since their reconstitution about who has legitimate claim and title to the legacy of the Brown Berets, and members remain rightfully suspicious of new members and their activities. Much as MEChA has attracted the attention and vitriol of racially and politically conservative groups, the Brown Berets have similarly experienced viral Internet attacks, mainly by those lacking a historical perspective and critical understanding of their work.

Unmasking Rumors and Urban Legends

The Brown Berets, much like the Black Panther Party, were infiltrated and documented by the FBI to a degree witnessed by few other Chicano movement organizations. Recent scholarship analyzing the FBI files and those of other agencies surrounding the Brown Berets has proven they were justifiably suspicious. By becoming a type of civilian police/military force, the organization directly challenged the legitimacy of its establishment counterparts. As such, infiltrators and provocateurs delegitimated the Brown Berets' work in the community by spreading rumors or urban legends about nonthreatening services its members performed, such as free pancake breakfasts and a health clinic.

As more documentation from the Berets' tumultuous period becomes available with the passage of time, some questions will be answered. Some information remains tightly controlled, such as the investigation into the death of Ruben Salazar. Salazar was a journalist killed in 1970 by a Los Angeles County Sheriff's deputy during a National Chicano Moratorium March against the Vietnam War. Other controlled information includes governmental resistance to the Chicano civil rights movement and the work of organizations like the Brown Berets.

Brown v. Board of Education of Topeka (1954)

The U.S. Supreme Court decision in *Brown v. Board of Education of Topeka* (1954) struck a resounding blow against the legalized segregation of children along racial lines in the United States. Prior to *Brown*, in spite of 90 years of African American freedom from slavery, society in the southern states was divided strictly along black and white lines under the legal doctrine of "separate but equal." This doctrine, combined with prejudicial beliefs, contributed to a public education system in which black and white children attended separate schools throughout the south and in other parts of the country. The Supreme Court in *Brown* expressly held that separate schools are inherently unequal and violated the Fourteenth Amendment to the U.S. Constitution, which guarantees equal protection under the law for all persons regardless of their race.

Emancipation

European colonial powers in the 16th century began forcibly capturing men, women, and children along the western coast of Africa and selling them to Europeans in the Americas. In 1800, the U.S. census reported nearly 900,000 slaves in the United States, primarily in the southern states, as many northern states had abolished slavery. In 1857, the Supreme Court ruled in *Dred Scott v. Sandford* that Scott, a former Missouri slave and free black man who sought to live as a free man in the slave state of Missouri, was not and could never be a U.S. citizen because he was black, and he had no right to bring a suit in a U.S. court. By 1860 there were close to 4 million slaves in the south, and the divisiveness of slavery set the nation on the edge of Civil War. In contrast, most Central and South American nations had abolished slavery.

During the Civil War, President Abraham Lincoln on January 1, 1863, issued the Emancipation Proclamation, officially freeing all slaves in the rebellious territories. On January 31, 1865, Congress passed the Thirteenth Amendment to the U.S. Constitution, outlawing slavery in all U.S. states and territories. The Confederacy surrendered on

April 9, 1865. The Thirteenth Amendment was ratified by the required three-fourths of the states on December 6, 1865, and took effect. On July 9, 1868, the nation ratified the Fourteenth Amendment to the Constitution, providing citizenship to all people born in the United States and prohibiting state action that denied people the equal protection of the laws. These amendments in principle made many racially discriminatory practices illegal, but in reality did very little to change the quality of life of African Americans.

Separate but Equal

In 1892, Homer Plessy, a black civil rights activist who could pass for white, sat in a “whites only” train car and declared he was black. Arguing that separate cars for whites and blacks violated the Thirteenth and Fourteenth Amendments, Plessy appealed his case to the Supreme Court. In 1896, the court announced the “separate but equal” doctrine—that separate facilities for blacks and whites do not violate the Constitution if they are equal. The “separate but equal” doctrine provided further justification for segregation. By 1900, a majority of elementary-age children in the United States attended a public school. However, throughout the southern states black children regularly were denied access to the growing number of public schools for white children. Southern state legislatures underfunded elementary schools and often provided no secondary education for black children. For instance, fewer than 5 percent of black high school-age children in Texas attended school in 1910.

In 1909, civil rights activists founded the National Association for the Advancement of Colored People (NAACP) to fight for African American equality in all aspects of society. In 1930 the NAACP developed a legal division and hired attorney Charles Hamilton Houston, dean of Howard University Law School, to head the division. Houston’s strategy was to overturn the “separate but equal” doctrine by proving that separate facilities were not equal, and that states were not providing equal funding to schools for black and white students. He intended to force states to either build schools for black students that were comparable to white schools or to integrate white schools.

Houston began with the case of Donald Gaines Murray, a black man who was denied admission

to the University of Maryland Law School. In *Pearson v. Murray* (1935), Houston argued that under the equal protection clause Murray should be admitted to the law school because Maryland did not have a law school for black students. The court ordered the university to admit Murray, and the Maryland Court of Appeals affirmed the decision. *Murray* was followed by a line of civil rights cases from 1935 to 1950, won by Houston and the NAACP against colleges for failing to admit qualified African Americans.

Brown v. Board of Education of Topeka

U.S. involvement in World War II (1941–45) brought new hope to many African Americans. Black soldiers demonstrated competence equal to whites and served with distinction in both the European and Pacific theaters of operation. They did so, nonetheless, in segregated military units, often with inferior equipment and training. Many African Americans took note that the United States was fighting against racist dictatorships and began to hope that attitudes were changing in the United States.

Latinos similarly hoped that white attitudes were changing. Although Latinos served in integrated units during World War II, their children typically attended segregated public schools across the southwestern United States, especially in Texas and California. In 1947, the Ninth Circuit Court of Appeals unanimously affirmed a decision that school segregation violated the equal protection rights of Latino children, though not on the basis of race but of social class. Latinos were not considered a protected ethnic or racial group.

By 1952, little had changed for black schoolchildren when *Brown v. Board of Education of Topeka* reached the Supreme Court. *Brown* originally was one of five cases the court agreed to hear to address a common legal question—whether the “separate but equal” doctrine should be permitted to continue segregating black and white schoolchildren. Houston’s protégé, Thurgood Marshall, was a key lawyer in *Brown*. Under Marshall’s guidance, the NAACP argued that “separate but equal” would never be equal. He maintained that even if the schools were exactly the same, segregation labels black children inferior, destroys their self-respect, denies their full democratic and social development, and ensures they will not learn as much as

others. The court was unable to reach a decision and asked to rehear arguments later in 1953, by which time President Dwight D. Eisenhower had appointed a new chief justice, Earl Warren.

Warren and several other justices believed it was essential to reach a unanimous decision—to overturn *Plessy* and the legal basis for school segregation, and to leave no basis for segregationists to resist. After rehearing the arguments in four of the cases—*Brown* (Kansas), *Briggs v. Elliott* (South Carolina), *Davis v. County School Board* (Virginia), and *Gebhart v. Belton* (Delaware)—the chief justice drafted the opinion, circulated it among the justices, and revised it until all justices could agree to its reasoning. The *Brown* decision was announced as a unanimous 9–0 ruling on May 17, 1954. The court found that:

... segregation of children in public schools solely on the basis of race, even though the physical facilities and other “tangible” factors may be equal, deprive[s] the children of the minority group of equal educational opportunities. . . .

Moreover, the court held that “in the field of public education, the doctrine of ‘separate but equal’ has no place. Separate educational facilities are inherently unequal,” and violate the Fourteenth Amendment rights of black children to the equal protection of the laws.

Desegregation

The *Brown* decision acknowledged that school desegregation was going to be a complex task, and ordered the parties to prepare arguments in order to fashion appropriate remedies. The court revisited these arguments in 1955 with a decision known as *Brown II*, ruling that the local courts, under which the individual cases originally were decided, must enforce desegregation “with all deliberate speed.” Regrettably, the phrase “with all deliberate speed” offered no practical guidance or time line for integration, thus allowing school systems to resist integration through a variety of mechanisms for many years.

For instance, in Prince Edward County, Virginia (*Davis v. County School Board*), the school board closed the schools to avoid integrating them, and provided financial assistance to white children

to attend private schools. Other school systems made only token efforts to integrate, such as carefully selecting a few black children to attend white schools. In Charlotte, North Carolina, the school board implemented a plan that partially integrated some schools but left over half of all black students in 21 schools that were 99 percent black.

In 1957, the first nine black students enrolled at the all-white Little Rock Central High School in Little Rock, Arkansas. In compliance with *Brown*, the Little Rock Board of Education agreed to implement an integration plan by 1957. That fall, the Little Rock Nine (as they became known) were blocked from entering the school by jeering mobs. The Arkansas governor deployed the Arkansas National Guard to prevent the integration of the high school. However, President Eisenhower deployed a U.S. Army division and took federal control of the Arkansas National Guard. The U.S. Army provided the nine students with protection from mobs of segregationists throughout the year, although they still were subjected to verbal and physical threats inside the school. Two decades later, the Little Rock schools would be implementing new comprehensive desegregation plans, including busing, with the goal of finally achieving integration.

By 1964, only 2 percent of black children living in the Deep South (i.e., Louisiana, Mississippi, Alabama, and South Carolina) attended integrated schools. Both the absence of progress and the influence of *Brown*, however, did provide impetus to the growing civil rights movement. Congress enacted the Civil Rights Act of 1964, prohibiting discrimination on the basis of race, ethnicity, nationality, religion, and sex in employment (e.g., hiring, promoting, firing), public accommodations (e.g., restaurants, doctor’s offices, shops), and in public education.

Thereafter, federal courts began delivering numerous decisions in support of desegregation. In 1965 and 1966, the Fifth Circuit Court of Appeals held that school districts have an affirmative duty to integrate, to undo the harm segregation has caused, and to equalize educational opportunity. In 1968, the Supreme Court ruled that school boards cannot delay desegregation any further and must immediately begin integration (see *Green v. County School Board of New Kent County*). Remarkably, by 1968 the rate of

integration of black students in southern public schools had risen to 30 percent.

In 1969, the Supreme Court approved of school boards using faculty ratios to ensure faculty integration. In 1970, the court upheld the principle that it did not matter whether harm to nonwhites was intentional; the mere presence of racial isolation created unequal education. In spite of these positive developments, many school districts continued to delay desegregation. Consequently, in *Swann v. Charlotte-Mecklenburg Board of Education* (1971), the Supreme Court held that the busing of students would be an acceptable means of achieving racial desegregation, creating precedent and a framework for a busing desegregation strategy in many future decisions.

Beginning in 1970, several important decisions began to recognize that Latinos were a distinct ethnic group from whites, and they could not be counted as “other whites” to permit their segregation in Latino majority schools. Moreover, courts began to recognize Latinos as an identifiable minority ethnic group entitled to the same Fourteenth Amendment equal protections as African Americans under the Civil Rights Act of 1964 (see *Keyes v. School District No. 1*). In 1971, the Fifth Circuit affirmed groundbreaking remedies to the existence of two highly segregated neighboring school districts (white and Latino) along the Texas border with Mexico. The court in *U.S. v. Texas* ordered consolidation of the two districts; the implementation of a comprehensive bilingual and bicultural educational program for all students, teachers, administrators, guidance counselors, and other staff; and cultural awareness training for school board members and community leaders. Never before had a court looked at the challenge of integration to require a multicultural solution.

The first major setback to desegregation was the Supreme Court’s 1974 decision in *Milliken v. Bradley*. The court determined that school districts in the Detroit metropolitan area were not required to bus students across district school lines in order to integrate the city. The court cited the importance of local district control, effectively preserving the predominantly white suburban schools from integration. In 1977, the court revisited *Milliken* to address other remedies for the educational deficits of African American children in Detroit. It affirmed a court order that the state of Michigan must assist

the Detroit school system in providing remedial reading and communication skills programs, in-service training for all teachers and administrators, and testing without cultural, racial, or ethnic bias.

By 1976, remarkably, 45 percent of black children living in the Deep South were attending integrated schools. However, in northeastern and midwestern schools, integration rates for black children ranged from only 27 to 30 percent.

Special Education

Brown had an unexpected impact on the rights of another historically excluded minority group: children with disabilities. Before the *Brown* decision, students with disabilities were educated in highly segregated environments, similar to African Americans, if they were educated at all. Advocates for disability rights in *PARC v. Commonwealth of Pennsylvania* (1972) and *Mills v. Board of Education of the District of Columbia* (1972) used the overturning of “separate but equal” to acquire equal educational rights for students with disabilities. Decisions in these cases ruled that schools must educate all students with disabilities and must allocate sufficient funds to do so. Congress then made these principles law by enacting the first federal civil rights laws protecting people with disabilities: the Rehabilitation Act of 1973 and the Individuals with Disabilities Act (IDEA). Section 504 of the Rehabilitation Act prohibits discrimination based on disability by entities receiving federal funding, and the IDEA ensures the rights of students with disabilities to receive a free, appropriate public education in the least restrictive environment.

In spite of *Brown* and these laws, African American and Latino children have long been overrepresented in special education programs, especially when eligibility for special education has been based in part on intelligence quotient (IQ) tests. Additionally, African American and Latino children are more likely than whites and other racial or ethnic groups to receive special education services in a segregated setting (i.e., without children who do not have disabilities). A significant factor in the misidentification of black and Latino children for special education services is the use of assessment tools that are normed largely on the responses of white children, the incorrect use or interpretation of assessment tools, and the overreliance upon IQ indicators for determining eligibility.

Pictured are (front row, left to right) Minnijean Brown, Elizabeth Eckford, Carlotta Walls, Mayor Wagner, Thelma Mothershed, Gloria Ray, and (back row, left to right) Terrance Roberts, Ernest Green, Melba Pattilo, and Jefferson Thomas.

Resegregation

Resegregation has been on the rise in the United States since the 1980s. This trend is most evident in large cities where more African Americans and Latinos live in poverty than whites and are often less able to afford living in the suburbs than whites. In the largest urban school districts, African American and Latino students are steadily experiencing decreased enrollment in schools with white students. In 2005, 38 percent of African American students attended intensely segregated schools—that is, schools having 90 percent or more African American students. Similarly, 26 percent of Latino students attend intensely segregated schools. White children are the most isolated students: on average the white student attends a school with a 77 percent white enrollment; the black child, 52 percent black enrollment; the Latino child, 55 percent Latino enrollment. Dozens of school districts that were formerly under court desegregation orders are now experiencing increased segregation.

Additionally, in 2007 the Supreme Court heard two cases addressing open choice policies that enabled students to select their preferred school to attend within a district. To maintain levels

of integration, the districts used several factors such as race, place of residence, school capacity, and random chance in making enrollment selection decisions. The court applied strict scrutiny and ruled that the open choice plans violated the Fourteenth Amendment Equal Protection Clause because they overrelied on race as a basis for enrollment decisions. These rulings are likely to permit further resegregation.

Conclusion

If *Brown* was meant to set in motion the complete integration of U.S. public education for all time, that legacy has not been realized. Beginning in the 1960s, many whites who could afford to do so moved to the suburbs, and this model remains evident in cities all over the United States today. More African American and Latino children live below the federal poverty line, live in single parent families, live in families that depend on federal financial assistance, attend poorly performing schools, and graduate from high school at lower rates than white children. Black, Latino, and white children frequently attend public schools with a majority of their peers being of their own race. While attitudes about race have improved

dramatically over the 60 intervening years since *Brown*, most children are sent to relatively segregated schools, not necessarily by choice, even though children need to learn how to live in a multicultural, increasingly interdependent world.

Buffalo Soldiers

On July 28, 1866, an army reorganization law authorized two cavalry and four (later merged into two) infantry regiments comprised of black soldiers, but overseen by white officers. The 9th Cavalry was activated at Greenville, Louisiana,

on September 21, 1866, the same day that the 10th Cavalry was activated at Leavenworth, Kansas. Two infantry regiments were also activated that day. The army recruited former enslaved people, freedmen, and Civil War veterans. The men in these regiments became known as the "buffalo soldiers," a name given to them by the American Indians, connoting a high honor.

The name may have derived from the recruits' characteristic black, kinky hair, similar to that of the buffalo, an animal revered by the Plains Indians. The motto of the buffalo soldiers was, "Ready and Forward." Between 1867 and 1896, these infantry units fought in approximately 200 minor and major engagements.

The buffalo soldiers were under tough scrutiny, with each flaw magnified. The idea of black peacetime soldiers, even segregated, offended many whites, who believed that blacks were not sufficiently intelligent to soldier, especially as cavalry. The discipline and courage of the buffalo soldiers were exemplary. In an army noted for the prevalence of drunkenness, they were extraordinarily sober. The army also had a problem with desertion, with a third leaving before their enlistments were up, but black soldiers had the lowest desertion and court-martial rates in the army. There were also charges that blacks were undisciplined and cowardly under fire. The accusations persisted through the three decades that the black units served with distinction. Their Indian war service garnered 24 Medal of Honor citations.

Compensation and Equipment

There was no shortage of volunteers. Because black service was segregated, volunteers could not join white units but instead had to wait for someone to retire or die and create a vacancy in a black unit. The army was a new home, perhaps an adventure and a new life. Medical care was free. Enlistments were for at least five years at \$13 a month, plus uniforms, quarters, and meals. Barracks for new recruits were located inside cotton compresses (buildings where once cotton was "compressed" by machine into tight bales). Food included hash, beans, boiled beef, corn bread with now and then molasses, sweet potatoes, and coffee. Service was a chance for blacks, recently freed from plantation slavery and lacking skills or worldliness, to

improve themselves economically and socially. Each regiment's black chaplain taught reading, writing, and arithmetic. Education meant respect and competency in a white world.

The 9th and 10th cavalries and the two infantry regiments received uniforms and equipment, but only after the white regiments had been allotted their supplies. Until around 1876, the buffalo soldiers wore Civil War-style uniforms, but after that they wore the Indian war uniforms that the other units had changed to around 1872. The buffalo soldiers also received the poorest horses. Because a horse was often the difference between life and death, recruits learned quickly to take better care of their mounts than they did of themselves.

Mutiny, Order, and Casualties

By February 1867, only 11 officers were assigned to the units. Waiting for the final officer complement, the troops became restless, surly, and unruly. Because they were untrained, led by officers prejudiced against them, unwelcome in Texas, and otherwise abused, they mutinied twice—first on the road to San Antonio and again in their San Antonio encampment. In the latter skirmish, an officer was killed, forcing another officer to shoot two of his own troops. Afterward, discipline was restored, and conditions stabilized as the soldiers received training and assignments.

That spring and summer, the cavalry moved to Forts Stockton and Davis in west Texas, their base for service in New Mexico and Arizona. The forts required total reconstruction, so the cavalry cut logs, made adobe bricks, and fortified the structures. For 24 years they served in the west, on the plains, along the Rio Grande, and in territories, including New Mexico, Texas, Arizona, Colorado, and the Dakotas. Their duties included guarding the mail and escorting coaches, cattle drives, surveyors, and railroad crews. Buffalo soldiers erected telegraph lines, built roads, and mapped and explored the territory. In October 1867, Corporal Emanuel Wright and Private E. T. Jones became the first buffalo soldier fatalities, ambushed on mail escort duty by the Kickapoo Indians. In December, the first full-scale battle took place against 900 Kickapoos, Lipans, Mexicans, and whites. The buffalo soldiers fought for three hours; they lost three men and killed 20 opponents.

The buffalo soldiers fought the Indians who often raided the area from safe bases in Mexico. They also fought outlaws. A major effort against Chief Victorio's band of Apaches finally succeeded in 1880, but it took another decade of effort by the 10th Cavalry before the other Apache bands were subdued. Meanwhile, the 9th Cavalry moved into Indian territory to handle whites who had illegally settled on Indian lands. The 10th relocated to Montana in 1892–96 to round up the Cree and deport them to Canada.

Other Wars

Having helped subdue the west, the 9th and 10th Cavalries went on to fight in the Spanish-American War in 1898 and in the Mexican campaign against Pancho Villa in 1916. The 10th Cavalry also served in the Philippine-American War that followed the Spanish-American War. Service with the buffalo soldiers launched many white officers on notable careers, the most notable being Lieutenant John H. "Black Jack" Pershing of the 10th Cavalry. George A. Custer was among the white officers who refused to lead black units, causing delays and shortages.

Blacks served in America's wars from the American Revolution, but their first large-scale deployment came during the Civil War, when 180,000 blacks served in the Union armies, with 33,380 dying in the war. In World War II the 2nd Cavalry Division (comprising the 9th, 10th, 27th, and 28th Regiments) was reactivated. It was segregated, received training and experience along the Mexican border, and then went to north Africa in 1944, where it was eventually deactivated and its units reassigned to service and port duty, a demoralizing end to the buffalo soldiers.

Bulgarian Americans

Bulgaria is an eastern European country on the Black Sea, bordered by Romania, Serbia, Macedonia, Greece, and Turkey. A former empire and the cultural hub of Slavic civilization in the Middle Ages, it became part of the Ottoman Empire in the 14th century; it gained its independence shortly before the dissolution of that empire at the close of World War I.

After World War II, it became a Communist republic but transitioned into a capitalist democracy after 1989, concurrent with the fall of eastern European Communism. In the 2000 U.S. census, 92,841 people identified themselves as having Bulgarian ancestry, 55,849 of whom listed Bulgarian as their primary ancestry. Including the growth in the population since then, the 30,000 students residing in the country, and other resident aliens, the Bulgarian government in 2010 estimated there were close to 300,000 Bulgarians and Bulgarian Americans living in the United States. That figure includes temporary residents as well as citizens and long-term residents. Bulgarian students are one of the most populous foreign student groups in the United States; in eastern Europe, only Russia (with 20 times Bulgaria's population) sends more students to American colleges.

The United States is home to more people of Bulgarian descent than any country except Bulgaria itself and possibly Moldova and Spain (depending on the figures accepted for these countries). Bulgarian immigration to the United States began in the middle of the 19th century, when immigration from central, southern, and eastern Europe began to overtake immigration from western and northern Europe. Early Bulgarians converted to Protestantism (there was not yet any Bulgarian Orthodox Church presence). America's

educational opportunities were the primary motivation for the early Bulgarian immigrants. Interest in the United States was especially ignited in the late 19th century by *To Chicago and Back*, a travel memoir by Bulgarian author Aleko Konstantinov. Konstantinov had visited Paris in 1889 and Chicago in 1893 (for the World's Fair), and was the first Bulgarian author to write of his experiences in western Europe and the United States. Konstantinov's writing—both this book and his stories about the character Bay Ganyo, whom he first conceived while in Chicago—popularized travel among Bulgarians, as well as inspiring many Bulgarians to relocate to Chicago, which today continues to have the largest concentration of Bulgarian Americans.

Immigration Waves

The first major wave of immigration from Bulgaria came in 1903, during the political turmoil that followed Bulgaria's separation from the Ottoman Empire. These immigrants were usually poor, selling their livestock or land or obtaining a high-interest loan to fund the steamship trip across the Atlantic to New York, Canada, or Mexico. (The latter two destinations were chosen by immigrants who then illegally crossed the border into the United States to avoid American immigration restrictions.)

Immigration decreased in the 20th century, at first because of country-of-origin quotas imposed by new immigration laws, and later because of the essentially closed borders of the Communist state. Bulgarian immigrants during the Communist years were political refugees, generally well educated, often intellectuals who were oppressed for their conflicts with the communist regime.

When Communism collapsed, Bulgarian immigration to the United States increased sharply. Over one million Bulgarians left the country in the years immediately after the fall of Communism, creating a new Bulgarian diaspora across western Europe and North America, as well as Argentina and Brazil. Many applied to the American green card lottery system. Only Spain and Moldova, if the outside estimates are accepted, attracted more Bulgarian immigrants than the United States, with Ukraine trailing close behind. The religious needs of much of the Bulgarian diaspora are served by the Bulgarian Eastern Orthodox Diocese of the

United States of America, Canada, and Australia, which was founded before World War II but disrupted by Communism in the postwar decades.

St. John of Rila Church (Tsurkva Sveti Ivan Rilski), an Eastern Orthodox Church in Chicago's Portage Park neighborhood, serves the Chicago Bulgarian community both as a parish church and as a major social and cultural center. (A 10th-century Bulgarian hermit, John of Rila was revered as a saint while he was still alive and is the patron saint of Bulgaria.) The brick and limestone building is widely admired for its architecture and attracts many tourists for that reason. It was built in 1928 as the Peace Lutheran Church, but after the Lutheran congregation consolidated with other parishes, a Bulgarian Orthodox group purchased the church in 1996.

New York, Los Angeles, California, and Miami, Florida, also have large Bulgarian populations. Houston has the fastest-growing nonstudent Bulgarian population. Compared to the general American population, Bulgarian Americans are less educated (only 17 percent have completed college) and slightly less wealthy (with a 2000 census median household income of \$44,578). They have a high degree of English fluency. About 30,000 American residents speak Bulgarian at home. Most of them are recent immigrants, but some are the children of first-generation Bulgarian Americans and others are older Bulgarian Americans who have retained the use of Bulgarian in the home. For the most part, Bulgarian Americans have assimilated.

Bureau of Indian Affairs

The Bureau of Indian Affairs (BIA), also known as the Office of Indian Affairs, is the U.S. government administrative unit that manages Indian policy and fulfills trust duties for American Indians, Indian tribes, and Alaska Natives. The 2010 U.S. census indicates 2.9 million persons, or 0.9 percent, were American Indians and Alaska Natives alone, and 5.2 million, or 1.7 percent, alone or if combined with one or more other races. These figures are increases of 18 percent and 27 percent over the 2000 census population figures of 2.5 million and 4.1 million persons, respectively. The largest population numbers were in the western and southern census regions of the country; the greatest proportion was in Anchorage, Alaska; the largest population place was New York. The U.S. government indicates there are more than 560 federally recognized American Indian tribes and Alaska Native villages, each with its own authority based on fundamental sovereignty.

From the late 1700s, the BIA has taken various forms. Original policy and trust responsibilities were placed with the Office of the Secretary of War by an official act in 1789. The Office of Indian Trade operated from 1806 to 1822. The formal Office of Indian Affairs was established on March 11, 1824; it began in the Department of War (1824–1849), was transferred to the Department of the Interior (1849–1947), and was renamed the Bureau of Indian Affairs (1947–present).

Throughout most of its existence, the BIA was integrally involved in virtually all aspects of the lives of Native Americans. The BIA administered the health, welfare, education, employment, and, at times, even the physical location of tribes throughout the country. Millions of pages of BIA archival documents confirm this pervasive influence and include records such as treaties, ledgers, claims, litigations, surveys, journals, correspondence, and speeches.

Today, the BIA structure is organized into Offices of Indian Services, Justice Services, and Trust Services; field offices; and 12 regions that offer programs and initiatives that cover a wide variety of areas of responsibility. In general, the BIA promotes self-determination through an emphasis on decentralization and local control. On an annual basis, the BIA distributes federal

funding (\$2.4 billion in fiscal year 2008) directly, through contracts and grants, and through compact agreements with tribes. More specifically, the BIA supports educational services to about 48,000 students in more than two dozen day and residential schools, colleges, and universities throughout the country. It delivers social services, as well as law enforcement and detention services. It maintains specific infrastructure such as certain roads, bridges, dams, and irrigation systems. It manages approximately 56 million acres of land held in trust, as well as trust assets of those lands, including, for example, natural and mineral resources such as forests. Finally, it is involved in energy and economic development with specialized business and loan programs to Indian enterprises.

Public Opinion and Moving Forward

Public opinion about the BIA has varied. Historically, the BIA—and specifically its policy-making authority—was seen by some as a positive authority toward assimilation, by others as

The Bureau of Indian Affairs is responsible for the administration and management of over 55 million acres of land held in trust by the United States for Native Americans. Four separate offices serve 566 federally recognized tribes.

a mixed-results power of paternalism, and by still others as a deculturalizing force of theft and destruction against Native peoples and their sovereign rights and resources through countless unfulfilled treaty obligations. The diversity of views has continued in modern times. From 1996 to 2010, for example, the BIA was involved in *Cobell v. Norton*, a lawsuit relating to historical accounting practices and claims of mismanagement. The case took some unusual turns; in 2001, for example, while it was pending, the case severely restricted public access to current government information as the BIA was ordered to sever all computer and information technology connections with the Internet that contained or connected to personal Indian trust data. The case went through district and appellate courts, but Congress did not support the legal decisions and did not appropriate funds for a settlement until November 30, 2010 (Claims Resolution Act of 2010).

President Barack Obama signed the \$3.4 billion Cobell settlement on December 8, 2010; it provides funds for class member compensation, voluntary buy-back of fractionated land interests and consolidation of lands, and scholarships for vocational training and higher education. Since this development, the BIA drafted a consolidation plan, held various regional government-to-government consultations, and established a National Commission on Indian Trust Administration and Reform.

Today, the BIA continues to pursue its mission to improve the quality of life for, and to protect the trust assets of, American Indians, Indian tribes, and Alaska Natives.

says in the introduction to the book, “Americans who have always looked westward when reading about this period should read this book facing eastward.” This shift in historical perspective is enhanced throughout the text through Brown’s source material, the structure of the work, and his use of language, creating a work that continues to resonate with 21st-century readers.

Bury My Heart at Wounded Knee begins with an overview of the interactions between various Native American tribes and European settlers, starting with Columbus. Brown then explores events such as the Sand Creek Massacre of 1864, Oglala Lakota Chief Red Cloud’s fight for the Powder River country, Custer’s intrusion into the Black Hills and the death of Crazy Horse, and the rise of the religion of the Ghost Dance. Key figures in this period of Native American history are also highlighted, including Donehogawa, the Seneca Iroquois man who was appointed by Ulysses S. Grant as the commissioner of Indian Affairs; the Modoc chief named Kintpuash, also known as Captain Jack; and Hunkpapa Lakota Chief Sitting Bull.

Sources, Style, and Structure

One of the most notable features of *Bury My Heart at Wounded Knee* is its use of a variety of source material, including congressional records, government reports, tribal council records, first-hand descriptions, and autobiographies. Brown’s use of these sources enabled him to provide a large number of direct quotations from Native American leaders and tribal members throughout the text. This inclusion of the actual words of many Native Americans is the primary way in which Brown establishes an alternate historical perspective throughout his work.

The structure and style of Brown’s history also contribute to the way that *Bury My Heart at Wounded Knee* depicts U.S. history from a Native American perspective. Brown begins each chapter with direct quotations from various tribal leaders and members that specifically relate to the subject of the chapter. Brown’s history then concludes with a quotation from Black Elk, which ends, “It was a beautiful dream . . . the nation’s hoop is broken and scattered. There is no center any longer, and the sacred tree is dead.” Each chapter also begins with a list of both U.S. and world historical events

Bury My Heart at Wounded Knee

Dee Brown’s *Bury My Heart at Wounded Knee* is a history of the American West, as told from the perspective of Native Americans. The book covers the period of American history from 1860 to 1890, starting with the Civil War and the effects it had on Native American tribes, and extending until the massacre at Wounded Knee Creek on December 29, 1890. Brown’s book was published in 1970, during a period of increasing Native American activism, and this history was instrumental in raising awareness of how Native American tribes have been treated by the U.S. government. As Brown

that happened at the same time as the events in the chapter, providing a contextual framework for understanding the events of each chapter.

Brown's focus on the Native American perspective on history is also enhanced through his use of language. In many cases, Brown uses the names for people used by various tribes, rather than their given names. George Armstrong Custer, for example, is frequently referred to as Long Hair, particularly in the chapter "The War for the Black Hills." This stylistic device extends to other elements of the text as well; trains are "iron horses," the president of the United States is the "Great Father," and spring is "corn-planting time."

The title for Brown's book comes from Stephen Vincent Benét's poem "American Names." The final two lines of the poem read as follows:

I shall not be there. I shall rise and pass.
Bury my heart at Wounded Knee.

Although Benét's poem does not have anything to do with Native American history, the Wounded Knee Creek, located in South Dakota, plays a significant role in *Bury My Heart at Wounded Knee*. It is both where Crazy Horse is buried and the site of the massacre of over 150 Miniconjou Lakota and Hunkpapa Lakota in 1890.

Reception

Bury My Heart at Wounded Knee was very well received upon its publication, spending over a year on the *New York Times* best seller list and receiving praise from Native American authors such as N. Scott Momaday. While generally seen by scholars as a text invaluable in drawing

attention to Native American history, Brown's work has been criticized by some for its lack of source material apart from direct quotations, as well as for the way it perpetuates the stereotype of the vanishing Indian.

In 2007, Brown's book was adapted into a television film directed by Yves Simoneau. While this HBO production draws heavily from the events described by Brown, it also features other events and characters, including Ohíye S'a, also known as Charles Eastman, a Santee Sioux physician, writer, and reformer. The film version of *Bury My Heart at Wounded Knee* won six Emmy Awards, including Outstanding Made for Television Movie.

C

Cabinet Secretaries

The cabinet of the United States is a body in the executive branch of the federal government consisting of the heads of the executive departments (Secretaries), plus other senior officers designated as cabinet-level positions.

Cabinet secretaries were first created as advisers to the president in specific designated areas (and other such advisers who are not considered cabinet-level in power or authority also exist), but as the federal government has grown in size and complexity, it has become equally significant that they administer the business of their department.

The attorney general, for instance, heads the Department of Justice and oversees a large number of federal law enforcement agencies as well as the federal government's involvement in federal legal cases (originally representing the government personally in Supreme Court cases, a task now delegated to attorneys within the Department of Justice). The secretary of state frequently negotiates international treaties and coordinates federal activity overseas, in addition to administering the State Department and serving as foreign policy adviser.

Like other key positions in government, secretaries and other cabinet-level officers are appointed by the president and confirmed by the

Senate, but they may be dismissed by the president at any time. Cabinet members are included in the presidential line of succession in order of the creation of their office, beginning with the secretaries of State, the Treasury, Defense, and the attorney general, the four cabinet officers that existed in George Washington's presidency.

Evolution of the Cabinet

The exact composition of the cabinet has developed over time, both expanding and reorganizing, since Washington's original four departments. Former cabinet-level officers include the directors of the Central Intelligence Agency (CIA), Federal Emergency Management Agency (FEMA), and the Office of National Drug Control Policy, as well as the postmaster general, whose Post Office Department was reorganized in 1971 as the U.S. Postal Service, an independent executive agency without cabinet rank.

The Navy and Air Force were formerly their own departments, until becoming combined with the Department of War in 1949 to form the modern Department of Defense. In the 21st century, the cabinet consists of the heads of the departments ("secretary" unless otherwise indicated) of State, Treasury, Defense, Justice (attorney general), Interior (created in 1849), Agriculture (created in 1862 and elevated to the cabinet in 1889),

Commerce (1913), Labor (1913), Health and Human Services (1953), Housing and Urban Development (1965), Transportation (1967), Energy (1977), Education (1979), Veterans Affairs (created in 1930, elevated to the cabinet in 1989), and Homeland Security (2002), as well as the cabinet-level positions of vice president, the White House chief of staff, the director of the Office of Management and Budget (OMB), the administrator of the Environmental Protection Agency (EPA), the Trade Representative, the ambassador to the United Nations, the chairperson of the Council of Economic Advisers, and the administrator of the Small Business Administration.

Diversity in the Cabinet

A number of factors drive the diversity or lack thereof in the cabinet. Frequently, an ethnic group's "firsts" are discussed with reference to the period when they were first enfranchised. Although the right to vote is not required in order to serve in the cabinet, it generally marks the beginning of official political participation of a group. Members of a group are also more likely to be elected when they can depend on at least a portion of that group's votes—and the votes of senators are in turn necessary to confirm cabinet appointments. But Senate demographics are not a determining driver of cabinet demographics: there was only one female senator when the first female cabinet member was confirmed, for instance, and in the whole of history only 44 women have served in the Senate, nowhere near sufficient for the female senatorial vote to guarantee a confirmation.

Though President Bill Clinton (1993–2001) openly embraced diversity in government and spoke of his cabinet as one that should "look like America," **President Barack Obama's first cabinet** (2009–13) was the most diverse in history. It included two Hispanic Americans, Hilda Solis (Labor) and Ken Salazar (Interior); Japanese American, Eric Shinseki (Veterans Affairs); two Chinese Americans, Gary Locke (Commerce) and Steven Chu (Energy); African American Eric Holder (Attorney General); and Lebanese American Ray LaHood (Transportation). Chu was later succeeded by Portuguese American Ernest Moniz.

Foreign-Born Cabinet Members

Several early cabinet members were foreign born, a natural consequence of the country's youth. The first secretary of the treasury, **Founding Father Alexander Hamilton**, was appointed to the position by President Washington in 1789. He had been born on the island of Nevis, a British colony in the West Indies, before moving to the American colonies for his education in the early 1770s.

The first four presidents all had foreign-born cabinet members: Irish immigrant James McHenry served both Washington and John Adams as secretary of war, Swiss immigrant Albert Gallatin served Thomas Jefferson as secretary of the Treasury, and Scottish immigrant George Campbell served James Madison as secretary of the Treasury.

However, from that point on there were only three more foreign-born cabinet members in the 19th century, despite the large influx of immigrants in that time. This could be ascribed to xenophobia, to the greater entrenchment of native-born Americans in social and political networks, or to coincidence.

Because foreign-born cabinet members are generally not natural-born citizens (the exception being those born to American parents while abroad), they are not eligible to serve as president or to exercise the powers of the president under the terms of the Presidential Succession Act. In light of this, it is perhaps unusual that there have been not one but two foreign-born secretaries of state, ordinarily next in line for succession after the president and vice president: Richard Nixon's Henry Kissinger (Germany) and Clinton's Madeleine Albright (Czechoslovakia). In contrast with State, many departments have never been headed by a foreign-born secretary, including Defense, Energy, Education, Health and Human Services, Homeland Security, Justice, Transportation, and Veterans Affairs.

Though foreign-born cabinet members were included early on, cabinet membership remained largely dominated by men of western European ancestry for most of U.S. history. The first Polish American cabinet member, for instance, was John Gronouski, the U.S. postmaster general (then a cabinet-level position) from 1963 to 1965. Zbigniew Brzezinski served as national security

President Barack Obama and Vice President Joe Biden with the full cabinet in the White House on September 10, 2009. George Washington appointed only four men to the first cabinet: Secretary of State Thomas Jefferson, Secretary of the Treasury Alexander Hamilton, Secretary of War Henry Knox, and Attorney General Edmund Randolph. Today, the president is still responsible for nominating all cabinet members, at which time they are presented to the Senate for confirmation or rejection by a simple majority.

advisor to President Jimmy Carter (from 1977 to 1981) and was instrumental in the major foreign policy successes of that presidency, including the Camp David Accords, the normalization of U.S.-China relations, and the support of human rights activism in eastern Europe. But the national security advisor is not a Senate-confirmed position, and so lacks cabinet rank. When former vice presidential candidate Edmund Muskie was made secretary of State for the last six months of President Carter's term (May 1980–January 1981), he attained the highest office held by a Polish American.

Jewish American Members

Jewish Americans were included in federal elected office from the early 19th century, and

Judah Benjamin served as the attorney general and later secretary of state and war in the brief-lived Confederate government during the Civil War. A generation later, German-born Jewish American Oscar Straus was appointed secretary of Commerce and Labor in 1906 by President Theodore Roosevelt. In 1973, German-born Jewish American Henry Kissinger was appointed secretary of State (1973–77) by President Nixon, a position he served simultaneously with his work as the national security advisor (1969–1975).

African Americans in the Cabinet

Long before any African American had served in a cabinet position, President Franklin Delano Roosevelt sought to address the needs of African Americans in the 1930s.

Over the course of his first term, he appointed 45 blacks to various positions in the federal government, none of them senior level or requiring Senate confirmation (which would have been politically impossible to obtain).

The informal collective of these black voices in government was known as the Black Cabinet, or the Federal Council of Negro Affairs, and advised Roosevelt on social policy, often working closely with First Lady Eleanor Roosevelt, in order to ensure better racial equity in the social programs adopted in the New Deal era.

President Lyndon Johnson had similar aims in mind when he formed the cabinet department of Housing and Urban Development in 1965, as part of his Great Society programs that mirrored and enhanced the New Deal in many ways but addressed race more explicitly.

The first African American in the cabinet was Robert C. Weaver, the secretary of Housing and Urban Development appointed by President Lyndon Johnson in 1966. In addition, he was followed by secretary of Transportation William Thaddeus Coleman (1975–77), secretary of Housing and Urban Development Patricia Roberts Harris (1977–79, later served as secretary of Health and Human Services 1979–81), Secretary of Housing and Urban Development Samuel Pierce (1981–89), Secretary of Health and Human Services Louis Wade Sullivan (1989–93), secretary of Education Rod Paige (2001–05), and secretary of Housing and Urban Development Alphonso Jackson (2004–08).

Though President Obama's cabinet is diverse, it includes only one African American. President Clinton, by contrast, appointed the most African American cabinet members in history, including Secretary of Commerce Ron Brown, Secretary of Agriculture Mike Espy, Secretary of Labor Alexis Herman, Secretary of Energy Hazel O'Leary, Secretary of Veterans Affairs Jesse Brown, Secretary of Veterans Affairs Togo West, and Secretary of Transportation Rodney Slater.

The significance of this number is underscored by the fact that it represents nearly half of the 17 African Americans who have served as cabinet secretaries. The highest-ranking African Americans in federal office have both served as Secretary of State, appointed by George W. Bush: Colin Powell and Condoleezza Rice.

Hispanic American Cabinet Members

The first Hispanic American cabinet secretary was not appointed until 1988, when President Ronald Reagan appointed Lauro Cavazos, Jr., secretary of Education. There have been a significant number of Hispanic Americans in the cabinet since, including Secretary of the Interior Manuel Lujan, Jr. (1989–93), Secretary of Housing and Urban Development (1993–97), Secretary of Transportation Federico Pena (1993–97) who later served as secretary of Energy (1997–98), Ambassador to the United Nations Bill Richardson (1997–98) who later served as the secretary of Energy (1998–2001), Secretary of Commerce Carlos Gutierrez (2005–09), Attorney General Alberto Gonzales (2005–07), Secretary of Labor Hilda Solis (2009–13), and Secretary of the Interior Ken Salazar (2009–13).

Asian American Representation

Japanese American Norman Mineta, the first Asian American cabinet member, served as secretary of Commerce from 2000 to 2001 before becoming secretary of Transportation from 2001 to 2006.

He was followed by Elaine Chao, the first Asian American woman in the cabinet, who served as secretary of Labor from 2001 to 2009; Gary Locke, the first Chinese American cabinet member, who served as secretary of Commerce from 2009 to 2011; Steven Chu, who served as secretary of Energy from 2009 to 2013; and Eric Shinseki, who has served as secretary of Veterans Affairs since 2009. There has not yet been a cabinet officer of south or southeast Asian ancestry, which is consistent with their overall low representation in elected office.

Arab, Greek, and Middle Eastern Members

The first Arab American in the cabinet was Donna Shalala (of Lebanese ancestry), who served as Secretary of Health and Human Services from 1993 to 2001. John Sununu, whose father's family immigrated to the United States from the Greek Orthodox community in Jerusalem and who has Lebanese ancestry, served from 1989 to 1991 as White House chief of staff, a cabinet-level position but not formally part of the cabinet. In George W. Bush's terms of office, he appointed Syrian American Mitch Daniels as director of the

Office of Management and Budget (2001–03) and Lebanese American Spencer Abraham as secretary of Energy (2001–05).

Women in the Cabinet

There have been 25 female cabinet members since the first, Frances Perkins, was appointed secretary of Labor by President Franklin Roosevelt in 1933, 13 years after the Nineteenth Amendment granted women the right to vote (though nothing would have legally prohibited an appointment before that time). Over time, female secretaries have become increasingly common and have been appointed and confirmed by both parties with little controversy. Among currently existing departments, only Defense, Treasury, and Veterans Affairs have never had a female secretary.

Cajuns

For 75 years beginning in 1688, England and France engaged in a series of wars over the expansion of their overseas empires, a conflict that led to four confrontations in North America known collectively as the French and Indian War. After one of these conflicts, by the terms of the Treaty of Utrecht in 1713, France ceded to Great Britain territories in *Acadie* (modern Nova Scotia), Newfoundland, and Hudson's Bay. Although the French residents were allowed to remain and to retain possession of any property they owned, over the next half-century many refused to sign oaths of allegiance to Britain while others openly joined pro-French militia units and aided the French forces in and around Fortress Louisbourg and Fort Beauséjour.

When war again broke out, the British became increasingly concerned about the questionable allegiance of *les Acadiens*. The result was a decision to expel the French population of Nova Scotia, New Brunswick, and Prince Edward Island, an event known as the Great Expulsion, or *le Grand Dérangement*. Between 1755 and 1763 some 11,500 Acadians were forcibly deported. In American history, this event formed the basis for Henry Wadsworth Longfellow's epic poem *Evangeline*.

Approximately 3,500 of those in the initial expulsion returned to France, but the rest were shipped to the United States. Many of these were resettled in rural communities in Connecticut, Maryland, Massachusetts, New York, Pennsylvania, and South Carolina, but most soon moved to nearby urban areas where they formed distinctive French communities in cities like Baltimore, Maryland; Charleston, South Carolina; and Philadelphia, Pennsylvania.

In the second wave of expulsions, a sizable number who were destined for France elected to settle in Louisiana instead. The first group of about 200, led by Joseph Broussard, arrived in 1765. Others soon joined them, some lured from other French settlements in America by relatives and some coming from France or other French possessions in the Western Hemisphere, especially Saint-Domingue (modern Haiti) during and in the wake of the Haitian revolution.

They initially settled along the lower Mississippi River, and then spread west into the Atchafalaya Basin and what is today known as Acadiana. Generally known as "Cajuns," a corruption of the original French name *Acadiens*, by 2010 they numbered about 433,000 and lived primarily in the coastal areas of southern Louisiana, with another 56,000 in the adjoining areas of Texas to the west. They were accorded official U.S. government recognition as a discrete ethnic group following a Supreme Court decision in the case of *Roach v. Dresser Industries Valve and Instrument Division* in 1980.

Culture

Cajun culture forms a very distinct and influential element in the American mosaic. Cajuns are overwhelmingly Roman Catholic, from which derives the traditional observance of *Mardi Gras* [Fat Tuesday] marking the beginning of Lent, a

40-day period of abstinence, fasting, and penitence leading up to Easter Sunday. Another old Catholic European tradition that survives among Cajuns is the Easter practice of *pâque-pâque* in which two people tap hardboiled eggs together with the winner being the one whose egg does not crack. A further custom that survives is the *coup de main* [lend a hand] in which neighbors assist one another in major tasks such as harvests and the construction of homes or barns.

Some of the best-known Cajun cultural contributions are in the fields of music and cuisine. Largely dominated by the fiddle and accordion, traditional Cajun music is sung in a unique Cajun dialect of French but it has also spread into the mainstream of American music. In 2007 a Grammy Award was added to recognize the best zydeco or Cajun music album. Zydeco is generally considered to be a combination of Cajun, blues, rhythm and blues, and African elements. In 2012, major annual zydeco and Cajun music festivals were being staged in places as diverse as California, Connecticut, Louisiana, New York, and Rhode Island.

Perhaps most famous is Cajun cuisine, whose French origins have been greatly influenced by Spanish, Creole, and other ethnic groups that also inhabit coastal Louisiana. Based largely on inexpensive local ingredients such as rice, okra, bell peppers, vegetables, grain, cornbread, duck, rabbit, pork, game birds, sugarcane, crawfish, and other seafood, a traditional meal would include three pots—one for the main dish, a second for a vegetable, and the third for rice, bread, or another grain dish.

Among the most popular dishes that can also be found in mainstream restaurants are gumbo, jambalaya, and étouffée. Gumbo is a heavy soup or stew with African and Native American influences that is based on a combination of rice and broth that is thickened with a roux to which is added chicken and andouille sausage or other ingredients to the individual's taste.

Jambalaya, also based on rice, was adapted from the Caribbean version of Spanish paella. It can include whatever meat or seafood ingredients are available, plus seasoning that usually includes celery, onion, bell pepper, chili pepper, and other spices. Created in the Louisiana bayous as a Cajun and Creole dish, étouffée is a mixture

of shellfish simmered in a roux-based broth and served over rice.

Other Cajun classics not as readily available outside more specialized establishments are boudin and cracklins. The first is made by grinding up leftover pork, mixing it with rice and various spices, and either cooking it as a sausage or deep frying it in little round balls. The second is prepared by frying pork skins into crunchy snack food.

In 1968, the Louisiana legislature created the Council for the Development of French in Louisiana to preserve and promote the French language and culture in the state.

the news spread rapidly throughout the United States, Mexico, Europe, and Asia, thousands converged on northern California within the next few years in hope of striking it rich. While few of these individuals achieved the wealth they so desired, their migration and settlement to this region set in motion the dynamics of shaping what is today one of the nation's largest and most culturally diverse cities (San Francisco) and the nation's largest state (California). The California Gold Rush of the late 1840s and 1850s profoundly shaped the course of local, state, and national history through the large influx of migrants from the eastern United States, as well as from other nations.

The ethnic and cultural diversity present in northern California in the mid-19th century in the wake of news of Marshall's discovery of gold foreshadowed the Golden State's future worldwide reputation; by the mid-to-late 20th and early 21st centuries California was considered a mecca of immigration, cultural diversity, and a place where people worldwide relocate to realize their dreams.

The legacy of the California Gold Rush is symbolized and commemorated in the name of San Francisco's NFL football team, the 49ers, who bear the popular nickname given to the migrants who relocated to the Bay Area in search of gold in the late 1840s and 1850s.

Historical Background

At the time of Marshall's discovery, California was a sparsely populated territory with a total non-Indian population estimated at 14,000. John Sutter, owner of the lumber mill where Marshall labored, wanted to keep Marshall's finding secret to prevent a flood of newcomers descending on the area. Despite Sutter's wishes, rumors of California as a gold-laden paradise soon spread to the East Coast and beyond.

A Chinese merchant from Canton named Chum Ming, who had been living in California at the time, quickly wrote a letter to a friend in his homeland that contained news of Marshall's find. Three Chinese immigrants who had just landed in San Francisco also sent letters to friends and relatives back home to announce the discovery of gold, setting the wheels of a major Chinese influx to California in motion.

California Gold Rush

On January 24, 1848, James Marshall discovered gold at Sutter's Mill near Coloma, California. As

Migration and Ethnic Relations

The discovery of gold at Sutter's Mill sparked a major wave of migration from various countries into the present San Francisco Bay Area and to California in general. Immigrants from China constituted the largest foreign-born population group lured by the Gold Rush. By the end of the 1850s, approximately 60,000 Chinese immigrants had settled in California. In China, rumors of Gold Mountain (the mid-century Chinese nickname for the United States) lured a large number of migrants across the Pacific Ocean, although many Chinese did not originally intend to settle permanently in California.

Most Chinese newcomers came from the southeastern provinces Fujian, Guangdong, and Guangxi, where a series of natural disasters and warfare—including the Opium Wars and the Taiping Rebellion—served as additional push factors encouraging residents of these provinces to seek better fortunes in Gold Mountain. China's southeastern provinces already had a well-established tradition of sending migrants to other regions of Asia to find employment, which stimulated further motivation to migrate in search of gold. The large number of Chinese making the journey eastward provided a boon for American traders and steerage operators, who charged passengers a \$40 to \$50 fare for a one-way trip to California. Many of these ships departed from Hong Kong and Canton.

The Chinese were not alone in their quest for gold. An estimated 7,000 immigrants from Mexico made the journey northward, despite the fact that Mexico had recently lost possession of California to the United States under the Treaty of Guadalupe Hidalgo, which ended the Mexican-American War (1846–48).

Tens of thousands of other immigrants from Chile, France, Germany, Ireland, Italy, and Turkey planted roots in California. Additionally, thousands of Anglos (non-Hispanic whites) of different ethno-national heritages relocated to California from the east coast. These American transplants from the eastern half of the country made the journey to the west coast either by sailing around the southern tip of Argentina toward California or by trekking across the rugged terrain in covered wagons via the California-Oregon trail. Whether by sea or by land, migrants

from the east coast faced a two- to six-month journey to California.

Prospectors searched for gold in the American, Sacramento, and San Joaquin Rivers and the Sierra Nevada Mountains using a variety of techniques. Those who lacked prior experience and better equipment often panned for gold in the rivers' waters using a sluice and screen, while others searched for placer (pronounced *plass-er*) gold near the earth's surface. Placer gold consists of gold flakes and stones. Those with more extensive mining experience preferred to mine for gold in the fields and foothills of the Sierra Nevada. The Chinese accounted for nearly one-quarter of all miners by the mid-1850s.

The rapid influx of newcomers to the West Coast in the wake of the Gold Rush transformed California seemingly overnight. San Francisco exploded from a tiny village of 1,000 inhabitants at the beginning of 1848 to a thriving city with more than 20,000 residents just two years later. In 1849 alone, more than 85,000 newcomers settled in California. The state's non-American Indian population boomed from just 14,000 in 1848 at the time of Mexican cession to 224,000 by 1852. The rapid surge in population expedited the process of statehood, as California gained formal entry into the union as the 31st state in 1850. However, the sudden population boom had negative ramifications.

As newcomers flooded into California with gold fever and new towns sprang into existence overnight, basic public services and the infrastructure remained nonexistent. Many new towns lacked police and fire departments, and that, coupled with hundreds or thousands of strangers living in proximity to one another, proved dangerous. Fires were a frequent occurrence and devastated numerous towns. Unsanitary conditions provided an additional concern. In many towns, contaminated drinking water led to sickness among a large portion of residents.

Approximately 1,500 residents of Sacramento perished in 1850 as a result of cholera. That same year, Sacramento also experienced floods and squatter riots. Pneumonia also took a toll on many gold seekers. Some historians estimate that of the original migrants to California in 1848 and 1849, approximately 30 percent succumbed to disease, violence, suicide, and other calamities.

As newcomers saw their dreams of finding gold unfulfilled after sacrificing everything they owned to make the trip to California, some took their own lives.

Unfortunately, the Gold Rush had some significant negative impacts on ethnic relations in California as well. The large, sudden influx of newcomers proved devastating for the Miwok, Maidu, and other indigenous Native American cultures of the local area, who found themselves unable to resist the immigrants who competed with them for their lands. An ethnic and class hierarchy soon emerged in California, as the state was inhabited by a heterogeneous population, with U.S.-born Anglos occupying the highest positions.

Immigrants from northern Italian provinces, many of whom came from a higher social class position than most other immigrants to California during the Gold Rush, became concentrated

as merchants in the fishing and agricultural industries within the Bay Area. Northern Italian immigrants also played a key role in the development of the Napa Valley wine industry. The social and economic experiences of migrants from northern Italy who settled in California in the 19th century contrast sharply with those of southern Italians. Primarily illiterate peasants from agrarian villages, southern Italians who settled in northeastern cities during the late 19th century were identified as an allegedly inferior racial group by the larger Anglo-Protestant society. Chinese, Mexicans, and Native Americans found themselves occupying the lowest rungs of the social hierarchy.

The Gold Rush produced a strong degree of anti-Chinese sentiment among Anglos, and in 1850 the newly established California state legislature implemented a monthly \$20 Foreign Miners Tax.

In 1851, Portsmouth Square in San Francisco, seen here, housed a restaurant, drug store, and print shop, among other establishments. Some profits from gold mining were spent locally to purchase food and supplies for the miners. They also went toward entertainment, including gambling, alcohol, and prostitutes. Local vendors, in turn, used the gold to purchase supplies from ships bringing goods into the state. The Gold Rush forever transformed San Francisco from a tiny village into an ever-growing city drawing more and more migrants.

The purpose of the tax was to discourage non-American miners, particularly the Chinese, from settling in California in the first place. The seeds of anti-Chinese resentment that had been planted in California throughout the 1850s escalated during the 1860s, as Anglos increasingly viewed the Chinese as unwanted foreigners who competed with them for jobs, spoke an unfamiliar language, wore unfamiliar clothing, and looked physically different from themselves.

Anti-Chinese nativism erupted into acts of violence in the 1870s, and in 1882, Congress passed the Chinese Exclusion Act. The act marked the first instance in American history in which a specific nationality was barred from entering the United States.

Proposition 209 asked California to dismantle any state affirmative action programs that it was conducting in any area, and Proposition 227 would require California schools to no longer provide bilingual education to non-English-speaking students. All three were approved by voters, although their effects were not necessarily what voters expected.

Background

Since 1911, Californians have been able to enact statutes, ordinances, and even constitutional amendments by means of the voter-created initiative, or to review measures initially passed by state or local legislatures using the voter-initiated referendum. Direct democracy in California also provides the electorate with the ability to recall elected officials. Supporters of direct democracy consider it the optimum way to express popular opinion. Opponents of the process aren't so sure. They have warned that its supporters might use it to deprive others of their civil liberties, and in some instances it has.

California has a record of people exercising white political hegemony, beginning with the agitation against Chinese immigrants in the 1850s and continuing through the internment of Japanese American citizens during World War II. The initiative and referendum process has allowed California voters to perpetuate this conduct, as evidenced in the repeal of the Rumford Fair Housing Act by referendum in 1964, a statute that had outlawed restrictive covenants against renting or selling to nonwhites. Historian Daniel HoSang calls this assault on multiculturalism by the California voter “political whiteness” that acts to perpetuate white privilege in campaigns that address racial liberalism in an increasingly multicultural and multi-ethnic society. Propositions 187, 209, and 227 each show how a majority white voting public has reacted to specific issues raised by a diverse and growing population in an increasingly multicultural California.

Proposition 187/Denying Services to Undocumented Immigrants

The debate over undocumented immigrants in California began during the mid-1980s as California's economy began to sour. Jobs, especially in the banking and aerospace industries, had shrunk

California Propositions 187, 209, and 227

During the 1990s, three ballot propositions that challenged the increasingly multicultural nature of California were put to the test. Proposition 187 (1994) prohibited California from providing services of any kind to undocumented immigrants,

because of cuts in defense spending, mergers and consolidations, and, with them, the tax base also diminished. Multifamily construction permits declined, while immigration from Latin America and Asia, fueled by political conflict in Central America and the Chinese takeover of Hong Kong, caused the state's population to grow by 25 percent. During the same period, the proportion of non-Hispanic whites fell from 71 percent to 59 percent. People who opposed the increasing multiculturalism of the state claimed that new immigrants took jobs away from U.S. citizens, that they cost the state money, and that they refused to learn the language.

By 1994, a coalition of immigration restrictionists, Republicans, and high-ranking immigration officials developed an initiative to eliminate spending state funds on undocumented immigrants. The initiative would prohibit the undocumented from attending public schools and colleges and using public health services. It established harsh penalties for document forgery and required all law enforcement officers to cooperate with federal and state agencies in reporting people suspected of being undocumented.

It required public schools to check the immigration status of all students and their parents or guardians every year, and to expel any student whose status could not be verified and made the same demands on the state's public colleges and universities. The initiative was given the formal title "Illegal Aliens. Ineligibility for Public Services, Verification and Reporting" and marketed as the "Save Our State" initiative. California's Republican governor, Pete Wilson, made it one of the centerpieces of his 1994 re-election campaign.

The clearest statements of supporters and opponents of initiatives and referenda in California are the materials they insert in the California Voter Guide that is distributed to each registered voter in the state. Proponents of 187, including the cochairs of the Save Our State Committee, referred to undocumented migrants in their voter guide statements as "ILLEGAL ALIENS" eight times and used the word "ILLEGALLY" six times. They claimed that welfare, medical, and educational benefits were the magnets that drew undocumented immigrants to California, and that opponents of the proposition were funded

by the organizations that provided services to those immigrants. Cutting off these benefits, they claimed, would cut the flow of immigrants into California and do the work politicians were unwilling to do. The initiative was supported by the Republican Party of California, and Governor Pete Wilson defended it in an ad campaign that distinguished between immigrants who came to this country the right way and immigrants who came the wrong way.

Opposition to Proposition 187

The rebuttal from the opponents of Proposition 187—including the California Parent-Teachers Association, California division of the American College of Emergency Medicine, and College of California Seniors—contended that the proposition was a badly drafted proposition that made a bad situation worse. Opponents of the measure included Los Angeles County Sheriff Sherman Block, California Teachers' Association president D. A. "Del" Weber, and California Medical Association president Ralph R. Ocampo.

The opponents conceded that undocumented immigrants posed a problem for the state, but said the people who would be most impacted were the Border Patrol and employers who hired undocumented workers. They warned that passage of the proposition would put federal funds at risk. Supporters, including the Border Solution Tax Force, a group allied with the Federation for Immigration Reform (an organization that favors immigration restriction), called the argument nonsense promoted by the special interests who benefited from the failure of border enforcement.

The campaign against Proposition 187 was disorganized. Taxpayers Against 187, a centrist group allied with the ballot argument against the proposition and tried to make increased border enforcement the key argument against its passage, instead of appealing to issues of social justice. Other opponents found the attack on immigrants by people who opposed the proposition distasteful and launched a grassroots community-based campaign, Californians United Against 187. While Taxpayers Against 187 tried to keep Latino immigrants out of the opposition campaign, Californians United understood that the proposition provided an opportunity

for immigrants to get involved in politics. Thus, on October 16, 1994, an estimated 70,000 to 100,000 people marched from East Los Angeles to City Hall carrying Mexican flags. While this was an impressive show of strength, it confirmed conservatives' fears that this group had no rights in trying to force the issue.

The proposition passed by a 59–41 margin, and 89 percent who voted in the 1994 election voted on the proposition. Sixty-three percent of white voters (who comprised 81 percent of the electorate in November 1994) voted for it, while 77 percent of Latino voters (comprising 8 percent of the electorate) voted against it.

Proposition 187 was never fully enforced. Lawsuits contesting its constitutionality were filed shortly after the election results. In 1998, federal judge Mariana R. Pfaelzer placed a permanent injunction on all major parts of the law, concluding that only the federal government could pass laws regulating immigration. Governor Wilson announced his intention to take the case to the Supreme Court, but with the subsequent election of a Democratic governor, Gray Davis, who said he would not appeal the decision, Proposition 187 was effectively repealed.

Proposition 209/Ending Affirmative Action

The success of Proposition 187 gave many people the idea that any proposition that reined in services offered to minority groups would do well in California. Proposition 209 was the idea of two academics: Glenn Custred, a professor of anthropology at California State University, Hayward, and Thomas Wood, executive director of the California Association of Scholars, a conservative organization that opposes academic liberalism. The pair had become frustrated by attempts to diversify the curriculum and makeup of the faculty in the state's universities and drafted the California Civil Rights Initiative (CCRI), which argued that public race- and gender-based affirmative action programs violated the Civil Rights Act of 1964, and thus should be ended.

Custred and Wood did not get the measure on the November 1996 ballot. But Governor Pete Wilson and Ward Connerly, an African American businessman and chairman of CCRI, whom Wilson had appointed to the University of California (UC) Board of Regents, persuaded the board to

pass a resolution ending affirmative action in the UC system. Connerly was very effective as the voice of CCRI, stating that Proposition 209 expressed a commitment to fairness, and led a picket in front of Pacific Gas and Electric in San Francisco when the company said it would oppose it.

The argument for the proposition was signed by Wilson, Connerly, and CCRI cochair Pamela A. Lewis. It framed the initiative in the Civil Rights Act of 1964, called affirmative action “reverse discrimination,” and said that affirmative action programs that enforced this reverse discrimination were costly and should be scrapped. It suggested the idea that women and minorities who needed special preference in hiring and in other areas in which affirmative programs existed was a myth, and asked voters to vote for fairness, not favoritism.

The argument against the proposition was signed by Fran Packard, president of the League of Women Voters of California; Maxine Blackwell, vice president, Congress of California Seniors, an affiliate of the National Council of Senior Citizens; and civil rights activist Rosa Parks. It described the initiative as one that would end equal opportunity programs and undo the strong protections in the state constitution against discrimination. It provided evidence that the California Council of Churches and General Colin Powell opposed the proposition, and suggested that what the supporters described as “fairness” was in fact a license to discriminate.

The supporters, including state Attorney General Daniel Lungren, state Senator Quentin L. Kopp, and San Diego law professor Gail L. Heriot, accused opponents of lying and suggested that a clause in the proposition that allowed consideration of gender if it was “bona fide” protected against unisex bathrooms. Opponents, represented by spokespersons of the United States YWCA, the California American Association of University Women, and the Leadership Conference on Civil Rights, reported that Newt Gingrich and Pat Buchanan, a noted xenophobe, supported the proposition, and that the meaning of the proposition was favoritism, not fairness.

Proposition 209 passed by a 55–45 margin, and, like Proposition 187, it was immediately challenged by a federal civil rights suit. A federal district court judge placed an injunction on it,

but in April 1997 the Ninth U.S. Circuit Court ruled it was constitutional and the Supreme Court refused to hear the case in November. The immediate impact was a sharp decline in the number of minority students accepted by the University of California system for the 1998 to 1999 academic year. In the decade since, graduation rates of African American and Latino/a students at University of California schools have increased substantially.

Proposition 227/Ending Bilingual Education

Proposition 227 had its roots in Proposition 187 and the 1994 gubernatorial campaign. Ron Unz, a software developer who ran against Pete Wilson in the 1994 gubernatorial race on an English-only platform and won 34 percent of the vote in the Republican primary. Unz was critical of the state's bilingual education programs, and, after the success of Proposition 209, he produced an initiative that would end these programs in favor of a year of English immersion and subsequent integration into classes conducted in English. He called the initiative "English for the Children," and, to sell it, described Latino parents and children as victims of bilingual education. In effect, he was launching an attack on multiculturalism, as language is one of the principal ways in which cultural heritage is maintained.

Unz insulated himself against this charge by enlisting the support of Latino/a educators who disagreed with the way bilingual education was working; some of these educators appeared as proponents of the ballot measure. The argument for the initiative, eventually titled "English Language in Public Schools," began with the premise that bilingual education in California had failed to teach children to read and write English. Because learning a new language gets harder as a child gets older, the proponents argued, they proposed that California schools require children be taught English in "sheltered immersion" classes as soon as they started school, although waivers could be given to children who would benefit more from another method. Bilingual education, they wrote, segregated children who did not speak English and prevented them from becoming successful members of society.

In their rebuttal, opponents observed that many bilingual education programs worked, that the initiative would create classrooms with first

through sixth graders together, and that funders of the initiative were right-wing zealots who had no business telling California teachers how to do their job. Opponents argued that passage of the initiative would impose an untested method of teaching English on every school district in the state. Of course children should learn English, they wrote, but school districts, in conjunction with parents, should decide what works best in their communities.

Supporters of the proposition, represented by Jaime Escalante, the math teacher portrayed in the movie *Stand and Deliver*, said that none of the opponents' arguments made sure that children would learn English.

Political whiteness once again prevailed. The initiative, which was on the 1998 primary ballot, was opposed by all four major gubernatorial candidates and by President Bill Clinton, and opponents of the initiative were able to link it to Proposition 187. The legislature, in fact, passed a more moderate bill that gave school districts more flexibility in phasing out bilingual education, but Governor Wilson, two weeks before the election, vetoed the bill and endorsed the proposition. In a low-turnout election, Proposition 227 won 61 percent of the vote, 22 points more than the "no" vote. White voters made up 69 percent of the electorate, and exit polls showed that 67 percent of them voted for this initiative.

Conclusion

On the strength of Proposition 209 ending affirmative action, Ward Connerly promoted a proposition that prohibited state and local government agencies from collecting data concerning race and ethnicity, the "Racial Privacy Initiative." The net effect of this proposition would have prevented the state from gathering statistics about housing discrimination. He filed the initiative with the secretary of state in February 2001, and a coalition of groups including the American Civil Liberties Union and the Mexican American Legal Defense Education Fund had already begun tracking it. These groups convinced the state to title the initiative "Classification by Race, Ethnicity, Color or National Origin" and formed the Coalition for an Informed California to fight what they labeled an attack on the enforcement of civil rights laws.

Voters defeated Connerly's proposition by a 28-point margin. Given a shift in party registration, due in part to the increase of Latino/a voters prompted by Proposition 187, it is unlikely that California would pass such an initiative today.

subsequent federal and state cases, *Cabazon* arose out of enduring tensions between tribal, local, and state governments.

By the mid-1980s, the Cabazon Band of Mission Indians began operating high-stakes bingo and a card room without regard to California State and Riverside County laws. Under pressure from law enforcement and politicians, the Cabazon Band filed suit against Riverside County in federal court seeking a declaratory judgment that the county lacked authority to apply its gambling-related ordinances inside reservation territory. The state of California joined the case on behalf of the county, and the district court found in favor of the tribes, ruling that neither the state nor the county had authority to apply gambling-related laws within reservations. The Ninth Circuit Court of Appeals affirmed the district court judgment in 1986, and the U.S. Supreme Court subsequently granted the state's petition for review. While those siding with tribal interests feared that the Supreme Court's willingness to review the case signaled an inclination to overturn in the state's favor, in 1987 the court released a 6–3 decision affirming lower court rulings that the county and the state had no authority to enforce their gambling-related laws on reservations.

Couching its position in relation to fears that Indian gaming would attract and foster organized crime, the state of California argued that Public Law 83-280 (commonly referred to as Public Law 280, or P.L. 280) authorizes states to regulate on-reservation activities. Passed in 1953, P.L. 280 expressly authorized six states (California, Minnesota, Nebraska, Oregon, Wisconsin, and soon-to-be-admitted Alaska) to enforce criminal laws on (most) reservations within their borders. The statute also expressly grants to state courts adjudicatory jurisdiction over private civil claims. California argued that P.L. 280 additionally authorizes state regulatory power in public civil matters.

In considering (and ultimately rejecting) the state of California's appeal, the *Cabazon* majority relied on the interpretation of P.L. 280 put forth in *Bryan v. Itasca County* (1976). In *Bryan*, the court ruled that P.L. 280 grants criminal jurisdiction to states but that it does not grant civil regulatory jurisdiction. The task before the court in *Cabazon*, then, was to make a determination

California v. Cabazon Band of Mission Indians (1987)

Even though it stood as valid law for little more than a year, the U.S. Supreme Court ruling in *California v. Cabazon* remains a momentous decision in federal Indian law. Cited in hundreds of

The Mashantucket Pequot Tribe's Foxwoods Resort Casino in Ledyard, Connecticut. The Cabazon decision in 1987 changed the world of Native American gaming. By 1996, 184 tribes were operating 281 gaming facilities spread across 24 states. As of 2007, Native American gaming had become a \$25 billion industry with over 360 tribal casinos in 28 states.

as to the character of California law regarding gambling—is it criminal or regulatory in nature? Citing previous lower-court decisions that the Supreme Court had tacitly affirmed by denying review (such as *Seminole Tribe v. Butterworth* and *Barona v. Duffy*), the *Cabazon* majority found that California laws regarding gambling are regulatory in nature. The court reasoned that the existence of provisions encouraging lottery gambling and charity bingo indicate that rather than being criminally prohibited, gambling is regulated (and even promoted) under California law. Because California law seeks to civilly regulate gambling rather than criminally prohibit it, P.L. 280 does not offer the state an avenue to apply gambling-related laws on Indian reservations.

While recognizing that the Supreme Court's ruling centrally privileged federal interests over those of states *and* tribes, American Indian nations greeted the decision enthusiastically. Many tribal leaders, advocates, and allies hoped that the ruling would put to rest growing controversies over state and federal roles in regulating Indian gaming, freeing tribes to pursue and self-regulate gaming ventures. These hopes were not to be fulfilled. The intense legislative aftermath of the case

would ultimately reflect key premises embraced by both the majority and minority opinions. The majority opinion reiterated the restrictive legal and political assertion that tribal sovereignty is always dependent on and subordinate to the federal government. Even while the *Cabazon* ruling finds that the U.S. Congress did not use P.L. 280 to authorize state jurisdiction over regulatory matters, it acknowledges that Congress has the authority to do so. The *Cabazon* decision intentionally leaves fully intact the plenary power of the U.S. Congress to wield authority over the affairs of Indian nations. Moreover, the first and final lines of the dissent explicitly called for Congress to deploy this plenary power to supervise Indian gaming.

In 1988 Congress responded to *Cabazon* by superseding it with the Indian Gaming Regulatory Act (IGRA). This exceedingly complex law provides a statutory basis for Indian gaming and establishes a network of regulatory policies and procedures. Even while spawning hundreds of lawsuits and vexed political transformations, the IGRA has nevertheless provided Indian gaming with a modicum of stability and affirmed the authority of tribes to operate and self-regulate high-stakes

bingo enterprises. Provisions for casino-style gaming also stand at the core of the IGRA. These provisions require tribal and state governments to negotiate the regulatory conditions under which tribal casinos can operate games such as slot machines, blackjack, craps, and roulette.

Because the IGRA grants significant power regarding tribal affairs to state governments, some scholars and activists committed to both rigorous scholarly inquiry and tribal interests aggressively criticize the post-*Cabazon* era of federal Indian policy in which states are asserting more and more power over tribal affairs while the nation-to-nation relationships with the federal government erode. (The nation-to-nation relations between tribes and the federal government are founded on the inherent sovereignty of Indian nations, treaties, and the fiduciary responsibility of the federal government toward tribes.) Yet other commentators and stakeholders emphasize the extent to which the IGRA acknowledges the inherent sovereignty of tribes and welcomes the diplomatic pathways mandated by the act as opportunities for tribal nations and state governments to work outside federal restrictions in order to collaborate on behalf of tribal and local interests.

Because it gave birth to the IGRA, *California v. Cabazon* remains a fundamental landmark in the emergence of the \$26 billion-a-year Indian gaming industry. While this fiscal influx has only had direct daily impact on a small minority of American Indians, it has significantly empowered Native communities and institutions while fundamentally shifting mainstream (mis)understandings of American Indian people and their nations. *Cabazon* also serves as a turning point at which federal Indian policy in the United States embarked on its current new-federalist trajectory.

Californios

Californio was a term used by Hispanic settlers of California to identify themselves before the annexation by the United States after the Mexican-American War (1846–48). This term appears to have emerged after Mexico gained independence from Spain (1821), as it best expressed the settlers’ regional identity and culture. It also refers to their descendants. Following the annexation, the Californios gradually lost their land, social influence, and political power. Although the numbers of the colonizers were small, their heritage in the state is of great importance.

Spanish Period

The Spanish settlement of California started in 1769 with the establishment of San Diego de Alcalá—the first of the 21 missions set up in California. Apart from the missions and four *presidios* (military forts) under Spanish rule, only three official civil *pueblos* (towns) were founded: present-day San José and Los Angeles, and the Villa de Branciforte (Santa Cruz). During the Spanish period relatively few land grants were given to individuals.

The society of colonial Mexico was hierarchically organized, with a division between the *gente de razón* [people of reason] (Catholic Spaniards) and the *gente sin razón* [people without reason] (non-Christian *Indios*). The pure [Spanish] blood [*limpieza de sangre*] was of much importance; however, many were, in fact, mestizo. Racial categories were relatively flexible and by the late 18th century “Spaniard” also included people of mixed blood born in the Americas. Apart from race, wealth was also one of the factors that defined social status. The wealthy kept apart from the *gente corriente* [working-class people].

Important elements of the Spanish culture in the then scarcely populated region were the Catholic faith, family loyalty, patriarchy, hospitality, community fiestas, folk music, and dances. Other customs included, for example, bullfights and horse racing. It was in this period that *vaqueros* [cattle herders on horseback] appeared in California. This pattern later spread and—adapted by the Anglos—evolved into the American cowboy.

The Mexican Period

Independence from Spain transformed California from a predominantly clerical province to a pastoral economy. The secularization process led to the redistribution of the mission lands, which passed largely into the hands of Californio families, while the wealthiest rancheros controlled vast lands. Ranchos prospered and cattle raising was vital.

Under Mexican rule, the existing social patterns remained largely unchanged. Although the Spanish racial *casta* system was abolished in 1824, Californio elites still maintained the racial-ethnic hierarchy, and intermarried within their group or with Anglo and European settlers in California. Family and patriarchy retained their important roles. Among the political Californio leaders who emerged in this period were, for example, Mariano Vallejo, José Antonio Carrillo, and the Pico brothers. By 1848, probably around 7,000 people considered themselves Californios.

After the Annexation

Annexation by the United States brought profound changes to California's legal and economic systems, while the Gold Rush changed its demographic and cultural profile. Whereas in 1848 Spanish-speaking people constituted approximately a half of the 15,000 inhabitants of the region, in 1850, when California acquired statehood, this population accounted for less than 20 percent. Many Californios themselves left their ranchos and headed toward the diggings, which also contributed to the gradual decline of the Californio community.

Under the Treaty of Guadalupe Hidalgo (1848) the Spanish-speaking people who remained on the land could become U.S. citizens and were ensured the free enjoyment of their liberty and property. However, Californios soon faced various problems. First, by the 1890s they had lost most of the

land they had owned before the war because of the complicated procedures of verification of their land titles introduced by the American government (1851), or because of taxes and fees. Second, they quickly lost political power. Third, although the California Constitution of 1850 stated that all state laws were to be published in English and Spanish, the use of Spanish was soon restricted and laws were published only in English. Fourth, many Californios fell victim to the prejudices that emerged toward non-European immigrants and often faced racist attitudes such as those inherent in the Foreign Miner's Tax, the Sunday Law, the Greaser Law. Californio elites intended to maintain the status distinctions within the Spanish-speaking population to escape prejudice. Nevertheless, because of their (often multi) racial profile (for example, Pío Pico, the last Mexican governor of California, was of multiracial origin), their "whiteness" was sometimes questioned. This was also the case with some prominent figures such as Pablo de la Guerra, a delegate to the California Constitutional Convention of 1849.

By the end of the 19th century the old pastoral California began to disappear, also because of the natural disasters of the 1860s, which destroyed crops and ruined about three-fourths of the cattle holdings.

One of the most famous outlaws and legendary figures in American California was Joaquín Murrieta. Considered a bandit by the Anglos, he was seen as a revenge-driven hero by the Spanish-speaking population. Murrieta is cited as one possible source of inspiration for Johnston McCulley in creating the character of Zorro (1919). Murrieta later also became one of the figures invoked by the Chicano Movement and appeared, for example, on the first Chicano mural painted by Antonio Bernal (1968).

Spanish-Mexican Heritage

Today the most obvious and visible examples of Spanish heritage are the names of cities like San Francisco and Los Angeles, rivers, and mountain ranges. The recognizable Californio names still used in California include Vallejo, Castro, Bernal, Peralta, Yorba, Sepulveda. Spanish architecture is visible in town layouts, missions, and ranchos that constitute important remnants of the colonial past. Examples include San Diego Mission

and Rancho Petaluma. It is also interesting to note that the municipal lands of Los Angeles, San Diego, and San Jose are based on the Spanish grants to the pueblos.

Spanish and Mexican influence on California's municipal and state laws is also evident; the inclusion of community property in marriage in the California Constitution of 1850 is one example of the Spanish influence.

Californio traditions are still alive in the state. Such events as the Old Spanish Days fiesta in Santa Barbara (since 1924) contribute profoundly to California's multicultural society. The vaquero culture remains an important part of California's heritage and differs from that of Texas. Each year different aspects of this tradition are celebrated at various gatherings and shows throughout the state like the Vaquero Days Western Heritage Festival.

It is difficult to estimate the number of the descendants of Californios today. According to U.S. census data, in 2000, fewer than 300 people reported such ancestry. Despite their struggle for the preservation of the Californio culture, today the Hispanic culture in California is predominantly Mexican.

Call Northside 777

Call Northside 777 is a 1948 film noir production directed by Henry Hathaway, a veteran of silent movies who successfully transitioned to sound productions. Filmed in semi-documentary style, the movie featured James Stewart as a *Chicago Times* reporter named P. J. McNeal (based on the real-life reporter James McGuire) and Lee J. Cobb as his editor, Brian Kelly (in real life Karin Walsh).

The story begins when the reporter happens on a classified advertisement offering a large reward for information proving the innocence of a convicted murderer. Intrigued, McNeal discovers the ad was placed by a poor woman named Tillie Wiecek who scrubbed floors for years to earn enough money to try to exonerate the convict, who turns out to be her son Frank. The son, played by Richard Conte, has been in prison for 11 years, along with accomplice Tomek Zaleska, played on screen by George Tyne, after being convicted of the murder of a policeman during a speakeasy robbery in 1932. What McNeal sees first as an interesting human interest story quickly turns into the reporter's quest to determine whether Frank is innocent, as he and his mother steadfastly maintain.

The first Hollywood feature movie to be filmed on location in Chicago, the production includes views of the Merchandise Mart, Holy Trinity Parish, and other recognizable Chicago landmarks that lend authenticity to the documentary style. Stewart's portrayal of the crusading reporter depicts an era when journalists were seen more as representatives of the common people seeking truth than as part of the corporate structure that newspapers have become today.

The case appears to rest on whether a witness who identified Wiecek in a police lineup had seen him before and been influenced by police to identify him as the perpetrator. The reporter is eventually able to locate a newspaper photograph of the two together and gets a photographer to enlarge the date it was taken, proving the witness had seen Wiecek before. Technology of the day also plays an important part, with an extended portion of the film devoted to explaining how a lie detector works. The results, along with the enhanced photograph, are sent to the hearing board over the new "wire photo system," leading to the conviction being overturned.

Justice for All

The film's dialogue emphasizes the reporter's quest for justice, and stresses that only in America, where everyone is treated equally under law regardless of race, ethnicity, or social standing, could this type of justice occur. In overturning Wiecek's conviction, the film's dialogue states: "It's a big thing when a sovereign state admits an error. Remember this . . . There aren't many governments in the world that would do it." Yet, while these themes reflect the generally positive and trusting public view of American government in the years following World War II and the initial phases of the Cold War, the premise is also clearly at odds with the resistance McNeal encounters from police and other officials as he questions the verdict and attempts to prove Wiecek's innocence. Additionally, some of the methods the reporter uses—including impersonating a police official to gain access to confidential records—clearly violate American standards of civil rights and protections.

The Real-Life Case

The real case upon which the movie is based involved the convictions of two Polish Americans, Joseph Majczek (Frank Wiecek in the movie) and Theodore Marcinkiewicz (Tomek Zaleska), who were found guilty based largely on the testimony of one eyewitness. The convictions were upheld on appeal in *People v. Majczek* (and Majczek's mother did indeed scrub floors for years to raise money to offer a reward for evidence). Although the film identifies the Wieceks as Polish, there is little attempt to place the family or the story within actual events of the day.

In reality, a series of some 30 articles published in the *Chicago Times* over a 10-month period beginning on October 11, 1944, brought quick reaction from Chicago's large Polish American community. The Polish Alma Mater, Polish Roman Catholic Union, Polish Welfare Association, and several other organizations sent petitions asking that the case be reopened. Faced with wide public interest, the newspaper took the unprecedented step of hiring prominent attorney Walker Butler, who was also a member of the state Senate. Butler's contention was that the only evidence implicating Majczek and Marcinkiewicz was the testimony of the speakeasy owner, Vera Walush,

and that she had clearly changed her statement, most likely under pressure to avoid being prosecuted for operating an illegal speakeasy.

Following the reporter's investigations—which did *not* involve the fictitious newspaper photo dating—an appeal to the state pardon board resulted in Majczek's release from Stateville Prison in Joliet, Illinois, on August 15, 1945, with a full pardon based on innocence and signed by Governor Dwight Green. Marcinkiewicz was released in 1950. In recognition of its services to justice, the *Chicago Times* and its reporters received numerous awards. The newspaper declined Tillie Majczek's \$5,000 reward. The Illinois legislature later appropriated \$24,000 to compensate Majczek for wrongful conviction and \$35,000 for Marcinkiewicz.

Caló

First gaining prominence as part of the pachuco subculture of the 1940s, caló has since emerged as a notable linguistic feature in the communication styles and cultural identities of many urbanized Mexican Americans throughout the southwestern United States. Sometimes conflated with Spanglish, caló actually differs from Spanglish in some key respects. Whereas Spanglish refers to a simple

linguistic practice of code switching between English and Spanish when communicating statements and questions, caló features specific words and phrases that are unique to this particular dialect. In other words, caló features a specific lexicon, while Spanglish does not. Various styles of Spanglish exist throughout the United States, as a result of different ethnic populations of Spanish-speaking Latinos in different regions of the country (Puerto Ricans and Dominicans in the northeast and Cubans in southern Florida, for example), each of which features its own distinct style of Spanish. Although certain local discrepancies may be found, caló as a whole is a much more uniform linguistic practice across the southwest than is the Spanish language (and subsequently, Spanglish) throughout the nation. Caló is sometimes described as a highly developed form of in-group ethnic slang that incorporates Mexicanized English and Anglicized Spanish.

Historical Development and Key Features

The exact origins of caló among Mexican Americans are subject to debate among linguists, historians, and Chicano studies scholars. However, a prominent theory contends that the antecedents of contemporary caló originated among the gypsies of Spain [*los gitanos*], who developed their own form of slang by blending their native Romany with Castilian Spanish during the 19th century. This hybridized slang eventually made its way to Mexico City by the early years of the 20th century and subsequently reached the major border city of El Paso, Texas, as a result of immigration from Mexico City throughout the 1920s.

In El Paso, caló slang underwent a further hybridization as bilingual Tejano youth infused it with English influences. The primary speakers of this new caló were largely lower-income Mexican American males who came to be known as “pachucos.” Improved railroad lines connected Texas with California, and large numbers of pachucos relocated to Los Angeles throughout the 1930s. As these young men migrated to the West Coast, they brought their linguistic idiosyncrasies with them and firmly planted caló in the cultural landscape of southern California. In the barrios of East Los Angeles during the 1940s, pachucho lifestyle flourished as it became associated with bilingualism, caló, and the zoot suit. Other Mexican

George Lopez performs at the Kids Inaugural: We Are the Future concert in Washington, D.C., in 2009. Lopez has used caló on television in his ABC sitcom *George Lopez*.

American teenagers began to adopt these customs and mannerisms, including caló speech.

Some of the more common caló words and phrases include *Órale!* [Okay, or All right!], *qué Onda?* [What’s going on?], *simón* [yes], *chále* [no], *a toda madre* [everything is swell], and *vato* [guy/dude]. Male speakers of caló may use the term *carnal* to refer to their biological brother or very close friends to whom they feel a strong attachment. The female counterpart is *carnala*. Similarly, the terms *ése* and *ésa* are frequently used as informal labels for a man or woman, respectively. Another defining feature of caló is its tendency to replace the letter B with V in the word *varrio* (traditionally spelled *barrio* in Spanish). The term means neighborhood

but is popularly used to connote specifically an urban district with predominantly Mexican/Chicano residents; as such *varrio* remains one of the most common terms in poetry and literature produced in caló. Much like the rhyming verses that comprise the jive talk of African American street slang, caló also exhibits numerous phrases based on rhyme, including *Me entiendes, Mendez?* [Do you understand me?] and *Al rato, vato!* [Later, dude!] akin to “see you later, alligator!”

Caló in Popular Culture

Caló usage is heavily featured in several motion pictures depicting Mexican American/Chicano themes, such as *American Me* (1992), *Blood In Blood Out: Bound by Honor* (1993), *Born In East L.A.* (1987), *Mi Vida Loca* (1994), *My Family/Mi Familia* (1995), *Selena* (1995), *Stand and Deliver* (1988), *Walkout* (2006), and *Zoot Suit* (1981). In addition, Chicano comedian George Lopez uses caló words and phrases extensively throughout his stand-up routines, thus requiring audiences to have a certain degree of familiarity with caló to fully comprehend his punch lines. Lopez also incorporated caló into his television sitcom *George Lopez* and his late-night talk show, *Lopez Tonight*. Numerous Mexican American/Chicano rappers such as Kid Frost, Jae-P, Akwid, and Mr. Shadow also rely on caló to deliver rhymes to their fans. Kid Frost’s popular 1990 single “La Raza,” somewhat of a Chicano pride anthem, was included on the soundtrack to the 2004 video game *Grand Theft Auto: San Andreas* and exposed caló to millions of younger generation non-Mexican gamers. Caló is also a central aspect of Chicano music and literature, as well as the lowrider subculture of the border states.

The rapid growth of Mexican American communities throughout the southwest, combined with the increased visibility of Mexican Americans/Chicanos in film, television, music, and comedy, ensures that caló will retain its social and linguistic significance for many years to come. As such, caló’s exposure is sure to reach ever-increasing numbers of Americans of non-Mexican descent as well as those who live outside the southwestern borderlands in the future.

Cambodian Americans

The first Cambodian immigrants, numbering no more than a couple hundred, arrived in the United States in the late 1950s and early 1960s; they were drawn by the promise of USAID-funded scholarships. Diplomatic tensions between Cambodia and the United States suspended connections between the countries for much of the 1960s. Immigration resumed in 1970, increasing as a result of a renewed U.S. relationship with Cambodia’s pro-Western leader, Lon Nol.

Civil war raged in Cambodia between 1970 and 1975, as Pol Pot and the communist Khmer Rouge opposed the U.S.-supported Lon Nol government. When Pol Pot entered the city of Phnom Penh on April 17, 1975, he defeated Lon Nol and set into motion a series of reforms. As estimated by scholars, these actions resulted in the deaths of between 1 and 2 million Cambodians.

Between 1975 and 1979, the Khmer Rouge regulated every aspect of civil life: abolishing money, separating families, forbidding education and the expression of individuality, and instituting a pervasive culture of fear. In January 1979, the Vietnamese liberated Phnom Penh, bringing an end to the terror. This signaled a new beginning for massive numbers of Cambodian refugees who, with the help of the global community, relocated to countries such as Canada, Australia, France, and the United States.

Of the 1.8 million Cambodian immigrants to the United States, most notable are the 152,000 refugees of the late 1970s Khmer Rouge occupation.

Survivors of genocide, these individuals frame a Cambodian American experience intent on recovering what may have been lost during the Khmer Rouge occupation, and creating strong, healthy communities in their adoptive countries.

Cambodian Refugee Families

Cambodians who arrived in the United States in the 1980s lived through a series of political and sociocultural transformations, enduring decades of political instability, including the genocidal regime that ruled Cambodia from 1975 to 1979. Many who survived the Khmer Rouge fled to Thai-Cambodian-border refugee camps, where they stayed, on average, five to seven years. Later they resettled in the United States as refugees.

This sequence of events had a significant impact on Cambodian family systems. Between 1975 and 1979, the Khmer Rouge systematically abolished the family unit, which was considered a threat to their absolute control. Children were separated from parents. Husbands and wives were separated from one another. The Khmer Rouge tried to remove any parental influence like parental love, support, and discipline, so that the revolutionary organization could have complete control over children. Many survivors' stories and memoirs attest that the regime failed to destroy deep affection between family members, especially between parents and children. But the Khmer Rouge did succeed in creating a lasting impact on the integrity of the family through murder, forced separation, and instilling fear and distrust among people.

Today, Cambodian families in the United States are complex. A family may be comprised of individuals who, as children or adults, lived through the Khmer Rouge regime, fled to refugee camps, and resettled in the United States. The same household may include children born in refugee camps and children born in the United States. Almost all Cambodian families lost one or more family members. Although many reunited after the fall of the Khmer Rouge, some families were separated when they fled to refugee camps or resettled in the other countries. It is not uncommon for a Cambodian American family to have relatives resettled in France, Australia, or Canada, and some members still in Cambodia. Many Cambodians are still searching for family members with whom they lost contact more than 30 years ago.

Current Demographic Profile

The 2010 U.S. census estimates that 231,616 individuals identify their ethnicity solely as Cambodian. Additionally, 45,051 individuals identify as another ethnic group or groups, in addition to Cambodian, bringing the estimated total United States population to 267,667.

This number, up from 206,000 in 2000, indicates a nearly 25 percent rise in those who identify as Cambodian in combination with other groups. Though there is no way to identify as Cambodian American on a census form, the increase suggests the strengthening of such an identification, one arising from a perceived connection with both a country of heritage as well as the country of residence and/or birth.

Though Cambodian Americans reside in all 50 states, the largest population can be found in California, with a concentration in Long Beach, a city that boasts a vibrant mile-long business corridor as well as a Cambodian/Cambodian American population of over 100,000. Lowell, Massachusetts; Seattle, Washington; San Francisco, California; Philadelphia, Pennsylvania; Minneapolis, Minnesota; New York, New York; Dallas, Texas; and Chicago, Illinois are also home to significant Cambodian American communities.

Contemporary Cambodian American Culture

Cambodian American communities across the United States have established organizations and religious institutions (mainly Theravada Buddhist temples) to revive Cambodian culture and spiritual practices that had been forbidden to them. These community-based organizations, many of which started as mutual assistance associations, and religious institutions play significant roles in strengthening families and individuals of all ages by providing comprehensive social services and/or spiritual support.

After more than 30 years of silence, Cambodians who survived the Khmer Rouge regime have started telling their stories to their children and to the public. Cambodian community organizations have been instrumental in facilitating these significant dialogues between generations and between Cambodians and non-Cambodians. In collaboration with scholars and researchers, these organizations have been conducting oral history projects, some of which resulted in video testimonials

and a museum exhibition. Different forms of self-expression are encouraged.

Dialogue between survivors and their children is the first step toward breaking the generation gap that was created by the complexity of Cambodian American families and that has affected relationships between family members and their well-being. This is the first step toward healing for communities, families, and individuals.

and Pinal Apache, almost entirely women and children, near Camp Grant, Arizona. The attackers and others argued that this action was justified by repeated Apache depredations. The massacre has sometimes been presented as simply another Anglo atrocity inflicted on Native Americans, but the diversity of the mob members suggests the complexities of conflict in at least some areas of the 19th-century West.

The Attack

Before the massacre, the Apache had surrendered at Camp Grant in accordance with army instructions. Having become prisoners of war, they had a right to expect military protection from attacks, and, having turned over their weapons to the troops, they could not defend themselves. The Apache were several miles away from the camp when attacked, however, so the garrison was unaware of the massacre until later the same day.

Some Apache were shot from a distance; however, most died as a result of injuries inflicted at close distance by their assailants. The attackers had to know that most of their victims were women and children and that the Apache, with few exceptions, were unresisting. A number of Apache children were seized, and most of them were retained by Mexican American families or sold into slavery in Mexico.

Responsibility for the massacre must be attributed to the Anglo community. In addition to providing some of the leaders of the mob, Anglos furnished weapons, ammunition, and food to the attackers. Many Anglos had pledged to participate in the attack, but few appeared when the mob gathered, perhaps because they thought that attacking the Apache would bring them into combat with the troops.

Western Reactions

The attackers and their supporters maintained that the massacre was entirely justified retaliation for Apache misdeeds and called their action a "raid" to prevent further Apache raids. The attack was portrayed as an act of desperation, because of the failure of the federal government to end Apache depredations. Undoubtedly, Arizona was a dangerous area in the 1870s. Apache raids were occurring, but the evidence suggests strongly that the Apache at Camp Grant had not been participants.

Camp Grant Massacre

On April 30, 1871, a mob consisting largely of Native Americans (O'odham, also known as Papagos) and Mexican Americans, with a few prominent Anglos, murdered more than 100 Aravaipa

In the west, particularly, Native Americans were viewed generally, at best, as encumbrances and, at worst, as savages who either the army or civilian volunteers should be allowed either to exterminate or, at least, to confine to reservations with the proviso that Anglos might change the dimensions of the reservations or even abolish the reservations, if such actions suited their purposes. Native Americans such as the O'odham who adapted fairly rapidly to Anglo pressure to become farmers were viewed somewhat more favorably than the Apache by the Anglos, but, in the long run, their treatment by the Anglos was little better than that experienced by the Apache.

The Trial

Criticism of the behavior of the attackers continued outside the southwest, and the federal government threatened to place the area under martial law unless the perpetrators were indicted and tried. Finally, in 1871, many attackers were tried at the territorial court in Tucson. The jury took less than a half-hour to reach a "not guilty" verdict, an outcome that was typical of what occurred at the time during legal proceedings against Native Americans, Mexican Americans, or Anglos who killed or mistreated Native Americans.

Subsequent Interpretations

Economic factors seem to have played a considerable role in the deliberations of the charges against the Anglo and Mexican American elites who instigated and, to a significant extent, led the massacre. Arizona and the rest of the southwest had attractive resources, but development was just beginning. The presence of Apache who preferred roaming freely to living a constricted life on a reservation might discourage more investment and immigration and thereby limit commerce. Moreover, Mexican Americans and O'odham had a long history of joint paramilitary action against the Apache. Conscious of the increasing Anglo economic, political, and demographic ascendancy, they may have wanted to conciliate the Anglos by differentiating themselves still further from the Apache by participating in a new attack on the Apache.

Recently, the dissemination of more factual information about the massacre, as opposed to legends, seems to have increased Anglo awareness

of the sordid and far-from-heroic nature of the attack. Memories of what occurred at Camp Grant remain robust among the Apache who, even today, must continue their struggles to retain their land and to win greater respect from other groups. By and large, present-day Chicano writers have skirted the subject of warfare between Mexican and Native Americans because they tend to minimize differences, including open conflict, between the two groups.

Canadian Americans

Canada borders only water and the United States and is the Western Hemisphere's largest country. The border with the United States is, at more than 5,000 miles long, the world's lengthiest undefended border. Internal tensions between French- and English-speaking Canadians in particular have fueled immigration to the United States over a number of years, and especially in the 20th century.

Although there has always been a flow of people between Canada and the United States, reliable data have only been kept since the 1910 census of the United States and the 1911 census

of Canada. Migration is also somewhat seasonal: the Canadian American population swells in the winter months. States such as Florida and Arizona have strong seasonal populations of Canadians, which affects items such as media for Canadians in the United States. By 1990, almost 30 percent of Canadians in the United States were 65 and older, which lowers the average income level for the group.

Since the 1850s the number of Canadians emigrating to the United States has grown at a steady rate. The number of Canadians entering the United States was throughout the early and mid-20th century around four times that of U.S. citizens emigrating to Canada. Immigration levels peaked in the 1920s and dropped sharply after 1930, when the economic woes of the Great Depression meant less opportunity for immigrants. The numbers picked up again in the 1950s and 1960s, however, and the immigration stream flowed unstemmed until the United States modified its immigration laws in 1965. Canada followed suit in 1976. Numbers of immigrants from Canada to the United States dropped by 60 percent after these legal changes. Even so, there were in excess of 3.5 million Canadian immigrants (net) into the United States in the 20th century alone.

Once the immigration laws changed, so did the face of immigration in the United States as a whole. In the early 1960s nearly 12 percent of all immigrants to the United States originated from Canada; within the next two decades that percentage dropped to 2 percent. By the time the 1980 U.S. census was taken, nearly 65 percent of all immigrants who listed their country of origin as Canada had been in America more than 20 years. By the time of the 1990 census only 0.2 percent of Americans reported Canadian ancestry. (It is worth noting that the U.S. census does not include immigrants from Newfoundland or Nova Scotia, or Acadians and French Canadians in the “Canadian” category. These groups each have their own category.)

Regionally speaking, the highest numbers of Canadian Americans are in the northeastern United States, with more than 110,000 residing in Massachusetts and New York alone. California presents a notable exception to this trend as it is actually home to the largest number of Canadian Americans: more than 86,000.

Assimilation

Canadian Americans, especially English-language immigrants, enjoy a very high level of assimilation into American culture. Even French-speaking Canadians usually also speak English, and this lack of language barrier plays a major role in assimilation. The proximity of the two nations is also a factor that facilitates acculturation, since so many traditions are shared between the close neighbors. In fact, in excess of 80 percent of Canadian immigrants to the United States who entered before 1980 are now naturalized American citizens.

Canadian Americans also benefit from the proximity of their country and any loved ones or traditions they left behind as they migrated. Most of the population of Canada is in the south of the country, close to the United States. Canadian news and media are readily available in the United States, and visits to Canada are easy. Furthermore, there is little doubt that a more North American culture is also very important to Canadians, rendering much of their culture a “shared” one with Americans.

The differences that do exist between the United States and Canada are often ignored by Americans—if they are even aware of them. Examples of this include the American tendencies to call Canadian provinces “states” and make other, related errors in nomenclature.

On the other hand, many stereotypes of what it is to be Canadian also abound in the United States. Many Americans think Canadians all speak French or play ice hockey. Furthermore, media sources like *Saturday Night Live* and *Second City Television* have presented American audiences with stereotypical buffoons like Bob and Doug Mackenzie, leading Americans to envision all of Canada as speaking in a bizarre way as they guzzle beer.

Canadians celebrate many of the same holidays as do Americans. Canada celebrates Thanksgiving, albeit in October rather than November. Canadians also celebrate their own independence day on July 1, called Canada Day. There are many provincial holidays in Canada as well, so there is a great deal of variation in holiday traditions of Canadian Americans.

One major adjustment Canadian Americans must make is adaptation to the American health

care system. Canada is home to a public health care system that covers most medical needs in exchange for a special tax that citizens pay. For Canadians, health care costs in American feel very high.

English and French are the two state languages of Canada, and one or the other of these two is the first language for almost 85 percent of Canadians. Obviously, English-language Canadians have the easiest time immigrating to the United States. Notable numbers of French-speaking Canadians also emigrate, along with Inuit, Iroquois, and Tlingit tribal peoples.

Several interesting demographic trends among Canadians living in the United States have been noted. The marriage rate between Canadians and Canadian Americans is about the same, but the divorce rate among Canadian Americans is more than twice as high. There are also twice as many widowed Canadian Americans, but, as noted above, the average age of Canadian Americans is high due to retirement-related immigration patterns.

Educational institutions occur at about the same per capita rate in Canada and the United States. Canadian Americans tend to have higher educational attainment levels than do Canadians. This is related in part to the higher likelihood of Canadian Americans to be highly skilled professionals.

As of 2013 the most active churches in Canada were the Anglican Church and the Roman Catholic Church. Canadian Americans are most likely to affiliate themselves with these churches. Of course, as a proud, multicultural country, Canada is also home to numerous other faiths that are also represented among immigrants to the United States.

The job history of Canadian Americans has been varied and shaped by the economic conditions they encountered both in the United States and back in Canada. There have, however, been two main trends. In the early years of the 20th century, the majority of Canadian immigrants worked in industrial jobs within the booming segment of American industry. The latter half of the 20th century, which coincided with tougher immigration laws, saw the majority of Canadian Americans working in highly skilled positions. In fact, as of 2013 there are disproportionately high

numbers of Canadian Americans among American specialty profession positions (like law or medicine) and managerial positions.

Very few Canadian Americans have become politically active in the United States. New Brunswick's Jerry Simpson is one notable exception. Populist Simpson served three terms in Congress at the turn of the 19th and 20th centuries. Thanks in large part to the successful assimilation of so many Canadian Americans there are few known trends among Canadian Americans in the realms of military service and voting. Similarly, most Canadian Americans become removed from participation in Canadian politics. One partial exception is the tendency of French Canadian Americans to maintain a sense of identity that is based on their ties to Canada. This group tends to be well aware of political trends, especially in Quebec, that affect French Canadians. Finally, there is a strong Canadian participation and presence in national Canadian labor unions and international trade unions that are represented in both Canada and the United States.

Famous Canadian Americans

Famous Canadian Americans have impacted many areas of American culture. Economist John Kenneth Galbraith was born in Ontario in 1908. Galbraith's works are central to the study of economics in America, with his classic text *American Capitalism* (1952) on most reading lists in the area. Other notable academics include physicist Richard Taylor, surgeon and professor of orthopedic surgery John Emmett Hall, and psychiatrist and professor Charles Shagass.

There have been numerous Canadian Americans in film and television. In the industry's infancy in America, Canadian Americans Mary Pickford and Douglas Fairbanks enjoyed major success and fame. Pickford's film *Coquette* earned her an Oscar. Fairbanks and Pickford together established United Artists with Charlie Chaplin and D. W. Griffith. Glenn Ford is one of the most famous Canadian Americans in the mid-20th century film industry. At around the same time as Ford, Lorne Greene became one of America's most famous and beloved television stars, as did Raymond Burr of *Perry Mason* renown.

More recent Canadian American names in film and television and on stage include Donald

Sutherland and his son Kiefer Sutherland, who have each also directed and produced, as well as Christopher Plummer, who has extensive Broadway credits in addition to his film career. Real-life couple Hume Cronyn and Jessica Tandy appeared on stage together many times and also graced the silver screen. Award-winning actress Colleen Dewhurst appeared in many theater productions. William Shatner, best known for playing Captain Kirk of *Star Trek* over the span of many years, was also born in Canada. Michael J. Fox, Alex Trebek, and Jason Priestly are also Canadian Americans.

Canadian Americans have heavily impacted American comedy. Dan Aykroyd, Phil Hartman, and Mike Myers began their comedy careers on the television show *Saturday Night Live* and went on to receive mass acclaim and loyal followings from Americans. Numerous other Canadian Americans had their first break on *Second City Television*, a Canadian program, including John Candy, Martin Short, Rick Moranis, Dave Thomas, Catherine O'Hara, Andrea Martin, and Eugene Levy. Other notable Canadian American comedians include Rich Little, Howie Mandel, and comedy troupe The Kids in the Hall.

Television anchorman Peter Jennings was born in Toronto and served as the lead anchor for ABC News from 1983 until his death in 2005. Robin MacNeil of the *MacNeil/Lehrer Report* and the *MacNeil/Lehrer News Hour* was born in Montreal, Canada. MacNeil also authored or coauthored five books.

Canadian American singer and songwriter Paul Anka spent 50 years on the *Billboard* charts from 1957 to 2007. He also boasts 15 gold records and at least 22 songwriting awards. Singer Joni Mitchell also hails from Canada as do Alanis Morissette, Celine Dion, and Justin Bieber.

Most Canadian American sports notables are unsurprisingly hockey players. Wayne Gretzky has won the National Hockey League scoring title and numerous other accolades. At the time of his retirement in 1999, he either held or shared 66 NHL records. Other well-known Canadian American hockey players include Brett Hull and Mark Messier.

Canal Zone

The Panama Canal Zone was located within the borders of the Republic of Panama; the area that at one time made up the zone is now the territory of the Republic of Panama, including the canal itself. The unorganized U.S. territory existed from 1903 to 1999.

The zone was brought into existence to allow American interests to build a canal, and thus eliminate the need to sail around the South American coast when traveling from the North Atlantic to the Pacific Ocean. Like much of the rest of the world in the early 20th century, racism was a major problem in the Canal Zone during and after the primary construction project. Institutionalized racism existed through a system of gold rolls and silver rolls, in which workers were

classified and treated accordingly almost entirely on the basis of race.

International Treaties and Development

Two key factors in the later part of the 1800s compelled the American government to pursue the creation of a canal through the Isthmus of Panama. First, traffic through the region greatly increased due to Americans wishing to travel from the east coast to the west coast of the United States during the California Gold Rush. Second, the Spanish-American War (1898) added urgency to the need for an American-controlled canal because of a perceived need to transport troops, supplies, and battleships from one theater of war to another.

At the beginning of the 1900s, the Isthmus of Panama was controlled by Colombia, and for this reason a treaty was required for Americans to access the area. In 1902, the U.S. Congress ratified a treaty with Colombia to establish the Canal Zone. The Colombian government rejected this treaty and proposed a counteroffer for a more financially lucrative deal. This process angered the jingoistic President Theodore Roosevelt.

In 1903, revolution broke out in the Isthmus of Panama. With President Roosevelt's consent, the United States supported the rebels in this conflict. After the rebels won their independence, their fledgling government quickly negotiated a Canal Zone treaty with the United States. Many in the new Panamanian government took issue with the terms of the hastily constructed treaty. However, they were told if they did not sign, U.S. forces would be pulled out of the area, thus allowing Colombians to retake the region. The resulting Hay-Bunau-Varilla Treaty was approved by the Panamanian government on December 2, 1903. On February 26, 1904, Panama granted to the United States control of the zone.

In 1977, riots over U.S. control of the zone and accusations of American colonialism compelled President Jimmy Carter to renegotiate the terms of the Canal Zone treaty. Certain American interests did not want to give up control of the zone as granted by the 1903 treaty, claiming it would weaken the ability of U.S. military forces to respond to threats. Carter, however, believed that regional stability outweighed these concerns of a

Black laborers running tripod drills at the Upper Miraflores locks in the Panama Canal Zone in April 1910. The hierarchy between white and mostly nonwhite workers established at the beginning of construction persisted for decades.

vague military threat. Thus, the Torrijos-Carter Treaties of 1977 established the neutrality of the canal, disbanded the majority of American military presence in the zone, and established joint U.S.-Panamanian control of the zone. Additionally, the treaty put into place a timetable for the canal and Canal Zone to be handed over to the Panamanian government on December 31, 1999.

Institutionalized Racism and the Canal Zone

In the early days of the construction of the Panama Canal, the labor force was divided into two groups: gold roll workers and silver roll workers. The employees listed on the gold roll were paid using U.S. gold, because they were supposedly U.S. citizens and needed to be paid in the currency of their country. Similarly, the employees

whose names were listed on the silver roll were supposed to be local workers who were paid in the silver coins of the Colombian peso. With very few exceptions, American and northern European whites were placed on the gold roll, while blacks and southern European whites were placed on the silver roll. American blacks were generally not hired, thus keeping them off the gold roll; American whites interested in silver-roll laborer positions were discouraged from applying.

The racial overtones of this system intensified with time, and its relevance to the actual functioning of the zone diminished. By 1918, all workers in the zone were being paid in American currency, but discrimination based on gold and silver labels continued. At first, the possibility of promotion between the labels was possible, but this ceased as the system became more racist. Mirroring segregation in the American south, separate towns, quarters, schools, libraries, recreation facilities, transportation, restrooms, and drinking fountains were set up for gold and silver roll workers. Gold and silver classification also determined pay rates, vacations, and pensions.

While American blacks who were on the gold roll did enjoy better treatment than those on the silver roll, that was little comfort to most. The National Association for the Advancement of Colored People (NAACP) did eventually call into question the practice of dividing the workforce by gold and silver rolls. It also questioned why African Americans were rarely given gold-roll jobs. Due to this pressure, the terms were dropped officially in the mid-1950s and signs making distinctions were taken down accordingly.

Cape Verdean Americans

A Cape Verdean American is an American whose ancestors were from Cape Verde or an immigrant from Cape Verde. A small but culturally distinct ethnic group in America, their history in the United States is unique.

The history, geography, and culture of the Republic of Cape Verde is key to understanding the Cape Verdean American of today. The Republic of Cape Verde is 320 miles off the coast of Senegal, which is on the west coast of Africa. The islands are plagued by recurring, cyclic droughts; each drought cycle lasts for more than a decade. Most of the land is unsuitable for grazing livestock and the country is mostly deforested, making major erosion of topsoil a central problem.

These various problems mean that migration has always been a major cultural factor, since many Cape Verdeans relocated for years at a time during droughts to find work. In the 1770s, famine was so severe that some Cape Verdeans sold themselves into slavery to leave the islands. Relentless famine again rocked the islands in the early 1830s and an estimated one-third of the population of Cape Verde perished during that time. In 1856 famine was so severe that the people of Boston and New York sent ships stocked with food to help the people of Cape Verde.

Cape Verdean American History and Culture

As far as recorded U.S. history goes, Cape Verdeans first settled as free people in mid-19th-century America near Boston. This is mostly because New England whaling ships often had Cape Verde on their routes. Many Cape Verdeans worked on

A family, including two boys 8 and 9 years of age, using wooden scoops to harvest cranberries in a bog near Wareham, Massachusetts, around September 1911. The family's Portuguese surname of Fernande suggests that they were of Cape Verdean origin. Many Cape Verdeans worked in the cranberry industry on Cape Cod in the early 20th century.

whaling ships until the industry declined in the early 20th century, ensuring that Cape Verdean Americans became known for crafts peculiar to whaling such as scrimshaw, wood carving, and ship building.

The cranberry industry in the United States is on the peninsula of Cape Cod in Massachusetts. The work is arduous and especially in the past required many workers to harvest in the cranberry bogs; many Cape Verdeans therefore settled in New England to join that industry and the whaling industry. These two migratory forces meant that the largest concentration of Cape Verdean Americans originally settled in Massachusetts and Rhode Island.

Cape Verdean Americans have always defied racial norms, which in the United States especially made for the perception of a maverick sensibility as a group culture. The island of Cape Verde had

a very diverse, mobile culture that defied the divisions into black or white culture that the United States had historically. Most Cape Verdeans are of mixed race. Originally, the islands were populated by the Portuguese, who then imported slaves from Africa, particularly from nearby Senegal. These groups mixed with Spanish and Italian sailors, Portuguese Jewish refugees, and various European, Chinese, American, and Brazilian settlers. This rich mix of cultures made for a much more varied *mestiço* ethnic identity.

Furthermore, Cape Verdean Americans have strong ties to their ancestral home. All Cape Verdean Americans are eligible for dual citizenship. Also, since so much of the immigration history of Cape Verdean Americans was tied to droughts and famines, the movement between countries has a cyclic feel for many Cape Verdean Americans.

Given this cultural background, it is hardly surprising that Cape Verdean Americans did not readily think of themselves as African Americans in the same way that the American descendants of slaves did. Furthermore, most Cape Verdean Americans were Roman Catholic and so found themselves worshipping with other immigrants—mostly white eastern Europeans. Like other Catholic immigrants, Cape Verdean Americans tended to have large families of at least five children.

In 1917, the U.S. Congress passed the Immigration Act of 1917, also known as the Asiatic Barred Zone Act. This stringent law forbade a record number of “undesirables” from entering the United States, including all immigrants over the age of sixteen who were illiterate; it was this condition that impacted Cape Verdeans most, and the act nearly brought immigration to a stop.

Eventually, as descendants of the original Cape Verdean Americans grew older and became involved in the American civil rights movement in the 1960s, they did come to identify with African Americans. Not unfamiliar with struggle, life on Cape Verde was challenging and a sort of pessimistic outlook permeates much of their oral culture, as well as their musical culture. Cape Verdean American music is replete with traditional, mournful ballads called *morna*. Lyrics to these ballads reflect the sadness of families separated by famines and immigration, and, of course, the forced uprooting and brutality of slavery. These themes translated to American culture, mainly in the blues and jazz genres.

Prominent Cape Verdean Americans

Cape Verdean Americans have come to influence U.S. politics. In 1998, Republican Cape Verdean American Vinny Macedo, the representative from Plymouth, was elected to the Massachusetts state legislature. Alfred J. Gomes was a prominent Cape Verdean American judge in Boston. Cape Verdean Americans have also strongly impacted the American arts. Anthony Barboza was a photographer whose work became world famous when published in *Time* and *National Geographic*. Joao de Lomba was a whaler and probably the best-known scrimshaw artist in America. The band Tavares was comprised of Cape Verdean Americans and their hit song “More Than a Woman” was featured in *Saturday Night Fever*. Jazz musicians

Horace Silva and Paul Gonsalves were also Cape Verdean Americans.

Cape Verdean Americans have influenced American sports. Cape Verdean American Dana Barros played basketball for the Boston Celtics. Wayne Fontes played football professionally and then went on to coach the Detroit Lions. And perhaps most famously, Henry Andrade competed in the 1992 Atlanta Olympic Games representing Cape Verde as a dual citizen.

Caribbean Americans

Caribbean Americans constitute a diverse group in terms of their cultural, ethnic, and racial origin. They also have distinct socioeconomic characteristics. Large-scale immigration from the Caribbean is a fairly recent phenomenon; according to the 2010 U.S. census, as many as 75 percent of foreign-born immigrants entered the United States after 1980. However, the first immigrants, especially those from Cuba and the English and French West Indies, arrived before the 20th century.

It should be noted that people born in Puerto Rico and the U.S. Virgin Islands are native born to

the United States. As U.S. citizens they are, therefore, migrants rather than immigrants. According to the 2010 U.S. census the Puerto Rican–origin population of the United States (4.6 million) was higher than the total population of Puerto Rico (3.7 million).

Origins and Geographic Distribution

In 2010 the biggest Caribbean populations in the United States, with the exception of Puerto Ricans, were of Cuban and Dominican origin. In fact, Cubans and Dominicans were, respectively, the third- and the fifth-largest Hispanic/Latino communities after Mexicans, Puerto Ricans, and Salvadorans. In general, Hispanics/Latinos form the largest minority in the country, and in 2010 they constituted over 16 percent of the total U.S. population (50.5 million). The almost 1.8 million Cubans comprised 3.5 percent of Hispanics/Latinos, while Dominicans were at 2.8 percent (1.4 million). As for their areas of residence, both groups are highly concentrated: Cubans in the south (mainly in Florida), Dominicans in the northeast (mainly in New York). Most Puerto Ricans live in the northeast (mainly in New York, where the famous Spanish Harlem—also known as El Barrio—is located), and in the south (mainly in Florida).

In 2010 people who reported West Indian ancestry (except Hispanic groups) accounted for around 2.6 million. Jamaicans form the largest non-Hispanic Caribbean population, and their community is growing relatively quickly (965,000 in 2010 as compared to 435,000 in 1990). Trinidadians and Tobagonians are the second-largest group from the English-speaking Caribbean (197,000 in 2010). Generally, most West Indians have migrated to eastern states (mainly New York, New Jersey, Massachusetts, Connecticut, and Florida). Brooklyn, New York, has the largest Afro-West Indian community in the United States, while Richmond Hill (Queens), New York, is the main community of Indo-West Indians.

Although Haitian remains a relatively small ancestry group, it almost doubled in size in 1990–2000. According to the American Community Survey, in 2010 it reached 881,000 people, two-thirds of whom lived in Florida and New York. Other French-speaking islands such as Martinique or Guadeloupe send few immigrants. The

Dutch West Indian origin community is also relatively small.

Immigration to the United States

Large-scale immigration from the Caribbean is a recent phenomenon. The primary motivations for migration have been economic opportunity (Puerto Ricans, Dominicans, Cubans, and West Indians), political reasons (Cubans, Dominicans, and Haitians), and family reunification. The time periods and the intensity of the 20th-century immigration have been influenced by a number of factors.

One of the key factors was U.S. immigration laws and policies. For example, because Puerto Ricans are U.S. citizens, their migration to the United States mainland has not been restricted, and the first significant wave (600,000) arrived from the mid-1940s until the mid-1960s. However, the 1920s immigration quotas, which applied to the European colonies in the Western Hemisphere, affected immigration from Jamaica, Trinidad and Tobago (both gained independence from the United Kingdom in 1962 but remain members of the commonwealth), and other colonies in the West Indies. Since 1965, when the quota system was abolished, immigration from the Caribbean has increased significantly; it also been aided by the preference system for relatives of U.S. citizens and permanent residents. The 1920s' quotas did not apply to independent nations in the Western Hemisphere. As a matter of fact, because of geographical proximity and economic links, in 1921–1930 at least 16,000 Cubans immigrated to the United States for either economic or political reasons, while in the 1940s and 1950s the total number climbed to over 100,000.

Dominican migration abroad was severely restricted under the regime of Rafael Trujillo (1930–61). A larger-scale migration started after his assassination in 1961, yet most Dominicans came to the United States after 1980. On the whole, in 1961–2001 the immigrants from the Dominican Republic comprised the most numerous group of arrivals from the Caribbean (over 850,000), with the exception of Puerto Ricans.

As for refugees, American policy toward Cubans was generally favorable until 1994, when the Clinton administration adopted the so-called dry foot–wet foot policy. The first two waves

following the revolution of 1959 were largely members of elites, the upper and upper-middle classes (1959–62), and family members of U.S. citizens and residents (1965–73). They were generally well received. The 1961 Cuban Refugee Program helped them accommodate to their new place of residence, and the 1966 Cuban Refugee Adjustment Act made it possible to apply for permanent resident status. In 1960–62 the United States also received over 14,000 unaccompanied Cuban children who entered the country under Operation Pedro Pan to escape political indoctrination and military service. The 125,000 people of the 1980 Mariel boatlift (from the lower classes, often of mixed racial characteristics, and including criminals and the mentally ill) were received with more reserve. Along with the arriving Haitians, they were categorized as entrant (status pending) but soon could regularize their status. The fourth wave, which came in the early 1990s and was known as the boat people, finally led to a change in the American policy toward Cuban immigrants.

As opposed to Cubans, Haitian boat people were discriminated against by subsequent U.S. administrations and had to struggle to receive permanent legal status. Since Haitians were not fleeing a Communist country, they were considered economic migrants rather than political refugees and, thus, were returned to Haiti. Eligible Haitians and Cubans could apply for an adjustment to permanent resident status under the Immigration Reform and Control Act of 1986. However, the Nicaraguan Adjustment and Central Americans Relief Act of 1997 did not include Haitians among the undocumented eligible for permanent status. It was not until 1998 and enactment of the Haitian Refugee Immigration Fairness Act that eligible Haitian refugees were given the opportunity to apply for lawful permanent residence status.

Acculturation

Generally, English-speaking Caribbean people benefit from the cultural and linguistic similarities between their countries of origin and the United States; therefore their acculturation and assimilation into American society is considered to be easier than that of Spanish- and French-speaking immigrants. Until recently, Jamaicans were

considered a model minority, while West Indian immigrants (an example of a brain drain) were often professionals, skilled workers, or clerks, some of whom graduated from colleges and universities in Canada, the United Kingdom, or the United States. Yet these communities have also faced some problems. Today, Jamaicans are likely to be seen as drug traffickers, whereas some Afro-West Indians, particularly in New York City, may be involved in the illegal numbers lottery, as well as the drug trade. Among the non-English-speaking communities, the Cuban is probably the most exceptional, largely because of its immigration history and development. Cubans are generally viewed as a successful group, with an important ethnic enclave in Miami.

Race and racial discrimination may pose a serious problem for some Caribbean Americans like Dominicans in their assimilation into American society. Still, it is Haitians who experience probably the most severe obstacles. Apart from racial discrimination, they often face other forms of prejudice, like being seen as HIV carriers. Young Haitians, especially those from lower socioeconomic backgrounds, may reject Haitian identity. Many are often ambivalent about their roots and their language, *krèyol* (Haitian Creole).

Cultural, Ethnic, and Racial Origin

The basic reason for the cultural (and linguistic) diversity among Caribbean groups is the colonial cultural heritage. Many Caribbean islands passed through the hands of various colonial powers and often had a turbulent history. However, other groups also had their impact on Caribbean societies and cultures. The racial profile of many islands was shaped by large contingents of black African slaves, who in many cases quickly outnumbered the white colonists. Many islands also became home to immigrants from different parts of the world, whose contribution to their cultural, social, and religious life was often substantial. Cuba, for example, both before and after the Spanish-American War, attracted many immigrants from Europe, especially from Spain. It also drew immigrants from other regions like China, becoming the fourth country in Latin America, along with Argentina, Brazil, and Uruguay, to have received the largest numbers of newcomers at the turn of the 20th

century. Jamaica and Trinidad and Tobago, on the other hand, welcomed, in the postslavery era, thousands of Asian-Indian indentured workers to substitute for the freed black slaves. These immigrants significantly changed the racial and cultural structure of Trinidad and Tobago to the extent that today about 40 percent of its population report Asian Indian ancestry.

Caribbean Americans therefore manifest diverse racial characteristics. According to the 2010 U.S. census data, an overwhelming majority of Cubans (85 percent) and slightly over 50 percent of Puerto Ricans report as white. The Dominican community is more racially diverse: only one in three reports as white and almost one-half as some other race. Dominicans and Puerto Ricans are much more likely than other Hispanics/Latinos to report as black; however, the proportion in either group is relatively small (approximately one in 10). Because of their racial characteristics, Afro Hispanics are sometimes perceived as a possible bridge to a Hispanic–black alliance. The racial profile of the French- and English-speaking Caribbean is different, with the predominant race being black or mulatto.

Language

The general division of the Caribbean into four major European language areas (Spanish, English, French, and Dutch) does not fully reflect the linguistic diversity of the region. The Caribbean islands are also home to a number of dialects and Creole languages based on the languages of the colonizers (for example, *papiamentu*, *patois*), which are also brought to the United States by the arriving immigrants. Many of the Haitians, for example, speak (only) *kreyól*, while the Jamaicans are likely to use a kind of English *patois*, which may obstruct understanding.

Spanish-speaking communities in the United States manifest strong language vitality. The U.S. Census Bureau data show that in 2010 as many as 92 percent of Dominicans and 82 percent of Cubans (as well as 66 percent of Puerto Ricans) spoke a language other than English at home, compared to 20 percent of the total population. However, slightly over a majority in both groups (as well as more than eight in 10 Puerto Ricans) report speaking English proficiently. Many Hispanic/Latino-origin Americans use Spanglish.

The proportion of Haitians who spoke another language at home is also high (81 percent). In this community, language choice itself (Creole or French) reflects class divisions. *Kreyól* is associated with the lower classes, French with the upper and middle classes.

Religion

Although Christianity traditionally plays an important role in the Caribbean American community, a considerable number of Spanish-speaking immigrants (especially from Cuba) may also practice *santería* (a syncretic Afro-Christian religious cult). A large group of Haitians, in addition to being devout Christians, may practice *vodun* (voodoo). Because of the religious diversity of the Caribbean, the immigrants also bring other religions, such as Islam, various syncretic cults, or Rastafarianism, though the latter is relatively rarely practiced in the United States. Also, some of the Hindus in the United States have come from the Caribbean, especially Trinidad.

Social and Political Life

Many Caribbean Americans have made significant contributions through writing, thought, or action to the civil rights movement in the United States and the development of the black identity.

As early as 1896, Homer Plessy, of Haitian origin, was a litigant in the United States Supreme Court case *Plessy v. Ferguson*, which unsuccessfully challenged racial discrimination. The New Orleans organization that was responsible for bringing the suit was also largely Haitian American.

Also of Caribbean origin were two notable Pan-Africanists at the beginning of the 20th century. Marcus Garvey, a Jamaican, was the founder and leader of the Universal Negro Improvement Association (UNIA) and promoted the back-to-Africa movement among black Americans. W. E. B. Du Bois, of Haitian origin, was a historian, sociologist, novelist, editor, civil rights activist, and a cofounder of the National Association for the Advancement of Colored People (NAACP). He is sometimes credited as the father of Pan-Africanism.

Arturo Alfonso Schomburg (Puerto Rico) was a historian, archivist, and bibliophile, who collected many books and other materials on black

history and culture. He also was a prominent figure in the Harlem Renaissance.

In the 1960s, Stokely Carmichael (Trinidad) was one of the influential leaders of the Student Non-Violent Coordinating Committee (SNCC), a chief architect and spokesperson for the black power ideology and later the prime minister of the Black Panther Party. Carmichael also co-authored the book *Black Power* (1967) with Charles V. Hamilton; the concept of institutional racism was introduced in the book. Another important figure for the African American community was Malcolm X, whose mother was born in Grenada. In the 1960s many Puerto Ricans were involved in the student movements, while the Puerto Rican (Boricua) Movement became, similarly to the Chicano Movement, an expression of the group's identity and its struggle for dignity and civil rights reforms.

Also of Caribbean origin was Shirley Chisholm (Barbados), who became the first African American congresswoman (1969) and the first African American woman candidate for president (1972).

Today Caribbean Americans are also active in American social and political life; for example, Colin Powell (Jamaica) was the first African American to serve as secretary of state (2001–05), and Sonia Sotomayor (Puerto Rico) was the first Hispanic and the third female justice on the U.S. Supreme Court (in office since 2009).

Music, Art, Cinema, and Other Fields

Generations of Caribbean Americans have made their impact on American art, for example, the Cuban Ana Mendieta (who was among the children brought in during Operation Pedro Pan) or avant-garde Puerto Rican artists Rafael Ferrer and Raphael Montañez Ortiz. The latter was also active in the Puerto Rican movement and cofounded the Museo del Barrio in Spanish Harlem (1969). No less important is the contribution of Caribbean writers and poets, such as the Nuyorican Poets Café or Oscar Hijuelos (Cuba), who won a Pulitzer Prize for *The Mambo Kings Play Songs of Love* (1989), the first Latino to do so.

Such genres of music or forms of dance as, for example, mambo, bachata, merengue, or reggae were introduced to the American audience by Caribbean Americans, while Trinidadian Carnivals take place in such cities as, for example,

New York; Miami, Florida; Boston, Massachusetts; Baltimore, Maryland; and Washington, D.C. Jelly Roll Morton, of Haitian origin, and Puerto Rican Juan Tizol, as well as other musicians (also Cubans like Chano Pozo) contributed to the development of jazz. In the 1960s, Cuban and Puerto Rican migrants in New York City pioneered salsa (performed by such stars as Celia Cruz and Tito Puente), whereas in the early 1970s Caribbean people vastly contributed to the birth of the hip-hop culture in the Bronx (most importantly, the Jamaican-born DJ Kool Herc). Rap music, an element of hip-hop culture, was strongly influenced by Jamaican dub. A recent contribution to American musical life is the Puerto Rico-born reggaetón, which has gained much popularity among younger generations of not only Latino origin.

Other famous musicians and singers of Caribbean origin in the United States include Grammy winners Gloria Estefan (Cuba), Ricky Martin and Marc Anthony (Puerto Rico), Wyclef Jean (Haiti), and Jennifer Lopez (Puerto Rico).

Cubans and Puerto Ricans have played a role in the development of American Hispanic/Latino cinema. Filmmakers like Orlando Jiménez Leal and León Ichaso often focus on themes directly related to the group. Thus, for example, depending on the generation, Cuban filmmakers frequently work with the issues of the revolution, the traumas of exile, the lost home, assimilation, or ethnic identity.

The first African American actor to receive the Academy Award for Best Actor in a leading role was Sidney Poitier (Bahamas). Many other leading actors are also of Caribbean origin. To mention just a few, there are other Oscar winners like José Ferrer, Rita Moreno, and Benicio del Toro (all of Puerto Rican origin) and Mercedes Ruehl (of Cuban origin), and nominee Andy García (Cuba). As for fashion, Oscar de la Renta, a world-renowned fashion designer, is of Dominican origin.

Many Caribbean Americans have achieved fame through their prowess in sports; these include José Canseco (baseball, Cuba), Sammy Sosa (baseball, Dominican Republic), and Chi Chi Rodríguez (golf, Puerto Rico).

Citizenship

Since many Caribbean countries like the Dominican Republic, Jamaica, and Trinidad and Tobago allow dual citizenship, some of the Caribbean

communities in the United States have benefited from this possibility and are more willing to naturalize. The U.S. Census Bureau data indicate, for example, that the proportion of naturalized U.S. citizens among Dominicans doubled in the last decade (from 25 percent in 2000 to almost 50 percent in 2010). Compared to Dominicans, Cubans, whose immigration history and relations with the United States have been very distinct, have experienced a smaller growth and rank at 56 percent (compared to 41 percent in 2000). Dual citizenship allows the immigrants embrace the new national identity, as well as enjoy the benefits of U.S. citizenship, without the need to break bonds with their country of origin. Also, thanks to the possibility of frequent travel back and forth as well as economic/business ties, some groups like Dominicans and Jamaicans have developed into important transnational communities. Dominican immigrants are also often engaged in home-country politics and may even have some influence on the political life at home.

It is interesting to note that race may have an impact on attitudes toward naturalization. Afro-West Indians, for example, are more reluctant to naturalize because of their experience of racism, whereas Indo-West Indians, who are generally viewed favorably, are more willing to become U.S. citizens.

Education, Economic Status, and Political Participation

Particular Caribbean American communities show considerable differences in terms of educational attainment. As far as Hispanic Caribbean Americans are concerned, for example, the American Community Survey data on education for 2006 to 2010 reveal that the proportion of Cubans with a bachelor's degree or higher (25 percent) was nearly as high as the average American (28 percent). Dominicans and Puerto Ricans ranked at about 15 percent. However, all three groups showed progress compared to 2000. As for the foreign-born population, the 2010 U.S. Census Bureau data on education show that fewer Caribbean people held a bachelor's degree (less than 20 percent) than an average foreign-born (27 percent).

Specific national groups may form ethnic niches in some sectors or small businesses. In New

York City, for example, Dominicans run bodegas (grocery stores), while many Haitians are taxi-cab owners and drivers. Jamaican women in the United States often work in health care (especially as nurses). Especially in New York, West Indians are to be found among the professional occupations such as lawyers, physicians, managers, or business people.

Some Caribbean groups have made notable advances in terms of their participation in the political life of the United States. Haitians have recently been elected to office in south Florida, and Dominicans and West Indians, for example, to the New York City Council. Because of their high geographical concentration, as of 2012, Cubans make up as much as 32 percent of eligible Latino voters in Florida (and only 5 percent nationwide).

Caribbean Americans form a relatively small multiethnic and multiracial community that has, however, had an important impact on American society and culture.

Carlisle Indian Industrial School

Carlisle Indian Industrial School was a boarding school in Carlisle, Pennsylvania, established in 1879 to assimilate Native American children into the larger American society. Richard Pratt, the founder of Carlisle, believed that through education Native Americans could be taught to shed their supposedly inferior cultural heritage in order to adopt the supposedly superior cultural heritage of the Anglo-American population. Carlisle would later serve as a template for the creation of other boarding schools in the western United States established for the same purpose.

Pratt's vision for Indian education began during his career as an officer in the U.S. military, when he was put in charge of the transportation and detention of Native American prisoners of war captured in one of the army's western campaigns. Pratt experimented with teaching the prisoners English, as well as other skills, and was encouraged by their progress. In working with these prisoners, Pratt came to believe that education could provide the ultimate solution to the United States' "Indian problem," or what the country should do with its Native American population. Scientific theory at the time suggested that all cultures existed along a ladder, and that cultural groups must either advance up the ladder toward civilization or eventually become extinct. Pratt, and others like him, believed that Indians had to be forcefully advanced up the ladder quickly or risk being lost forever. He was convinced that education could assimilate Indian children into American society, then return them to their home communities to do the same for the other members of their tribes.

After briefly experimenting with educating Native American children at Hampton Institute (a school designed primarily for African American students), Pratt received permission to open a school of his own at some unused army barracks in Carlisle, Pennsylvania. Pratt recruited students from tribal communities all over the United States. Students attended Carlisle for a minimum of five years, completely isolated from their home communities. Cut off from the influences of home, students endured nothing less than an attempt at complete assimilation. In fact, a student's first experience at Carlisle was often a western-style haircut and the assignment of a military-like school uniform. They also received new English names, which school personnel used exclusively. Some scholars have referred to this acculturation process as a sort of cultural genocide. Indeed, Pratt's own motto was, "Kill the Indian, Save the Man."

Students spent half the day in the classroom and half in industrial training. Classroom instruction was conducted completely in English, and any use of students' native languages was strictly prohibited. During industrial training, students learned any of a variety of trades and skills from carpentry, harness-making, tailoring, blacksmithing, or other vocations for boys, to domestic science training for the girls. Though some students found uses for their industrial training after attending the school, most did not. Many of their specialized skills made no sense in the reservation life to which they returned, and very few students integrated successfully into the larger American workforce in ways that utilized their training.

But children were not exposed to American society and culture only through their classroom and industrial training. The most important aspect of a Carlisle education in Pratt's mind was the outing program that sent students to live with nearby American families during the summer. The outing program served as a sort of double apprenticeship—students honed their industrial trades with their host families, but also honed their understanding of American society and culture by living with them for several months at a time. Finally, Carlisle students, especially male students, gained exposure to American society and culture through participation in sports. Carlisle sports teams played teams from nearby schools and even

universities, competing with distinction. In fact, the talent of the football team garnered national recognition, with individuals such as Pop Warner and Jim Thorpe becoming household names.

Life at Carlisle was difficult for many students. For the most part, school personnel genuinely cared about the students under their care. However, in their ethnocentricity, they believed the best thing they could do for their students was to destroy every aspect of their Indian-ness. In addition, students faced frequent malnutrition, sometimes widespread illness, and severe punishment for running away. Some students never returned home, forever buried in the graveyard that still exists on the old Carlisle campus.

Those students who did return home often had a difficult time adjusting to life among their own people again, a fact that eventually caused reformers and government officials to question

the effectiveness of Pratt's educational model. Pratt's constant complaints about underfunding and lack of resources, combined with growing realizations about the ineffectiveness of his model to fully assimilate Indian children, caused him to lose favor with the same crowd of reformers and officials that had made him a bit of a national celebrity. Eventually, Pratt resigned as superintendent of the Carlisle Indian school in 1904, and the school closed in 1919.

Carlisle's legacy continued, however, in the several dozen off-reservation boarding schools built in the trans-Mississippi west, with Carlisle as their model. Though Carlisle closed after only 40 years of existence, similar boarding schools continued to function well into the latter part of the 20th century, though with changes to their educational philosophy. In fact, some of these schools are now owned by Native American tribes who

These Indian students were learning printing in the printing shop at the Carlisle Indian Industrial School in Carlisle, Pennsylvania, sometime in the early 1910s. They typically spent half their day in a classroom and half their day learning trades. The students were also made to cut their hair and wear uniforms in an attempt to rid them of their Native American cultural heritage.

use the institutions to educate their own children, as well as the children of other tribes.

Carmen Jones

Carmen Jones is a 1943 reinterpretation of Georges Bizet's opera *Carmen*. Librettist Oscar Hammerstein II adapted the opera for the musical theater and reset it in an African American community during World War II. After a successful run on Broadway, it was made into a film in 1954. In the title role, Dorothy Dandridge was nominated for the Academy Award for Best Actress, the first African American to be so honored. The 1991 West End production won numerous awards, including the Laurence Olivier Award for Best New Musical.

Reinterpreting a Classic

Hammerstein, who had written, produced, or directed more than 30 Broadway productions, including *Oklahoma!*, *Show Boat*, *The New Moon*, and *Very Warm for May*, had been interested in adapting *Carmen* to an African American context since the 1930s. Like his previous work on *Show Boat*, Hammerstein had intended for the musical to present African Americans in a sympathetic light, which was uncommon on Broadway at the time. Hammerstein, working with

orchestrator Robert Russell Bennett, made few alterations to Bizet's score. Although some classical music purists decried the jettisoning of recitative in favor of spoken dialogue, Hammerstein noted that most of that music was composed by Ernest Guiraud after Bizet's death; he argued that his version adhered to Bizet's original intentions. In addition, he remained faithful to the general outline and themes of Henri Meilhac and Ludovic Halévy's original libretto, and the 1845 Prosper Mérimée novella that inspired it.

Carmen Jones tells the tragic story of its eponymous character, a parachute-maker at an army-run factory in a small North Carolina town. When she scuffles with a coworker, the sergeant orders a young corporal named Joe to escort her to the appropriate authorities in a neighboring town. On the trip, Carmen makes several attempts to seduce Joe. However, due to his engagement to his longtime girlfriend, Cindy Lou, he initially rebuffs Carmen's advances. When Joe finally succumbs to her charms, Carmen uses the opportunity to escape, which results in his being disciplined by the army.

Carmen later encounters a prizefighter named Husky Miller, who takes a liking to her. Her close friends, Frankie and Myrt, attempt to convince Carmen to join them in Chicago to watch Husky box. She does head to Chicago, but is accompanied by Joe, who recently has created more trouble for himself by striking his sergeant. After she tires of hiding out from the military police with Joe, she starts dating Husky, who lavishes her with gifts and money. Cindy Lou finds Joe in Chicago and implores him to return to her. He spurns her in favor of Carmen, who, in turn, rejects Joe for Husky. Devastated by her refusal, Joe stabs Carmen.

Because *Carmen Jones* required a full company of black actors with the classical training to sing Bizet's score, the show was considered a risky investment; finding a producer proved difficult. Eventually, Billy Rose signed on to produce, and enlisted talent scout and civil rights advocate John H. Hammond to assist with the casting. Most of the performers cast were not professional singers: Muriel Smith, who played Carmen, had been a salesclerk; Luther Saxon, who played Joe, worked in a shipyard; and Glenn Bryant, who played Husky, was a police officer. The original

Dorothy Dandridge became the first African American to be nominated for an Academy Award for Best Actress. This Hollywood gazebo honors multiethnic actresses, including Dandridge, Dolores del Rio, Anna May Wong, and Mae West.

production, which opened on December 2, 1943, played 502 performances at the Broadway Theatre. While the reviews were uniformly strong, some in the black community lamented what were perceived as the musical's negative representations of African Americans as promiscuous, violent, irresponsible, and materialistic.

Other Adaptations

In spite of being underwhelmed by the original Broadway production, director Otto Preminger secured the film rights in 1953. At the suggestion of the head of 20th Century Fox, Preminger

asked National Association for the Advancement of Colored People (NAACP) leader Walter White to review the script for objectionable material prior to the start of filming. Preminger's cast was comprised largely of actors with little professional experience at the time, including Harry Belafonte, Diahann Carroll, Pearl Bailey, Brock Peters, Olga James, Max Roach, and Dorothy Dandridge in the title role. Although most were singers, their voices were deemed inappropriate for the operatic score, and they were dubbed by studio singers. The reviews were mixed; there was praise for the actors, but many critics noted an incongruity in having the operatic score performed in the contemporary context. Despite this criticism, the film won the 1954 Golden Globe for Best Motion Picture—Musical or Comedy, and Dandridge was nominated for the Academy Award for Best Actress.

African American mezzo-soprano Grace Bumbry recorded the title role with a studio cast of British performers in 1962. Later in the decade, Bumbry would find great success playing the lead in *Carmen* with several prominent opera companies. As of 2012, *Carmen Jones* has been produced twice in the West End. The 1991 production starred Wilhelmenia Fernandez, Damon Evans, Gregg Baker, and Sharon Benson. A second production in 2007 reset the action in Cuba and featured Sherry Boone, Tsakane Valentine Maswaganyi, Andrew Clarke, and Rodney Clarke.

Carpatho-Rusyn Americans

Carpatho-Rusyn Americans are Americans whose ancestors called Carpathian Rus their homeland. Carpathian Rus is not a sovereign nation but a region in the Carpathian Mountains near Ukraine, Slovakia, and Poland. Although they are a distinct people, because they are stateless in a region in which borders change frequently, Carpatho-Rusyns have found themselves a minority in many different countries.

Immigration and History

As people without their own country, Carpatho-Rusyns have faced an ongoing battle for recognition and self-rule that was variably successful, depending on the larger political scene around them. They have called themselves “Rusyns” or “Rusnaks” traditionally, but the different ruling states they have lived under have called them many other names. This variability has also meant it is nearly impossible to know how many Carpatho-Rusyns there actually are in Europe with any accuracy, but best estimates indicate that there are probably 800,000 to one million.

Carpatho-Rusyn immigration to the United States started in the late 1870s and 1880s, and by the start of World War I, around 225,000 had arrived. This first wave of immigration was the largest influx of Carpatho-Rusyn and only approximately 30,000 have come since that time. It is difficult to ascertain their numbers because upon immigrating to the United States, Carpatho-Rusyn Americans tended to identify with whatever host country their family group came from rather than as Carpatho-Rusyn Americans.

At the time most Carpatho-Rusyn came to America, they were coming from small mountain villages and were used to engaging in agriculture, grazing livestock, and seasonal labor for other, more dominant groups. This was difficult to duplicate in the United States, however, and most Carpatho-Rusyn immigrants settled in the north-eastern and north central coal-mining areas, as well as urban areas in that region. In 1920, almost 80 percent of Carpatho-Rusyn Americans lived in Pennsylvania, New York, and New Jersey, and this trend mostly stayed in place. Carpatho-Rusyn

Americans never faced discrimination specific to their actual ethnic identity, although they were initially combined with laborers of eastern European origin. In essence this makes them an unrecognized ethnic minority.

Acculturation and Assimilation

Carpatho-Rusyn Americans assimilated into American society in three phases. Between 1880 and 1925 Carpatho-Rusyn Americans were culturally, socially, and linguistically isolated in the United States. Of course, they lacked proficiency in English, and when they immigrated, they were Byzantine Rite Catholics, also known as Greek Catholics (a church that didn't exist in the United States at that time). Greek Catholicism was extremely important in the day-to-day lives of Carpatho-Rusyns so this was a major loss for Carpatho-Rusyn Americans. Therefore, Carpatho-Rusyn Americans began their own churches and social/fraternal organizations to help provide financial and other support to community members. These organizations provided services that included schooling in the Carpatho-Rusyn language. So, as a result, in this first phase of acculturation the major trend was preservation of the traditional ways as much as circumstances allowed.

The next phase spanned 1925 to 1975 and during this time second-generation Carpatho-Rusyn Americans rejected traditional customs more and more. Youth groups that used English were started in the Carpatho-Rusyn American community and sports clubs that were most popular in the community were devoted to American sports. By the 1950s community media were nearly all English-language. Carpatho-Rusyn Americans made active efforts to assimilate and even the Byzantine Rite Catholic churches in the community rejected rituals that differed from the Roman Catholic Church. This was further supported by the European situation; the Iron Curtain effectively prevented much contact or travel between Carpatho-Rusyn Americans and Carpatho-Rusyns.

The third phase of Carpatho-Rusyn American life began in 1975 and lasts today. In this period the third generation of Carpatho-Rusyn Americans has tried to get back to their roots and engaged in ethnic recovery as did so many starting in the

1970s. The fall of communism opened up the homeland for travel and maintenance of social ties.

Family and Community Dynamics

In Europe, Carpatho-Rusyns had large families and agricultural homesteads. Arranged marriage was common but was abandoned by Carpatho-Rusyn Americans. Self-reliance was a valued concept and governmental assistance was shunned until the 1970s, when the industrial landscape changed enough that assistance was often needed by so many. Women have always been active in Carpatho-Rusyn American culture and maintained their own social and sports clubs. However, only since the 1960s have Carpatho-Rusyn American women been encouraged to seek education and pursue careers.

Carpatho-Rusyn Americans who came to the United States before World War I primarily worked in mining and the northeastern steel industry. Women were generally required to work outside the home because of economic need; at first Carpatho-Rusyn American women were limited to working as cleaners in offices or as in-home servants. Second-generation Carpatho-Rusyn American women were more likely to work in retail, manufacturing, or service-industry positions while their male counterparts worked as skilled and semiskilled workers. By the next generations, Carpatho-Rusyn Americans had moved somewhat to management and semiprofessional jobs.

Politics and Public Life

At least until World War I, Carpatho-Rusyns in Europe had no meaningful role in politics. As stateless minorities, they were ruled over and did not take part in work of government. Therefore, Carpatho-Rusyn Americans have rarely become elected officials in the United States.

In contrast, Carpatho-Rusyn Americans played in active role in European politics toward the close of World War I as they proposed locations for their homelands; eventually, it was in fact the Carpatho-Rusyn American suggestion of Czechoslovakia that was adopted at the Paris Peace Conference in 1919. Carpatho-Rusyn Americans also became active in the World Congress of Rusyns in 1991.

Undoubtedly, Andy Warhol was the most famous Carpatho-Rusyn American. His older

brothers, John and Paul Warhola, were instrumental in promoting the Carpatho-Rusyn heritage of Andy and his family after his death; that heritage is prominently featured in the Warhol Foundation and Pittsburgh's new Andy Warhol Museum. The Warhol Foundation also provided money and paintings for the Warhola Family Museum of Modern Art in Slovakia just miles from the birthplace of Andy Warhol's parents. Sandra Dee, the good girl of 1950s and 1960s movies, was also Carpatho-Rusyn American.

Cart War

During the 1850s, the road that led westward from Indianola, a port city, to San Antonio and beyond to Chihuahua, Mexico, was heavily traveled by freight haulers transporting goods into the interior of Texas and Mexico. The Old Cart Road, so named for the ox carts the drivers used, became the setting for large-scale violence known as the Cart War. In July 1857, Anglo teamsters, angered by what they believed was unfair competition, attacked Mexican and Tejano (Texans of Mexican descent) carters, destroying carts and wounding or killing drivers. Hostilities continued until protests from the Mexican government to Lewis Cass, U.S. secretary of state, resulted in federal pressure on Texas to protect the Mexican carters. Texas appropriated funds for a special militia, and armed escorts ended the attacks by December 1857.

The Treaty of Guadalupe Hidalgo marked the official end to the Mexican-American War in 1848, but isolated outbreaks of ethnic and racial hostilities between Mexicans and Texans continued. The hostilities were exacerbated by white anger over Mexican sympathy for slaves and by the rise of the Know-Nothings in Texas politics. Officially known as the Native American Party, the Know-Nothings were committed to stopping the influence of persons of foreign birth in economic and political affairs of the United States. Although the party emerged first in the east in 1853 in response to the influx of Catholics from Ireland and Germany in the 1840s and 1850s, by 1855, the Know-Nothings were challenging the Democrats in Texas, winning elections in Austin and Galveston.

Heightened racial tensions ignited Anglo teamsters' anger. Moving freight from Mexico and the Texas coast was a lucrative business in 1857. One expert estimates the total at \$2 million. One San Antonio newspaper credited the Tejano cart men, most of them with 10 to 12 teams of mules, with hauling double the freight in half the time at half the price charged by their Anglo, mostly German, competition, who were using five to six teams of oxen. One cart driver from Karnes County placed the number of carts owned by the Mexicans at 2,000. Hundreds of carts were traveling the route on any given day.

An early attack on Mexican carters occurred that same year near Seguin, but it was two years later when sustained violence began. Goliad was one site where masked gangs of Texans attacked the Mexican and Tejano cart men, destroying their carts and hanging some of the drivers from the town's hanging tree. Some accounts place the number of deaths as high as 75, although 21st-century historians question the accuracy of so high a number. Regardless of numbers, town authorities responded to the attacks with indifference. Karnes County was another chief site of the attacks. In a public meeting held in the county seat on December 4, 1857, the citizens of the county adopted a resolution that described the Mexican *carreteros* as an "intolerable nuisance" and charged the citizens of San Antonio to hire only Texans. Residents of Goliad and Karnes wrote letters to editors of local newspapers and to local and state leaders expressing their anger and prejudice.

Response

Not all Texans agreed with these attitudes. Political leaders, businessmen, and private citizens in San Antonio, for example, called on state government to protect the constitutional rights of Tejanos. Some calls for an end to the violence were more pragmatic, expressing concerns about disruptions to the flow of goods and higher prices and fears that the violence could spread to affect other groups not part of the white, Protestant mainstream. Even humanitarian pleas, however, reveal racism, as in a Corpus Christi newspaper that declared Mexicans deserving of the protection of civil authorities despite their low intelligence. Opposition to the attacks gained strength when Antonio Delgado, a San Antonio citizen who had fought for the United States at the Battle of New Orleans in 1815, against the Spanish at the Battle of Medina, and in the Texas Revolution in 1835 and 1836, was gunned down.

Goliad residents, fearful that the state would revoke the county's charter because of the violence occurring within its borders, lynched several of the cart cutters from the same tree that had served to lynch carters earlier. Sentiments within the county toward the Mexican drivers remained unchanged, but the need to set priorities resulted in a change in action.

When news of the violence reached Mexico, the Mexican government responded quickly. On October 14, 1857, Manuel Robles y Pezuela, the Mexican minister in Washington, delivered Mexico's official protest to Secretary Cass. In turn, on November 11, Cass approached Texas governor, Elisha M. Pease, with the federal government's mandate that hostilities end. On November 30, Pease declared to the Texas state legislature that the endangerment of citizens "of Mexican origin" along the Old Cart Road made necessary special appropriations for a militia to stop the attacks.

Although not all Texans were pleased with armed escorts for Tejano carters, the legislature approved the funds within 72 hours with minimal opposition. The lynching of an unknown number of attackers in Goliad and the arrival of Pease's special militia of 75 Texas Rangers to act as escorts for the carts ended the Cart War in December 1857. The ethnic conflicts were not ended so easily. Some insist that they echo in the

21st century in continuing debates within the state over immigration policy.

Caucasians

Through multiple analyses of mitochondrial and nuclear DNA, as well as specific alleles and other polymorphic traits, biological anthropologists and geneticists have shown that biologically distinct racial groups or subspecies do not exist within the human species, *Homo sapiens*. Instead, racial categories are arbitrary, socially constructed, and culturally defined labels that vary between societies and have shifted in their terminologies and classification schemes over time. No clear-cut scientific consensus has ever delineated a precise number of human races, with some early-20th-century scholars and social observers proposing the existence of three races (Caucasoid, Negroid, Mongoloid), while others argued for the existence of five, nine, or several dozen racial groups.

The highly subjective nature of racial taxonomy, which is influenced by the establishment of arbitrary standards as racial boundaries, renders impossible any objective attempt of human racial classification. From the late 18th to the mid-20th century, racial theorists known as "lumpers" have proposed racial typologies consisting of a relatively small number of human races based largely along continental lines (European, African, Asian,

American Indian, etc), while "splitters" have simultaneously put forth more elaborate racial classification models that subdivided major continents into more specific, regional racial groupings (e.g., northern Europeans, central Europeans, southern Europeans).

Although human biological variation is real, attempts to pigeonhole such tremendous physical and genetic variation into a finite number of human categories is not. This is because much human phenotypic and genetic variation is continuous, or clinal, in nature and occurs over a series of gradations between neighboring indigenous populations, rather than manifesting itself in a few distinct, discrete types. As one such example, human skin color does not occur in just five, 15, or even 55 different shades. Rather, the range of human skin color, as a continuous trait, constitutes a spectrum from very light to very dark, with every possible hue, shade, and tone in between manifesting itself among various members of the species. Central Africans generally have darker skin pigmentation than north Africans, who in turn are generally darker than southern Europeans. Southern Europeans tend to be slightly darker than northern Europeans. In addition to skin color, other physical traits such as hair color, hair texture, height, nose shape, and eye color are also clinal traits.

Furthermore, genetic research reveals that of the total amount of genetic diversity found within the human species, approximately 88 to 92 percent exists *within* any continental region (Europe, Africa, Asia, etc.). Only 8 to 12 percent of the total amount of human genetic diversity is found *between* these continental regions that are often assumed to be the homelands of distinct racial groups. As such, significantly more genetic diversity is found within presumed racial groups than between such groups. In order for race to hold biological significance, the opposite must be true—more genetic discrepancies must exist between groups than within. Nevertheless, the belief in biological races remains a powerful idea in the United States, and issues of race constitute some of the most vexing and emotional social and political topics in the nation.

Demographics

Ever since the administration of the first census in 1790, whites have constituted the largest

racial group in American society. The term *Caucasian* is purely a social label, rather than a political or legal label, and the U.S. government does not classify or identify persons as “Caucasians.” Instead, the federal government uses the label *white* for official demographic record-keeping purposes; the government defines a white person as “a person having origins in any of the original peoples of Europe, north Africa, and the Middle East.” Office of Management and Budget (OMB) Directive 15, implemented in 1977, established the official racial category “White” and the above definition.

Many Americans express surprise upon learning that the government officially classifies north Africans and Middle Easterners as white, thus illustrating that political and legal definitions of race do not necessarily correspond with popular social perceptions of race.

The 2010 census counted a total white population of 223,553,265 out of a total national population of 308,745,538. Whites account for 72.4 percent of the U.S. population. This statistic may appear to be misleading, however, due to the fact that the U.S. Census Bureau counts two ethnic categories of whites—Hispanic and non-Hispanic. Because Hispanics are officially considered an ethnic (rather than racial) group under OMB Directive 15, Hispanic persons are able to also identify their race as “white.” Fifty-three percent of Hispanic respondents selected “white” as their race in 2010.

Because so many Americans erroneously assume that Hispanics or Latinos are a distinct “racial” group separate from whites, the non-Hispanic white population count may provide a more realistic count of the nation’s white population, with regard to the popular social concept of whiteness as commonly understood by most Americans. Non-Hispanic whites accounted for 63.7 percent of the national population in 2010.

Non-Hispanic whites comprise 78.8 percent of the population in the midwest, the highest portion of any region of the country. By contrast, non-Hispanic whites account for 53.2 percent of the population of the western states, the lowest portion in the country. Maine and Vermont have the highest proportions of non-Hispanic white populations at 94.4 percent and 94.3 percent, respectively.

Origins of the Term *Caucasian*

The age of the Columbian Exchange throughout the 16th and 17th centuries exposed Western European explorers to the multiple geographic, floral, faunal, and cultural variations within the Americas, central and southern Africa, and eastern Asia. This period in history corresponds to the early years in the development of biology as a modern science, as well as the Enlightenment-era approach toward positivism and scientific classification of natural phenomena. Within this social matrix, Western rational thinkers contemplated the vast diversity of humanity, both physically and culturally, and attempted to categorize such diversity.

The Swedish botanist Carolus Linnaeus produced one of the earliest racial taxonomies that attempted to classify human beings into different “varieties” (races) in the 1758 edition of *Systema naturae* (Natural System). Linnaeus defined his varieties according to a combination of alleged physical, cultural, and personality characteristics. While asserting that all humans belonged to a singular species, Linnaeus identified five varieties of humanity: *ferus*, *afer*, *americanus*, *asiaticus*, and *europaeus*. His description of each variety read:

- *Ferus*: Four-footed, mute, hairy.
- *Americanus*: Red, choleric [angry], upright. Hair black, straight, thick; nostrils wide; face harsh; beard scanty; obstinate [stubborn]; content free. Paints himself with fine red lines. Ruled by habit.
- *Europaeus*: White, sanguine [cheerful], muscular. Hair yellow, brown, flowing; eyes blue; gentle, acute, inventive. Covered with cloth vestments. Ruled by custom [or law].
- *Asiaticus*: Pale-yellow, melancholy, stiff. Hair black; eyes dark; severe, haughty, covetous. Covered with loose garments. Ruled by belief [or opinions].
- *Afer*: Black, phlegmatic [sluggish], relaxed. Hair black, frazzled; skin silky; nose flat; lips tumid [swollen]; crafty, indolent, negligent. Anoints himself with grease. Ruled by caprice [impulse].

Linnaeus’s taxonomy was highly influential in the social construction of race in the Western

world, and his different varieties reflect the contemporary racial categories used by the U.S. Census Bureau. The late biologist Stephen Jay Gould noted in his classic history of racial science *The Mismeasure of Man* that although Linnaeus's taxonomy invoked ethnocentric descriptions of the various racial groups, this classification system was based strictly on geographic regions rather than a hierarchical ranking of superiority and inferiority.

Gould points out that if Linnaeus attempted to posit Europeans (*europaeus*) as the superior race, he would have listed them first in his typology instead of positioning them below American Indians (*americanus*). Instead, Gould credits the late-18th-century to 19th-century German naturalist Johann F. Blumenbach with devising a hierarchical racial typology that was later invoked to justify white supremacy, as well as with originating the term *Caucasian* in reference to white persons.

Blumenbach coined the term *Caucasian* in the third edition of his influential treatise *De generis humani varietate nativae* (On the Natural Variety of Mankind), published in 1795. Blumenbach's typology consisted of five distinct races of humanity, including Caucasian (white), American (red or American Indian race), Mongolian (yellow or East Asian race), Malay (brown or Pacific Islander race), and Ethiopian (black or African race).

Blumenbach greatly admired Linnaeus, and the influence of Linnaeus's own taxonomy on that of Blumenbach is readily apparent. However, Blumenbach's classification scheme gave rise to the term *Caucasian*, and his 1795 definition of this term ascribes to this category of people two features that in the centuries afterward have been invoked by white supremacists to justify their racist beliefs: the alleged ultimate beauty of Caucasians and their alleged status as the original form of humankind, from which Asiatic and African populations drastically diverged. Blumenbach wrote:

Caucasian variety. I have taken the name of this variety from Mount Caucasus, both because its neighborhood, and especially its southern slope, produces the most beautiful race of men, and because . . . in that region, if anywhere, we ought with the greatest probability to place the autochthones [original forms] of mankind.

The Caucasus Mountains consist of two mountain ranges located between the Black Sea and the Caspian Sea. The Caucasus region consists of the southernmost points of present-day Russia, Chechnya, Armenia, Georgia, and parts of Turkey and Iran. Although Blumenbach was a committed antiracist and abolitionist who believed in the moral and mental equality of Africans and Europeans, his beauty-based definition of Caucasians and his conjecture that Caucasians were the original humans proved to be one of the most fateful long-term developments in the history of science. Stephen Jay Gould has remarked on Blumenbach's reworking of Linnaeus's racial taxonomy:

The shift from a geographic to a hierarchical ordering of human diversity marks a fateful transition in the history of Western science—for what, short of railroads and nuclear bombs, had more practical impact, in this case almost entirely negative, upon our collective lives and nationalities. Ironically, J. F. Blumenbach is the focus of this shift—for his five-race scheme became canonical, and he changed the geometry of human order from Linnaean cartography to linear ranking by putative worth.

From Ethnic Immigrants to White Americans

The emergence of whiteness as a significant social (as opposed to a biological) identity in American society dates to the 17th century when colonial British aristocrats invoked the idea of a common racial identity to quell any potential class-based insurrections among the propertyless and economically depressed English and other European settler masses. In particular, the ruling elites of the colonial era feared social unity between working-class European settlers and African indentured servants and slaves, as had occurred during Bacon's Rebellion. Since both groups occupied the lowest rungs of the social hierarchy ladder, they each stood to profit from the overthrow of the aristocratic classes throughout the colonies.

The Anglo-Protestant establishment began to promote to lower-class European immigrants an ideology that they were members of a superior and advantaged "white race," distinct from the "uncivilized" and "lesser" American Indian and African "racial" groups. The "one drop rule" of hypodescent that dictated racial classification

ensured that a child born to one black and one white parent was to be classified as black. By the end of the 1600s, marriage between whites and Africans or Indians had been outlawed in most colonies. A series of laws granted special rights and privileges to the newly defined “whites” that were denied to Africans and American Indians, such as the right to own firearms, the right to own livestock, and the right to whip Africans as a means of discipline, even if they did not own them. Gradually, commoners of English, Scottish, Welsh, Scots-Irish, German, and other European backgrounds came to perceive themselves as above Africans and American Indians within the colonial hierarchy, fellow “whites” with political elites, slaveholders, and propertied landowners.

W. E. B. Du Bois has termed this race-based identity among upper-class British aristocrats and lower-class European laborers the “psychological wages of whiteness” to highlight that white racial identity in American society is based on a lack of class consciousness. Bestowing an elite racial status upon the masses who hailed from nonelite class and family backgrounds enabled America’s aristocrats to fracture class consciousness among lower-class whites by substituting psychological wages for financial wages.

Although many Americans today refer to white persons of European ancestry as “Caucasians,” various Catholic and Jewish immigrant groups from southern and eastern Europe were not initially accepted as white upon their early years of migration to the United States. Prominent examples include Irish Catholics of the mid-19th century, southern Italians and eastern European Jews of the late 19th and early 20th centuries, and Hungarian immigrants during the early 20th century. Each of these groups encountered negative racialization as they entered the United States that manifested in extreme nativist rhetoric, efforts to curtail immigration, and popular discourses that characterized each group as posing a threat to the white “racial stock” of the United States.

Irish Catholic immigrants began to settle in the United States in large numbers during the 1830s and 1840s, driven out of Ireland by the devastation of the Great Potato Famine and attempts to escape persecution at the hands of the British in their homeland. Popular destinations for Irish migrants included the major port cities of Boston,

AMERICAN CITIZENS!
We appeal to you in all cultures. It is not time to part. Already the progress of our democratic institutions, like the foreign spirit in the Trojan horse of old, are within our gates. They are engaging themselves upon us, as the sons of Hecuba, and the Trojan women weal. They are an insidious sort of serpent and supremacy over us.

A PAPER ENTITLED THE

AMERICAN PATRIOT

<p>IN FAVOR OF</p> <p>The protection of American Mechanics against Foreign Pauper Labor.</p> <p>Foreigners having a residence in the country of 21 years before voting.</p> <p>Our present Free School System.</p> <p>Carrying out the laws of the State, as regards sending back Foreign Paupers and Criminals.</p>	<p>OPPOSED TO</p> <p>Papal Aggression & Roman Catholicism.</p> <p>Foreigners holding office.</p> <p>Raising Foreign Military Companies in the United States.</p> <p>Numerous and the Jesuits.</p> <p>To being taxed for the support of Foreign paupers millions of dollars yearly.</p> <p>To accept Foreign Orders in the U. ---	--	--

The PATRIOT is Published by J. E. Farwell & Co., 32 Congress St., Boston.

This advertisement published in Boston in 1852 announced a new nativist newspaper with an anti-Catholic illustration targeting foreign immigrants, especially the Irish. Part of the text states, “They aim at nothing short of conquest and supremacy over us.”

New York City, and Philadelphia, as well as smaller cities and towns throughout the midwest. As the first Roman Catholic population to enter the nation in large numbers, the Irish encountered the first major wave of nativism in American history at the hands of Anglo-Saxon Protestants who initially regarded the Irish as both racially and religiously inferior. By the mid-1840s, American newspapers commonly portrayed the Irish negatively as drunken, violent, immoral, “subhuman,” and “apelike.” Following the publication of Charles Darwin’s *Origin of Species* (1859), Anglo-Protestant nativists depicted the Irish as the “missing link” between the English, Africans, and apes.

The Democratic Party played an important early role toward the “whitening” of the Irish in American society by hardening the social boundary between Irish immigrants and African Americans. Irish immigrants constituted a disproportionate number of Union soldiers during the Civil War, a conflict that the Irish generally saw as providing no benefit for them. The Democratic Party, itself opposed to the war, sought the votes of Irish immigrants by rewarding them with food, money, jobs, housing, and other services, thus establishing early political machines. In certain regions, particularly the south, the Democratic Party aggressively persuaded the Irish that if slavery ended, the newly freed blacks would compete with them for scarce jobs. This extension of

the “psychological wages of whiteness” to Irish immigrants exacerbated social tensions between Irish Americans and African Americans. Many Irish Americans became minstrel performers, mocking African Americans and portraying them as buffoons in an effort to demonstrate their own whiteness. Other important factors, such as the high rate of participation in labor unions during the early years of the Industrial Revolution and the transfer of nativist sentiments toward new immigrant groups, enabled the Irish to begin entering the mainstream of American society by the 1920s.

From the 1890s through the mid-1920s, millions of southern Italians, eastern European Jews, Hungarians, Greeks, Poles, and other immigrants from the “peripheral” regions of southern and eastern Europe settled in the United States, evoking racial concerns about the nation’s changing demographics among the Anglo-Saxon majority. These turn-of-the-century immigrants found themselves in a racial purgatory of sorts. The U.S. government generally defined them as “white,” while the Anglo-Protestant public generally considered them to be racially inferior “Mediterraneans,” “Hebrews,” “Hunkies,” and “Polacks” who deserved the discrimination and nativism they encountered from the racially superior “Nordics” (Anglo-Saxons).

Anthropologist and eugenicist Madison Grant, leader of the Immigration Restriction League, spearheaded the charge that “Nordics” risked being overrun by these immigrant “race bastards” who would interbreed with Anglo-Saxons and sire racial “horrors that will be beyond the power of future anthropologists to unravel.” Southern Italians and Hungarians were routinely described as being innately brutish and intellectually inferior, and the Mediterranean diets of Greek and Italian migrants were cited as proof of these populations’ alleged racial inferiority. Efforts to preserve Anglo-Saxon racial “purity” led to enactment of the Johnson-Reed Immigration Act, signed by President Calvin Coolidge.

World War II and the Postwar Era

Historians and anthropologists credit World War II and the postwar economic boom as the most critical factors in bringing about the social transformation of southern and eastern European

immigrant groups from racially stigmatized “others” to full-fledged, undisputed American “whites.” During the war, the Americans All propaganda machine portrayed new immigrants and their children in a positive fashion, praising them for their heroism and patriotism on the battlefield. This contrasted sharply with how the media depicted immigrants during World War I, which viewed immigrants suspiciously and questioned their loyalties to American democratic principles. Anti-Nazi sentiments on the home front led to a reassessment of intra-European racism, with such ideologies falling out of favor with many Americans given the nature of the atrocities that anti-Semitic, anti-Polish, and anti-Roma attitudes had produced within Europe. The decade following the war saw the emergence of suburbs across the nation, and the combined influence of the automobile, home mortgage loans, free college educations for veterans through the G.I. Bill, and increased disposable incomes accrued during the postwar boom facilitated the relocation of millions of European Americans to the suburbs during the late 1940s and 1950s. Carolyn Fluehr-Lobban asserts:

The postwar G.I. Bill of Rights was probably the most massive affirmative action project in U.S. history. A college degree was no longer an upper-class privilege, as eight million white G.I.s took advantage of the program. White workingmen left the assembly line to become professional doctors and lawyers; this workforce was replaced by Latin[os] and African American[s] . . . African American G.I.s were almost completely shut out from the benefits of the G.I. Bill . . . Suburbanization, symbolized by Levittown outside of New York City, was hugely aided by cheap Federal Housing Authority loans, and blacks were closed out once again, creating “lily white” suburbs that remain mostly segregated to this day.

Within this sociohistorical context, the concept of race in American society underwent a significant metamorphosis. The old racial subdivisions of Europeans, previously categorized as “Nordics,” “Alpines,” “Mediterraneans,” etc., disappeared in favor of an all-inclusive, general category of whiteness. These old divisions and

boundary lines blurred as southern and eastern European immigrant groups fought alongside white Anglo-Saxon Protestants during the war, and then lived alongside them in the suburbs after the war. Equally important, this expanded redefinition of American whiteness was solidified by emphasizing that some groups were much more different from “whites” than were Slavs, Jews, or Sicilians from Anglo-Saxons or the Irish. While whiteness emerged as a significantly more inclusive social category after World War II, the racial boundaries between “white” and “nonwhite” remained steadfast. This phenomenon set the stage for racial conflicts between “white ethnics” and African Americans in cities such as Boston, New York City, Philadelphia, Chicago, and others during the mid-to-late 20th century.

The whitening process that southern and eastern European ethnic groups underwent throughout the 19th and 20th centuries is obvious today. With the notable exception of “old money” Anglo-Protestant elites, most European Americans no longer oppose the idea of intraethnic marriage with persons of other European heritages. Indeed, most white Americans today are of mixed European heritages, themselves the products of unions between an Italian mother and a German-Irish father, for example. While the thought of a Scots-Irish woman dating a Polish or Hungarian man once generated considerable social opposition, such a reaction seems almost laughable in the 21st century. In fact, such cross-ethnic unions facilitated the spread of a generic “white” identity among Americans of European descent.

Whiteness Studies

Since the mid-1990s, a number of scholars have contributed to the emerging field of whiteness studies. Interdisciplinary in nature, whiteness studies encompass research from the academic fields of anthropology, history, psychology, and sociology. In general, whiteness studies focus on two major dimensions of the experiences of white persons in American society. The first dimension of whiteness studies examines the immigration histories and gradual incorporation of various European immigrant groups into the ever-expanding social boundaries of whiteness throughout the nation’s history. Major works in this area include Karen Brodtkin-Sachs’s *How Jews Became White Folks*

(1998); Noel Ignatiev’s *How the Irish Became White* (1999); Nell Irvin Painter’s *The History of White People* (2010); David Roediger’s *The Wages of Whiteness: Race and the Making of the American Working Class* (1991) and *Working Toward Whiteness: How America’s Immigrants Became White—The Strange Journey From Ellis Island to the Suburbs* (2005); Peter Schrag’s *Not Fit for Our Society: Immigrants and Nativism in American History* (2010); and Audrey Smedley’s *Race in North America: Origin and Evolution of a Worldview* (1999).

The other dimension of whiteness studies investigates the nature of white racial identity/identities and the social meaning(s) that white persons attach to being white. Although this field of research is still in its infancy, several scholars have already published on these topics. Notable researchers include Bob Blauner, Ashley Doane, Ruth Frankenberg, Charles Gallagher, John Hartigan, and Pamela Perry.

Qualitative and quantitative research indicates that whiteness remains a hidden and invisible identity to many Americans, particularly whites themselves, because whiteness is so dominant and prevalent in society. Whiteness is the default, hegemonic norm in American society, and across American history to be white was to be considered “normal.” Even studies of race in American society have long focused on the experiences and identities of African Americans, Asian Americans, and other minority groups rather than examining whiteness itself. Sociologist Ashley Doane claims:

The emphasis by whites upon the racial “other” has gone hand in hand with the politically constructed role of whiteness as the “unexamined center” of American society. Because whites have historically controlled the major institutions of American society, they have been able to appropriate the social and cultural “mainstream” and make white understandings and practices normative.

Because whiteness was originally established during the colonial era as the definition of both “normal” and “American,” and because whiteness has been at the very heart of what is socially defined as “mainstream” in American society, many “Caucasians” throughout the United States

wholeheartedly believe that they “don’t have a culture.” Whiteness is commonly perceived as implying the lack of culture. Such thinking, while commonplace, is erroneous. All members of society have experienced a cultural upbringing and socialization experiences that influence the manner in which they live their daily lives, but as anthropologists point out, culture remains elusive to most people unless they are placed in an alien cultural environment for an extended period of time. Whiteness remains invisible and seemingly “culture-less” to the majority of “Caucasians” in American society precisely because it is an unmarked identity; whiteness is not clearly named and identified in the mass media and popular culture as is blackness, *Latinidad*, and other minority identities. Sociologist Ruth Frankenberg recognizes whiteness as a range of unmarked and unnamed cultural practices and identities, which are often labeled as “national” or “normal” instead.

Several scholars contend that while whiteness often remains an elusive and invisible identity for many white persons, whiteness becomes readily apparent and openly articulated when white persons perceive a threat to the “racial status quo” or sense that whiteness is under attack. White persons who fear that they are or will soon become a minority may angrily or defensively invoke the ideas of English-only laws, white student unions, and White History Month. As Frankenberg notes, “In times of perceived threat, the normative group may well attempt to reassert its normativity by reasserting elements of its cultural practices more explicitly and exclusively.” Along similar lines, sociologist Charles Gallagher contends that a more cognizant white racial identity and consciousness has developed among white Americans since the late 1980s in response to the nation’s rapidly shifting demographics and the identity politics movements of peoples of color during the post-civil rights era. Gallagher argues that a white identity politics movement, which constructs whiteness as a social disadvantage as a result of affirmative action and multiculturalism, has gained momentum in recent years. The recent election and reelection of President Barack Obama, bolstered by his overwhelming support among African American, Latino, and Asian American voters, has generated discourses within

certain circles of American society regarding the alleged “end of white America.”

White Privilege

White privilege refers to the “unearned and unacknowledged benefits conveyed by being white” in American society. These privileges range from the relatively minor to major determinants of life chances, and include phenomena such as the ability to purchase bandages in “flesh” color that matches one’s skin, never being seen as a representative or spokesperson for one’s entire racial group, not having to worry about being racially profiled while driving through an affluent neighborhood, and being able to grow one’s hair naturally without being considered “radical” or “militant.” Sociologist Pamela Perry and activists Tim Wise and Robert Jensen remain the nation’s most high-profile speakers on the subject of white privilege.

It is important to keep in mind, however, that privilege is always relative and never absolute. Various axes of social advantage and disadvantage intersect with one another in shaping a person’s overall life experiences. While whites may be socially privileged in terms of race vis-à-vis nonwhites, the social experiences of whites (and nonwhites) also are profoundly shaped by class, gender, sexuality, age, (dis)ability, and other variables. In other words, a person may experience privilege through one of these variables, while experiencing disadvantage through another variable.

White Supremacy

Although the idea of race is a socially constructed concept, white supremacists argue that biologically distinct human races exist. These races, according to white supremacists, are easily identifiable and differ in their innate intellectual capacities, personalities, and moralities. According to their logic, the “white race” constitutes the superior race in terms of intelligence, beauty, and moral worth. Notable white supremacist organizations in the United States include the Ku Klux Klan, the Neo-Nazis, and the Aryan Nations. Despite a shared belief in white racial superiority and hatred for nonwhites, white supremacists themselves disagree over the exact definition of whiteness and who, exactly, they

Various white supremacist groups can still be found throughout the United States. This photo, in which a member of the Ku Klux Klan watches a cross burning while sitting next to his young children, was taken in 1987 in Jackson County, Ohio.

consider to be white. Some regard all “Caucasians” (except Jews) as white. Others utilize a much more exclusionary concept of whiteness, reminiscent of Madison Grant’s racial diatribes of the early 20th century, and reserve their definition of whiteness to persons of northern European or “Nordic” ancestry.

Controversial Terminology

In recent years, several pundits and social observers have expressed objections to the usage of the term *Caucasians* in reference to white persons. The rationale for such objections varies, ranging from misleading and inaccurate connotations of the word to objections over the proliferation of political correctness in American society. Some

critics note the history of racism that the term *Caucasian* imbues, which derives from the hierarchical arrangement of racial groups throughout the history of Western racial taxonomies stemming from Blumenbach’s original designation of “Caucasians” as the allegedly most beautiful racial group.

Critics contend that referring to white persons today as Caucasians serves to legitimize this term and Blumenbach’s ethnocentric thinking imbued within this term, similar to the way that referring to white persons today as Aryans or Nordics would serve to legitimize Adolf Hitler’s or Madison Grant’s racialized ideologies because of the loaded sociohistorical implications of such terms. In this vein, *white* is perceived as a more neutral term than *Caucasian*.

On the other hand, others have argued that the practice of referring to white persons as Caucasians is a relatively recent development in American society since the 1980s and is an outgrowth of the increasing political correctness and identity politics. Those who articulate this position contend that the transition from “white” to “Caucasian” is akin to the switch from terms such as *black* and *Oriental* to *African American* and *Asian/Pacific Islander*, respectively. Under this logic, the term *Caucasian* is merely a euphemism rooted in hypersensitivity.

At the same time, other critics note that the overwhelming majority of white persons in the United States do not trace their ethnic heritage to the Caucasus Mountains region or to the Republic of Georgia or the former Soviet Union more generally. These critics assert that referring to white Americans as “Caucasians” is therefore highly inaccurate and as illogical as referring to Latinos collectively as “Mexicans” or to Asian Americans collectively as “Chinese.” Nevertheless, whether the result of political correctness, historical legacy, or the general concern and confusion that often surround discourses of race, the term *Caucasian* appears to be deeply entrenched within the American lexicon and will likely continue to be used by Americans of various racial and ethnic backgrounds as a designation for white persons for several years to come.

Century of Dishonor, A

A Century of Dishonor: A Sketch of the United States Government's Dealings With Some of the Indian Tribes by Helen Hunt Jackson is a work of nonfiction. Published in 1881, the book is brutally critical of federal policy toward Native Americans and of white–Native American relations generally.

The book is neither history nor political theory but rather an impassioned challenge to the United States to act morally and honorably in its dealings with Native Americans. Relying on extensive research, Jackson recounts stories of displacements, massacres, and broken treaties. *A Century of Dishonor* did not sell in record numbers, and it did not result in immediate improvement in Native American affairs. But it did make the public aware of cruelties and corruption, and it captured the attention of other reformers.

Before writing *A Century of Dishonor*, Jackson was already a prolific writer who had published children's stories, novels, essays, and poems. Ralph Waldo Emerson considered her superior to most American writers. In 1879, during a visit to Boston, Jackson attended a lecture by Chief Standing Bear, who traveled the country telling his story of the forced removal of the Ponca from their tribal land. Jackson was so emotionally stirred by the speech that she devoted herself to arousing public opinion on behalf of the unjust treatment of Native Americans. She circulated petitions, raised money for lawsuits, and wrote letters to newspapers and government officials, including Carl Schurz, secretary of the interior.

She also spent months researching mistreatment of Native Americans and specific instances of broken treaties. *A Century of Dishonor* was the product of that research. It included histories of seven tribes and a chapter on massacres of Native Americans by whites. She pointed out the long history of broken treaties and demanded that the U.S. government end “murder, outrage, robbery, and wrongs” against the Indians. She was pleased when the Reverend Henry Benjamin Whipple, the Episcopal bishop of Minnesota and a longtime supporter of Indian rights, agreed to write the preface. All her earlier work had been published under pseudonyms, a common practice for women writers in the 19th century. In a bold move, she published *A Century of Dishonor* under her own name. She paid for copies of the book to be sent to each member of Congress. The special copies were bound in blood-red cloth. Embossed on the cover were words Benjamin Franklin penned in a letter to a member of Parliament on July 5, 1775: “Look upon your hands! They are stained with the blood of your relations.”

The book did not bring the response Jackson hoped. There were some positive reviews, and some humanitarians were outraged by the abuses Jackson had so carefully delineated, but for the most part, Congress and the American public were indifferent. But Jackson did not forsake the cause. In the fall of 1881, she visited California and became aware of the plight of the various tribes living around the former Spanish mission towns. Massive dispossessions by Americans had left only around 4,000 mission

Indians in southern California, where an estimated 15,000 had lived 30 years earlier. Once more Jackson was stirred to action. This time her work was noticed by Hiram Price, commissioner of Indian affairs, who recommended that Jackson be appointed an agent of the Department of Interior. She was assigned to investigate and make recommendations concerning the mission Indians. Her 56-page *Report on the Conditions and Needs of the Mission Indians of California*, completed in 1883, listed 11 recommendations, ranging from the purchase of new lands for reservations to the establishment of more Indian schools. Legislation that adopted most of these recommendations was introduced; it passed the Senate but died in the House of Representatives.

Still unbowed and inspired by the reception of Harriet Beecher Stowe's *Uncle Tom's Cabin*, Jackson decided that fiction might accomplish what nonfiction had failed to do. In December 1893, she began writing *Ramona*, the story of a half-Indian, half-Spanish heroine and her ill-starred love for a mission Indian man. She finished it in less than three months, and it was published in November 1884. The novel sold 7,000 copies in the first three months after its publication, but Jackson died before the novel's full popularity was realized. The novel went through more than 300 printings and eventually inspired adaptations on the stage, on the screen, and in song, although it was the romance and not the politics that attracted its audience.

Less than a year after the publication of *Ramona*, Jackson died. Her plan to write a children's story on the cause to which she had devoted the final seven years of her life was never realized. Jackson expressed her pride in *Century of Dishonor* and *Ramona*, and her confidence that they would bear fruit. Her last letter was to President Grover Cleveland, asking him to read *A Century of Dishonor* and take action for which his predecessors had lacked the courage.

César Chávez Day

César Chávez Day, created to recognize the legacy of one of the founders of the United Farm Workers of America, has been proposed as a federal holiday and is currently celebrated in some states. It is the first holiday to recognize the civil rights work of a specific U.S. labor leader. The holiday has met with resistance from antiunion activists, and has also been caught in a dispute over paid and unpaid workers' holidays and pitted against Martin Luther King, Jr. Day and Presidents Day.

César Estrada Chávez was a first-generation American of Mexican descent born in Yuma, Arizona, on March 31, 1927. Like many Dust Bowl families who lost their farms during the Great Depression, the Chávez family moved to California to join the agricultural migrant stream. Chávez left school before graduation so he could go to work with his family, and he joined the U.S. Navy in 1946. He and his wife Helen moved to the Sal Si Puedes (Get Out If You Can) neighborhood in San Jose, California, where he worked for the Community Service Organization, as did the eventual cofounder of his union, Dolores Huerta. In 1962, Chávez cofounded the most successful and publicly recognized agricultural union in the United States: the United Farm Workers of America.

Chávez sacrificed personally to build the union and change agricultural labor law in the country. His speeches and actions promoted nonviolent organizing and public education as the means to

further justice for hard-working laborers. Chávez found strength in the words and strategies of Mohandas Gandhi and Martin Luther King, Jr., with whom he is often compared. Chávez fasted on three occasions to publicize the plight of migrant farmworkers, and engaged in frequent *peregrinaciones* (pilgrimages or marches) to the California capital in Sacramento to change labor law. He also called on consumers to boycott table and wine grapes, later followed by campaigns to boycott other crops, arguing that consumers, like farmworkers, were victimized by the environmental risks of pesticides. After a lifetime of dedication to and success in his efforts, Chávez died near his childhood home in Arizona in 1993. He took a vow of poverty throughout his work, never earning more than \$6,000 a year. He did not own a home and left nothing to his family after his death. In 1994, President Bill Clinton posthumously awarded the Presidential Medal of Freedom to Chávez.

In California, Senate Bill 984 passed both houses and was signed into law by Governor Gray Davis in 2000, making March 31, the date of Chávez's birth, César Chávez Day, an official holiday for state government and university employees. The law also created the César Chávez Day of Service and Learning Program, held each year on March 31, to promote and facilitate community service. On this day, state schools include instruction about Chávez in their kindergarten-through-12th-grade curriculum. The law provided money to enable the California Department of Education to create a model K–12 curriculum about Chávez. This mandated, annual standards-based curriculum has increased public awareness about Chávez, the United Farm Workers, food production, and working conditions. Following the passage of California's law, nine additional states (Arizona, Texas, Colorado, Illinois, Michigan, New Mexico, Utah, Wisconsin, and Rhode Island) enacted laws making César Chávez Day a commemorative or optional holiday, which may be requested and substituted for a different holiday in the same fiscal year.

The recognition of Chávez has been met with controversy and resistance. In 2006, Republican senators blocked a Democratic resolution acknowledging Chávez on his birthday. The following year, a César Chávez federal holiday bill

This poster produced by the U.S. Department of Labor celebrates César Chávez Day 2010. In 2011 President Barack Obama backed the addition of César Chávez Day as a federal holiday in a presidential proclamation.

was blocked again, this time when Senate Republicans introduced a rules change that prevented consideration of any bills that established commemorative days for an individual. In 2007, U.S. Rep. Joe Baca (D-CA) introduced a resolution to overturn the rules change in order to allow a federal bill to be introduced creating a Chávez holiday. In the four subsequent years, Republicans prevented similar resolutions from passing by failing to pass the resolution unanimously.

Community celebrations of Chávez have not always been positive occasions. In Chico, California, students for seven years commemorated the holiday by dressing as stereotypical Mexicans, and local bars offered drink specials in Chávez's name, a tradition that has received national attention.

In 2003, the U.S. Postal Service recognized Chávez with a postage stamp, adding to a movement to make César Chávez Day a national holiday. In 2008, a national holiday organization was founded in order to promote the holiday; this organization was cochaired by actors Martin Sheen and Edward James Olmos and musician Carlos Santana. That year, celebrations in over 30 states, many with no recognized holiday, were held.

In 2011, President Barack Obama issued a presidential proclamation supporting making César Chávez Day a federal holiday, to be held each March 31, an action Obama also endorsed while he was a presidential candidate in 2008. Other 2008 presidential candidates who endorsed the holiday were Bill Richardson, John Edwards, and Dennis Kucinich; notably absent was John McCain, who had opposed a bill for the Martin Luther King, Jr. Day federal holiday in 1983.

Chaldean Americans

Chaldean Americans descended from the people of the northern Tigris-Euphrates Valley, which is located in present-day Iraq. Chaldeans represent less than 10 percent of Iraq's population although they make up the majority of Iraqi Americans. Most Iraqis are Muslim, but Chaldeans are Roman Catholic; Chaldean Americans are a very

religious community and take pride in their Christian culture. The mother tongue of Chaldeans is a form of Aramaic called simply Chaldean. At the outset of Chaldean immigration to the United States, Chaldean Americans only spoke Chaldean; in modern times most Chaldean Americans speak Arabic, which was mandatory in Iraqi schools. Chaldean Americans identify themselves as such and generally do not see themselves as part of Iraq or the Arab world.

The densest concentration of Chaldean Americans is in Detroit, Michigan; Chaldeans also live in Chicago, Illinois, and parts of California and Mexico. Chaldean Americans are not counted by the U.S. Census Bureau so population statistics are an estimate, but the Chaldean American community indicates that in the early 1940s there were fewer than 1,000 Chaldean Americans in Detroit, and by the early 1960s there were around 3,000. As immigration laws became more favorable for Chaldean Americans, more came to the United States, and by the mid-1980s there were approximately 45,000 Chaldean Americans in Detroit. Today 70,000 to 80,000 Chaldean Americans live in Detroit, and perhaps 2,000 to 3,000 live in California, mostly in San Jose and El Cajon.

History and Immigration

The first significant wave of Chaldean immigration into the United States was around 1910. Detroit was the target location for Chaldeans and Lebanese Christians as well (as well as other immigrant groups) in large part because of the work generated by the automobile industry. The impetus for this migration was to escape religious persecution by the Muslim majority. In a classic example of chain migration, more than 95 percent of Chaldean Americans in Detroit can trace their paths back to Telkaif, a poor, agrarian Christian village.

Immigration all but ceased during World War II as travel became more challenging, but recommenced at the close of the war; student visas increased immigration even more. Many Chaldean Americans came to the United States with student visas and married locally, which allowed them to remain. There was a steady immigration stream until the Gulf War started; this steady influx of Chaldeans has meant that assimilation has been slow.

Chaldean Americans born and raised in the United States are comfortable speaking English, attending mainstream schools, and generally pursuing an American lifestyle. Chaldeans who immigrated more recently are more likely than older-generation Chaldean Americans to have grown up in modern cities like Baghdad. Many Chaldean Americans have attended college. As the two groups of Chaldean Americans mix, they speak Arabic; Chaldean is not often spoken anymore.

To outsider Americans, Chaldean Americans often appear to be Arab Americans; however, this tends to insult Chaldean Americans. Muslim Arabs obviously have many religious differences. Chaldean Americans also tend to feel that their culture is less patriarchal and that women have more opportunities in their communities. One other reason for the tendency of Chaldean Americans to assert their own unique ethnic identity is simply that they can; in Detroit there is a substantial Chaldean American community so it is relatively easy for members of it to find others that share most aspects of life with them.

Grandparents, uncles, aunts, cousins, and siblings are considered to be just as much a part of the family for Chaldean Americans, and extended families often share meals and household duties. Chaldean Americans tend to keep to the traditional Catholic norm of having many children. Although Chaldean American families are not as large as they once were, they are still larger than the national average. Chaldean Americans follow endogamous patterns. When there are exogamous marriages, most often the “outsider” is brought into the community rather than the opposite. There is a strong expectation in Chaldean American communities that family preferences will be taken into consideration when spouses are chosen.

Chaldean Americans have frequently owned their own businesses, many of them grocery stores, and almost all of them family owned. In the 1980s, Chaldean American leaders estimated that there more than 1,000 Chaldean-owned grocery stores were in the Detroit area. There have at times been clashes between Chaldean Americans and African Americans in Detroit. Many Chaldean Americans run small family grocery stores in areas that big chain grocery stores find less profitable; these are generally in urban African American communities. African Americans have argued

that Chaldean American stores overcharge for their goods and refuse to hire anyone but Chaldean Americans. To some extent this is true, but mostly because small stores are forced to charge more than chains for a variety of reasons, and it makes more economic sense to hire employees within the family. In recent years this tension has resolved somewhat.

Religion

Religion is absolutely central to Chaldean American life. The first Chaldean Church in the United States, Mother of God, was opened in Detroit in 1947. In more recent times Mother of God moved and ascended to cathedral status. Now it is called Our Lady of Chaldeans Cathedral and is under the direction of the Chaldean diocese of the United States. Western Rite Catholic Churches serve the community when Chaldean churches are not available and many Chaldean American children attend Western Rite Catholic schools as Chaldean Rite does not offer education.

The Chaldean Church has been the community’s center since its inception. Even today it offers weddings, funerals, baptisms, and first Communion, and graduation ceremonies. The church also forms a variety of community groups, including youth groups, family groups, and men’s and women’s groups.

The Gulf War

The 1991 and 1992 Gulf War years were, predictably, some of the most momentous ever for Chaldean Americans (the largest concentration of Iraqi immigrants in the United States). Chaldean Americans were the subject of scrutiny from all sides; they were suspected of being national security risks and harassed by members of the public. Chaldean Americans, however, see themselves as dedicated Americans, and these experiences were disillusioning. Further trauma came from the relatives of Chaldean Americans who remained in Iraq being in constant peril; this problem is ongoing.

Chan, Charlie

American writer Earl Derr Biggers (1884–1933) used the life of a Chinese Hawai‘ian Honolulu Police Department officer to create Charlie Chan, the fictional Chinese American detective featured in novels, films, comics, and radio programs. While fans saw Biggers’s character as a pop culture icon, he was criticized by Asian American scholars and artists for producing a stereotype that depicted the Asian American experience in patronizingly simplistic ways and through yellowface performances.

Redefining Asian Stereotypes

After learning about the accomplishments of Honolulu police officer Chang Apana (1871–1933), Biggers created the fictional character of Charlie Chan to help solve a murder mystery set in Waikiki in his novel *The House Without a Key* (1925). Biggers was inspired by Apana’s heritage and success as a detective to create an amiable Chinese character who would serve as a counterbalance to the predominant stereotype of Chinese people at the time: the sinister Yellow Peril threatening American values. Biggers envisioned Charlie Chan as a plump civil servant who spoke in accented fortune cookie statements and in so doing, recast orientalist fears by portraying a peaceful, asexual, and exotic stereotype of Chinese culture.

Biggers would pen five additional Charlie Chan novels: *The Chinese Parrot* (1926), *Behind That Curtain* (1928), *The Black Camel* (1929), *Charlie*

Chan Carries On (1930), and *Keeper of the Keys* (1932). The exoticism of Chan and the popularity of detective fiction encouraged the crossover of Biggers’s literary work to other entertainment industries, such as comics, radio, and television. The most successful crossover industry was motion pictures, beginning with the film adaptation of *The House Without a Key*. The novel was released in 1926 as a 10-chapter serial film bearing the same title.

Over 50 Charlie Chan films were made over the course of six decades, including films in languages other than English. Forty-seven of the films were made by Hollywood movie studios and released between 1926 and 1949. During this period, the Charlie Chan character was fleshed out and became a successful franchise and popular culture icon. However, none of the actors playing Charlie Chan were of Chinese descent, and all but three of the films featured non-Asian actors. The first three Chan films—*The House Without a Key*, *The Chinese Parrot* (1927), and *Behind That Curtain* (1929)—featured Japanese actors, George Kuwa and Kamiyama Sojin, and Korean actor E. L. Park. In *Charlie Chan Carries On* (1931), Swedish actor Warner Oland was cast to play Chan, and, intentional or not, began a practice of yellowface acting that became symbolic of the Chan franchise and continued with the casting of actors Sidney Toler (1938–47) and Roland Winters (1947–49).

Reconstructing a More Complex Experience

Although the notion of an amiable, entertaining, albeit inaccurate imagining of a Chinese American detective was meant to provide a positive representation of Chinese Americans, Charlie Chan nevertheless obscured the Chinese American experience with a prejudicial falseness, presenting Asian Americans as dutiful, foreign, passive, and one-dimensional. Indeed, the yellowface performances were seen by Asian Americans as an Asian version of the blackface minstrels that hid the real racism and violence against African Americans. Asian American artists and activists have since used Charlie Chan as a point of departure for critique and envisioning more complex representations of the Asian American experience. Filmmaker Wayne Wang produced the film *Chan Is Missing* (1982), which followed two Chinese American amateur sleuths in their search

for a missing friend. The film used the genre created by the Charlie Chan franchise as a metaphor for introducing a more complex depiction of the Asian American experience. Similarly, artist and activist Jessica Hagedorn published two anthologies, *Charlie Chan Is Dead* (1993) and *Charlie Chan Is Dead 2: At Home in the World* (2004), that used Charlie Chan as the foil for deeper understanding of the Asian American experience.

Efforts to revive the Charlie Chan franchise continue to this day, and while Charlie Chan is a part of American popular culture, the character remains a disputed figure for Asian Americans, and signals a critical call for a broader range of Asian representations.

hallmark work in the history of American independent film. Directed, produced, and cowritten by Wang, *Chan Is Missing* features Asian American characters who question the stereotypical representation of Asians in U.S. popular culture. Produced on a budget of almost \$22,000, and shot on black-and-white 16mm film, the innovative 80-minute documentary-style *Chan Is Missing* joined a wave of clever, low-budget feature films that stood in contrast to the Hollywood blockbusters that characterized the 1980s. In 1995, *Chan Is Missing* was named to the National Film Registry, a list of films deemed "culturally, historically, or aesthetically significant."

Set in San Francisco's historic Chinatown, *Chan Is Missing* follows two Chinese American cab drivers, Jo (Wood Moy) and his nephew Steve (Marc Hayashi), as they search for Chan Hung, a friend who took \$4,000 that was loaned to him as part of an agreement to secure a cab license. As they pursue leads as to Chan's whereabouts, Jo and Steve meet a heterogeneous Asian American community living in Chinatown and across San Francisco. Every encounter with a Chan family member, acquaintance, or clue, however, raises more questions about Chan than provides answers about his location. All the clues, Jo and Steve realize, reveal Chan to be a complicated and contradictory figure. Was Chan a naïve immigrant who still needed to learn the lessons of America or was Chan a genius inventor? Was Chan duplicitous with his finances or was he honest and trustworthy? Was Chan an ashamed husband who failed to make enough money to support his family? Was Chan a dedicated political civil rights activist in the United States or was Chan a Chinese patriot who returned to China to build the country? Or was Chan from Taiwan, where he was disputing his family inheritance? Was Chan unchangingly "Chinese" in his customs or was he a cultural eccentric, revealed by his love of mariachi music? Jo ponders these questions when he and Steve end their search for Chan, never solving the mystery of the film.

In the context of Asian American representation, *Chan Is Missing* responds to the limiting stereotypes of Asian Americans popularized in American culture. The title and genre of the film *Chan Is Missing* refer to novelist Earl Derr Biggers's fictional character, Charlie Chan, the

Chan Is Missing

Wayne Wang's first feature film, *Chan Is Missing* (1981), is widely considered to be a groundbreaking film for Asian American cinema and a

Chinese American investigator who launched a detective mystery franchise that perpetuated myths about Chinese Americans and envisioned the Chinese American experience in yellowface. In place of the orientalist representations propagated by Charlie Chan and other stereotypes in popular circulation, such as the martial artist, model minority, dragon lady, or inscrutable foreigner, *Chan Is Missing* offers a complex Chinese American experience. The ambiguous and contradictory observations about Chan's identity, and the textures of a heterogeneous Chinese American community, encourage speculation about the nature of Chinese American identity and its representation.

Wang animates this narrative trajectory with documentary-style techniques and playful references to literary and cinematic conventions, such as the genre of film noir. The black-and-white film and the setting of San Francisco frame *Chan Is Missing* with the conventions of a film noir mystery. The pairing of the older Jo with the younger Steve mimics the pairing between Charlie Chan his Number One Son sidekick. While *Chan Is Missing* makes use of familiar conventions, relying on them to build the narrative, the film does not follow them. Instead, *Chan Is Missing* is a story without a protagonist, a narrative that ends without closure, a mystery in which clues lead to more riddles, and an Asian American tale without Asian American stereotypes.

The documentary-like style of *Chan Is Missing* further plays with genre conventions and stereotypes. Many of the scenes are shot on location with mobile 16mm film cameras. The dynamic movement and the grainy texture of the 16mm film adds realness to the scenes. Through this lens, Wang uses settings and other props to treat Chinese America as a hybrid experience. Shots of Chinatown are mixed with pieces of American pop culture, parts of the film are scored with Cantonese versions of well-known American pop songs, and Chinese American characters are knowledgeable about American popular culture.

Members of the San Francisco Chinese community and nonprofessional actors play themselves in the film, giving the film an unscripted, sometimes aimless feel with its awkward pauses in dialogue and random topics. Accented and non-accented English and both main Chinese

languages—Mandarin and Cantonese—are spoken in the film, further adding to its sense of reality. The documentary style gives dimension to the representations in the film, and by so doing, allows the characters to serve as real examples of Chinese American life.

The use of film for a complex and experimental exploration of the Asian American experience treats representation as an artistic and political act. *Chan Is Missing* was produced just over a decade removed from the civil rights activism that established the discipline of ethnic studies and the Asian American movement. As part of this journey, the film resonates with the developing sense of empowerment and cultural critique in the Asian American community, and its desire to change the cultural discourse of America. Wang's playful use of convention not only served as a narrative metaphor for his critique of stereotypes and Chinese American identity, but it also found appreciation as an alternate mode of storytelling. As a nonstudio Hollywood film—that is, an independent film produced without studio funds—*Chan Is Missing* had freedom to experiment with cinematic storytelling and richly envisioned Asian America as a site of imagination.

Cherokee

According to the 2010 census, the Cherokee are the largest of the 565 federally recognized

American Indian tribal groups in the United States, with more than 800,000 individuals identifying themselves as Cherokee. They are also culturally diverse, with more than 65 percent of that population reporting multiple tribal and racial affiliations. Less than half of the population self-identified as Cherokee in the 2010 census are officially enrolled in one of the federally recognized tribes, reducing membership to 300,000. Nonetheless, this still makes them one of the largest groups.

The word *Cherokee* has several sources, including a Choctaw word meaning Cave People. After being adopted and used by Europeans, the Cherokee eventually embraced the name as well in the form of *Tsa'lagi'* or *Tsa'ragi'*. Traditionally, the Cherokee people refer to themselves as *ani'yûn'wiya'*, which means the Real People or the Principal People. At the time of European contact in 1540, the Cherokee occupied and utilized a vast area, approximately 40,000 square miles of land, in what is now Alabama, the Carolinas, Georgia, Kentucky, Tennessee, and the Virginias, until relocated to present-day Oklahoma in 1835–39. Today, the Cherokee are comprised of three federally recognized tribes—the Cherokee Nation and the United Keetoowah Band of Cherokee Indians, both located in Oklahoma, and the Eastern Band of Cherokee, located on a reservation in North Carolina. In addition, there are also Cherokee bands like the Echota Cherokee Tribe in Alabama.

Sequoyah and Cherokee Literacy

Sequoyah (George Grist) was a pivotal figure in Cherokee history whose translation of the Cherokee language into an 85-symbol syllabary (a set of written symbols representing spoken syllables in the Cherokee language) contributed to the rapid spread of literacy among the Cherokee in 1821. The use and dissemination of the syllabary occurred during an important period in Cherokee history. Sequoyah's syllabary made written correspondence between the geographically separated Cherokee groups possible. It contributed to the survival of their language and the independence of the Cherokee people as a whole. As a result of Sequoyah's syllabary, parts of the Bible were translated into Cherokee and from 1827 to 1828, both the Cherokee constitution and the *Cherokee*

The forced relocation of several tribes from the southwestern United States after the Indian Removal Act of 1830 led to the deaths of an estimated 4,000 Cherokee. Known as the Trail of Tears, two of the routes are marked as National Historic Trails.

Phoenix, a weekly newspaper printed in Cherokee and English, were an important voice in the battle over removal.

Land Cessions, Removal, and the Trail of Tears

Between 1721 and 1835 numerous land cession agreements made with the British and the United States diminished Cherokee ancestral homelands. After the 1828 election of President Andrew Jackson, a supporter of removal, and the discovery of gold in Cherokee territory, Georgia aggressively campaigned to secure Cherokee land. Backed by the 1830 Indian Removal Act, which relocated eastern tribes to Indian Territory (now Oklahoma), Georgia nullified Cherokee legal rights and extended state jurisdiction over their land. The Cherokee fought removal by pursuing their legal rights as an independent, sovereign state in court.

Despite two lawsuits filed by the Cherokee in the U.S. Supreme Court (*Cherokee Nation v. Georgia* (1831) and *Worcester v. Georgia* (1832)), the latter of which upheld Cherokee national sovereignty over their land, Georgia held its 1832 land lottery. Cherokee land was divided into lots distributed to Georgia citizens as lottery winners.

In 1835 John Ridge and a small group of Cherokee, known as the Treaty Party, signed the controversial Treaty of New Echota, which

provided for the cession of all Cherokee territory east of the Mississippi in exchange for financial compensation and land in present-day Oklahoma. Despite opposition to the treaty by the Ross Party, a larger group led by Chief John Ross and 15,000 Cherokee signatures denouncing the treaty as fraud, the U.S. Congress ratified it and gave the Cherokee two years to move. Supporters of the treaty voluntarily emigrated with relative ease between 1835 and 1838. The remaining majority were placed in internment camps, where many died from disease. Although accounts vary, at least one-quarter of the 20,000 Cherokee forcibly removed between 1838 and 1839, in what is known as the Trail of Tears, perished during the 1,500-mile long journey.

After removal, Ridge, his father, Major Ridge, and his cousin and former editor of the *Cherokee Phoenix* newspaper, Elias Boudinot, were assassinated in 1839. In Oklahoma, the Cherokee lost more land under the Dawes Act (1887), which divided tribal-owned land into allotments awarded to individuals registered on the Dawes Roll. Remaining land was sold to non-Cherokees.

Cherokee Culture Today

Despite a difficult history, the Cherokee are at the forefront of linguistic, cultural, and economic revival. Today most Cherokee speak English, but approximately 20,000 still speak the Cherokee language. The Cherokee Nation of Oklahoma's tribal education system consists of 144 elementary schools. The Eastern Band of Cherokee participated in the development of the 2005 Cherokee Language Revitalization Program and the establishment of the Qualla Arts and Crafts Mutual, Inc., which is an artist cooperative founded in 1946 to preserve and promote Cherokee art. There are also numerous museums and heritage centers that uphold Cherokee history and culture.

The Cherokee have always been leaders in self-governance. The Cherokee Nation of Oklahoma operates under a tripartite government with a tribal constitution, a district court, and judicial appeals tribunal. Approximately 70,000 residents live in a 7,000 square mile area that encompasses eight counties and portions of six more counties. The tribal government controls and manages tribal assets that range from 65,000 acres of land to the Cherokee Nation Entertainment

LLC, which engages in various business enterprises, including operating casinos, retail stores, golf courses, and hotels.

Cherokee Nation v. Georgia (1831)

Cherokee Nation v. Georgia (cited as 30 U.S. 1) is a case decided on March 18, 1831, by the U.S. Supreme Court. The Cherokee Nation petitioned the Supreme Court for a federal injunction against Georgia state laws that severely curtailed the nation's political, civil, and property rights. The court ruled that it did not possess original jurisdiction to hear the suit, as the Cherokee Nation was not a "foreign State" within the meaning of Article III of the U.S. Constitution, but rather a "domestic dependent nation" with a relationship to the United States akin to that of a ward to its guardian.

Prior to the arrival of European colonists, the Cherokee Indians inhabited North America's southeastern seaboard. However, by the late 18th century, the Cherokee had peacefully entered into treaties with the United States that relegated them to specified lands in northwest Georgia. While retaining significant independence, the Cherokee adopted many aspects of European culture and

civilization. Within the first quarter of the 19th century, they had adopted an agrarian lifestyle, embraced commerce, established a written language, enrolled children in American schools, and established a codified legal system

Tensions between the Cherokee and Georgians were exacerbated by the discovery of gold on Cherokee lands within Georgia. The state legislature enacted a series of laws on December 20, 1828, which declared Cherokee laws to be void, stripped the Cherokee of certain state rights, and anticipated the westward relocation of the Cherokee in accordance with federal policy. A Cherokee delegation departed for Washington, D.C., in order to demand federal enforcement of tribal rights. Though Republican congressmen supported the Cherokee claims, President Andrew Jackson approved of the extension of Georgian laws over the Cherokee. In May 1830, Jackson signed the Indian Removal Act, which provided federal funds to accomplish the relocation of Indians to lands west of the Mississippi River.

William Wirt, who had served as attorney general under Presidents James Monroe and John Quincy Adams, took the case on behalf of the Cherokee and, wishing to avoid the hostile forum of Georgian state courts, petitioned the Supreme Court for an injunction prohibiting the execution of Georgia state law against the Cherokee. In order for the Supreme Court to claim original jurisdiction (as opposed to appellate jurisdiction arising from lower-court decisions), Wirt was compelled to argue that the Cherokee constituted a foreign nation within the meaning of the Constitution.

Wirt maintained that the Cherokee constituted a sovereign and independent nation prior to the arrival of European colonists and that subsequent treaties confirmed their status as a foreign nation. Georgia's state legislature therefore had no jurisdiction over Indian lands, and any laws that attempted to assert such authority were null and void. Conversely, the state of Georgia contested the classification of the Cherokee Nation as a foreign state and insisted that the federal government had no authority to regulate the application of state law within Georgia.

Chief Justice John Marshall, delivering the opinion of the court, ruled that the Cherokee were indeed a state, but found that they were not a foreign state. Observing that the "condition of the

Indians in relation to the United States is perhaps unlike that of any other two people in existence," Marshall compared this relation to "that of a ward to his guardian" and concluded that the Indians were a "domestic dependent nation." Following a long recitation of the manners in which Indians acknowledged and depended upon American sovereignty over them, Marshall found that "the framers of our Constitution had not the Indian tribes in view when they opened the courts of the union to controversies between a State or the citizens thereof, and foreign states." As such, the court was found to lack original jurisdiction over the case and the request for injunctive relief was denied.

Justice William Johnson, as was his habit, wrote a fully concurring opinion that assented to Marshall's reasoning. Justice Henry Baldwin concurred with the majority's conclusion, but rejected Marshall's early assertion that the Indian tribes constituted sovereign states. Justice Smith Thompson, joined by Justice Joseph Story, dissented from the majority opinion, arguing that the Cherokee constituted a foreign state with standing to sue and that the requested injunction was an appropriate remedy to prevent further violations of treaty law by the laws of Georgia.

Effects

The ruling proved extremely consequential for the Cherokee, who ultimately failed to prevail against the Georgian and federal policies of relocation. By 1838, all Cherokee lands had been ceded to the United States and the entire Cherokee people were forcibly moved to detention facilities before being relocated to the territory of present-day Oklahoma. Approximately 4,000 Cherokee died of disease and exposure during the six-month, 1,000-mile winter march later known as the Trail of Tears.

In 1832, a year after *Cherokee Nation v. Georgia*, the Supreme Court held that Georgia's laws affecting the Cherokee were unconstitutional in the case of *Worcester v. Georgia*. Though the opinion of the case—which holds that states generally lack jurisdiction over Indian lands, which fall within the federal government's sole authority—remains valid today, the decision had little practical effect on the plight of the Cherokee.

Cheyenne

A word of Lakota origin, *Cheyenne* means “red talkers” or “foreign talkers.” They call themselves *Tsitsistas*, for which one meaning is “people of a different speech.” Members of the Algonquian language group, the Cheyenne were originally a nation of farmers, but as they migrated, they became nomadic hunters and gatherers. In the 19th century, the tribe split into the Northern and Southern Cheyenne. According to the 2010 census, there are 11,375 Native Americans who self-identify solely as Cheyenne, and another 5,311 who are Cheyenne in combination with some other tribal identity. The Northern Cheyenne Reservation in Montana was established in 1884. Most Southern Cheyenne live in cities and towns of western Oklahoma.

Historians place Cheyenne first among the Algonquian-speaking tribes who may have come north from the lower Mississippi Valley. In the 16th and 17th centuries, they lived in permanent villages in the upper Mississippi Valley, in what is now northern and western Minnesota, where they grew corn, beans, and squash and fished and hunted game. By the 18th century, attacks by other tribes forced them to leave their home and migrate westward. They acquired horses from the Spanish and gradually combined farming with hunting buffalo. By the early 19th century, raids by the Sioux had forced them onto the Plains, where they ceased to plant crops and became buffalo hunters and fierce fighters. Building alliances first with the Arapaho and later with the Lakota, they lived primarily near the Black Hills and then in the upper Platte–Powder River area. About

this time, they absorbed the Sutaio tribe, another Algonquian group.

Around 1832, some bands of Cheyenne moved, lured by trade in Taos, New Mexico, and Bent’s Ford, Colorado. The move led to a tribal split into Northern and Southern Cheyenne. The Cheyenne were a party to the Fort Laramie Treaty of 1851, an agreement between eight Indian nations and the United States that established territorial boundaries to end war among the tribes and guaranteed the safety of settlers on the Oregon Trail. It also recognized the Northern and Southern Cheyenne as distinct groups, thus making their split formal.

The Gold Rush of 1848 and the Homestead Act of 1862 brought more and more white settlers into Indian territories. The Southern Cheyenne—although they were being heavily pushed into leaving the region after the Pike’s Peak gold rush of 1859—under Chief Black Kettle compromised repeatedly in an effort to avoid war and retain their land in Colorado. But the Sand Creek Massacre in 1864, when hundreds of Cheyenne and Arapaho were slaughtered at Sand Creek, Colorado, where they had been told to camp by the U.S. Army, left them with no choice but to cede their land to the state.

The Cheyenne divided once more. The greater number ended up on the Southern Cheyenne and Arapaho Reservation, which was lost to white settlement in 1902. Some went north to the Powder River Country, and a few continued to fight with the Kiowa, Comanche, and Arapaho until 1875. The Northern Cheyenne had their own struggles with invaders seeking land and gold in violation of the 1851 Fort Laramie Treaty. After the Sand Creek Massacre, they joined the tribes who were at war. In 1876, the Northern Cheyenne were among the warriors who emerged victors at the Battle of Little Bighorn.

The Cheyenne and those fighting with them won that battle, but they lost the war. By the time Cheyenne Chief Dull Knife surrendered to the U.S. Army, many Cheyenne had died of starvation or exposure. After a long and difficult forced march to join the Southern Cheyenne, they arrived at the reservation in Indian Territory (now Oklahoma) to find little food and unhealthy conditions. Two-thirds of the tribe fell ill, and many died. Dull Knife and a war chief, Little Wolf, escaped the

reservation with almost 400 Cheyenne, most of them women and children, all of them desperate, and many sick with malaria. Little Wolf's band headed northwest, surrendered to the U.S. Army on March 25, 1879, and was allowed to remain in Montana; Dull Knife's group eventually was imprisoned at Fort Robinson (Nebraska) when they refused to return to Oklahoma. A failed escape attempt left 64 dead and more than 70 were recaptured. Only six, including Dull Knife, escaped and joined Little Wolf.

Contemporary Cheyenne

The Northern Cheyenne Indian Reservation, approximately 444,000 acres with almost 100 percent tribal ownership, is located in southeastern Montana, about 40 miles east of the site of the Battle of Little Bighorn. In 2012, the tribe had approximately 10,050 enrolled tribal members, with about 4,939 residing on the reservation, slightly more than the 4,789 reported in the 2010 census. The Cheyenne and Arapaho Tribes are a united, federally recognized group in western Oklahoma. Because intermarriage is common between members of the Cheyenne and Arapaho tribes, a population count of Southern Cheyenne is difficult. In 2003, of the 11,507 enrolled Cheyenne-Arapaho, about 8,000 self-identify as Cheyenne.

Unemployment and poverty rates are high among both groups. Among the Northern Cheyenne, unemployment ranges from 50 to 90 percent, with federal and tribal governments employing the greatest number. The Cheyenne-Arapaho Tribes operate four casinos. Both Northern and Southern Cheyenne work to ensure their cultural survival. Dull Knife College, chartered in 1976, exists in part to pass on the Cheyenne way of life. In 2008, the college, with a grant from the Montana state legislature, published *We, the Northern Cheyenne People: Our Land, Our History, Our Culture*.

The Cheyenne-Arapaho Tribes of Oklahoma Culture and Heritage Program teaches traditional games and music along with the Cheyenne and Arapaho languages, horse care and riding, and buffalo management. The Cheyenne and Arapaho Tribal College, chartered in 2006, offers degrees in Tribal Management and American Indian Studies. Both tribes boast members with remarkable

achievements. Ben Nighthorse Campbell represented Colorado in the U.S. House of Representatives (1987–93) and served as a U.S. senator (1993–2005). He serves as one of 44 members of the Council of Chiefs of the Northern Cheyenne. Walter Richard West, Jr., the founding director of the Smithsonian National Museum of the American Indian, is a citizen of the Cheyenne and Arapaho Tribes in Oklahoma and a peace chief of the Southern Cheyenne.

Cheyenne Autumn

Cheyenne Autumn (1964) was directed by John Ford, whose earlier credits included classic westerns such as *Stagecoach* (1939) and *The Searchers* (1956). Inspired by Mari Sandoz's historical novel, the film focuses on an actual event. In 1878, approximately 300 Cheyenne Indians, led by Dull Knife and Little Wolf, escaped from a desolate Oklahoma reservation and embarked on an arduous 1,500-mile journey to their homelands on the northern Plains. Ford's film tells the story from the Native American perspective. Significantly, the film's approach to history, race, gender, and ethnicity, as well as its attacks on the establishment for supporting corruption and exploitation, foreshadowed the nuanced approaches that would be associated decades later with the New Western History.

The big-budget movie explains all the obstacles and hardships the Indians encountered along

the way. As the Cheyenne fight off the pursuing cavalry, they also have to cope with lack of food and water, punishing rain- and windstorms, and deadly blizzards, not to mention threats from bureaucrats, cowboys, townsfolk, and even internal dissension. On the verge of total defeat, the Indians are saved by a sympathetic cavalry officer (played by Richard Widmark) who secures help from Secretary of the Interior Carl Schurz (Edward G. Robinson).
