

Praktyczne metody weryfikacji

Wykład 4: Weryfikacja
modelowa dla LTL

(i) $M \mapsto \mathcal{A}_M$

(ii) $\neg\phi \mapsto \mathcal{A}_{\neg\phi}$ (a nie $\phi \mapsto \mathcal{A}_\phi \mapsto \bar{\mathcal{A}}_\phi$)

(iii) $L_\omega(\mathcal{A}_M) \cap L_\omega(\mathcal{A}_{\neg\phi}) = \emptyset$? (a nie $L_\omega(\mathcal{A}_M) \subseteq L_\omega(\mathcal{A}_\phi)$)

$L_\omega(\mathcal{A}_M \times \mathcal{A}_{\neg\phi}) = \emptyset$?

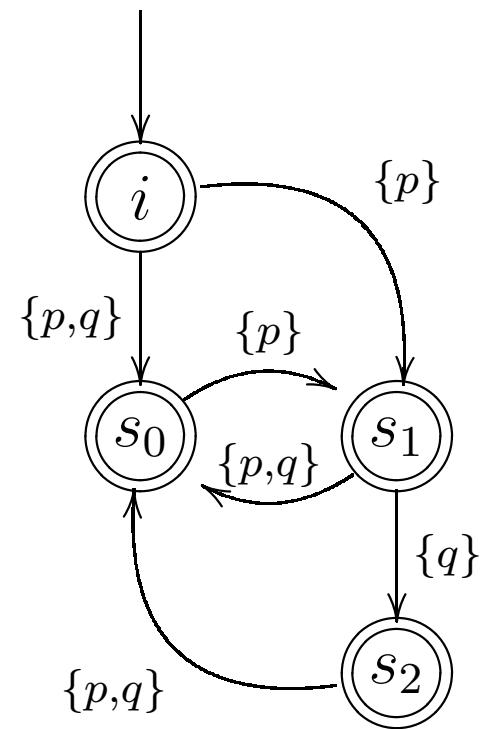

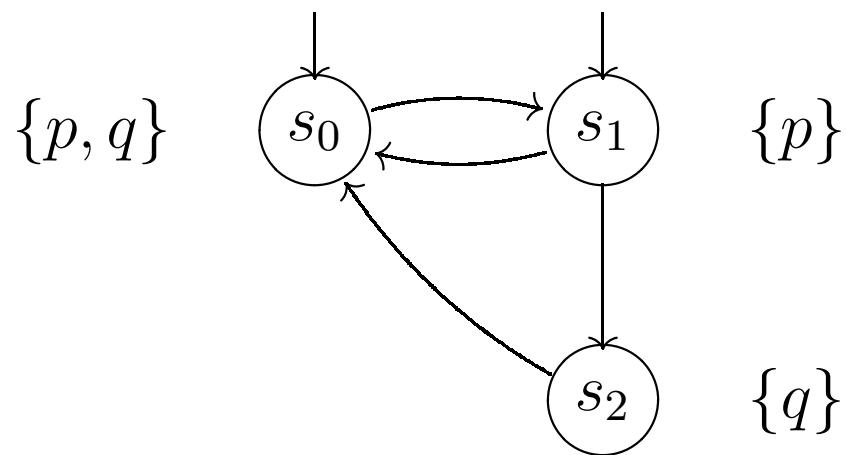

tak $\rightarrow M \models \phi$

nie $\rightarrow \neg(M \models \phi)$, kontrprzykład = ścieżka w M

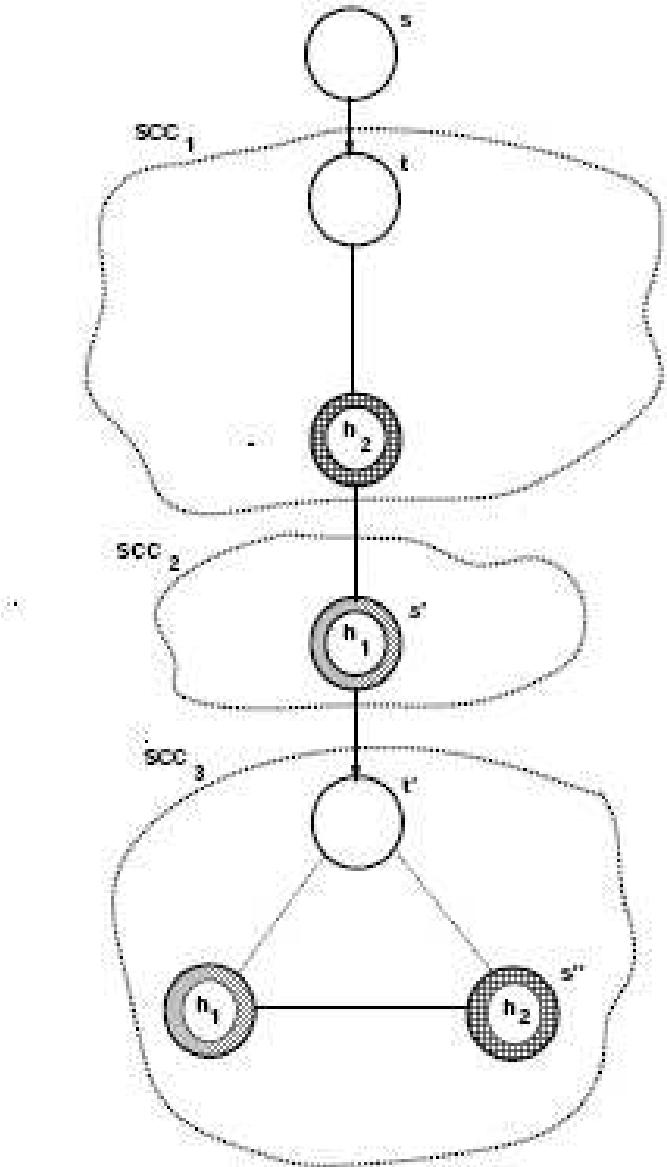

$$(i) \quad M \mapsto \mathcal{A}_M$$

$$M \mapsto \mathcal{A}_M$$

(iii) $L_\omega(\mathcal{A}) \neq \emptyset?$

(1) Weryfikacja w locie

for each successor t of s do ...

...

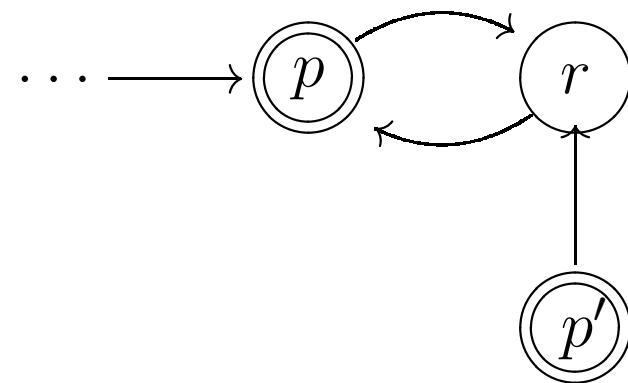

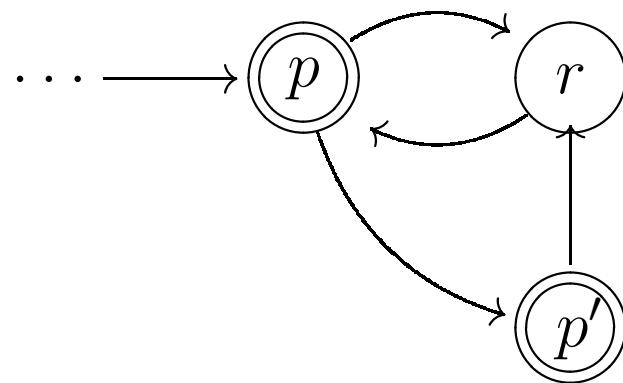

```
proc dfs(s)
    if error(s) then report error fi
    add {s,0} to Statespace
    for each successor t of s do
        if {t,0} not in Statespace then dfs(t) fi
    od
    if accepting(s) then seed:=s; ndfs(s) fi
end

proc ndfs(s) /* the nested search */
    add {s,1} to Statespace
    for each successor t of s do
        if {t,1} not in Statespace then ndfs(t) fi
        else if t==seed then report cycle fi
    od
end
```

Założmy, że jest stan akceptujący p , który ma cykl niewykryty w $\text{ndfs}(p)$. Niech p – pierwszy taki stan.

Niech r – pierwszy stan odwiedzony w $\text{ndfs}(p)$ t.ż. r jest na cyklu zawierającym p i $\{r, 1\} \in \text{Statespace}$.

Niech p' – stan akceptujący t.ż. r osiągnięto w $\text{ndfs}(p')$.

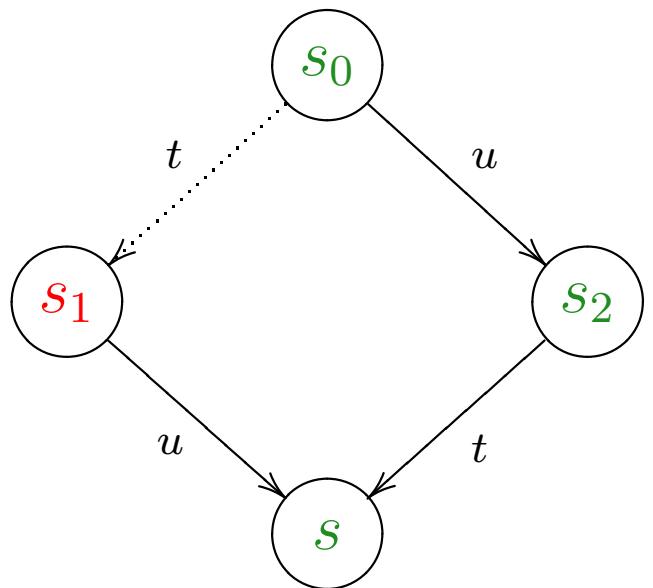

(1) Weryfikacja w locie

for each successor t of s do ...

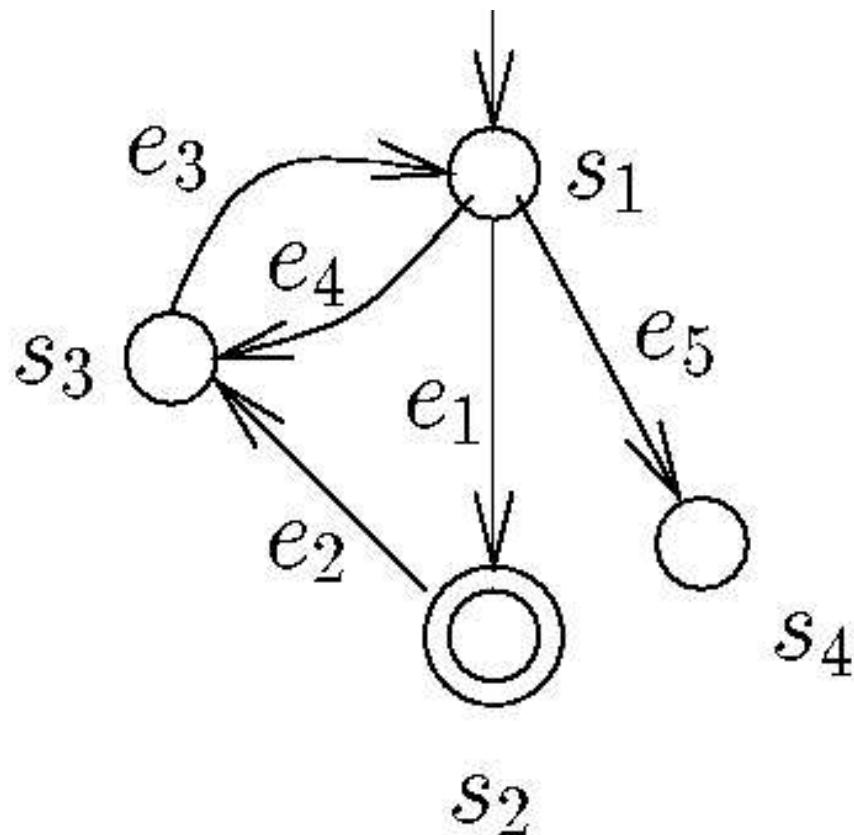

(2) Redukcje częściowo-porządkowe

for each (selected) successor t of s do ...

for each (selected) successor t of s do ...

(selected) – zależy od dotychczasowej ścieżki !

```
proc dfs(s)
    if error(s) then report error fi
    add {s,0} to Statespace
    add s to Stack
    for each (selected) successor t of s do
        if {t,0} not in Statespace then dfs(t) fi
    od
    if accepting(s) then ndfs(s) fi
    delete s from Stack
end

proc ndfs(s) /* the nested search */
    add {s,1} to Statespace
    for each (selected) successor t of s do
        if {t,1} not in Statespace then ndfs(t) fi
        else if t in Stack then report cycle fi
    od
end
```

np-cycles: FG \neg progress

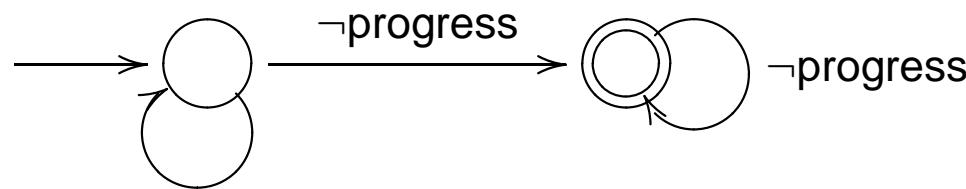

```
proc dfs(s)
    if error(s) then report error fi
    add {s,0} to Statespace
    for each successor t of s do
        if {t,0} not in Statespace then dfs(t) fi
    od
    ndfs(s) /* different */
end
